In the first line the poet reminds us of the extraordinary strength displayed by a simple mushroom in forcing its way to the surface against obstacles. 'Asurian' is not a colour: it is the radiance associated with Asuras, which at this period in Indo-Aryan history meant the divinities. The fly-agaric sloughs off the radiant envelope that is his to start with the 'universal veil', and prepares to meet with the Sky (= Father). He dons of course his gorgeous apparel, his *nirṇíj*, his 'vesture-of-grand-occasion', what Renou calls his *robe d'apparat*. Nine times[24] in Maṇḍala IX the poets speak of the *nirṇíj* of Soma: this is his dazzling vesture-of-grand-occasion. Often his costume is linked with the milk of cows: this is the fly-agaric while still studded with plaques of snow, with tufts of snowy wool. There is one occasion on which the poet stoops to a banal simile:

> IX 86[44c]
> Like a serpent he creeps out of his old skin.
>
> अहि॒र्न जू॒र्णा॑मति॑ सर्पति॒ त्वच॒म
> *áhir ná jūrṇā́m áti sarpati tvácam*

At least some of the poets knew their fly-agaric *in situ*, high in the mountains: could the last phrase in this verse have been written by anyone who did not know it?

> IX 70[7]
> He [Soma] bellows, terrifying bull, with might, sharpening his shining [*hári*] horns, gazing afar. The Soma rests in his well-appointed birthplace. The hide is of bull, the dress of sheep.
>
> रु॒वति॑ भी॒मो वृ॑ष॒भस्त॑वि॒ष्यया॒ शृं॑गे॒ शिशा॑नो॒ हरि॑णी विचक्ष॒णः
> आ योनिं॒ सोम॒ः सुकृ॑तं॒ नि षी॑दति ग॒व्ययी॒ त्वग्भ॑वति नि॒र्णिग॒व्ययी॑
> *ruváti bhīmó vṛṣabhás taviṣyáyā &sacute;ṛ́ṅge &sacute;í&sacute;āno háriṇī vicakṣaṇáḥ*
> *ā́ yóniṃ sómaḥ súkṛtaṃ ní ṣīdati gavyáyī tvág bhavati nirṇíg avyáyī*

'The hide is of bull, the dress of sheep.' The red bull of IX 97[13] supplies him with his skin; his dress is of fluffy tufts of white sheep's wool.

Often have I penetrated into a forest in the fall of the year as night gathered and seen the whiteness of the white mushrooms, as they seemed to take to themselves the last rays of the setting sun, and hold them fast as all else faded into the darkness. When fragments of the white veil of the fly-agaric still cling to the cap, though night has taken over all else, from afar you may still see Soma, silver white, resting in his well-appointed birth-place close by some birch or pine tree. Here is how three thousand years ago a priest-poet of the Indo-Aryans gave voice to this impression:

> IX 97[9d]
> By day he appears *hári* [colour of fire], by night, silvery white.
>
> दि॒वा ह॒रि॒र्द॒दृ॑शे॒ नक्त॑मृ॒ज्रः
> *dívā hárir dádṛ&sacute;e náktam ṛjráḥ*

Soma's scarlet coat dominates by day; by night the redness sinks out of sight, and the white patches, silvery by moon and starlight, take over.

C. The bull and soma

The bull was the mightiest beast familiar to the Indo-Aryans. It was the symbol of strength in the ṚgVeda and it was the commonest metaphor for Soma. It exchanged attributes with Soma: both were seated high in the mountains, both were gazing afar off, both bellowed, both sharpened shining horns. Sometimes the image was taken from Soma, sometimes from the bull, thus:

> IX 70[7ab]
> He [Soma] bellows, terrifying bull, with might, sharpening his shining horns, gazing afar…
>
> रु॒वति॑ भी॒मो वृ॑ष॒भस्त॑वि॒ष्यया॒ शृं॑गे॒ शिशा॑नो॒ हरि॑णी विचक्ष॒णः
> *ruváti bhīmó vṛṣabhás taviṣyáyā &sacute;ṛ́ṅge &sacute;í&sacute;āno háriṇī vicakṣaṇáḥ*

The hallucinogenic mushrooms of Mexico act passively: the subject seems to an outsider to be withdrawn in meditation. Soma, in addition to translating one to Elysium, seems to have possessed a kinetic potency, filling

---

24. IX 68[1], 71[2], 82[2], 86[26,46], 95[1], 99[1], 107[26], and 108[12].

one with the joy of extraordinary physical and vocal activity. This is reported alike in the ṚgVeda and in Siberia, where, as we shall see, phenomenal displays of physical prowess sometimes attend inebriation by the fly-agaric.

It is important that the modern reader fix his attention on the sense of power that Soma gave to the poets of the ṚgVeda. They ring all the changes on this metaphor of a bull. (Sometimes Soma is a buffalo.) For the poets the bull is a creature that constantly sharpens his horns: there are many such references. We have just seen Soma compared to a bull 'sharpening his shining horns'. Once the poet resorts to synecdoche:

> IX 97[9c]
> Soma with sharpened horns [*i.e.*, Soma the bull] attains his [full] reach.
>
> प॒री॒ण॒सं कृ॑णुते ति॒ग्मशृं॑गो॒ *parīṇasáṃ kṛṇute tigmá&sacute;ṛṅgo*

Some have deduced from this verse that Soma must have been a plant with thorns! But of course the 'sharpened horns' are nothing more than the familiar cliche for a bull, and the bull is Soma.

Plate V - AGNI: Fire.

D. The udder and soma

The swollen hemisphere of the fly-agaric's cap naturally suggests an udder to the poet:

III 48[3ab]
Approaching his mother, he [Indra] cries for food; he looks toward the sharp Soma as toward the udder.

उ॒प॒स्थाय॑ मा॒त॒र॒मन्न॑मैट्ट ति॒ग्मम॑पश्यद॒भि सोम॒मूधः॑

upasthā́ya mātáram ánnam aiṭṭa tigmám
apa&sacute;yad abhí sómam ū́dhaḥ

IV 23[1ab]
What priest's sacrifice has [Indra] enjoyed, [approaching] the Soma as it were an udder?

क॒था म॒हाम॑वृध॒त्कस्य॒ होतु॑र्य॒ज्ञं जु॑षा॒णो अ॒भि सोम॒मूधः॑

kathā́ mahā́m avṛdhat kásya hótur yajñā́ṃ juṣāṇó abhí
sómam ū́dhaḥ

VII 101[1ab]
Raise the three voices that are preceded by light and that milk the udder, which is milked of sweetness... [... Soma]

ति॒स्रो वाच॒ः प्र व॑द॒ ज्योति॑रग्रा॒ या ए॒तद्दु॒ह्रे म॑धुदो॒घमूधः॑

tisró vā́caḥ prá vada jyótiragrā yā́ etád duhré
madhudoghám ū́dhaḥ

VIII 9[19a]
When the swollen stalks were milked like cows with [full] udders...

यदापी॑तासो अं॒शवो॒ गावो॒ न दु॒ह्र ऊध॑भिः

yád ā́pītāso aṃ&sacute;ávo gā́vo ná duhrá ū́dhabhiḥ

IX 68[1]
The sweet juices have hurried to the god like milch cows [to a calf]. Resting upon the barhis, noisy, with full udders, they have made the red ones their flowing garment. [This is before the Soma plants are pressed. They are resting in an open space, on the ground, waiting to be pressed.]

प्र दे॒वमच्छा॒ मधु॑मंत॒ इंद॒वोऽसि॑ष्यदंत॒ गाव॒ आ न धे॒नवः॑
ब॒र्हि॒षदो॑ वच॒नाव॑ंत॒ ऊध॑भिः परि॒स्रुत॑मु॒स्रिया॑ नि॒र्णिज॑ं धिरे

prá devám ácchā mádhumanta índavó
&sacute;iṣyadanta gā́va ā́ ná dhenávaḥ
barhiṣádo vacanā́vanta ū́dhabhiḥ parisrútam usríyā
nirṇíjam dhire

IX 69[1ab]
The thought is placed like an arrow upon a bow; like a calf to the udder of his mother he hastens. [The figure may not refer to Soma but the context suggests that it does.]

इषु॒र्न धन्व॒न्प्रति॑ धीयते म॒तिर्व॒त्सो न मा॒तुरुप॑ स॒र्ज्यूध॑नि

íṣur ná dhánvan práti dhīyate matír vatsó ná mātúr úpa
sarjy ū́dhani

IX 107[5ab]
Milking the dear sweetness from the divine udder, he has sat in his accustomed place.

दु॒हा॒न ऊध॑र्दि॒व्यं मधु॑ प्रि॒यं प्र॒त्नं स॒धस्थ॒मास॑दत्

duhāná ū́dhar divyáṃ mádhu priyáṃ pratnáṃ
sadhástham ā́sadat

E. The stalk and soma

Not only is the Soma plant likened to an udder; the stalk or *aṃ&sacute;ú* (literally a 'shoot', a perfect word for the stipe of a mushroom) is likened to a teat:

I 137[3ab]
The priests milk this *aṃ&sacute;ú* for you both [Varuṇa and Mitra, two gods], like the auroral milch cow, with the aid of stones they milk the Soma, with the aid of stones.

तां वां॑ धे॒नुं न वा॑स॒रीम॒ंशुं दु॑ह॒ंत्यद्रि॑भिः॒ सोमं॑ दुह॒ंत्यद्रि॑भिः

tā́m vām dhenúm ná vāsarī́m aṃ&saucte;úṃ duhanty
ádribhiḥ sómaṃ duhanty ádribhiḥ

II 13[1cd]
The first milk of the *aṃ&sacute;ú* is the best.

तदां॒हना अं॑भवत्पि॒प्युषी॒ पयो॒ऽ◌ंशोः पी॒यूषं॑ प्रथ॒मं तदु॒क्थ्यं॑

tád āhanā́ abhavat pipyúṣī páyo 'ṃ&sacute;óḥ pīyū́ṣaṃ prathamáṃ tád ukthyám

III 36^{6cd}
Indra is farther than this seat when the milked *aṃ&sacute;ú*, the Soma, fills him.

अत॑श्चि॒दिंद्रः॒ सद॑सो॒ वरी॑या॒न्यदीं॒ सोमः॑ पृ॒णति॑ दु॒ग्धो अं॒शुः

áta&sacute; cid índraḥ sádaso várīyān yád īṃ sómaḥ pṛṇáti dugdhó aṃ&sacute;úḥ

IV 1^{19cd}
He has tapped so to speak the pure udder of the cows, rendering the milk clear as is the juice yielded by the *aṃ&sacute;ú*.

शुच्यूधो॑ अतृ॒णन्न गवा॒मंधो॒ न पू॒तं परि॑षिक्तमं॒शोः

&sacute;úcy ū́dho atṛṇan ná gávām ándho ná pūtáṃ páriṣiktam aṃ&sacute;óḥ

V 43^{4}
The ten fingers, the two arms, harness the pressing stone; they are the preparers of the Soma, with active hands. The one with good hands [the priest] has milked the mountain-grown sap of the sweet honey [Soma]; the *aṃ&sacute;ú* has yielded the dazzling [sap].

दश॒ क्षिपो॑ युंजते बा॒हू अद्रिं॒ सोम॑स्य॒ या श॑मि॒तारा॑ सु॒हस्ता॑
मध्वो॒ रसं॑ सु॒गभ॑स्तिर्गिरि॒ष्ठां चनि॑श्चदद्दुदुहे शु॒क्रमं॒शुः

dá&sacute;a kṣípo yuñjate bāhū́ ádriṃ sómasya yā́ &sacute;amitārā suhástā mádhvo
rásaṃ sugábhastir giriṣṭhā́ṃ cáni&sacute;cadad duduhe &sacute;ukrám aṃ&sacute;úḥ

VIII 9^{19ab}
When the swollen *aṃ&sacute;ú* were milked like cows with [full] udders...

यदापी॑तासो अं॒शवो॒ गावो॒ न दु॒ह्र ऊध॑भिः

yád ā́pītāso aṃ&sacute;ávo gā́vo ná duhrá ū́dhabhiḥ

IX 72^{6a}
They milk the thundering[25] *aṃ&sacute;ú*...

अं॒शुं दु॑हंति स्त॒नयं॑त॒मक्षि॑तं क॒विं क॒वयो॒ऽपसो॑ मनी॒षिणः॑

aṃ&sacute;úṃ duhanti stanáyantam ákṣitaṃ kavíṃ kaváyo 'páso manīṣíṇaḥ

Plate VI - RV IX 71^{1bc}: He sloughs off the Asurian colour that is his.
He abandons his envelope.

---

[25] The word for 'thundering' here, *stanáyantam*, from the verb *stan*, 'to roar' or 'to thunder', is probably related to the Vedic and

classical Sanskrit word for breast, *stana*, thought also to be derived from *stan*, perhaps *via* the image of the cloud.

IX 95[4ab]
They milk the *aṃ&sacute;ú*, this bull at home on the mountain.

तं म॑र्मृजा॒नं म॑हि॒षं न सानां॑वं॒शुं दु॑हंत्यु॒क्षणं॑ गिरि॒ष्ठां	*tám marmṛjānáṃ mahiṣáṃ ná sā̆nāv aṃ&sacute;úṃ duhanty ukṣáṇaṃ giriṣṭhā̆m*

IX 107[12cd]
With the milk of thy *aṃ&sacute;ú*...

अं॒शोः पयं॑सा मदि॒रो न जागृं॑वि॒रच्छा॒ कोशं॑ मधु॒श्चुतं॑	*aṃ&sacute;óḥ páyasā madiró ná jā̆gṛvir ácchā kó&sacute;aṃ madhu&sacute;cútam*

In the light of my fly-agaric hypothesis, the milking imagery that pervades the Soma passages in the ṚgVeda acquires new meaning. A chlorophyll-bearing plant, whether leafy or leafless, does not suggest the udder and milking. The dominance of the word *aṃ&sacute;ú* - stalk, stem, stipe - calls for comment. Over much of Eurasia certain important species of wild mushrooms are dried and strung together on strings by the stipes, hanging caps down. (The caps shrink more than the stipes and are more friable.) This may have been the practice in Vedic times and would explain, if explanation be needed, the emphasis on the stipe in the vocabulary.[26] Bogoraz, writing about the turn of the century, says expressly that in the Chukotka the fly-agarics were usually *strung up* in three's, this being it seems the trading unit. (*Vide* **[**22**]** p. 273)

F. Soma's "head"

In English we speak of the 'cap' of the mushroom, but in many other languages including the Vedic 'head' is used instead:

IX 27[3]
This bull, heaven's head [*mūrdhán*], Soma, when pressed, is escorted by masterly men into the vessels, he the all-knowing.

ए॒ष नृभि॒र्वि नीं॑यते दि॒वो मू॒र्धा वृषा॑ सु॒तः सोमो॒ वनें॑षु विश्व॒वित्	*eṣá nṛ́bhir ví nīyate divó mūrdhā̆ vṛ́ṣā sutáḥ sómo váneṣu vi&sacute;vavít*

IX 68[4cd]
While Soma enters into contact with the fingers of the officiants, he protects his head [*&sacute;íras*].

अं॒शुर्यवें॑न पिपिशे य॒तो नृभिः॒ सं जा॒मिभि॒र्नसं॑ते॒ रक्षं॑ते॒ शिरः॑	*aṃ&sacute;úr yávena pipi&sacute;e yató nṛ́bhiḥ sáṃ jāmíbhir násate rákṣate &sacute;íraḥ*

IX 69[8cd]
For you are, O Soma juices, ... the heads [*mūrdhán*] of heaven, carried erect, creators of vital force.

यू॒यं हि सों॑म पि॒तरो॒ मम॒ स्थनं॑ दि॒वो मू॒र्धानः॒ प्रस्थिं॑ता वय॒स्कृतः॑	*yūyáṃ hí soma pitáro máma sthána divó mūrdhā̆naḥ prásthitā vayaskṛ́taḥ*

IX 71[4cd]
On Soma's head [*mūrdhán*] the cows with a full udder mix their best milk in streams, [*i.e.*, milk is mingled with Soma juice.]

आ यस्मि॒न्गावः॑ सुहु॒ताद ऊधं॑नि मू॒र्धंछ्री॒णंत्यं॑ग्रि॒यं वरीं॑मभिः	*ā̆ yásmin gā̆vaḥ suhutā̆da ū̆dhani mūrdhā́ñ chrīṇánty agriyáṃ várīmabhiḥ*

IX 93[3abc]
The udder of the cow is swollen; the wise juice is imbued with its streams. In the vessels the cows mix with their milk the *mūrdhán*.

---

[26] When I was a boy in Chesterfield County, Virginia, the farmers would call the leaves of the tobacco plant 'stems'. When the time came for gathering the leaves, they would string them together by the principal rib or 'stem', perhaps a score of them together, and take them to the tobacco barn to be dried by smoking, hanging each batch over rungs that stretched from beam to beam in the barn. Fires were then built in troughs on the ground. This is another example where handling practices led to a curious use of the word 'stem'.

उ॒त प्र पिं॑प्य॒ ऊध॒रघ्न्यां॑या॒ इंदु॒र्धारां॑भिः सचते सुमे॒धाः मू॒र्धानं॒ गावः॒ पयं॑सा च॒मूष्व॒भि श्री॑णंति॒ वसुं॑भि॒र्न नि॒क्तैः	*utá prá pipya ū́dhar ághnyāyā índur dhā́rābhiḥ sacate sumedhā́ḥ* *mūrdhā́naṃ gā́vaḥ páyasā camū́ṣv abhí &sacute;rīṇanti vásubhir ná niktáiḥ*

G. Four poetic conceits

In speaking of Soma the poets of the ṚgVeda have recourse repeatedly to four conceits. They have never been adequately explained. They are not descriptive in any immediate sense: they express what the poets considered transcendental truths. Let us see how the fly-agaric fares with them.

1. The single eye[27]

I 87^{5ab}
We speak because of our descent from the ancient father; the tongue moves with *the eye of Soma*.

पि॒तुः प्र॒त्नस्य॒ जन्मं॑ना वदामसि॒ सोमं॑स्य जि॒ह्वा प्र जिं॑गाति॒ चक्षं॑सा	*pitúḥ pratnásya jánmanā vadāmasi sómasya jihvā́ prá jigāti cákṣasā*

IX 9^{4}
Quickened by the seven minds, he [Soma] has encouraged the rivers free of grief, which have strengthened *his single eye*.

स स॒प्त धी॒तिभिं॑र्हि॒तो न॒द्यो॑ अजिन्वद॒द्रुहः॑ या एक॒मक्षिं॑ वावृ॒धुः	*sá saptá dhītíbhir hitó nadyó ajinvad adrúhaḥ* *yā́ ékam ákṣi vāvṛdhúḥ*

IX 10^{8ab}
I have drunk the navel [*i.e.*, Soma] into the navel [*i.e.*, stomach] for our sake. Indeed, *the eye* is altogether with the sun. [*Bhawe rendering*]

नाभा॒ नाभिं॑ न॒ आ दं॑दे॒ चक्षुं॑श्चि॒त्सूर्ये॒ सचां॑ क॒वेरपं॑त्य॒मा दुं॑हे	*nā́bhā nā́bhiṃ na ā́ dade cákṣu&sacute; cit sū́rye sácā* *kavér ápatyam ā́ duhe*

IX 10^{9}
The sun [*i.e.*, Soma] looks *with the eye* towards the dear places and the highest place of heaven, ... [*Bhawe rendering*]

अ॒भि प्रि॒या दि॒वस्प॒दमं॑ध्व॒र्युभि॒र्गुहां॑ हि॒तं सूरः॑ पश्यति॒ चक्षं॑सा	*abhí priyā́ divás padám adhvaryúbhir gúhā hitám sū́raḥ* *pa&sacute;yati cákṣasā*

IX 97^{46c}
[Soma] who has *for eye* the sun

स्वं॑र्चक्षा रथि॒रः स॒त्यशुं॑ष्मः॒	*svárcakṣā rathiráḥ satyá&sacute;uṣmaḥ*

The one element in these verses, some of them difficult, that concerns us here is 'the single eye'. Does not the photograph, reproduced in Plate X, explain the image that the poet had in mind? How perverse this metaphor is if we have to do with a creeper, *vallī*. How meaningless if we deal with rhubarb.

---

[27] In the Atharvaveda, XIII 1^{45}, there is another allusion to the single eye that is relevant here. In Wm. D. Whitney's translation, p. 717.

2. Mainstay of the sky

IX 2[5]
The ocean [of Soma] has been cleansed in the waters; *mainstay of the sky*, the Soma in the filtre, he who is favourable to us.

स॒मु॒द्रो अ॒प्सु मा॑मृजे विष्टं॒भो ध॒रुणो॑ दि॒वः सोमः॑ प॒वित्रे॑ अस्म॒युः	*samudró apsú māmṛje viṣṭambhó dharúṇo diváḥ sómaḥ pavítre asmayúḥ*

IX 72[7ab]
In the navel of the earth [is situated the Soma], which is also the *mainstay of the sky* ...

नाभा॑ पृथि॒व्या ध॒रुणो॑ म॒हो दि॒वो॒३॒॑ऽपामू॒र्मौ सिंधु॑ष्वं॒तरु॑क्षि॒तः	*nā́bhā pṛthivyā́ dharúṇo mahó divó 'pā́m ūrmáu síndhuṣv antár ukṣitā́ḥ*

IX 74[2ab]
Mainstay of the sky, well laid, the full *aṃ&sacute;ú* runs throughout everything ...

दि॒वो यः स्कं॒भो ध॒रुणः॒ स्वा॑तत॒ आपू॑र्णो अं॒शुः प॒र्येति॑ वि॒श्वतः॑	*divó yáḥ skambhó dharúṇaḥ svā́tata ā́pūrṇo aṃ&sacute;úḥ paryéti vi&sacute;vátaḥ*

IX 86[35cd]
... thou sittest in the vessels, having been pressed for Indra, inebriating drink, which inebriates, supreme *mainstay of heaven*, [Soma] who gazes in the far distance.

इंद्रा॑य॒ मद्वा॒ मद्यो॒ मदः॑ सु॒तो दि॒वो वि॑ष्टं॒भ उ॑प॒मो वि॑चक्ष॒णः	*índrāya mádvā mádyo mádaḥ sutó divó viṣṭambhá upamó vicakṣaṇáḥ*

IX 86[46ab]
He has spilled forth, *mainstay of the sky*, the offered drink; he flows throughout the world ...

अस॑र्जि स्कं॒भो दि॒व उद्य॑तो॒ मदः॒ परि॑ त्रि॒धातु॒र्भुव॑नान्यर्षति	*ásarji skambhó divá údyato mádaḥ pári tridhā́tur bhúvanāny arṣati*

IX 87[2cd]
... father of the gods, progenitor of the moving force, *mainstay of the sky*, foundation of the earth.

पि॒ता दे॒वानां॑ जनि॒ता सु॒दक्षो॑ विष्टं॒भो दि॒वो ध॒रुणः॑ पृथि॒व्याः	*pitā́ devā́nāṃ janitā́ sudákṣo viṣṭambhó divó dharúṇaḥ pṛthivyā́ḥ*

IX 89[6ab]
Mainstay of the sky, foundation of the earth, all establishments are in the hand of this [Soma] ...

वि॒ष्टं॒भो दि॒वो ध॒रुणः॑ पृथि॒व्या विश्वा॑ उ॒त क्षि॒तयो॒ हस्ते॑ अस्य	*viṣṭambhó divó dharúṇaḥ pṛthivyā́ ví&sacute;vā utá kṣitáyo háste asya*

IX 108[16]
Enter into the heart of Indra, receptacle for Soma, like rivers into the ocean, thou [O Soma] who pleasest Mitra, Varuṇa, Vāyu, supreme *mainstay of heaven*!

इंद्र॑स्य॒ हार्दि॑ सोम॒धान॒मा वि॑श समु॒द्रमि॑व॒ सिंध॑वः जुष्टो॑ मि॒त्राय॒ वरु॑णाय वा॒यवे॑ दि॒वो वि॑ष्टं॒भ उ॑त्त॒मः	*índrasya hā́rdi somadhā́nam ā́ vi&sacute;a samudrám iva síndhavaḥ júṣṭo mitrā́ya váruṇāya vāyáve divó viṣṭambhá uttamáḥ*

We have given only a selection of the passages where Soma is a mainstay of the sky. Others have translated this by 'pillar' and 'fulcrum' of the sky.

What poet could conceive of a creeper, a climber, any vine - some species of Sarcostemma or Ephedra - as 'mainstay of the sky', 'foundation of the earth'? But the sturdy stanchion with its resplendent capital that is the fly-agaric lends itself well to this poetic conceit.

3. The navel

'Navel', *nābhi*, is one of the most important words in the ṚgVeda. In its primary meaning as the umbilicus it occurs only once, in a late hymn, X 90[14]. As the 'hub' of a wheel it recurs three times; this use need not detain us. What we call 'blood kin' for the Vedic poets was 'umbilical kin'; in this sense we find it nine times. By far the most interesting citations of the word are the ones where it is used transcendentally, to express a mythological idea, in a reverential and sacred context. Soma is the Navel of the Way (= *Ṛtá*), says the poet. By *Ṛtá* he means the divine order of things, a word that seems to convey somewhat the same idea as the *Tao* of Lao Tze.

Plate VII - RV IX 71[2d]: He makes of milk his vesture-of-grand-occasion.

Plate X - RV IX 9[4c]: The single eye.

This figurative use of the navel for Soma in Vedic times arrested my attention. In the fungal vocabularies of various unrelated Eurasian peoples I had come across the navel, and here it was playing a rôle in the India of the Aryans! Was this accidental convergence, or was it because Soma was a mushroom - the fly-agaric?[28] True, all words relating to childbirth play a bigger rôle in the vocabularies of primitive peoples than among others. Thus in ancient Greece the ὄμφαλος [*ómfalos*], a stone carving fixed in Delphi and now in the Delphi museum, was famed for centuries as the center of the world.

But it is a fact that peoples who know their mushrooms and live with them in their daily lives are apt to see parallels between mushrooms and the umbilicus. The lexicographer Dal reports that in Russia *pup* means 'navel' and the derivative *pupyri* is applied in the familiar language to fungal growths. In contemporary Cambodian the word *psət* means both navel and mushroom. This word's primary meaning is navel and it is clearly borrowed from the Malayo-Polynesian family of languages, where the hypothetical proto-Malayo-Polynesian word was **pusəg*, 'navel', a word with far flung progeny in languages spoken off the east coast of Asia, including *heso* in Japanese, whose medieval form was *feso*, stemming back to **pëso* in proto-Japanese. In standard contemporary Korean the word recurs in the form *p°sət*. There it means only 'mushroom', but in two southwestern dialects spoken only on the island of Tšedju, in the province of Cholla Namdo, words that may stem back to the same root mean the navel. In these dialects the navel takes the forms *pötoŋ* and *pötoŋ-ro*.[29]

In April 1966 Georges Dumézil introduced to me a young Turkish national, Orhan Alparslan, a student of architecture at the University of Paris. He came from a village, Zennun, situated off the highway running from Ankara to Samsun, at about the half-way point. He was a Circassian and his village was largely Circassian. He had been a shepherd boy in his childhood, and he possessed a remarkably clear memory. He described for me the various kinds of mushrooms that he had learned to know and gave me the names for them. He drew the shaggy mane - *Coprinus comatus* -, explained that it quickly turned into black ink but the black was tinged with violet, and gave its local name as *göbek mantari*, Turkish words meaning 'navel mushroom'.

Even in the scientific vocabulary of mycologists the navel has crept in. Many species of mushrooms are either 'umbilicate' or 'umbonate', depending on whether the 'navel' is a pocket in the middle of the cap or a protrusion. There is a genus, the Omphalia, whose name comes from the Greek ὄμφαλος [*ómfalos*], navel. True, these are neo-classical words devised in the last two centuries by scientists, but scientific names, especially those devised in the youth of the science (such as is here the case), often reflect facts lying deep in the consciousness of the race. The *muscaria*, for example, in *Amanita muscaria*, expresses the folk traditions of the Germanic race.

It is not my contention that these far flung analogies in vocabulary have influenced each other; quite the contrary. I believe a mushroom is apt to suggest the navel to the primitive observer, wherever he be, and that the Vedic people, obsessed as they were with the fly-agaric, applied to it the navel analogy, and imbued it with a multitude of transcendental meanings. Already we have seen a number of these figures of speech. We learned in IX 74[4] that Soma was the Navel of the Way. Here are others:

> IX 79[4ab]
> Your highest navel is attached in heaven; your fingers grow on the back of the earth.
>
> दि॒वि ते॒ नाभा॑ पर॒मो य आ॑द॒दे पृ॑थि॒व्यास्ते॑ रुरुहुः॒ सान॑वि॒ क्षिपः॑
>
> *diví te nā́bhā paramó yá ādadé pṛthivyā́s te ruruhuḥ sā́navi kṣípaḥ*

We recall how the single eye of Soma was tied to the eye of the sun in IX 10[8]; in that same verse the navel now figures intelligibly:

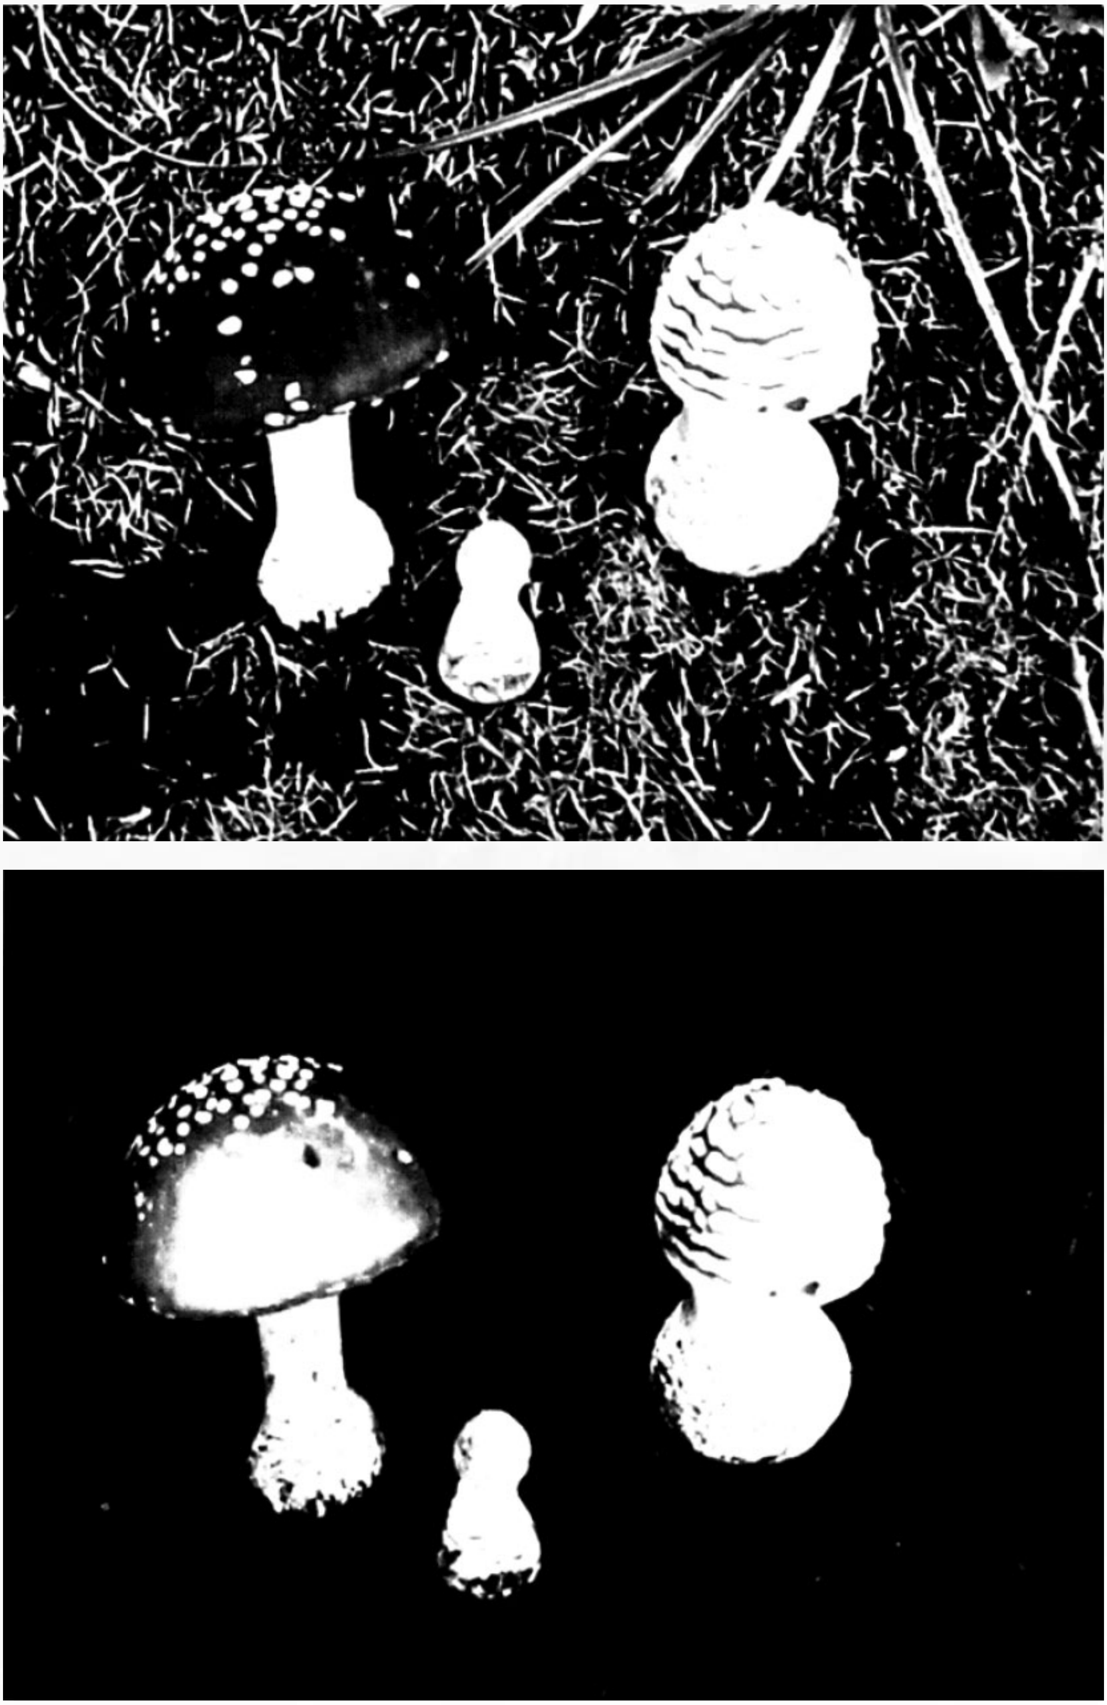
---

[28] One of our valuable sources about the fly-agaric in Siberia is G. H. von Langsdorf. He found it in use as an inebriant among the Kamchadal. In discussing its fungal identification he writes: '... the Kamchadal mushroom has a cap with a *navel-like* protuberance in the middle,...'! *Vide* **[**10**]**, p. 247. The word in the German text is *nabelförmig*.

[29] I am indebted to Dr. Johannes Rahder of Yale University for this information about the Korean dialects. He relied on the two volume work on Korean dialects compiled by the late Professor Shinpei Ogura, *Chōsen-go Hōgen no Kenkyū* (Studies of Korean Dialects): publishers, Iwanami, Tokyo 1944, pp. 97-98 of Vol. 1.

IX 10[8]
I have drunk the navel [*i.e.*, Soma] into the navel [*i.e.*, stomach] for our sake. Indeed, the eye is altogether with the sun. I have milked the child of the wise. [*Bhawe rendering*]

नाभा॒ नाभिं॑ न॒ आ द॑दे॒ चक्षु॑श्चि॒त्सूर्ये॒ सचा॑ क॒वेरप॑त्य॒मा दु॑हे	*nā̆bhā nā̆bhiṃ na ā̆ dade cákṣu&sacute; cit sū̆rye sácā* *kavér ápatyam ā̆ duhe*



Plates VIIIa & VIIIb - RV IX 97[9d]: By day he appears *hári*. By night, silvery white.

Again two hymns later Soma is called the all-seeing navel of the wise:

> IX 12[4]
> The sharp seer, in heaven's navel, is magnified in the woolen filtre, Soma the wise, possessed of good intelligence.
>
> दि॒वो नाभा॑ विचक्ष॒णोऽव्यो॒ वारे॑ महीयते
> सोमो॒ यः सु॒क्रतु॑ः क॒विः
>
> *divó nā́bhā vicakṣaṇó 'vyo vā́re mahīyate sómo yáḥ sukrátuḥ kavíḥ*

In the following verse Soma's navel is associated with the 'head' (= cap) of the mushroom:

> I 43[9abc]
> Thy descendants, O Immortal One, according to the supreme institution of the Way, receive them on thy navel, O Soma, thou who art the head [of heaven];
>
> यास्ते॑ प्र॒जा अ॒मृत॑स्य॒ पर॑स्मि॒न्धाम॑न्नृतस्य॑
> मू॒र्धा नाभा॑ सोम वेन
>
> *yā́s te prajā́ amŕ̥tasya párasmin dhā́mann ṛtásya mūrdhā́ nā́bhā soma vena*

Soma is repeatedly said to be in the navel of the earth, in the navel of heaven. It was a practice of the ṚgVeda poets to use epithets proper to one god when speaking of another. Agni and Soma, fire and the 'fire-agaric' (as I am tempted to call the fly-agaric) thus exchange epithets, and 'navel' is often applied to Agni. But I think it will not be disputed that the navel figure belongs to Soma; the frequency of its use with Soma and the elaboration of the uses make it peculiarly Soma's. As we have seen, pp. 39 ff [org. edit.], 'Agni' for the poet is a way of saying 'Soma'.

4. The filtres

In the ṚgVeda filtres figure prominently. One of them, a filtre of lamb's wool, presents no problem. After the Soma had been pounded with stones and mixed with water, it was forced through a filtre or strainer, which caught the pulp and fibrous elements and allowed the tawny yellow liquor to pass through and run down to the vats.

But the ṚgVeda speaks of two other filtres that have always baffled the scholars. If Soma is the fly-agaric they present no problem. The woolen filtre is in fact the second or middle filtre.

The First Filtre

In the order of their function, the verses speak first of a celestial filtre, the filtre that I offer to the reader in Plate XII, where the sun's rays, escorting Soma down from the sky, are caught and held on the fiery back of heaven (= the pileus of the fly-agaric).

In the first verse that I shall quote the poet says expressly that King Soma has the filtre for his chariot, and immediately thereafter cites the studs, *bhṛṣṭí*, that carry him to fame; *i.e.*, the white patches on his cap.

> IX 86[40cd]
> King, having the filtre for chariot, he has attained the victory prize; a thousand studs, he conquers puissant renown.
>
> राजा॑ प॒वित्र॑रथो॒ वाज॒मारु॑हत्स॒हस्र॑भृष्टिर्जयति॒ श्रवो॑ बृ॒हत्
>
> *rā́jā pavítraratho vā́jam ā́ruhat sahásrabhṛṣṭir jayati &sacute;rávo bṛhát*

> IX 10[5]
> (This verse has puns difficult to translate. Its meaning is clear. The Soma plants are called 'suns', *sū́rā*, a natural metaphor in the light of our various plates. The heavenly Somas spread the strainer of their (= the sun's) rays for *themselves* to come down).
>
> आ॒पा॒नासो॑ वि॒वस्व॑तो॒ जनं॑त उ॒षसो॒ भगं॑
> सू॒रा॒ अण्वं॒ वि तं॑न्वते
>
> *āpānā́so vivásvato jánanta uṣáso bhágam sū́rā áṇvaṃ ví tanvate*

How clear this would have been for Geldner and Bhawe if they had possessed the key. Bhawe, commenting on this verse in his Part I, p. 53, refers to the 'mysterious sieve through which the sun's rays pass'. Geldner before him had sensed that the Somas and the Suns are the same, and in his commentary had divined that the filtre straining the sun's rays is referred to elsewhere, notably in IX 66[5], 76[4], and 86[32].[30]

> IX 66[5abc]
> Thy clear rays spread over the back of heaven, the filtre, O Soma,...
>
> तव॑ शु॒क्रासो॑ अ॒र्चयो॑ दि॒वस्पृ॒ष्ठे वि त॑न्वते
> प॒वित्रं॑ सोम॒ धाम॑भिः
>
> *táva &sacute;ukrā́so arcáyo divás pṛṣṭhé ví tanvate*
> *pavítraṃ soma dhā́mabhiḥ*

Plate IX - RV IX 70[7d]: The hide is of bull, the dress of sheep.

As a poetic figure for the fly-agaric, there seems nothing to explain here. In this same hymn, verses 19-21, Soma is addressed as Agni, *i.e.*, the fly-agaric as fire. (We have already called attention to this on p. 39.) The fly-agaric is both fire and sun, it catches the sun's rays on its back and holds them there, where they filtre the Soma juice into the plant. The same theme recurs in

> IX 67[22-25]
> This Soma, which today circulates in the distance, which is a cleanser, may it cleanse us in the filtre!
> The filtre that has been spread in thy flame, O Agni, with it, cleanse our song.
> Thy filtre, O Agni, equipped with flames, may it cleanse us, cleanse us with the fruits of sacred songs!
> With these both, the filtre and the fruits [of song], O God Savitṛ, cleanse me through and through!

---

[30] Harvard Oriental Series, 35, p. 17, ftn. to 5c.

पव॑मानः॒ सो अ॒द्य नः॑ प॒वित्रे॑ण॒ विच॑र्षणिः
यः पो॒ता स पु॑नातु नः
यत्ते॑ प॒वित्र॑म॒र्चिष्यग्ने॒ वित॑तम॒न्तरा
ब्रह्म॒ तेन॑ पुनीहि नः
यत्ते॑ प॒वित्र॑मर्चि॒वदग्ने॒ तेन॑ पुनीहि नः
ब्र॒ह्म॒स॒वैः पु॑नीहि नः
उ॒भाभ्यां॑ देव सवितः प॒वित्रे॑ण स॒वेन॑ च
मां पु॑नीहि वि॒श्वतः॑

pávamānaḥ só adyá naḥ pavítreṇa vícarṣaṇiḥ
yáḥ potā́ sá punātu naḥ
yát te pavítram arcíṣy ágne vítatam antár ā́
bráhma téna punīhi naḥ
yát te pavítram arcivád ágne téna punīhi naḥ
brahmasaváiḥ punīhi naḥ
ubhā́bhyāṃ deva savitaḥ pavítreṇa savéna ca
mā́ṃ punīhi vi&sacute;vátaḥ

Here Soma is addressed under the name of Agni. Metaphorically the miraculous plant seems to share every attribute of Agni, - flame-coloured, subtle, it purifies with its filtre as fire does with its flames.

In the following verse the strainer is not mentioned by name. Soma, Lord of the Universe, cleanses himself in the Sun's rays, the celestial filtre:

IX 76[4]
Monarch of everything that sees the sun-light, Soma cleanses himself. Triumphing over the Prophets, he made the Word of the Way to resound, he who is cleansed by the Sun's ray, he the father of poems, Master-Poet never yet equalled!

विश्व॑स्य॒ राजा॑ पवते स्व॒र्दृशं॑ ऋ॒तस्यं॑ धी॒तिमृं॑षि॒षाळं॑वीवशत्
यः सूर्यं॒स्यासिं॑रेण मृ॒ज्यते॑ पि॒ता मं॑ती॒नामसं॑मष्टकाव्यः

ví&sacute;vasya rā́jā pavate svardṛ́&sacute;a ṛtásya
dhītím ṛṣiṣā́ḷ avīva&sacute;at
yáḥ sū́ryasyā́sireṇa mṛjyáte pitā́ matīnā́m
ásamaṣṭakāvyaḥ

IX 83[1ab]
Thy filtre has been spread, O Bráhmaṇaspáti [Soma]...

प॒वित्रं॑ ते॒ वित॑तं ब्रह्मणस्पते प्र॒भुर्गात्रा॑णि॒ पर्ये॑षि वि॒श्वतः॑

pavítraṃ te vítataṃ brahmaṇas pate prabhúr gā́trāṇi
páry eṣi vi&sacute;vátaḥ

IX 83[2abd]
The filtre of the burning [Soma] has been spread in heaven's home. Its dazzling mesh was spread afar... They climb the back of heaven in thought.

तपो॑ष्प॒वित्र॒ं वित॑तं दि॒वस्प॒दे शोचं॑तो अस्य॒ तंत॑वो॒ व्यं॑स्थिरन्
अवं॑त्यस्य पवी॒तारं॑मा॒शवो॑ दि॒वस्पृ॒ष्ठमधिं॑ तिष्ठंति॒ चेतं॑सा

tápoṣ pavítraṃ vítataṃ divás padé &sacute;ócanto asya
tántavo vy ásthiran
ávanty asya pavītā́ram ā&sacute;ávo divás pṛṣṭhám
ádhi tiṣṭhanti cétasā

In this verse the 'filtre' that we see in Plate XII is translated to heaven in the flame of the sacrifice. How easy it is for the poet to move from the earthly to the transcendental plane. How compact is the cosmology. Soma, fire, sun, sun's rays, the navel of the earth, the single eye, mainstay of the sky, celestial strainer, thunder-storm, aurora - they are all interlocked, meeting in our resplendent fly-agaric.

Here are further verses in the same tenor:

IX 86[30ab]
As for thee, O Soma-juice, thou art clarified in the filtre so as to establish thyself [in] space for the gods.

त्वं प॒वित्रे॒ रजं॑सो॒ विधं॑र्मणि दे॒वेभ्यः॑ सोम पवमान पूयसे

tváṃ pavítre rájaso vídharmaṇi devébhyaḥ soma
pavamāna pūyase

IX 86[32ab]
The Soma envelops himself all around with rays of the sun,...

स सूर्यं॑स्य र॒श्मिभिः॒ परिं॑ व्यत॒ तंतुं॑ तन्वा॒नस्त्रि॒वृतं॒ यथां॑ वि॒दे

sá sū́ryasya ra&sacute;míbhiḥ pári vyata tántum
tanvānástrivṛ́tam yáthā vidé

IX 91[3cd]
... By a thousand paths free of dust, Soma, armed with verses, knowing the Word, the Sun passes the filtre.

स॒ह॒स्र॒मृक्वां॑ प॒थिभिं॑र्वचो॒विदं॑ध्व॒स्मभिः॒ सूरो॒ अण्वं॒ वि यां॑ति

sahásram ṛ́kvā pathíbhir vacovíd adhvasmábhiḥ sū́ro
áṇvaṃ ví yāti

It seems that in this verse the Sun is a metaphor, standing for Soma.

The Third Filtre

A third filtre is mentioned in two verses of the ṚgVeda, and this brings us back to the discussion of the *Two Forms* of Soma on pp. 25 ff [org. edit.], which we promised to resume at a later point in the argument.

> IX 73[8ab]
> The Guardian of the *Ṛtá* [Soma] cannot be deceived, he of the good inspiring force; he carries three filtres inside his heart.
>
> ऋ॒तस्य॑ गो॒पा न दभा॑य सु॒क्रतु॒स्त्री ष प॒वित्रा॑ हृ॒द्यं१◌॒॑तरा द॑धे
>
> *ṛtásya gopā́ ná dábhāya sukrátus trī́ ṣá pavítrā hṛdy ántár ā́ dadhe*
>
> IX 97[55]
> Thou runnest through the three filtres stretched out; thou flowest the length, clarified. Thou art Fortune, thou art the Giver of the Gift, liberal for the liberal, O Soma-juice.
>
> सं त्री प॒वित्रा॒ वित॑तान्ये॒ष्यन्वेकं॑ धावसि पू॒यमा॑नः
> असि॒ भगो॒ असि॑ दा॒त्रस्य॑ दा॒तासि॑ म॒घवा॑ म॒घव॑द्भ्य इंदो
>
> *sáṃ trī́ pavítrā vítatāny eṣy ánv ékaṃ dhāvasi pūyámānaḥ*
> *ási bhágo ási dātrásya dātā́ 'si maghávā maghávadbhya indo*

Let us assume the fly-agaric surmise is well founded. Then the third filtre becomes clear: the Soma juice that is drunk by 'Indra' and 'Vāyu' in the course of the liturgy is filtered in their organisms and issues forth as sparkling yellow urine, retaining its inebriating virtue but having been purged of its nauseating properties.

That the priceless ambrosia was filtered down from the celestial sphere on the sun's rays into the plant is clear. That the Soma juice was filtered through the lamb's wool into the vessels at the place of sacrifice is also clear. What happened next? 'Indra' and 'Vāyu' consumed the liquor mixed with milk or curds and it would appear that their condition was a matter of considerable anxiety. How else are we to explain the poets' preoccupation with the Soma as it passed through their organisms? The poets do not stress the inebriation of the priests. Instead they take us with Soma into Indra's heart, into his belly or bellies, into his entrails. If these verses do not mean that in the Vedic ritual the priests were impersonating the gods, what do they mean?

> IX 70[10bcd]
> Purify thyself in Indra's stomach, O juice! As a river with a vessel, enable us to pass to the other side, thou who knowest; thou who battlest as a hero, save us from disgrace!
>
> वाजं॑म॒र्षेंद्रं॑स्येंदो ज॒ठर॒मा पं॑वस्व
> ना॒वा न सिंधु॒मति॑ पर्षि वि॒द्वांछूरो॒ न यु॒ध्य॒न्नवं॑ नो नि॒दः स्पः॑
>
> *vā́jam arṣéndrasyendo jaṭháram ā́ pavasva*
> *nāvā́ ná síndhum áti parṣi vidvā́ñ chū́ro ná yúdhyann*
> *áva no nidáḥ spaḥ*

Or the preceding verse:

> IX 70[9]
> Clarify thou thyself, O Soma, for the invitation to the gods. Thou who art a bull enter into the heart of Indra, receptacle for Soma! Enable us to traverse the evil passages saving us from oppression! For he who knows the country gives the directions to him who informs himself.
>
> पवं॑स्व सोम दे॒ववीं॑तये॒ वृषेंद्रं॑स्य॒ हार्दि॑ सोम॒धान॒मा विं॑श
> पु॒रा नों॑ बा॒धाद्दुं॑रि॒ताति॑ पारय क्षेत्र॒विद्धि दिश॒ आहा॑ विपृच्छ॒ते
>
> *pávasva soma devávītaye vṛ́ṣéndrasya hā́rdi somadhā́nam ā́ vi&sacute;a*
> *purā́ no bādhā́d duritā́ti pāraya kṣetravíd dhí dí&sacute;a ā́hā vipṛcchaté*

Obviously there was doubt about the outcome of the perilous passage. 'Indra' and his colleagues had to know their business, had to be experienced pilots. It looks as though Bhawe was justified in saying that skill was needed in mixing the Soma juice with milk or curds in the right way.

Is not the following verse imbued with new meaning, in the light of my interpretation, - the *human waters* being put into movement?

IX 63[7]
Clarify thou thyself by that stream by which thou madest the sun to shine, putting into movement the human waters!

अ॒या प॑वस्व॒ धार॑या॒ यया॒ सूर्य॒मरो॑चयः	*ayā́ pavasva dhā́rayā yáyā sū́ryam árocayaḥ*
हि॒न्वा॒नो मानु॑षीर॒पः	*hinvānó mā́nuṣīr apáḥ*

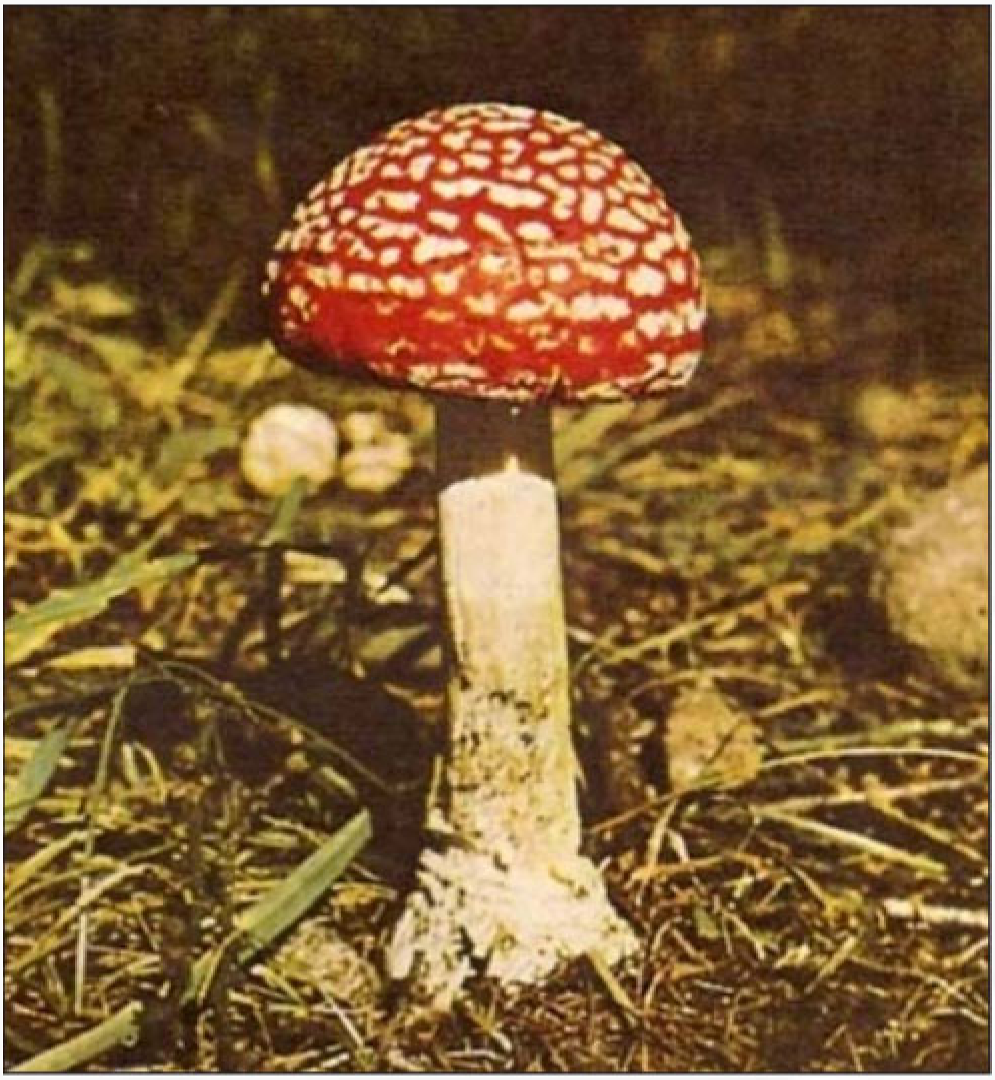


Plate XI - RV IX 109[6a]: Thou art the mainstay of the sky.

Here are other references to Soma in the belly of Indra:

IX 72[2ab]
… the [Officiants] … draw the Soma by milking into the belly of Indra.

सा॒कं व॑दंति ब॒हवो॑ मनी॒षिण॒ इंद्र॑स्य॒ सोम॑ ज॒ठरे॒ यदा॑दु॒हुः	*sākám̐ vadanti bahávo manīṣíṇa índrasya sómaṃ jaṭháre yád āduhúḥ*

IX 72[5ab]
Spurred on by the two arms of the Officiant, in jets, the pressed Soma is clarified according to its nature, suitable for thee, O Indra!

नृबा॒हुभ्यां॑ चोदि॒तो धार॑या सु॒तो॑ऽनुष्व॒धं॑ प॑वते॒ सोम॑ इंद्र ते	*nṛ́bāhúbhyāṃ coditó dhā́rayā sutó 'nuṣvadhám̐ pavate sóma indra te*

IX 76[3a]
O Soma Pávamāna, … penetrate into the entrails of Indra!

इंद्र॑स्य सोम॒ पव॑मान ऊ॒र्मिणा॑ तवि॒ष्यमा॑णो ज॒ठरे॒ष्वा वि॑श	*índrasya soma pávamāna ūrmíṇā taviṣyámāṇo jaṭháreṣv ā́ vi&sacute;a*

IX 80[2d]
O Soma, thou clarifiest thyself for Indra; ...

इंद्रा॑य सोम पवसे॒ वृषा॒ मद॑ः	*índrāya soma pavase vŕ̥ṣā mádaḥ*

IX 80[3]
In the belly of Indra the inebriating Soma clarifies itself.

एंद्रं॑स्य कु॒क्षा पं॑वते म॒दिंत॑म॒	*éndrasya kukṣā̆ pavate madíntama*

Here is a clear statement. As in the other two filtres, Soma is clarifying itself in the belly of Indra, in preparation for a further step.

IX 81[1ab]
The waves of Soma Pávamāna advance into the belly of Indra.

प्र सोमं॑स्य॒ पवं॑मानस्यो॒र्मय॒ इंद्रं॑स्य यंति ज॒ठरं॑ सु॒पेशं॑सः	*prá sómasya pávamānasyormáya índrasya yanti jaṭháraṃ supé&sacute;asaḥ*

IX 85[5cd]
Cleansed like a winning race horse, thou hast spilled thyself in the belly of Indra, O Soma!

म॒र्मृ॒ज्यमा॑नो॒ अत्यो॒ न सा॑न॒सिरिंद्रं॑स्य सोम ज॒ठरे॒ समं॑क्षरः	*marmr̥jyámāno átyo ná sānasír índrasya soma jaṭháre sám akṣaraḥ*

The 86th hymn is climactic for Indra as Soma's filtre:

IX 86[2]
Thy inebriating drinks, swift, are released ahead, like teams running in divers directions, like the milch cow with her milk towards her calf, so the Soma juices, waves rich in honey, go to Indra, thunder-bolt carrier.

प्र ते॒ मदा॑सो मदि॒रासं॑ आ॒शवोऽसृं॑क्षत॒ रथ्या॑सो॒ यथा॒ पृथं॑क् धे॒नुर्न व॒त्सं पयं॑सा॒भि व॒ज्रिण॒मिंद्र॒मिंदं॑वो॒ मधुं॑मंत ऊ॒र्मय॑ः	*prá te mádāso madirā̆sa ā&sacute;ávó 'sr̥kṣata ráthyāso yáthā pŕ̥thak* *dhenúr ná vatsáṃ páyasābhí vajríṇam índram índavo mádhumanta ūrmáyaḥ*

IX 86[3]
Like a race horse launched in movement for the victory prize, flow, O Soma, thou who procurest the light-of-the-sun for heaven's vat, whose mother is the pressing stone; thou, Bull, seated in the filtre above the calf's wool, clarifying thyself, thou Soma, that Indra may have his pleasure!

अत्यो॒ न हिंया॒नो अ॒भि वाजं॑मर्ष स्व॒र्वित्कोशं॑ दि॒वो अद्रिं॑मातरं वृषा॑ प॒वित्रे॒ अधि॒ सानो॑ अ॒व्यये॒ सोम॑ः पुना॒न इं॑द्रि॒याय॒ धायं॑से	*átyo ná hiyānó abhí vā̆jam arṣa svarvít kó&sacute;aṁ divó ádrimātaram* *vŕ̥ṣā pavítre ádhi sā̆no avyáye sómaḥ punāná indriyā̆ya dhā̆yase*

IX 86[16cd]
He advances to the rendez-vous with Indra, the Soma juice ...

प्रो अं॑यासी॒दिंदु॒रिंद्रं॑स्य निष्कृ॒तं	*pró ayāsīd índur índrasya niṣkr̥táṁ*

IX 86[19cd]
By the action of the streams he has made the utensils resound while penetrating into the heart of Indra.

क्रा॒णा सिंधू॑नां क॒लशाँ॑ अवीवश॒दिंद्रं॑स्य॒ हार्द्या॑वि॒शन्मं॑नी॒षिभि॑ः	*krāṇā̆ síndhūnāṁ kalá&sacute;āṁ̐ avīva&sacute;ad índrasya hā̆rdy āvi&sacute;án manīṣíbhiḥ*

IX 86[22]
Clarify thyself, O Soma, in the celestial structures of thine essence, thou who hast been released roaring into the vessel, in the filtre. Lodged in the belly of Indra, roaring with vigour, held in hand by the Officiants, thou hast made the sun to mount the sky.

पवं॑स्व सोम दि॒व्येषु॒ धामं॑सु सृजा॒न इं॑दो क॒लशे॑ प॒वित्र॒ आ सीद॒न्निंद्रं॑स्य ज॒ठरे॒ कनिं॑क्रद॒न्नृभि॒र्यं॑त॒ः सूर्य॒मारो॑हयो दि॒वि	*pávasva soma divyéṣu dhā̆masu sr̥jāná indo kalá&sacute;e pavítra ā̆* *sī̆dann índrasya jaṭháre kánikradan nŕ̥bhir yatáḥ sū̆ryam ā̆rohayo diví*

IX 86[23ab]
Pressed by the pressing-stones, thou clarifiest thyself in the filtre, O Soma-juice, when penetrating into the entrails of Indra!

अद्रि॑भिः सु॒तः प॑वसे प॒वित्र॒ आँ इंद॒विंद्र॑स्य ज॒ठरे॑ष्वावि॒शन्

ádribhiḥ sutáḥ pavase pavítra ā́m̐ índavíndrasya
jaṭháreṣv āvi&sacute;án

★

IX 108[15]
For Indra, that he may drink, clarify thou thyself, O Soma, held in hand by the Lords, well armed, inebriating ...

इंद्रा॑य सोम॒ पात॑वे॒ नृभि॑र्य॒तः स्वा॑यु॒धो म॒दिंत॑मः
पव॑स्व॒ मधु॑मत्तमः

índrāya soma pā́tave nṛ́bhir yatáḥ svāyudhó
madíntamaḥ
pávasva mádhumattamaḥ

IX 108[16]
Enter into the heart of Indra, Soma's receptacle, like the rivers into the ocean, thou, [O Soma,] who pleasest Mitra, Varuṇa, Vāyu, O thou supreme Mainstay of the Sky!

इंद्र॑स्य॒ हार्दि॑ सोम॒धान॒मा वि॑श समु॒द्रमि॑व॒ सिंध॑वः
जुष्टो॑ मि॒त्राय॒ वरु॑णाय वा॒यवे॑ दि॒वो वि॑ष्टं॒भ उ॑त्त॒मः

índrasya hā́rdi somadhā́namā vi&sacute;a samudrám
iva síndhavaḥ
júṣṭo mitrā́ya váruṇāya vāyáve divó viṣṭambhá uttamáḥ

IX 109[18]
O Soma, advance into the belly of Indra, having been held in hand by the Officiants, pressed by the stones!

प्र सो॑म या॒हींद्र॑स्य कु॒क्षा नृभि॑र्येमा॒नो अद्रि॑भिः सु॒तः

prá soma yāhī́ndrasya kukṣā́ nṛ́bhir yemānó ádribhiḥ
sutáḥ

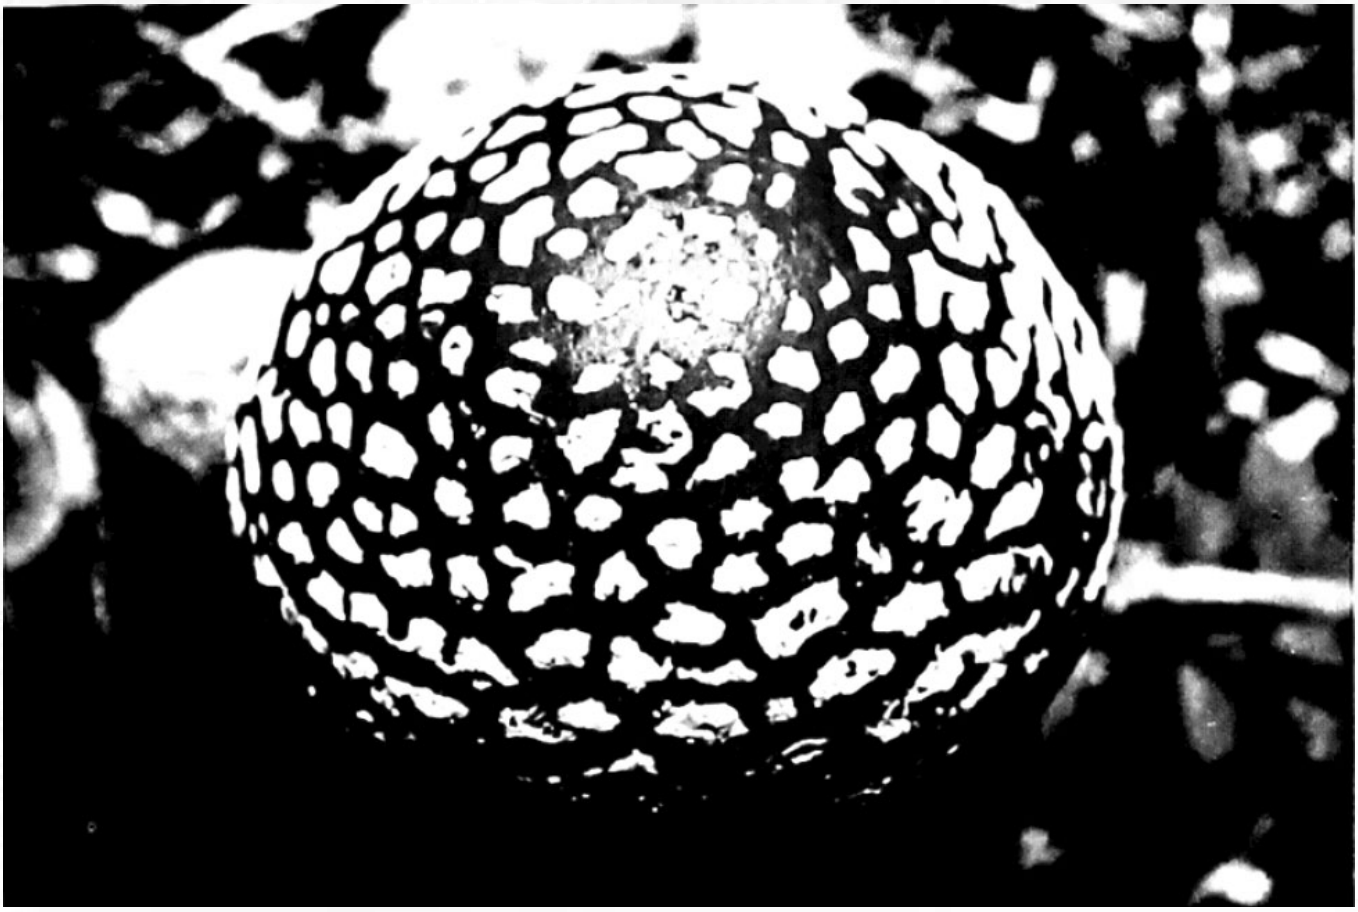

Plate XII - RV IX 86[40d]: With his thousand knobs he conquers mighty renown.

H. "Tongue of the way"

The second verse of IX 75 begins with 'Tongue of the Way' (*ṛtásya jihvā̆*), and the poet continues to apostrophize Soma as the source of eloquence. 'The Way' is *Ṛtá*, the divine order of things. Abel Bergaigne[31] remarked that the expression, 'Tongue of the Way', was picturesque and said it meant prayer. Caland and Henry,[32] on the other hand, were baffled. 'Tongue of the Way' could not be translated in any other way, but how could Soma be a tongue? These scrupulous scholars did not visualize the fly-agaric: its cap, the full blown red tongue, held the clue to the little mystery.

Plate XIII - RV IX 75[2a]: Tongue of the Way.

I. The 'Knots' or 'Knobs' or 'Studs' or 'Spikes' on the Fly-Agaric.

Already we have seen how well the spots on the fly-agaric serve as the first of the three 'fibres' for Soma. In a more mundane sense these spots are called in Vedic *bhṛṣṭí*, a word that is used for the knobs or studs on a cudgel, as on the cudgel of Indra. With his thousand knobs or studs Soma conquers potent fame: so say the hymns in two places, IX 83[5d] and 86[40d].

There is yet another passage pertinent to this theme, and it illustrates well the kind of problem that working in a language as remote as Vedic leads one into. Early in my inquiries I came upon a verse, IX 15[6], that seemed to present an obstacle to my fly-agaric thesis. According to the poet of this hymn, when the Soma plant is pressed and then run through the woolen filtre, it leaves behind in the filtre its 'knots' or 'nodules'. (The Vedic word, in the plural, is *páruṣā*.) There has been some difficulty with the sense of the sentence, but agreement on this particular word. Now mushrooms have no knots or nodules, which are characteristic of shrubs and trees. Here was a hurdle to cross or I was in trouble.

The latest translation of this hymn is S. S. Bhawe's (1957), and I found that he had devoted two pages of concentrated commentary to all the words that attend these 'knots'.[33] Suddenly, without his knowing the full import of what he was saying, he cleared up my difficulties. The 'knots', it seemed, had been 'sticking to' (*pibdanā̆*) Soma's body, and they were shining (*vásūni*) also! His verbal analysis is original and seemingly sound. Without knowing of our fly-agaric thesis, he comes out with a sense that fits the fly-agaric perfectly.

---

31. Abel Bergaigne, *La Religion Védique*, Vol. III, p. 241.
32. W. Caland and V. Henry, *L'Agniṣṭoma*, Paris, 1906, Para. 221, p. 338, ftn. 7.
33. Part 1, pp. 71-3; *vide* p. 6, ftn. I.

The shining 'rays' (as the Vedic poets are always referring to them), the scales or white patches or knobs or warts sticking to the cap (as we say) of the fly-agaric, are left behind in the strainer. Whether the Vedic word *párus* covers a semantic area broad enough to embrace not only the knots in wood but also the 'knobs' on the fly-agaric's cap, or whether the poet was resorting to a metaphor as we do in English, I leave to Vedic scholars to determine. For the Indo-Aryans the white spots of the fly-agaric were shining (*vásūni*) knobs or studs (*páruṣā*) sticking (*pibdanā̆*) to the cap. This example illustrates the delicacy of the task of the translator, the rare prescience of gifted students who are oft-times groping in the dark, and finally the help it will be to the scholar when at last he knows the identity of Soma and can familiarize himself with all its characteristics and properties.

As an instance of this help I will cite the word *sahásrapājas*, an epithet for Soma that occurs twice in the ṚgVeda in almost identical passages. (ṚgVeda IX 13[3] and 42[3]). The first part of this word offers no difficulty: *sahásra*- means 'thousand'. But what is the meaning of a thousand -*pājas*? On this there has been much comment but no agreement. Some have thought the word meant 'forms', others have suggested 'colours', and yet a third commentator sees in it 'rays'. But in the light of our Plate XII and our discussion of the First Filtre are we not simply viewing the thousand 'studs' from a different metaphoric angle? This is consonant with the imagery of the First Filtre, the rays escorting Soma down from their heavenly abode and then filtering the divine inebriant with midwifely solicitude into the plant. We do not yet know the precise meaning of -*pājas*, nor the anatomy of its poetic associations, but we do localize it and, for lack of a better, 'rays' will do. The Vedic poets see the white spots on the fly-agaric either as 'studs' or as sparkles of the divine light. (We in the English-speaking world see them as warts disfiguring a repulsive toadstool.) If I am right in identifying Soma with the fly-agaric, then in re-studying the whole of the ṚgVeda we must at all times be alive to the numinous glow of this awesome plant, a plant with miraculous inebriating virtue fully matched by its vesture-of-grand-occasion. When still in the dark as to its identity, great scholars like Renou have felt that Soma was the heart and soul of the ṚgVeda. If we know now what Soma was, like the holy *óṣadhi* itself the ṚgVeda with its thousand hymns - **sahásrarc* - is certainly destined to glow again with a rebirth of radiance from its thousand facets.

IX. Soma and the Fly

Does the fly-agaric help us in understanding this verse, which has troubled the translators? It reads, in part, as follows:

> I 119[9ab]
> To you, O A&sacute;vins, that fly betrayed the Soma.
>
> उ॒त स्या वां॒ मधु॑म॒न्मक्षि॑कारप॒न्मदे॒ सोम॑स्यौशि॒जो हु॑वन्यति
>
> *utá syā̆ vāṃ mádhuman mákṣikārapan máde*
> *sómasyau&sacute;ijó huvanyati*

The word for 'fly', *mákṣika*, might mean bee. The word for Soma is *mádhu*, 'honey', a frequent metaphor for Soma. The verse might well be interpreted as meaning that the bees have betrayed their honey to the A&sacute;vins. This is grammatically and semantically unexceptionable, but it is banal to the point of inanity. On the other hand, if a fly betrayed Soma to the A&sacute;vins, we are plunging to the depths of Indo-European folklore. Throughout northern Europe, wherever the fly-agaric is well known, there is a folk belief that the fly-agaric is linked to flies. Here we find the statement that the fly betrayed Soma to the A&sacute;vins. Did the fly lead the A&sacute;vins to the fly-agaric?

I have conducted experiments with the fresh Eurasian fly-agaric, splitting the stipe (stem, *aṃ&sacute;ú*) lengthwise and letting it bleed. Where flies have access to such stipes, the flies are drawn to them, suck the juice, and collapse helpless into a stupor. They do not die from the juice. On the contrary they recover completely in a matter of hours or one or two days. While in the stupefied state they may of course be killed by their enemies or be blown away to their deaths in non-viable surroundings.[34]

---

[34] *Vide* also *Nature*, Vol. 206, No. 4991, pp. 1359-1360, June 26, 1965: 'Constituents of *Amanita Muscaria*', K. Bowden, A. C. Drysdale, G. A. Mogey.

X. Words Used for Soma in the ṚgVeda

The name Soma is derived from the root *su*, meaning 'to press'. Soma is the pressed one. Another word for Soma is *ándhas*. Both Soma and *ándhas* are used in the ṚgVeda to designate the plant and its juice, *ándhas* being probably cognate with ανθος [*anthos*], the Greek word for 'flower'. (It is as though the Aryans called Soma *the* flower.) In the ṚgVeda 'Soma' and *ándhas* are used exclusively for the sacred plant and its juice, but the plant must have carried a name before it was elevated to its high station as a god and before it could have been called by a name derived from the liturgical act of pressing; this early name is lost. The Vedic lexicographer Grassmann translated *ándhas* by the word *Kraut*, 'herb', such as 'food for cattle'. In classical Sanskrit one of the common words for 'herb' is *tṛ́ṇa*, and, surprisingly, in the earliest Sanskrit dictionary, the *Amarako&sacute;a* (*ca*. A. D. 450), it is defined not only as 'herb' but as 'mushroom'. In the ṚgVeda *tṛ́ṇa* occurs from time to time but no translator had ever found a passage where he said it meant 'mushroom'. But there is a hymn directed to the Ṛbhus that says:

> I 161[11ab]
> In the uplands you have created *tṛ́ṇaṃ* for this people, in the lowlands ingenious waters.
>
> उ॒द्वत्स्व॑स्मा अकृणोतना॒ तृणं॑ नि॒वत्स्व॒पः स्व॑प॒स्यया॑ नरः
>
> *udvátsv asmā akṛṇotanā tṛ́ṇaṃ nivátsv apáḥ*
> *svapasyáyā naraḥ*

Because Soma is repeatedly associated in the hymns with the heights, if I am right that Soma is the fly-agaric, this sentence should be reviewed to consider whether *tṛ́ṇa* does not mean here the divine plant, the fly-agaric. Another word often used for Soma in the ṚgVeda is *óṣadhi*, and the lexicographers tell us that it also meant herb. But in the Vedic mind the plant categories did not correspond precisely to our own, and the three terms for 'herb' seem to have embraced all small fleshy plants. Similarly, as we shall see, the Chinese term *chih* 芝 originally meant a fleshy plant, but as time passed its meaning came to be confined to a particular mushroom.

Many other names are applied to Soma in the ṚgVeda, all of them metaphors stressing one or another of its aspects. In passages where the drink receives the highest homage it is sometimes called *amṛta*, cognate with 'ambrosia', the liquor of immortality. That which is pressed is *aṃ&sacute;ú*, 'stalk'. Sometimes Soma is called simply *vīrúdh*, 'the plant'. The juice is *pávamāna*, from the root *pu*, 'clear flowing', or *indu*, the 'bright drop', or sometimes *drapsá*, the 'drop', or *rása*, the 'fluid', or *pitú*, the 'beverage', or *máda*, 'inebriation', or *mádhu*, 'honey'.

The rich Soma vocabulary reflects the importance of the plant and its sacred rôle. The ordinary word for a common or garden mushroom occurs only once in the ṚgVeda, in a hymn addressed to Indra, where the poet says:

> I 84[8ab]
> When will he trample upon the godless mortal as upon a *kṣúmpa*?
>
> क॒दा मर्तं॑मरा॒धसं॑ प॒दा क्षुंपं॑मिव स्फुरत्
>
> *kadă mártam arādhásaṁ padă kṣúmpam iva sphurat*

Yāska, the earliest of the commentators on the ṚgVeda, who lived not later than the 5th century B.C., said *ksúmpa* meant a mushroom, *ahichatrikā*, and Geldner accepts this identification. The word survives in contemporary Hindi as *khumbi* and in the market place of Old Delhi one buys under that name a wild mushroom belonging to the genus Phellorina, close to or identical with *Phellorina delestrei* Dur.

It is not surprising, on the contrary it is to be expected, that the sacred mushroom should be in a category by itself, segregated from the rest of the mushroom world. This is what happens among the Mazatec Indians of Mexico, in whose language there are two words, one that embraces mushrooms belonging to sacred species, and the other that includes the rest of the fungi. Among the Mazatecs the two words neatly divide the fungal world between them.

'Mushroom' in classical Sanskrit is *chattra*. In the sense of 'mushroom' this word may not have existed in Vedic times; certainly the Aryans did not bring it down from the North. The word itself comes from the root *chad*, 'to cover', and its primary meaning is 'parasol'. For southern peoples the parasol, furnishing protection from the sun, is of importance, and from Cambodia to Ethiopia it is a symbol of authority, in India the mark of the Kṣatriya caste, the rulers, the rajputs. Until recently the northern peoples have not known the parasol or the umbrella. When the Aryans invaded Iran and India, they gave to this newly discovered utensil an Aryan name, *chattra*, and later extended the meaning of that name to embrace the fleshy capped fungi.

In India today mushrooms do not play an important role. Only in the Northwest, in Kashmir and the Punjab, are they much relished, as well as among Muslims and Sikhs in the Punjab and Delhi. *Agaricus hortensis* (our cultivated mushroom, the *champignon de Paris*) is almost unknown, as well of course as *Agaricus campestris*. The mushroom that enjoys some popularity for the table is *Pleurotus eryngii* in various of its subspecies. In Delhi large quantities of *P. eryngii* s. sp. *nebrodensis* are imported from Afghanistan for sale in the market, where they are called *dhingri*. In Kashmir there is a smaller variety, *P. eryngii* Fr. ex D. C. forma *tesselatus*, that goes by the name of *hĕḍar*, *hĕnḍa*. The aristocrats of the mushroom world in Kashmir are the morels, called *kana-g*^{ü}*ch*, the 'ear-morel'; recently they have become too expensive for the people of Kashmir to eat, and today they are gathered only for export to the Punjab, New Delhi, and Paris. But they still figure in the folklore of Kashmir and must be served at wedding feasts, if there are means to buy them. For mushrooms considered inedible, *kukur-nmt(t)ā*, 'dog's urine', and endless variations of the same expression, are the dominant word throughout India. In the languages derived from Sanskrit of modern India I have found no trace of a sacred mushroom.

The Laws of Manu, Chap. V 5, place a tabu on mushrooms for the three upper castes of Hindus (= 'twice-born men'): 'Garlic, leeks and onions, mushrooms [*kavaka*] and all plants springing from impure substances are unfit to be eaten by twice-born men.' It is impossible to say whether this prohibition is related to a sacred use of the fly-agaric in Vedic times; probably not. The hermit or ascetic lies under a similar inhibition, Chap. VI 14: 'Let him avoid honey, flesh, and mushrooms growing on the ground [*bhūmi kavaka*], *bhūstṛṇa*,...' Elsewhere *bhūstṛṇa* is said to mean, among other plants, mushrooms that grow on the ground, the same as *bhūmi kavaka*. Clearly the Hindus are mycophobes. In the Punjab, Kashmir, and the Northwest, where the population has been Muslim and Sikh for centuries - in the Indus Valley, south of the Hindu Kush - there is a deep-seated mycophilia running counter to the general Hindu attitude. This is the area where the ṚgVeda was composed.

There is one episode conspicuous in the religious annals of India in which mushrooms played, or may have played, a decisive rôle: the death of Buddha at the age of 80 in the middle of the sixth century B. C. He was making his way with his followers, talking and preaching as he went, through the kingdom of Magadha, the present state of Bihar, and had paused for the night at a place called Pāvā. One Chunda, a metal worker, asked him for dinner and he accepted. Among other dishes Chunda served *sūkara-maddava*, called in one recension *sūkara-mansa*. (These words are from the Buddhist scriptures written in the Pali language, a tongue spoken a century or more later than the events we are describing and farther to the west. The Buddha himself must have spoken Magadhi Prakrit, also closely related to Sanskrit.) The two terms mean the same thing, but what is that meaning? The first word means 'swine', 'boar', cognate with the Latin *sus*, English 'swine'. The second element means soft flesh. 'Soft flesh of swine?' 'Swine's soft flesh?' *i.e.*. the soft flesh of which pigs are fond? A subjective genitive or an objective genitive? Buddhism has never made much of this, but the two great schools, Mahayana and Theravāda, have disagreed on it. The Mahayana school has held that the Buddha ate pork, it proved to be bad, and he died of the effects, after dysentery. The Theravāda school believes, on the other hand, that he died from mushrooms, a food of which pigs are fond. A Chinese translation of the *Dīgha Nikāya*, including the Book of the Great Decease, made in the beginning of the fifth century A. D., rendered *sūkara-maddava* by *mu erh*, tree mushroom.[35] I record the extraordinary circumstances of Buddha's death because they bring in mushrooms, but I am not prepared at this time to advance an explanation for the myth that would link it with Soma: the sources - Chinese, Sanskrit, and Pali - need to be re-examined with minute care. Nor, so far as I now know, are the ṚgVeda and Soma to be associated with the triple-tiered *chattra* ('parasol' and 'mushroom') that surmounts the great stupa at Sanchi, one of the earliest and most awe-inspiring Buddhist structures that survive; nor with the megalithic 'mushroom-stones' found in great numbers in Kerala, and less often in Nepal.

XI. Miscellanea

George Watt, the botanist who devoted his life to the study ot the flora of India,[36] is said to have declared that 'no plant is known at present [1884] which would fulfil all the requirements [of Soma], and he lays particular stress on the fact that the vague and poetical descriptions given of the Soma make any scientific identification almost impossible.'[37] Watt did not read Sanskrit, much less Vedic. He did not allow for the deficiencies in the translations of the ṚgVeda on which he depended: he may have been unaware of them. The early renderings of the ṚgVeda made the ancient poets sound like upper class Europeans of the 19th century, frock-coated, with their inhibitions and pruderies, their etiolated religious outlook. Even today one hears it said that the ṚgVeda is vague and contradictory about Soma. This recalls the blind men who were defining the elephant by feeling each one a different part of the huge beast. Their reports were contradictory indeed. Who is to say that the ṚgVeda is contradictory without first knowing what Soma is?

The hymns of the ṚgVeda fit the fly-agaric like a glove. True, one must possess some awareness of the psychotropic plants of the world and their rôle in primitive religion. Given that familiarity, a reading of Geldner, Renou, and Bhawe leads straight to the fly-agaric.

Indians and Westerners who reverence the ṚgVeda for its religious feeling will perhaps be revolted by the dual forms of Soma and will even experience a visceral resistance to this solution of the enigma. Furthermore, a few Vedic scholars may know a momentary pang of regret. For almost a century and a half Soma has been the great unknown of Vedic studies, until this unknown had come to be considered a permanent built-in feature of this remote area of learning. Playing the Vedic game with aces wild has had its charms: it allowed individual leeway in reading difficult passages. It permitted even the great Bergaigne, in an unguarded moment, to suppose that Soma was merely some plant or other expressly selected by Aryan priests who went looking high in the mountains for this purpose (an 'Ecclesiastical Commission', we would call it), that the myth of Soma's mountain origin might be fulfilled;[38] as though the myth came first and the plant was an afterthought! This was possible only because Soma remained a blank. If Bergaigne was right, the poets of the ṚgVeda, and especially of Maṇḍala IX, must have been engaging in make-believe. His remark flouted all that the poets had to say in praise of the marvelous properties of the plant and the divine inebriation that resulted from drinking its juice. Their religion was founded on a hoax.

On the other hand the identification of Soma will give impetus to Vedic studies. The religion of the ṚgVeda now assumes body, fresh colour, a sharp bite. If I be right, the whole corpus of hymns, and the Avesta as well, must be re-read in the light of the discovery that a divine mushroom was at the center of these religions, was the focus of these poets. How astonishing that we can still draw parallels with the fly-agaric cult in Siberia, where as we shall see in *Part Three* it lingers on, in the last stages of degeneration among the peripheral tribes of the extreme north.

In Siberia the fly-agaric is utilized by the shamans. In the Indus Valley we associate it with an organized priesthood. This priesthood may have characterized Indo-European society in their homeland, but are we safe in assuming so? May not a shamanistic religion have acquired an hieratic structure under the pressures of a tough war of conquest lasting centuries? In a world of enemies the shamans may have found it in their own interest and the interest of the community to close their ranks, to band together and organize a tribal priesthood, as a weapon of political power. The assembling of the hymn book, about which Vedic scholars know something from internal evidence, may have kept step with the organizing of the priesthood.

Why was Soma so soon abandoned in India, perhaps even before the forms were closed on the canon of the ṚgVeda? For one thing, questions of supply, which must always have been awkward, became impossible when the Indo-Aryans spread out over all of India. The mushroom crop in the Hindu Kush and the Himalayas was each year a fixed quantity. Of course for a time the priests could make do with insufficient fly-agarics (as they had had to do many times in seasons of short supply), stretching out the Holy Element by utilizing the *Second form*, and by mixing the precious fluid with ever more water and milk until only a symbol of the Real Presence remained. Possibly the *Second form* fell from favour and came under the condemnation of the priesthood, as it seems to have done in some quarters in Iran. The silence among later Indian writers about the true Soma would indicate that the decision to abandon it was deliberate and universal, and extended even to the discussion of it. But the memory of Soma must have stayed alive in the inner circles of Brahmans, perhaps for centuries. India is a land where the incredible sometimes comes true, and I should be delighted, but not altogether surprised, to discover that there are still circles privy to the knowledge of the true Soma.

---

[36] Watt's monumental work, *Dictionary of the Economic Products of India*, 1889-1896, edited and partly written by him, in many volumes, is a major legacy of the British rule in India, of lasting value.

[37] Quoted from Max Müller, *Collected Works*, London, Vol. X, 1888, p. 223. The observations attributed by Müller to Watt do not appear in Watt's published statements.

[38] Abel Bergaigne, *La Religion Védique*, Vol. I, p. 183. The French text reads: 'Enfin le choix que les Aryas védiques faisaient d'une plante croissant sur les montagnes pour en tirer le breuvage du sacrifice, ne leur avait-il pas été suggéré par le mythe du Soma, venu de la montagne suprême, IX 87^8, c'est-à-dire du ciel et particulièrement des nuages du ciel, I 187^7?'

As the substance of the Sacrifice became diluted and finally vanished, as the Divine Inebriant was reduced to a fading sacerdotal memory, inevitably more and more emphasis was placed by the priests on the efficacy of pure liturgy, and sacerdotalism proliferated to a point that the world has never seen equalled. The Brahmans of those days, profoundly moved by the legacy they had received from their ancestors and not yet possessed of an alphabet, set up, and copper-riveted in place, a method of preserving by sheer memory the words and melody of the original hymns that would withstand the vicissitudes of time. Would it be too much to say that the psychotropic mushrooms stirred them to make this supreme effort? With the passing of the generations Soma, the Divine Plant, no longer a part of Hindu experience, became sublimated in later Hindu mythology and took its place in the heavenly firmament as the Moon God. Dr. Stietencron has asked whether the Soma-Moon equivalence may not have been suggested by several of the attributes of the fly-agaric - its successive phases as it passes from the egg stage through to its ultimate end, all in a period comparable with the monthly cycles of the moon, though quicker; its pock-marked face; its white flesh; its white rotundity before it breaks through the white veil; the crescent that appears when the cap is bisected at a certain stage of its growth. A people richly endowed with poetic imagination would need only these features to see in the moon a transcendental fly-agaric.

The sublime adventure of religious contemplation, the mystical experience, which the priestly caste (and perhaps others) of the Indo-Aryans had known through the mediation of the fly-agaric, could now only be achieved through regulated austerity and mortification of the flesh, and the Hindus, who had known to the full the bliss that contemplation can give, made themselves the masters of these techniques: the price being counted as nothing compared with the prize.

XII. Mani, Mushroom, Urine

Possibly we can adduce evidence that will show vestiges of the cult of the sacred mushroom surviving in esoteric circles under Iranian influence down to the 11th century of the Christian era. The evidence is tenuous but in the light of my fly-agaric thesis it is tantalizingly suggestive. For the first time our trail leads us to China.

Of the sacred texts of Iran only a part survives, and much of what survives is corrupt and confusing. A succession of religions marked the history of ancient Iran - the primitive religion that Zoroaster undertook to reform, Zoroastrianism, Mithraism, Manichæism, some others, each of them preserving features of its predecessors and changing the emphasis, but all of them laying stress on the dualism of this world, the conflict between light and dark, between good and bad.

For some years before his conversion to the Christian faith in A. D. 386, St. Augustine was a follower of Mani, though he never visited Iran. Immediately thereafter he wrote his attack on the Manichæans, in which there is a passage, seldom noticed, condemning them for eating mushrooms, as well as other delicacies.[39] The Latin text reads as follows:

---

39. St. Augustine, *De Moribus Manichæorum* ('About the Ways of the Manichæans'), Chap. 13, Para. 30. In imperial Rome *boletus* was the name applied to what we call the genus Amanita, including both the edible and the toxic amanitas. *Vide: Mushrooms Russia and History*, Wasson & Wasson, New York, 1957, Chap. IV, Mushrooms for Murderers. So great was St. Augustine's influence on later churchmen that I think his mycophobic utterance may have had a part in shaping the virulent diatribes against mushroom-eaters of St. François de Sales and Jeremy Taylor. *Vide* our *MR&H*, pp. 21-2, 353.

> Quid porro insanius dici aut cogitari potest, hominem boletos, orizam, tubera, placentas, caroenum, piper, laser, distento ventre cum gratulatione ructantem, et quotidie talia requirentem, non inveniri quemadmodum a tribus signaculis, id est a regula sanctitatis excidisse videatur.

Writing to confound the Manichæans, St. Augustine speaks of those who stuff themselves every day, to gratify their appetites, with *boletos* (a class of mushroom), rice (in Rome at that time an expensive luxury), truffles (or perhaps underground mushrooms of the genus known today as Terfezia, common in North Africa), flat cakes, sweet wine boiled until thick, pepper, and silphium (a spice, highly esteemed, from a plant now allegedly extinct), and he asks whether anyone can suppose that such people do not lose their standing in holiness.

Only an ethno-mycologist might remark, on coming across this sentence in the great Doctor of the Church, that of the seven cates bringing down his censure, two belong to the fungal tribe, that the first of the seven is the Amanitas to which the fly-agaric belongs, and that he is writing against the Manichæans, an Iranian religion founded by Mani about a century earlier. Even an ethno-mycologist could hardly do more than make a mental note of this; which note, however, would spring to life on reading about the Manichæans in China.

The Iranians introduced the religion of Mani into China in A. D. 694 and 719, and during the rest of the T'ang dynasty and down through the Sung this Iranian sect of Manichæans played something of a rôle in the religious life of the Chinese, especially in their impact on the Taoists.[40] They won a victory when in A. D. 763 they gained as a convert the Khan of the Uighurs, a powerful Mongolian people. Much later an unfriendly Chinese official, Lu Yu 陸游 (A. D. 1125-1209), wrote two reports on the activities and practices of the devotees of Manichæism in Fukien province. Among their evil ways he lists their practice of eating certain mushrooms:

What they eat is always the *red mushrooms, hung hsün* (紅蕈)

The two distinguished French sinologues who edited this text, Messrs. Chavannes and Pelliot, could not be expected to know that it is precisely in Fukien province that there grows an abundance of an edible red mushroom, which is gathered there and widely eaten not only in Fukien province but throughout China. Chinese mycologists call it *Russula rubra* (Kromb.) Bres., and anyone conversant with the province would assume that this is the mushroom of which Lu Yu speaks. How astonishing was this charge of mycophagia, which Lu Yu hurled against the little sect of Mani disciples. The Chinese know their mushrooms and consume wild species in quantities. It is not as though a mycophobic Englishman had leveled the heinous accusation against, say, a band of Gypsies. To be guilty of this offense the Manichæans must have been gluttons for mushrooms, and the local red mushrooms to boot, and clearly, since he was speaking about their religion, the practice was a part of their religion. Were not these mushrooms another substitute for Soma, a substitute more appropriate, in that it was *red mushrooms*, than any known to have been used in India?

The second report of Lu Yu, probably submitted in A.D. 1166, is just as interesting.

以溺為法水, 用以沐浴

They [the Manichæans] consider urine as a ritual water and use it for their ablutions.

MM. Chavannes and Pelliot observe in a footnote that 'the use of cow's urine is known in Brahmanism and, on certain occasions, in Mazdaism [Zoroastrianism]; but the context here hardly permits one to think of anything

---

40. The information about the activities of the disciples of Mani in China comes from *Un Traité manichéen Retrouvé en Chine, traduit et annoté par Ed. Chavannes et P. Pelliot*, Paris, 1912, pp. 292-340, especially 302-5 and 310-314, including the footnotes. This study was first published in the *Journal Asiatique*, November-December 1911. On p. 304 the French scholars, translating the passage from St. Augustine, render *boletos* by *cèpes*, thereby falling into error. In Antiquity, as we have said, the *boletus* was an amanita and the *cèpe* was the *suillus*, the Italian *porcino*. Linnæus created the confusion: when he was naming the genera and species he resorted to the ancient Greek and Latin words but paid not the slightest heed to their ancient meanings.

except human urine, and analogies are more rare on this point'. Lu Yu goes on to complain that as the Manichæans eat so many Russula mushrooms, the price of mushrooms of the Russula kind goes up. For 'mushrooms', he here uses the two characters *hsün* 蕈, *chün* 菌. The first Chinese character is the same as he used before. The second one is the other standard Chinese character for mushroom. In the second half of the sentence he repeats the two characters but in reverse order:

食蕈菌, 則菌蕈為之貴

As they eat fungi mushrooms, therefore mushrooms fungi grow dear.

Mani was born in Iran perhaps a millennium or more after Zoroaster and at least 1,500 years after the period when the ṚgVeda was being composed in the Indus Valley. If anyone takes the attitude that, because of the lapse of time, the practices of the Manichæans are irrelevant to my Soma-Haoma-fly-agaric thesis, I will not argue with him. In a part of the world and in a period where religious practices and beliefs showed a marked underlying stability and persistence, it seems to me that the use in this Iranian cult of urine, apparently human urine, and of mushrooms, *red* mushrooms, is more than chance. In esoteric religious circles the ancient practices may have lived on with modifications for many centuries.

The religion of Zoroaster still survives in the community of Parsis, largely centered in Bombay. It is pertinent to my argument that they still drink urine in their religious rites, though only in token amounts and only the urine of a bull.[41] As I have already mentioned, throughout the area that stretches from Iran to India cow's urine is used as a disinfectant, a religious or ceremonial disinfectant, paralleling somewhat our historical use in the West of Holy Water.

So much emphasis is laid on cows in the ṚgVeda and on the urine of bulls in the religion of the Parsis that the question naturally presents itself whether cows consume the fly-agaric and whether they are affected by it, along with their urine and milk. I cannot answer this. In early October 1966 with three Japanese friends, all mycologists,[42] I visited Sugadaira, in Nagano prefecture, five hours west of Tokyo by fast train. There were many birch trees scattered over the mountains, and an abundance of fly-agarics growing at their feet. A herd of heifers was grazing in the lush highland pasture, and we took advantage of the opportunity to offer them some of the fly-agarics that we had in our baskets. Two of the animals ate them from our hands avidly; two or three turned away with indifference. We did not carry our experiment further, as the animals were of fine Frisian breed and the owner was unaware of our scientific activities. We did not have an opportunity to catch the urine of the heifers that had eaten the fly-agarics; besides, they would have eaten many, many more, had we supplied them.

In 1965 and again in 1966 we tried out the fly-agarics repeatedly on ourselves. The results were disappointing. We ate them raw, on empty stomachs. We drank the juice, on empty stomachs. We mixed the juice with milk, and drank the mixture, always on empty stomachs. We felt nauseated and some of us threw up. We felt disposed to sleep, and fell into a deep slumber from which shouts could not rouse us, lying like logs, not snoring, dead to the outside world. When in this state I once had vivid dreams, but nothing like what happened when I took the Psilocybe mushrooms in Mexico, where I did not sleep at all. In our experiments at Sugadaira there was one occasion that differed from the others, one that could be called successful. Rokuya Imazeki took his mushrooms with *mizo shiru*, the delectable soup that the Japanese usually serve with breakfast, and he toasted his mushroom caps on a fork before an open fire. When he rose from the sleep that came from the mushrooms, he was in full elation. For three hours he could not help but speak; he was a compulsive speaker. The purport of his remarks was that this was nothing like the alcoholic state; it was infinitely better, beyond all comparison. We did not know at the time why, on this single occasion, our friend Imazeki was affected in this way.

---

[41] Jivanji Jamshedji Modi: *The Religious Ceremonies and Customs of the Parsees*, 1923, 2nd ed. 1937; Bombay. *Vide* p. 93 (in the 2nd edition) and other references indexed under 'Gaomez', 'Nirang', and 'Nirangdin'.

[42] These friends were Yoshio Kobayashi, Rokuya Imazeki, and Masami Soneda, all well known mycologists. We were guests of Shigeyoshi Iwasa at the lodge of the Meguro High School, Tokyo; unfortunately Professor Iwasa could not join us. We were most hospitably cared for by the hosts at the lodge, Mr. and Mrs. Mikiyoshi Motai.

In the cultural history of Eurasia has the reindeer played a part in the attitude toward mushrooms and also toward urine, owing to certain traits peculiar to the reindeer? The northern forest and tundra folk live in an intimacy with the reindeer that is hard for us to imagine, an intimacy that amounts almost to a symbiotic relationship. Reindeer manifest two addictions, two passions, one to urine especially human urine, and the other to mushrooms including the fly-agaric. When human urine or mushrooms are in the vicinity, the half-domesticated beasts become unmanageable. All reindeer folk know of these two addictions (how could they not know about them?), though not all know that the mushroom addiction embraces the fly-agaric since the fly-agaric does not always grow over the areas where reindeer abound. Reindeer, like men, suffer (or enjoy) profound mental disturbances after eating the fly-agaric. In *Part Three* and the Exhibits we shall give the testimony of travelers on these points. I now call attention, for the first time in this context, to the odd traits of the reindeer because of their possible bearing on the fly-agaric complex in the religious life of the Siberian peoples. In the give and take of the human species and the reindeer may not the human race have learned from the reindeer to esteem urine and the inebriating qualities of the fly-agaric also, and finally the combination of the two? It has been said that in Vedic times - *ca*. B. C. 1500-1000 - reindeer had not been domesticated. How conclusive is the evidence for this in northern Siberia? It is thought that the ancestors of the Aryans did not live in the reindeer latitudes. There is linguistic evidence that may show the Indo-Europeans discovered the virtues of the fly-agaric before the Siberian tribes, and we are beginning to perceive the extent of the trade relations that always existed across those vast land expanses of Siberia. In that heyday of the fly-agaric cult may the Indo-Europeans have mastered techniques that encouraged cows to eat the resplendent heavenly mushroom? All these questions are speculative and at present unanswerable.

XIII. The Marvelous Herb

1

In the Shahnameh of Firdousi there is an episode that bears on our quest for the genuine Soma. The Shahnameh ('Book ot Kings') is the great Persian epic of 60,000 rimed couplets, a repository of all Iranian history and all national legends known to the poet. Firdousi completed his prodigious work just after A. D. 1000, and the episode that interests us is attributed to the 6th century, at the court of the outstanding Sassanid king Khosru I, called Anushirvan ('the Blessed'), who reigned from A. D. 531 to 579. Whether the episode as recounted by Firdousi took place as told or whether he merely passes on an embroidered version of what had become a legend is immaterial: its terms are what interest us,[43] whether true or false. Here is my summary of the passage pertinent to our inquiry. It will be apparent later why I have put a sentence in italic.

> At the court of King Khosru there was an outstanding physician, one Bursōē, an elderly man who loved to talk and who was reputed to be versed in every branch of knowledge. One day he presented himself before the King at the hour of audience and said: 'O King, friend of learning, you who explore science and who keep it in memory, today I have perused in a serene spirit an Indian book. It is said therein that on a mountain in India there grows a plant brilliant as Byzantine satin. If a skillful man gathers it and mixes it cannily, and *if then he spreads it on a dead man, the dead man recovers the power of speech without fail and forthwith*. If the King permits, I am going to undertake this difficult quest. I shall make use of all that I know to guide me and I hope to accomplish this marvel. It would be only just that the dead return to life, since the world has for king the Blessed One.' Whereupon the King replied: 'It is not likely that this will be, but perhaps we must try.'
>
> The King added that as Bursōē would probably need a guide, he should go amply supplied with gifts for the Indian Rajah. [Later in the story the Rajah is identified as having his capital at Kanauj, the meager ruins of which still exist in Uttar Pradesh, fifty miles from Kanpur, on the Ganges far south of the Himalayas.]
>
> Bursōē set out on his journey and arrived in the presence of the Rajah, who welcomed him and

---

[43] Firdousi: *Shahnameh*, verses 3431-3568; I have relied on the French translation of Jules Mohl.

> read the letter delivered to him. He assured Bursōē that all the Brahmans living in the mountains would help him. Bursōē went everywhere in the mountains on foot, and he chose herbs dry and fresh, faded and others in their full glory. After crushing them he spread them over corpses, 'but those herbs did not bring back a single one to life.'

The rest of the tale, which recounts how Bursōē extricated himself as well as he could from his embarrassing predicament, does not concern us.

It is noteworthy (1) that the book that Bursōē had read was Indian; (2) that according to the Indian book the herb shimmered like satin of Byzantium; (3) that in India Bursōē had recourse to the mountains; and (4) that he was promised Brahmans living in the mountains for his guides. The herb grew in the mountains of India - no other place is mentioned. Bursōē had been reading an Indian book - we are not told what one nor when it was written. In the episode do we not hear a clear though fading echo of the Soma of the ṚgVeda, of the marvelous herb that grew high in the mountains and for which the Brahmans alone held the key?

2

In Indian literature the Purāṇas contain legends and tales of the olden days, all of them religious and in verse. The different Purāṇas took their present shape at different times, running from perhaps the 4th to the 16th centuries.

A story is told in several of the Purāṇas that may bear on the Bursōē episode in the Shahnameh. The version that I shall give is from the *Padma Purāṇa*, Part 2, Book 6, Chapter 8, verses 40-63. Scholars tell us that it assumed its present form between A. D. 800 to 1000. A certain Mount Droṇa figures in it: '*dróṇa*' (from *dru*, Sanskrit, 'made of wood') is the word commonly used in the ṚgVeda for the wooden vessels that contain Soma. Here the word has been transferred to that other receptacle for Soma, the mountain out of which the marvelous herb grew.

> Jalandhara was the king of the demons and he was waging war against the gods. The spiritual preceptor of the demons, their guru, was named &sacute;ukra; he had a magic incantation that he had received from &sacute;iva by means of which he revived all the demons as they fell in battle. Viṣṇu, who was leading the army of the gods, said to Bṛhaspati, who was the guru of the gods, '&sacute;ukra has revived all the demons. Why do you not revive the gods?' Bṛhaspati said, 'I will revive the gods with herbs.' Then Bṛhaspati went to the great Droṇa Mountain beside the ocean of milk, and he took the herbs that grew there and by means of yoga he revived the gods. Seeing this, Jalandhara said to &sacute;ukra, 'How can the gods be revived without your magic?' &sacute;ukra said, '*There is a mountain named Droṇa beside the ocean of milk, and herbs grow there that revive the dead. The guru of the gods went there and took the herbs and revived the gods who had fallen in battle*.' Hearing this, Jalandhara went to the ocean of milk and he went to the mountain Droṇa and beat it with his fists until Droṇa said, 'I am your slave; protect me.' Jalandhara then commanded the mountain to go down to the nether world below the earth, and Droṇa went there; as he went, all the herbs cried out. Then Jalandhara returned to the battlefield and fought with Viṣṇu and conquered him. - *Translated by Wendy Doniger O'Flaherty.*

In the Sanskrit text the word for herb is *óṣadhi*, one of the terms often used for Soma in the ṚgVeda. In Sanskrit there was a poetic convention that precious herbs (*óṣadhi*) grew on the Himalayas. They were brilliant and shone like lamps at night. There are hundreds of such references, of which perhaps the most famous is Kālidāsa's *Kumārasambhava* I 10:

> Where the magic herbs (*óṣadhi*) cast their glow into the caves of mountaineers who lie there with their mistresses, lamps of the love-chamber that need no oil.[44]

---

44. I am indebted to Professor Daniel H. H. Ingalls for this reference. He also supplied me with a Sanskrit proverb, which may go back to a Prakrit original: 'On the snowy mountains grows the magic herb, but the snake is on your head.' (Snowy mountains = Himalayas) *Vide* translation by D. H. H. Ingalls: *An Anthology of Sanskrit Court Poetry*, Harvard Oriental Series 44, verse 791; also *idem* p. 522 for further references to the proverb.

All Chinese know the *ling chih* 靈芝, a conception that goes back in Chinese cultural history for thousands of years; just how far back is the question at issue here.

The *ling chih* is a symbol of happy augury, bespeaking good fortune, good health, longevity, even life with the immortals. Conventionally the phrase is translated by 'the divine fungus - or mushroom - of immortality'. The 'marvelous herb' would be a simpler rendering, or again the 'herb of spiritual potency'. It is one of that large family of Chinese expressions drawn from nature - animals, plants, mountains, clouds, *etc.* - which seem to have constituted in a sense the furniture of every Chinese mind. The Chinese would distill from the chosen objects a conventional meaning, and thereafter the objects were used in literature and art to convey this meaning, like pictographs. At an early date the Taoists captured the concept of a divine mushroom of immortality, and they exploited it fantastically in their writings in the first millennium of our era and even later, until the original idea was lost in a welter of imaginary divagations. Beginning with the Yüan Dynasty (A. D. 1280-1368) the *ling chih* has been endlessly represented in art - in paintings, carvings in jade and deer's antlers, furniture and carpet designs, balustrades, jewelry, lady's combs, perfume bottles, in short wherever the artistic urge found an outlet. It has become a cliché in newspapers, novels, conversation. For two thousand years the idea of the *ling chih* has passed through various phases in the cultural history of China, and I hope someday to publish my notes on these, looking to the time when enough will be known for someone to write the biography of the miraculous fungal idea.

Up to now students of Chinese culture have always regarded the *ling chih* as indigenous to China.[45] I shall suggest that it came from India and was a 'literary' reflection of Soma, the miraculous mushroom of the ṚgVeda. Certainly the fungal idea, once it reached China, found there fertile soil: an 'elixir of immortality' has bemused many peoples, such as the West Europeans in the 16th century, but the Chinese seem to have been singularly susceptible to this will-o'-the-wisp, always hoping to come upon a plant or mineral or juice that would prolong virility and longevity. The novelty of the *ling chih* is precisely that it was a mushroom, and this is India's contribution to our story.

Alfred Salmony in his *Antler and Tongue*[46] has called attention to the accumulating evidence of the influence of India on the China of the Late Eastern Chou, from the 7th to the 3rd centuries B.C. He has pointed out that the influence could be solely 'literary', *i.e.*, whereby the Chinese 'heard tell' of practices elsewhere and under the stimulus of such reports sought to duplicate them. This is what Joseph Needham calls 'stimulus diffusion',[47] what I would call 'idea diffusion'. Salmony cites a number of examples and supplies the bibliographical references. To this list I now propose to add the *ling chih*.

First a word as to the vocabulary for the divine, the miraculous, mushroom. This assumed such importance in Chinese culture that alternative expressions evolved. It is often called the 'miraculous *chih*', 神芝, or 'auspicious herb', 瑞草. With Chinese culture the idea spread to Korea and Japan, where however it has tended to be confined to the literate and intellectual classes. *Ling chih* in Japan, written with the same Chinese characters, becomes *reishi*, the *l* yielding to *r* in the customary way. But more widely used than *reishi* today is *mannentake* 萬年茸 'ten-thousand-year mushroom'. Scholars say that in the archaic stage of Chinese culture the character for *chih* 芝 was written , a pictograph of 'herb', a small plant that was not woody. In Japanese this meaning is still current: where *chih* 芝 appears in contexts other than *ling chih*, it is pronounced *shiba* and means 'lawn'. Presumably it meant this in spoken Chinese in the early T'ang Dynasty (A. D. 618-906), when the Japanese probably borrowed the word. But in the specific sense of 'mushroom' it had already had a long history in China. In the *Li Chi*, one of the 'Thirteen Classics' of China, *chih* 芝 is listed as

a ritual food of the emperor, thus figuring in the religious ceremonies that were an important part of his functions.[48] The early commentators gloss this as meaning an edible mushroom growing on trees, probably what is known in recent centuries as the tree-ear, *mu erh* 木耳 familiar throughout the temperate zone to those versed in mushroom lore as the wood ear, *Auricularia auricula-judae* (Bull.) Quél. The *Li Chi* comes down to us in a recension dating from the early Han (the two centuries before Christ), but the contents are supposed to have been assembled in the late Chou period, from the 7th to the 3rd centuries B.C.

Though *chih* in the sense of 'mushroom' seems already to have been familiar, the idea of *ling chih*, a supernatural mushroom with miraculous powers, appears first in the Ch'in Dynasty (B. C. 221-207) under the great Emperor Shih-huang, who assumed the title of the 'First Emperor', by which he has always been known, for it was he who unified all China for the first time and who built the Chinese Wall to keep the barbarians out. Until his reign we find not a single word about the marvelous plant: no mention in the Classics, in the inscriptions on the bronze vessels, on the oracle bones. There are no carvings in jade or deer's antlers, no representations in pottery or jewelry, on halberds or belt buckles. If the conception had existed, we must assume an implausible conspiracy of silence in this singularly articulate people concerning an idea that prompts thousands of tongues to wag.

Then, suddenly, there is a burst of talk about the wonder fungus, but only talk. People busy themselves looking for it, especially in the mountains, but no one finds it. The great historian Ssu-ma Ch'ien (B. C. 145-87?) is the source of most of our reliable information on this. There are many passages in his account of Shih-huang's reign telling of talks between the Emperor and his necromancers: a magical herb ('*chih*') existed, but where was it? Everyone was searching but it was nowhere to be found. Matters reached a point where the Emperor was advised to go into the mountains alone, and in disguise, obscurely, on tip-toe, and perhaps he might surprise it! We your humble servants are trying to find *chih*. It is one of the miraculous medicines that even the gods cannot come upon easily. 'This is the manner in which the Emperor is addressed by Lu-shêng, one of the sages who was giving advice.[49] The Emperor has been told of a marvelous plant and, asking his necromancers to find it, gets only evasive answers. They believe (or pretend to believe) the reports of its properties, but have no idea what to look for. Addressing the 'master of humanity', who clearly believed the reports, they do not dare confess their ignorance by telling the truth.

Or again we read that Shih-huang sends vessels into the Eastern Sea to seek the mysterious fungus on islands off the coast and far away.[50] One sage (or necromancer, or shaman), Hsü Fu, seems to have rallied hundreds of youths of both sexes to embark with him and to have sailed away to the Southeast. The reports of this voyage are numerous. According to one account, they never returned, but Ssu-ma Ch'ien tells us that Hsü Fu came back and reported falsely about as follows: 'Your humble servants sailed east and southward and reached P'êng-lai [allegedly one of the three godly islands in the Seas]. There your humble servants saw palaces made of *chih*. There were servants, copper in colour and dragon in appearance. The palaces were so bright that they lit up the heavens.'[51]

I take it that the reports of Soma had reached the Emperor by the sea route: hence the voyages to establish contact with the source of information. I take it that the reports placed Soma high in the mountains: hence the futile excursions into the mountains to find the plant. The first reports about Soma probably reached China in the reign of Shih-huang-ti, but possibly they came a few decades earlier, Shih Huang being the first to pursue the matter. In any case in China the conception of the miraculous *chih* probably does not antedate the 3rd century B. C.

[48] *Li Chi*, Chap. 12. 禮記内則.

[49] From Ssu-ma Ch'ien: *Shih chi* 史記, biography of Shih-huang.

[50] The proponents of early deliberate trans-Pacific contacts with America must face these texts in considering the stage of development in navigation that the Orientals had reached as late as the Ch'in Dynasty. Contacts by sea between India and China involved only plane sailing, but the difficulties were staggering for the people of those times. The Japanese had hardly established contacts with China *via* Korea, much less the islands of the Pacific. As late as the middle of the first millennium A. D. voyages from Kyushu to Shantung were formidable adventures, exceedingly perilous.

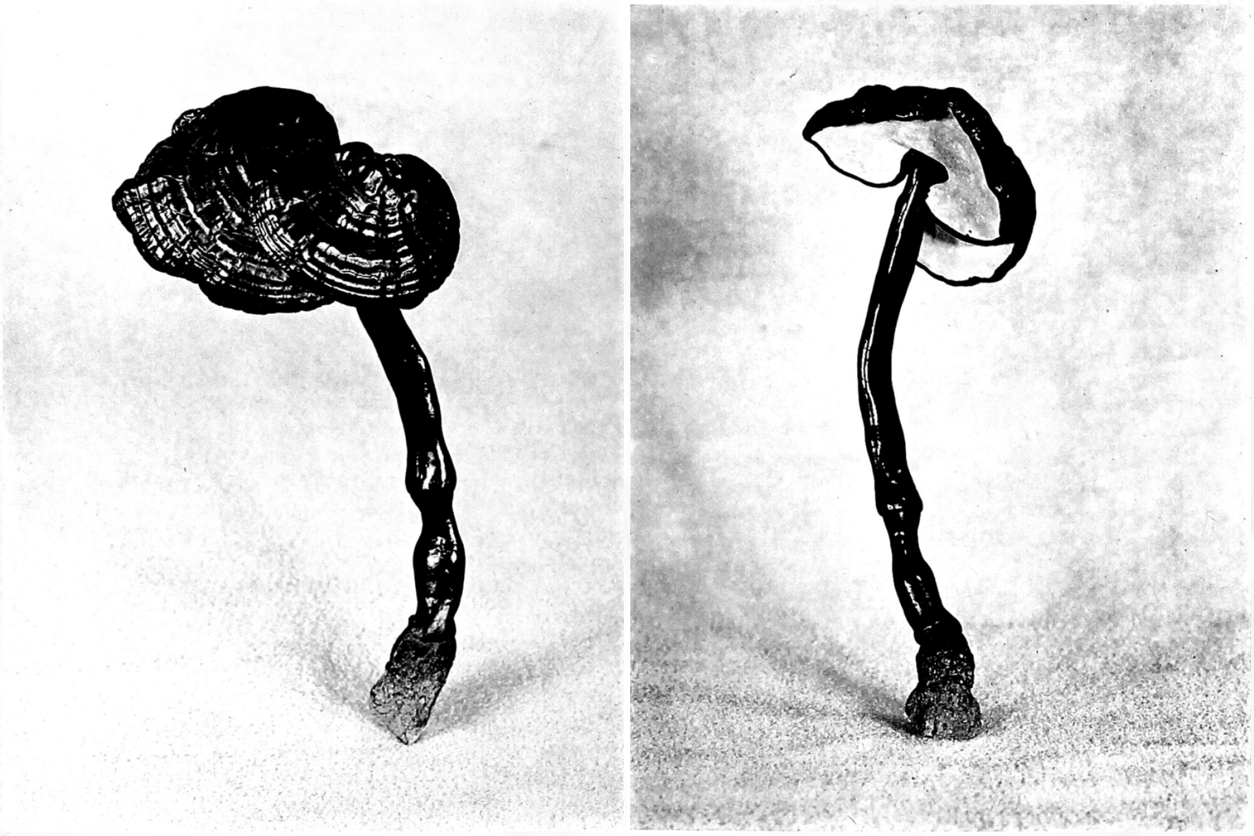

Plate XIV and Plate XV - Twin-leafed LING CHIH from above and from below.
(*Collection R. G. Wasson*)

Ssu-ma Ch'ien, the father of Chinese history, lived in the reign of the early Han Emperor Wu (B.C. 157-87), about a century after Shih-huang. Contemporary with Ssu-ma Ch'ien there was a famous gentleman-in-waiting at court by name Tung-fang Shuo 東方朔, a man renowned for his ready wit. In the Taoist canon there survives a work attributed to him, the *Shih chou chi* 十洲記, 'Notes on Ten Continents', that gives another account of the voyage of Hsü Fu. Scholars say that the attribution to Tung-fang Shuo is certainly spurious, and that the *Shih chou chi* could not have been written before the 4th or 5th centuries and probably several centuries later. In short it is a product of the second half of the first millennium, therefore contemporaneous *sensu lato* with Bursōē's journey and with the *Padma Purāṇa* from which we have already quoted. In the following excerpt taken from the *Shih chou chi*[52] we have underlined phrases that will strike a familiar chord:

> The isle of Tsu is situated close by, in the Eastern Sea. There grows a never-dying plant, shaped like water-grass, with blades three to four *ch'ih* [feet] in length. *A man who has been dead three days revives immediately when this plant is laid on him*. When it is eaten it prolongs life. In the time of Shih-huang-ti of the Ch'in dynasty, when murdered people lay broadcast in the 'great preserve' and across the roads, *birds resembling crows or ravens appeared with this plant in their bills, and placed it on the faces of those corpses, with the effect that they sat up immediately, and revived*. The officers reported this to the Emperor. On this Shih-huang-ti sent out an envoy with a sample of this plant [草 *ts'ao*]; and he interrogated the doctor of the Spectre Valley, who lived near the north wall. 'This herb [*ts'ao*]', thus spoke the sage, 'is the herb of immortality of the Tsu island in the Eastern Ocean, where it grows in a red marble field. Some call it *chih* 芝 which feeds the *shên* 神 [spirit]. Its leaves grow luxuriantly, and one stalk suffices to give life to a man.' On these words Shih-huang-ti with enthusiasm spoke: 'Can it be fetched from there?' And he sent

---

[52] The Chinese text of this episode is given by J. J. M. de Groot: *The Religious System of China*, Brill, Leiden, Vol. IV, pp. 307-8. I have followed de Groot's translation except in a few particulars where on the advice of my Chinese friends I have emended it.

> an envoy to the island, one Hsü Fu, with five hundred young people of both sexes, in command of a ship with decks. They put to sea to seek the island but they never came back.

Here then we have three tales that intermesh in an odd manner. The Iranian version conveys a clear echo of the Soma of the ṚgVeda. There has been added to the marvelous herb one fabulous property: it revives the dead. In the Indian tale an herb with the identical miraculous virtue grows on Mount Droṇa, the name of this mountain echoing the word in the ṚgVeda that designates the receptacle for the juice of Soma. In the late Chinese revision of the Hsü Fu tale the same fabulous virtue is attributed to an herb: it makes the dead to rise. This tale is a variant of one told by Ssu-ma Ch'ien perhaps six or seven hundred years earlier about the First Emperor, Shih-huang, and a *fungus or mushroom with miraculous properties*. Here is an example of idea diffusion, and the idea, I believe, had its source in the Soma of the ṚgVeda. The marvelous fungus of the Chinese, first appearing in the reign of Shih Huang-ti, must today be viewed in the light of Sino-Indian contacts and the evidence that Soma was a mushroom.

The next chapter in the history of the *ling chih* takes place in B. C. 109, a century after the time of the Emperor Shih-huang. The Han Dynasty (B.C. 206 - A. D. 220) now rules China and Wu-ti occupies the throne. The sources for our information about the episode that I am going to relate are the same Ssu-ma Ch'ien whom we have already quoted and who was contemporary with the later event, and Pan Ku (A. D. 32-92), the chronicler of the Han Dynasty and also a reliable historian. In the imperial Kan-ch'üan palace building operations had been under way in the first half of the year. Then, in late summer (probably August), in an inner pavilion of the palace, there appeared a fungal plant, a marvelous growth with nine paired 'leaves'. The Emperor Wu made the most of the event. He identified the plant with the famous *chih* that Shih-huang and his necromancers could not locate. He issued an edict and exclaimed that even the inner chambers of the palace were not discriminated against. He proclaimed an amnesty of prisoners, served beef and wine to a hundred families, and composed an ode for the occasion, the earliest poem about a mushroom (but far from the last and far from the best) that comes down to us in Chinese history. Pan Ku has preserved it for us:

齊房產草	My secluded dwelling produces an herb,
九莖連葉	Nine stems with twin leaves!
宮童效異	The palace pages busy themselves with this miracle;
披圖案諜	They lay out pictures and consult records!
玄氣之精	The essence of the Mysterious Breath,
回复此都	There it is, returned again to this residence,
蔓蔓日茂	Day after day this superb growth,
芝成靈華	This *chih*, which unfolds its beauties most marvelously!

Under the Emperor Wu taxes were levied harshly to meet his needs and grumbling was widespread. He was hardly popular and perhaps he seized on the unusual appearance of a fungal growth inside the palace chambers as a public relations ploy, bestowing on this plant the name *chih* to turn in his favor its good name and prestige. The episode is known to this day by everyone familiar with Chinese history, somewhat like the vase of Clovis in French history and King Alfred and the pancakes in English history. The ode is No. 13 in the nineteen ritual odes that were sung to music on the seasonal occasions of the Chinese year.

At last the unidentified *chih* of Shih-huang-ti had found an identity, an identity that it has retained to this day. Naturally this fungus had nothing to do with its Indian precursor, which Shih-huang had never succeeded in locating in the mountains of China. I think it is safe to assume that the plant found growing in the imperial palace in B. C. 109 was *Ganoderma lucidum* (Leyss.) Karst., the same species that has been represented in Oriental art - Chinese, Japanese, Korean - time without number in recent centuries. The definitive scientific identification of the fungus pictured in Chinese paintings since the Yüan Dynasty was made by two Japanese mycologists, by Iwao Hino in May 1937 and by Rokuya Imazeki in 1934 and 1939.[53]

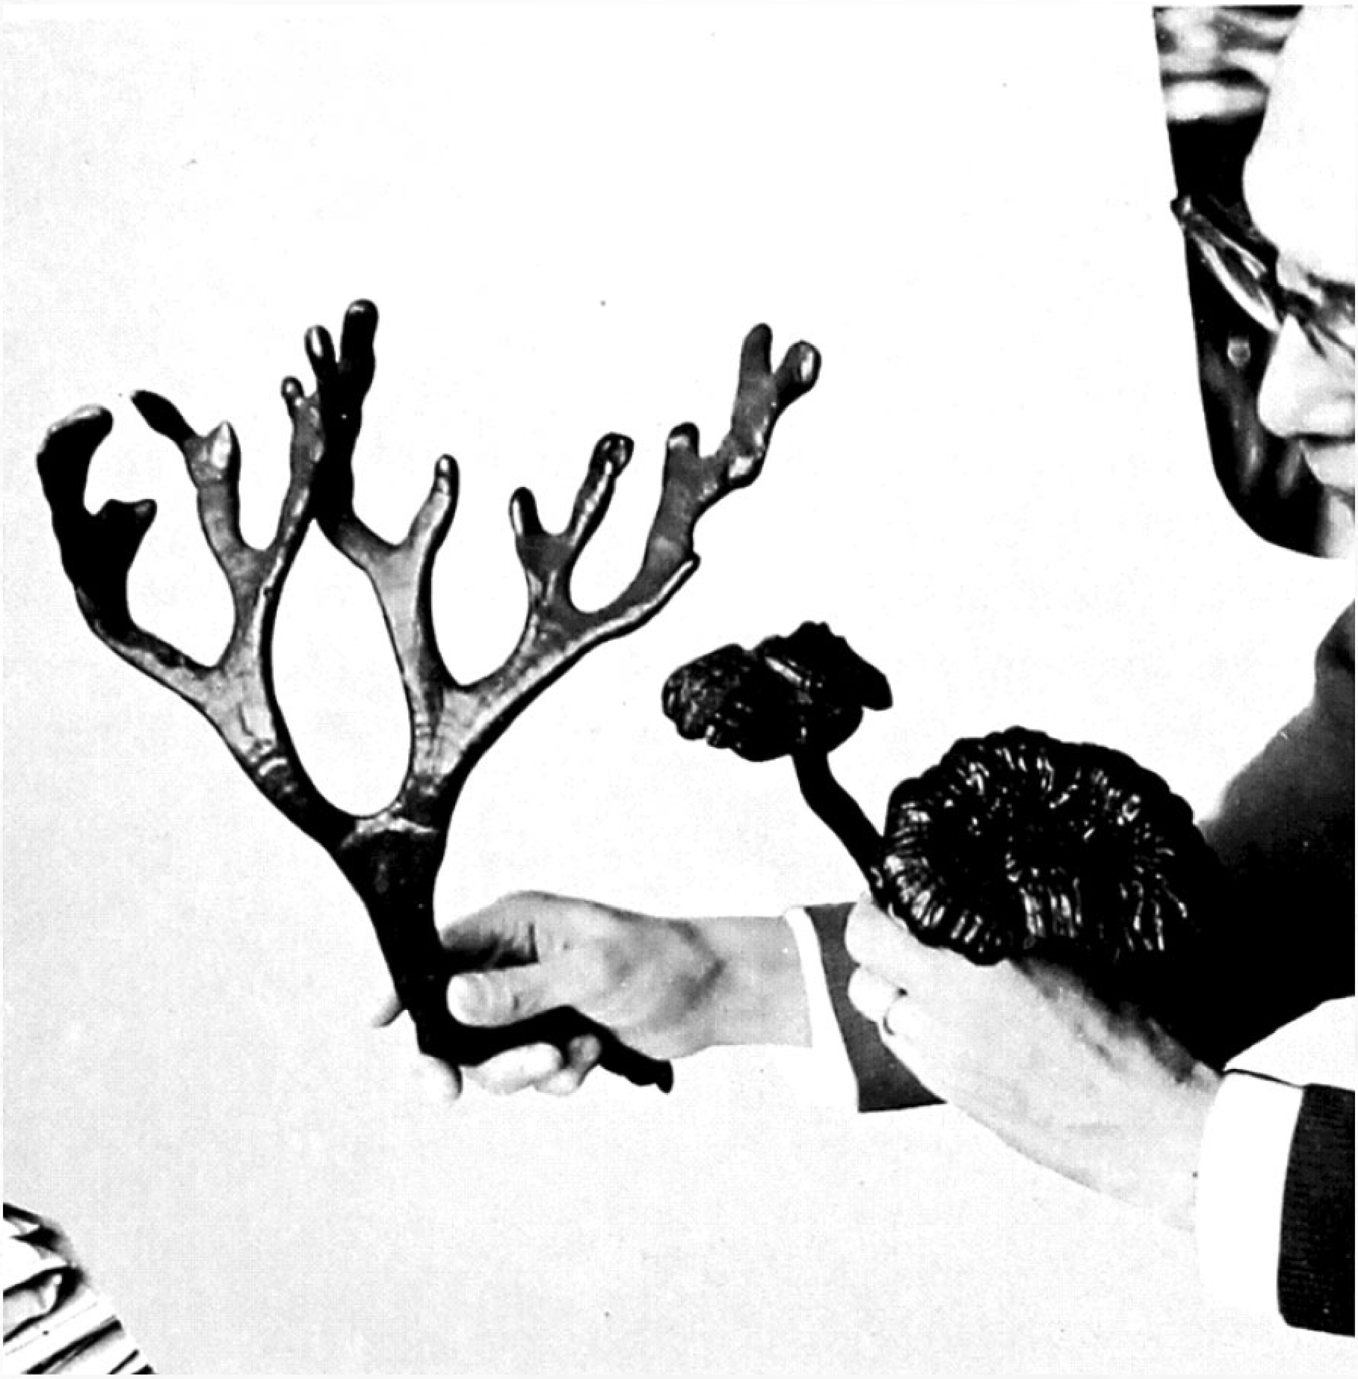

Fig. 1. *Ganoderma lucidum*. Normal and abnormal shapes.

Ganoderma lucidum is a woody fungus, therefore inedible, that grows widely in the temperate zone. We see it in Europe and America, but we have never made anything of it. In appearance it can be of stunning beauty, with its rich lacquer-like finish, the concentric lines of its strange pileus, its odd stem. Those unversed in these matters often refuse to believe that the high polish of this mushroom has not been artificially applied. But its peculiar virtue is that it is protean. There is the normal form, and there is the endless variety of other shapes and consistencies that it assumes when it grows under abnormal conditions, as for example in the dark. The cap (or 'pileus') is always attached to the stem (or 'stipe') eccentrically, and it can give rise to the 'paired leaves' of Wu-ti, as we show in Plates XIV and XV. (*Vide supra*, poem by Wu-ti. In classic Chinese the pileus of a mushroom was a 'leaf' and in Japanese this use of 'leaf' has survived down to our own day. The Chinese character is 葉, in Chinese reading *yeh*, Japanese *ha*.) We know that there had been building operations going forward in the Imperial Palace earlier in the year. This is precisely the condition that might produce an abnormal *chih* inside the new structure: the wood was not seasoned and the growth made its appearance in the obscurity of the secluded chambers. The nine 'double-leaves' would be a rare curiosity, but it is certainly not at all unbelievable.

[53] Rokuya Imazeki: *Natural Science and Museums*, 1934, No. 61, pp. 11-15, 'Good Omen Plant, *Mannentake*'; also *Bulletin of the Tokyo Science Museum*, March 1939, No. 1, 'Studies on Ganoderma of Nippon'. I wao Hino (Miyazaki): *Botany and Zoology*, May 1937, Vol. 5, No. 5, '*Reishi* and *Ganoderma lucidum* that grow in Europe and America: their Differences'. (All are in Japanese, with English summary.)

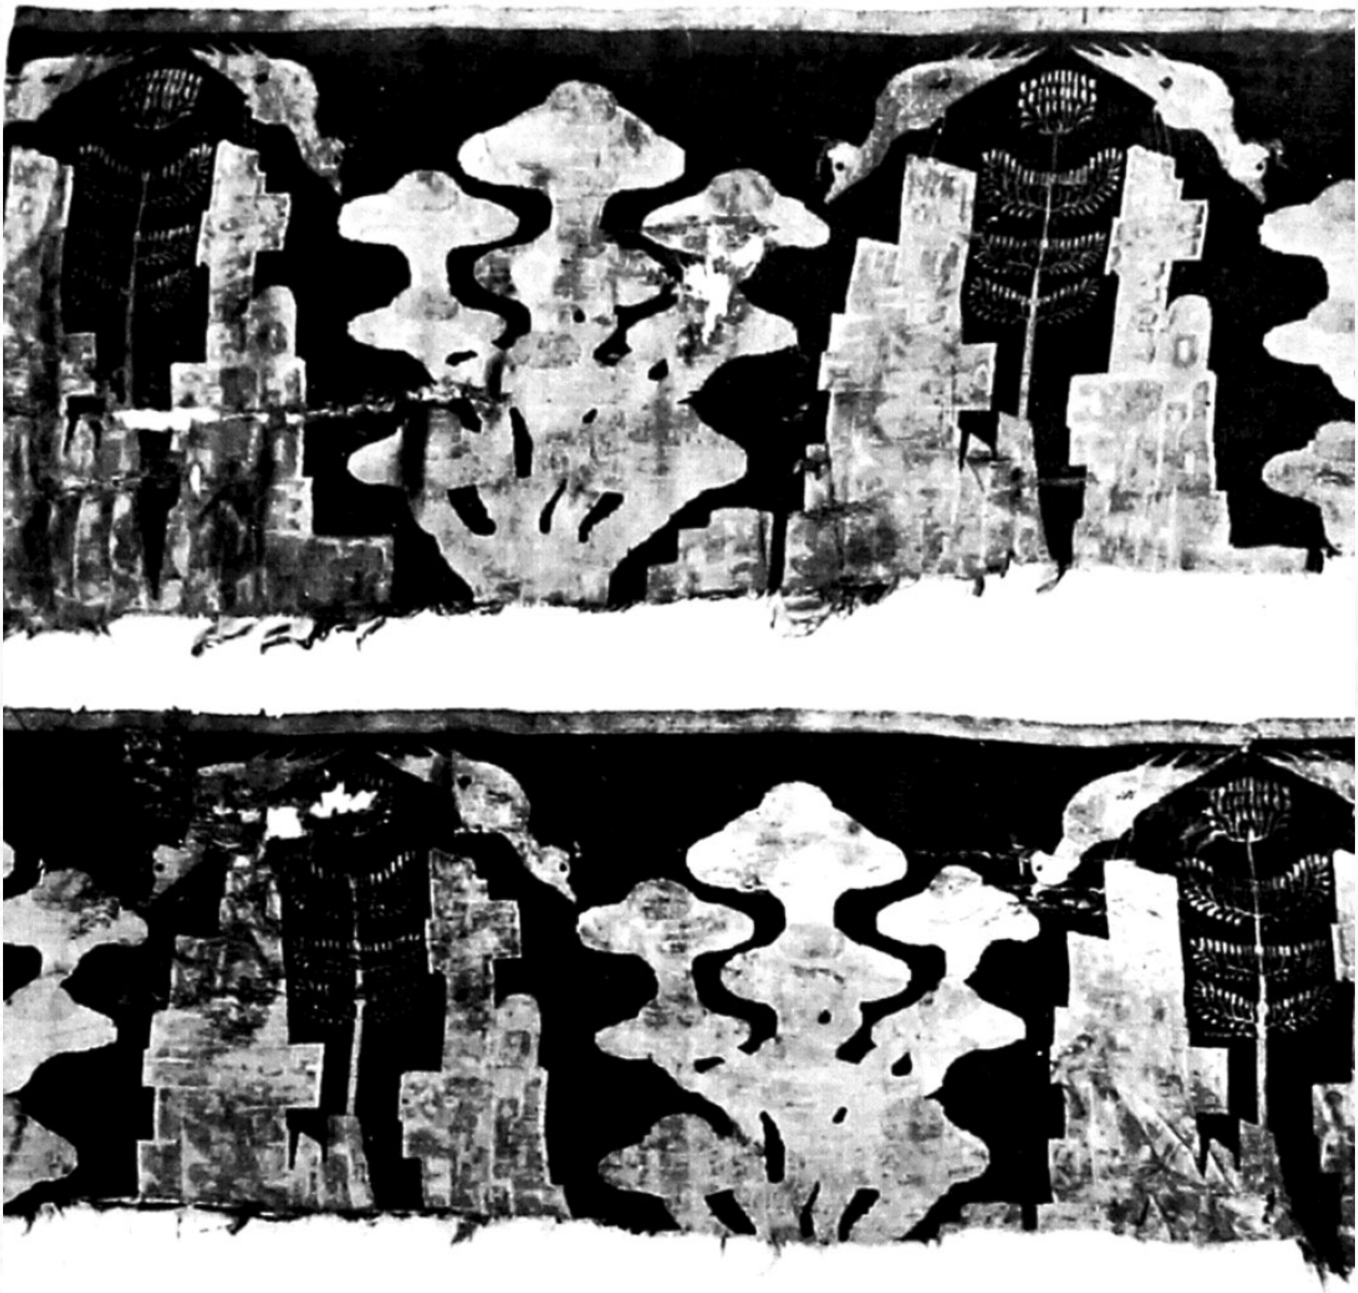

Plate XVI - NOIN ULA TEXTILE (*here shown divided in two parts*), 1st century A. D. From Mongolian tomb. Contemporary connoisseurs of Chinese art suggest that the enigmatic plant toward which the birds are leaning is LING CHIH, the fabulous Fungus of Immortality. (*Courtesy of the Hermitage Museum, Leningrad*).

Pan Ku, the chronicler of the Han Emperors, composed a second ode to the *ling chih*, more than a century after the Emperor Wu's. The attentive reader will have noted that until now we have never quoted an ancient source for the name *ling chih*. Everyone has used either *chih* alone, or *ts'ao chih*, 草芝, 'plant chih', or *chih ts'ao* 芝草 'chih plant'. In the last line of the Emperor Wu's poem, the first character is *chih* 芝, the next to the last is *ling* 靈. *Ling* has a long and complicated history in Chinese. To start with, it is made up by the combination of three characters - 雨, 'rain'; 口口口 (three mouths) 'praying for'; and 巫, 'shaman'. Combined in a single character, they mean spiritual potency, a stirring of the soul. Pan Ku in his ode joined *ling* and *chih*, the two concepts that the Emperor Wu had associated together in the same verse, thus minting the phrase that ever since has been in common currency. Here is Pan Ku's ode:

因露寢兮產靈芝	*Ling chih* grows with the settling dew,
象三德兮瑞應圖	The sign of the three virtues, happy omen's picture fulfilled.
延壽命兮光此都	It prolongs lives and glorifies the capital.
配上帝兮象太微	It accompanies the Emperor on high, Image of the Sky!
參日月兮揚光輝	Image of the sun and the moon, it throws out bursts of light!

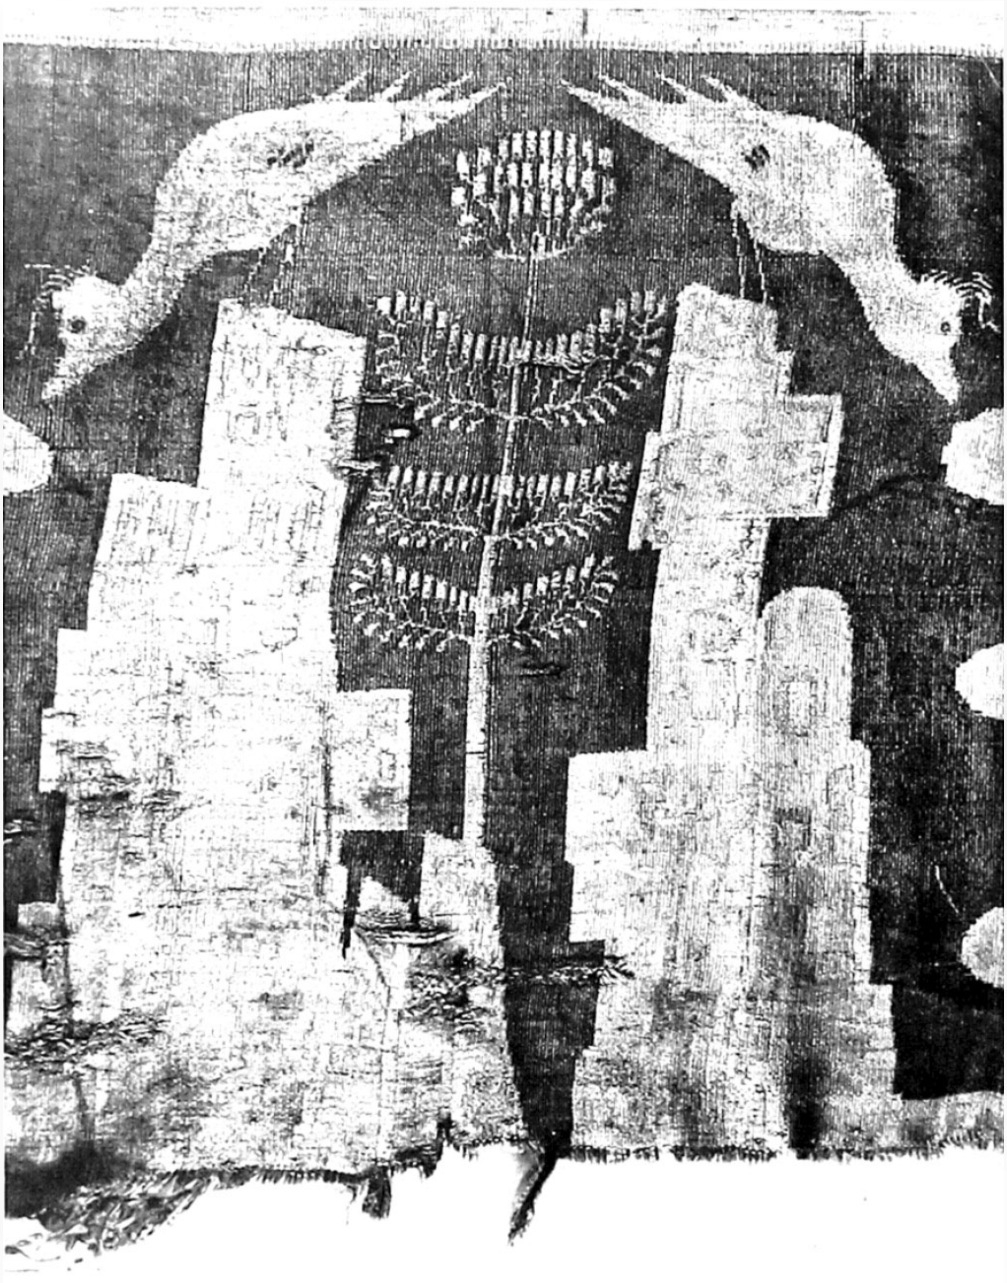

Plate XVII - NOIN ULA TEXTILE (detail).

The three Virtues of the Universe are the Heavens, the Earth, and Man. The pictures of happy omens were mythical documents from heaven depicting auspicious marvels such as the unicorn, the phoenix, the dragon, and the *ling chih*. Was not Pan Ku's ode intended to be used as an alternative to Wu-ti's in the liturgical year?

Lately the art historians have provided us with an unexpected development in the history of *ling chih*. A Russian archæological expedition in 1924-5 unearthed some remarkable artefacts in tombs at Noin Ula in what is now Mongolia. They date from the first century A. D., perhaps the early part of the century. Among the finds was a silk textile, reproduced in our Plates XVI and XVII.[54] A single motif is repeated several times. It consists of two rocky crags, a bird perched on each of the crags leaning down and outward, a graceful tree between the crags, and outside the crags, a plant with nine stalks terminating in what Michael Sullivan calls a 'poached-egg' design. The birds are so placed that they are about to reach the 'poached eggs'. Perceval Yetts in his description of this textile refers to the plant as a 'clumsy fungoid form'. Sullivan has identified it with *ling chih*. Sullivan sees no parallel for the treatment of the rocky crags in either Han China or the Near East, and he suggests a derivation from India, the wall painting in Cave X at Ajanta dating from the first century B.C. showing a similar silhouette. Here is independent support for my thesis of an Indian origin for the *ling chih* notion.

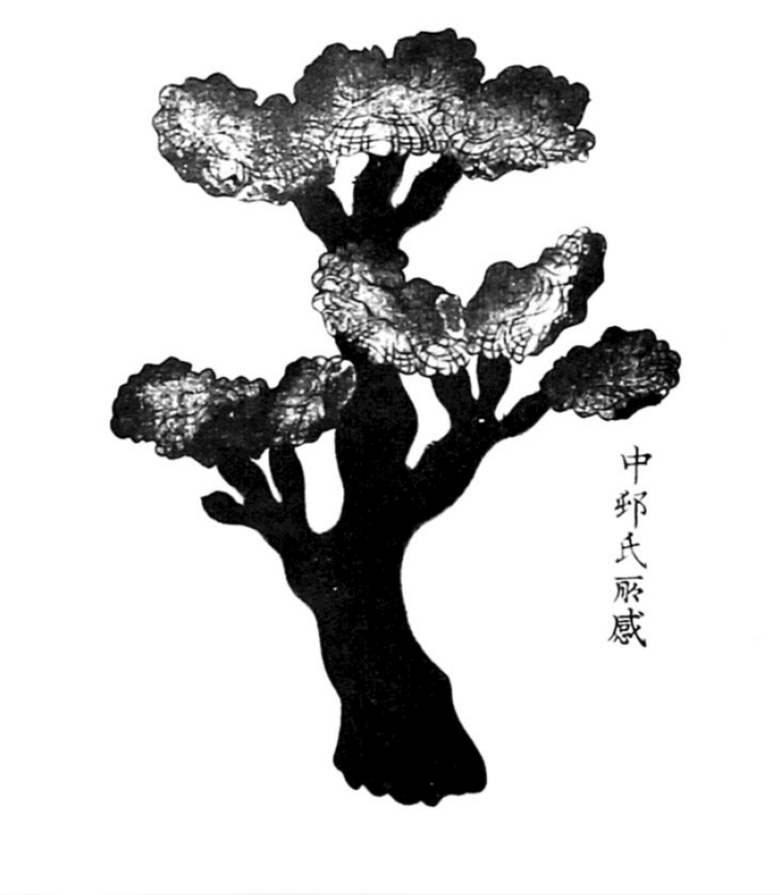

Fig. 2. From *Sakikusa-kō* ('An Inquiry into the Happy Herb'), by Suigetsu Kan-ō. An essay published in 1850 in Japan. The inspiration for this representation of *Ganoderma lucidum* stems back almost 2,000 years to the specimen that the Emperor Wu of China discovered growing in the inner pavilion of his palace.

---

[54] The first and best description in English of the Noin Ula finds as a whole was that of W. Perceval Yetts: 'Discoveries of the Kozlov Expedition', *Burlington Magazine*, April 1926, pp. 168-176. The textile that interests us was discussed at some length by Michael Sullivan: *The Birth of Landscape Painting in China*, pp. 52-53 and Pl. 35; other references to *ling chih* in his index, with numerous reproductions of *bas reliefs* representing the fungus. William Willetts: *Chinese Art*, London and New York, 1958, also accepts the identification, pp. 290-292. The Noin Ula textile hangs in the Hermitage Museum, Leningrad, where the Museum authorities graciously photographed it for me.

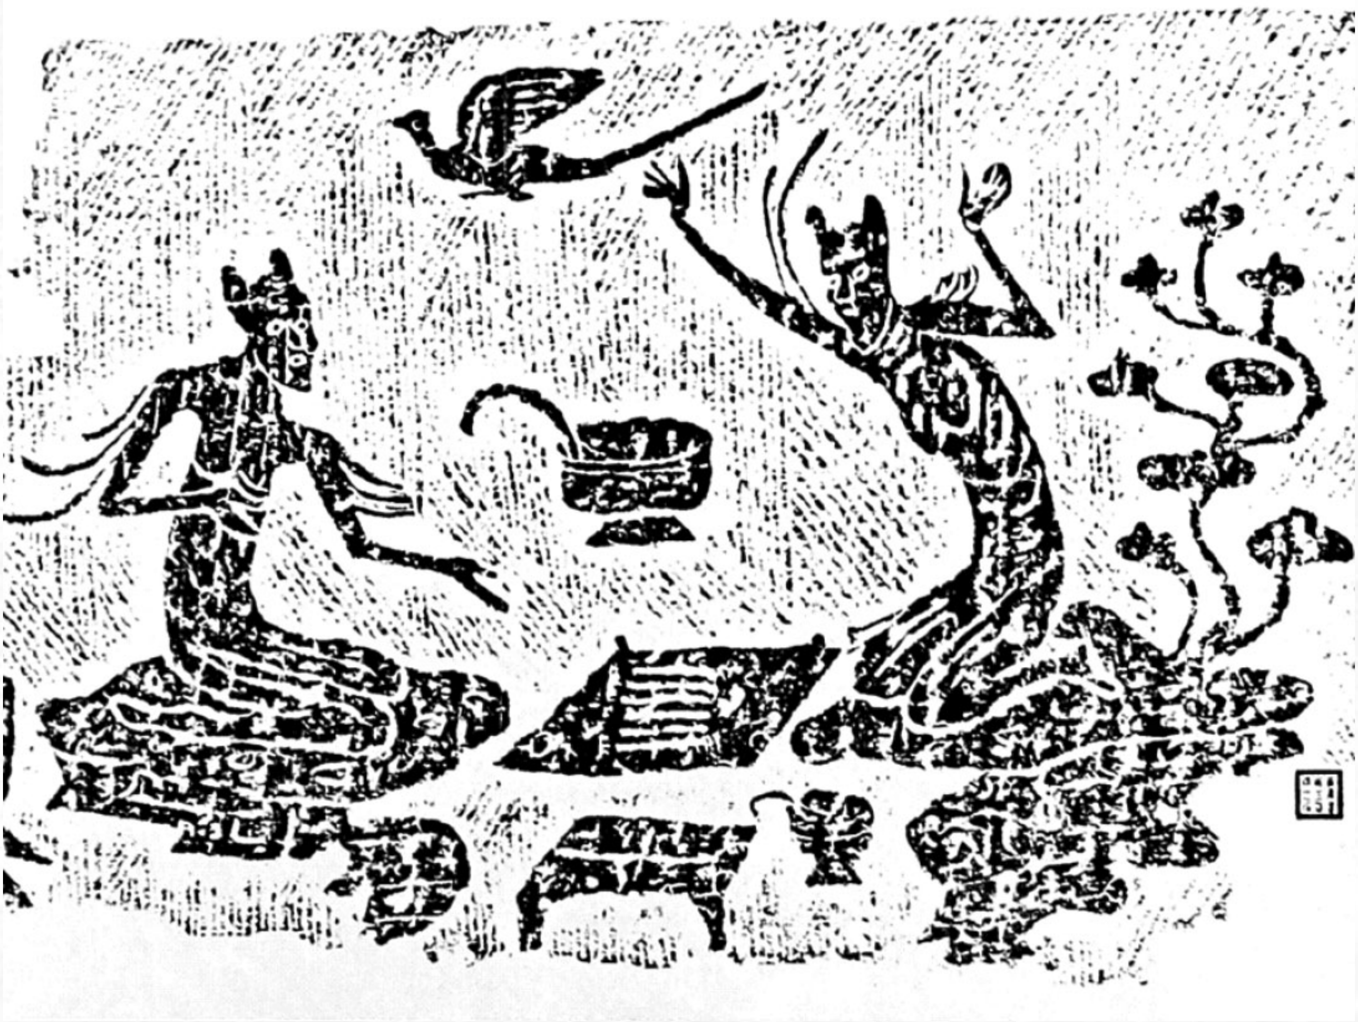

Plate XVIII - Rubbing of a Han Dynasty Stone Carving. Found in Szechwan Province. The two hags with pendulous breasts, having wings on their arms, are assumed to be Immortals. They are playing the board game, popular at that time, known as *liu-po*. Behind the figure on the right there is what Chinese art critics today interpret as a Han Dynasty conception of the LING CHIH, the fabled 'Marvelous Herb' or 'Divine Fungus of Immortality'.
(*Courtesy of Rolf Stein, Esq.*)

I suggest that the fungal form was the artist's effort to embody the Emperor Wu's *chih* with nine twin-leaves, his knowledge of it being only literary. (The textile, dating from the later Han, came more than a century after the event in Wu-ti's reign.) And if India inspired the crags, perhaps the birds reaching down to the fungoid forms re-enact the familiar Indian legend of the rape of Soma by a falcon from a celestial mountain top.[55] Since the Noin Ula finds art historians have assembled a number of *bas reliefs* representing the same conventionalized motif, the 'poached eggs', and the stalks or stems that support them. In Plate XVIII we show one of these, also having nine 'stems' or stipes.

If I am right, we see the genesis of the *ling chih* in the reign of Shih Huang-ti, when on the strength of verbal reports from India about a miraculous mushroom he sent his necromancers looking for it here there and everywhere in the mountains. We see Wu-ti fixing the identity of this elusive mushroom on *Ganoderma lucidum* thanks to its fortuitous appearance in an inner chamber of his palace - a changeling that he was successful in foisting on the Chinese people. We see artists in the later Han, obviously unfamiliar with the fungus itself, depicting from verbal reports a fungus every whit as fabulous as the phoenix, the dragon, and the unicorn.

---

[55] The birds in the textile are probably the demoiselle crane, whose distribution extends from China to Spain. This was the guess of Roger Tory Peterson when we visited him in his home in Old Lyme, Conn., at Christmastide 1966. The legs are those of a wader. The black wing feathers and crest complete the identification. But of course the artist may not have considered the species of bird important, so long as it was big and spectacular.

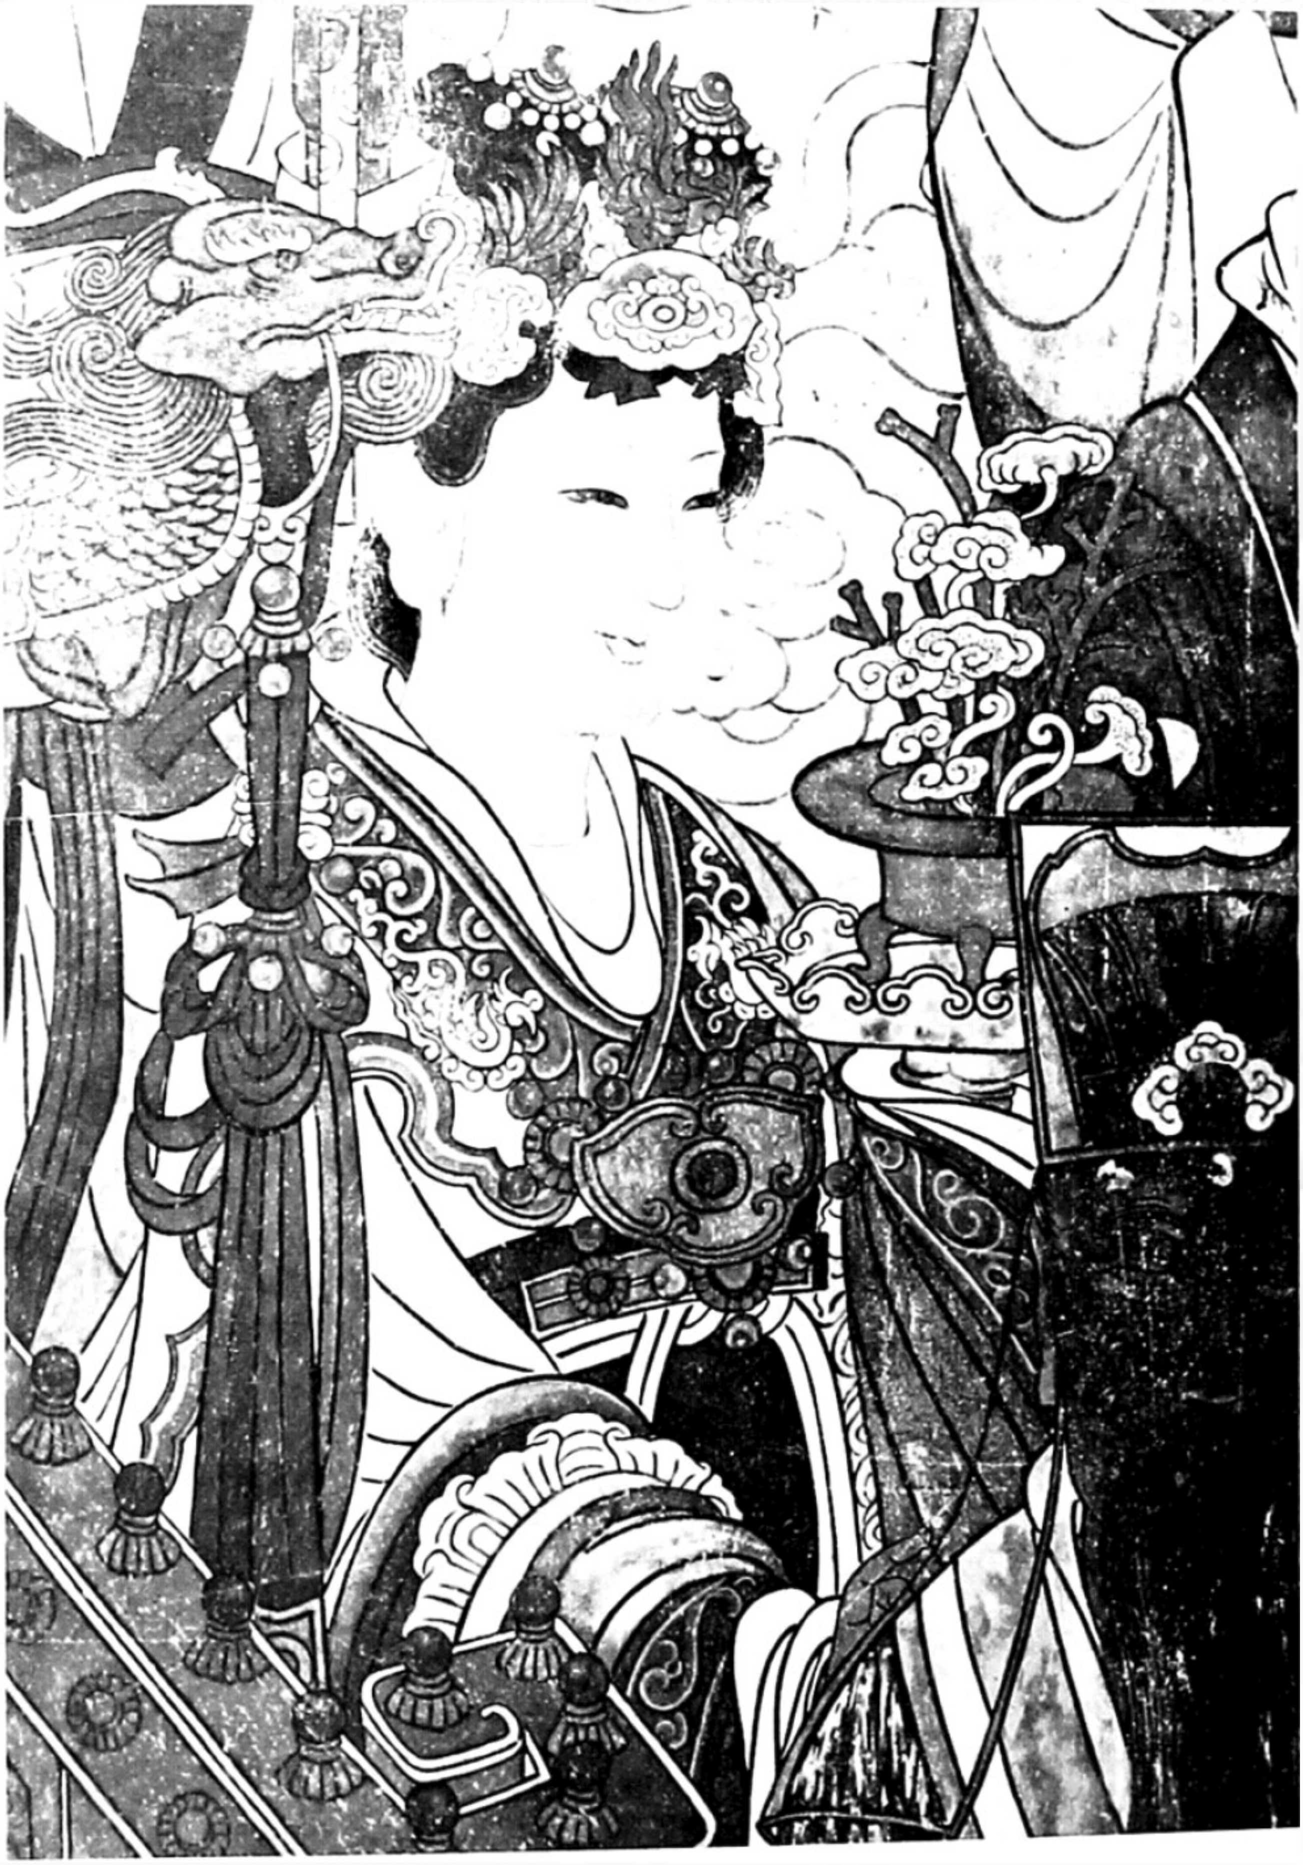

Plate XIX - Maid of Honour 女侍, attending the Heavenly Emperor. In her left hand she carries a vase with LING CHIH in two of its shapes, the normal one and the one that suggests deer's antlers or coral branches. Painted c. A. D. 1300.

If I failed to make good my case for the fly-agaric as Soma, the argument in this chapter has no base. If Soma was the fly-agaric, then I submit the probabilities favour Soma as the inspiration for the Chinese idea of a divine mushroom of immortality. That the idea lived on in Iran and India well into the first millennium of our era is certain: Firdousi, the *Mahābhārata*, the Purāṇas, Kālidāsa and the other poets - all testify to that. In these centuries the Chinese picked up the idea but only by hearsay. It will not have escaped the perceptive reader that when Wu-ti joined in a single verse the *ling* and the *chih*, and thus took a vital step in fathering on a certain fungus the vibrant name of the Marvelous Herb, he chose one that, in addition to other remarkable properties, was deep *red* in colour and that *shimmered like a satin of Byzance*. The strange convolutions of its pileus suggested to the Chinese mind the cumulus where the Immortals dwell, and thus in the course of time there came about an artistic convention by which, in the Yüan Dynasty and later, the painters made the clouds of the Celestial plane and the Herb of Immortality resemble each other to a point where, in extreme cases, it is hard to tell them apart.

We have advanced one step toward a United Field throughout Eurasia for a religious origin underlying the supernatural folklore that centres on an hallucinogenic mushroom. In *Part Three* we will carry this argument into northern Eurasia. But meanwhile we invite our readers to divert their attention to Dr. O'Flaherty's account of the post-Vedic history of the Soma question. The lesson that one must draw from her narrative about the futility of much scholarship is humbling.

PART TWO

THE POST-VEDIC HISTORY OF THE SOMA PLANT

by Wendy Doniger O'Flaherty

The history of the search for Soma is, properly, the history of Vedic studies in general, as the Soma sacrifice was the focal point of the Vedic religion. Indeed, if one accepts the point of view that the whole of Indian mystical practice from the *Upaniṣads* through the more mechanical methods of yoga is merely an attempt to recapture the vision granted by the Soma plant, then the nature of that vision - and of that plant - underlies the whole of Indian religion, and everything of a mystical nature within that religion is pertinent to the identity of the plant.

In place of such an all-inclusive study, the present essay attempts to summarize what has been written since Vedic times about the physical nature of the Soma plant and the substitutes for Soma. I have worked in the Bodleian Library and the Indian Institute at Oxford, the India Office in London, and the British Museum, and of necessity I have omitted the contributions of Indian scholars whose works are not available in those collections. Furthermore, I have dealt summarily with the Haoma of the Avesta, since the work done on the botanical identification of Haoma has been subsumed for the most part under the study of Soma.

I. The Brāhmaṇas and the &sacute;rauta-sūtras

After the era of the Vedas there came a period when the centre of intellectual activity moved from the valley of the Indus to the upper Ganges and the Yamunā. A spate of works, the direct outgrowth of the Vedas and preserving ancient traditions, many of them lengthy, arose as a kind of corpus of ritual textbooks. These are the *Brāhmaṇas*, prose works dating from about 800 B.C.

Súrā is generally believed to have been an alcoholic drink of some sort - wine or rice wine or fermented liquor or beer or even distilled spirits[56] - or else to refer to alcoholic drinks in general. The *Brāhmaṇas* say clearly that Soma was not *súrā*. The *&sacute;atapatha Brāhmaṇa* declares: 'Soma is truth, prosperity, light; and *súrā* untruth, misery, darkness.'[57]

The *Taittirīya Brāhmaṇa* says, 'Soma is male and *súrā* is female; the two make a pair.'[58] The sharp distinction made by the text seems to rule out the possibility that Soma was simply another kind of alcoholic drink, and it would seem probable that *súrā* embraced all the fermented drinks that rated mention in the ṚgVeda.

The *Brāhmaṇas* are much preoccupied with the question of substitutes for Soma. They are books of ritual composed for the sacerdotal caste, and in places they seem to be deliberately obscure. If the priests knew what Soma was, they never stated it clearly, and their references to the Soma plant are ultimately of little help in establishing its botanical identity. It may be assumed that Soma was none of the plants expressly suggested as substitutes for it, though of course it may have resembled any of them in some particular and probably did so. But it is difficult to draw any sure conception from these negative hints, for the substitutes often bear little resemblance to each other, including as they do grasses, flowers, creepers, and even trees.

The *&sacute;atapatha Brāhmaṇa* sets forth an order in which substitutes should be used. First comes the reddish-brown (*aruṇá*) *phālguna* plant, which may be used because it is similar to Soma (*sómasya nyañga*), but the bright red (*lóhita*) *phālguna* plant must not be used. If *phālguna* is unavailable, then the *&sacute;yenahṛta* plant may serve, for there is a tradition that Soma was once carried away by a falcon, and a stalk (*aṃ&sacute;ú*) fell from the sky and became the *&sacute;yenahṛta* plant. The third choice is the *ādāra* plant, which sprang from the liquor that flowed from the sacrificial animal when it was decapitated. Fourth comes the brown *dū́rvā* grass, which is similar to Soma, and last choice is yellow *kú&sacute;a* grass. This being least satisfactory, a cow must be given in atonement.[59]

---

[56] Monier-Williams' dictionary gives 'distilled liquor' as a primary meaning of *súrā*, but evidence is strong that the distilling process was not known in India until a much later era.

[57] *&sacute;atapatha Brāhmaṇa*, Chowkhamba edition, 5.1.2.10.

[58] *Taittirīya Brāhmaṇa*, Ānandā&sacute;rama edition, 1.3.3.2.

The *Tāṇḍya Brāhmaṇa* says that the *putīka* is the plant which grew from a leaf (or feather, *parṇa*) that fell when Soma was carried through the air, and that it is therefore a suitable substitute.[60] In his commentary on this work, Sāyaṇa says, 'If they cannot obtain the Soma whose characteristics are described in the sacred text, then they may use the species of creeper (*latā*) which is known as *putīka*; if they cannot find *putīka*, then they may use the dark grass (*&sacute;yāmalāni tṛṇāṇi*) known as *arjunāni*.'[61] Yet another ætiological myth is used to explain the substitution of the fruit of the *nyagrodha* (sacred fig or banyan tree): the gods once tilted over their Soma cups, and the *nyagrodha* tree grew from the spilt drops.[62] Elsewhere it is said that even when Soma is available, one should use the juice of the *nyagrodha* fruit for non-Brahmans to drink.[63] It is probable that this fruit, like the *dū́rvā* and *kú&sacute;a* grasses, was accepted as a substitute for Soma more by virtue of its own sacred nature than for any resemblance to the Soma plant.

Various other substitutes for Soma appear in the *Brāhmaṇas*: *syāmaka* (cultivated millet, said by the *&sacute;atapatha Brāhmaṇa* to be most like Soma of all the plants),[64] *muñja* grass (sacred in itself), *kattṛṇa* (a fragrant grass),[65] and *parṇa* (a sacred tree).[66] The European lexicographers - Wilson, Roth, Monier-Williams - struggle to identify all these plants in modern botanical terms but often arrive at conflicting conclusions, as do the *Brāhmaṇas* themselves. Certain pertinent facts emerge, however, from the Brāhmaṇic literature:

1. The colour red is consistently associated with the Soma substitute. Red is the colour of the *nyagrodha* flower; the colour of the *phālguna* plant;[67] the colour of the acceptable *dū́rvā* grass;[68] and even the colour of the cow used in the purchase of Soma.[69]
2. There is a clear distinction between the identity of Soma and the identity of the substitutes. For Soma one must look to the ṚgVeda; for the substitutes, the *Brāhmaṇas* are the earliest sources of importance, but they contain no passages about the authentic Soma of sure evidential value. They are concerned with the ritual and symbolic nature of the Soma plant, not with its botanical identity.

II. Later Sanskrit Works

The writers of the post-Brāhmaṇic period, Sanskrit lexicographers and Vedic commentators, continued to dwell upon a multiplicity of plants that served as Soma, but most of them agreed upon only one thing: that Soma was a creeper (*vallī* or *latā*). Yet nowhere in the ṚgVeda do these terms appear, Soma being there considered an herb (*óṣadhi*) or plant (*vīrúdh*). Amara Siṃha, the earliest of the Indian lexicographers (ca. A. D. 450) gives many synonyms for what he calls *somavallī*, all of which Monier-Williams has the courage to define as *Cocculus cordifolius*. Amara also describes a plant that he calls *somarājī*, which Monier-Williams says is *Vernonia anthelmintica*.[70] These are distinguished from *súrā*.[71] The later lexicographers generally imitate

71. *Ibid.*, 2.10.39. Amara gives as synonyms for *súrā* the terms *varuṇātmayā*, *halipriyā*, and *pari&sacute;rut*; the latter may refer to an intoxicating liquor made from herbs or to the Soma of the Vedas (ṚgVeda IX I^{6}, and *&sacute;atapatha Brāhmaṇa*

12.7.1.7).

Amara in their discussions of Soma: Medinī refers to an herb, the Soma creeper,[72] which Yāska had mentioned as an herb that caused exhilaration when pressed and mixed with water,[73] while Sāyaṇa, the most famous of the Vedic commentators, refers to it as the Soma creeper.[74] &Sacute;abarasvāmi, another great commentator, also refers to Soma as a creeper, but one that yields milky juice;[75] this was to be retained as an acceptable attribute of Soma from then on through the European discussions, and the belief in the milky sap appears in the Hindu medical works as well.[76]

One might expect the early medical treatises to be less fanciful than the *Brāhmaṇas*, but this is not the case. The *Dhanvantarīyanighaṇṭu*, a medical work of *ca*. A. D. 1400, says that the Soma creeper yields the Soma milk and is dear to Brahmans.[77] The *Rājanighaṇṭu* describes the properties of Soma: the *somavallī* has great clusters and is a bow-like creeper, yielding the Soma milk; the *somavallī* is acrid, pungent, cool, black, sweet, and it serves to dispel biliousness, to quench thirst, to cause wounds to dry up, and to purify.[78] A more detailed, but hardly more scientific, description appears in the *Su&sacute;rutasaṃhitā*, a medical text in verse, dating from perhaps the fourth century A.D., which reduces to its ultimate absurdity the passion for symmetry and classification that permeates these writings. It tells us that although there was originally created one kind of *somavallī*, it was then divided into twenty-four varieties: *aṃ&sacute;uman* Soma smells like ghee; *muñjara* Soma has leaves like those of garlic; *garuḍahṛta* (= *&sacute;yenahṛta*) and *&sacute;vetākṣa* ('white-eyes') are pale, look like cast-off snake-skins, and are found pendant from the boughs of trees; *etc*.[79] Unfortunately, the enumeration of these varieties proves of limited value for botanical identification: one reads that all of them have the same qualities, all are creepers with milky juice, all are used in the same way, and all have fifteen black leaves, which appear one per day during the waxing moon and drop off one per day during the waning moon.[80]

Folk medicine and medical science in India are known collectively as *Āyurveda* ('The Sacred Knowledge of Long Life'). There is a widely quoted Āyurvedic verse, found both in Dhūrtasvāmi's commentary on Āpastamba's *&sacute;rautasūtra* of the black Yajur Veda and in the *Bhāvaprakā&sacute;a*, that Max Müller cited in 1855 as the earliest 'scientific' description of Soma that he knew. It describes the plant as a black creeper, sour, leafless, yielding milk, having fleshy skin, causing or preventing phlegm, causing vomiting, and eaten by goats.[81] In spite of the admittedly late origin of this description, and in spite of the many equally authoritative descriptions in earlier Sanskrit works which contradict it, it served European scholars as a peg on which to hang their favourite theories. Its sharp detail and 'scientific' tone contrasted favourably with such descriptions as that of the *Su&sacute;ruta*, and it seemed to agree with the descriptions of Soma given to Westerners by Indians of that day.

73. Yāska's *Nighaṇṭu* and *Nirukta*, Laksman Sarup, ed., University of the Punjab, 1927; 11.2.2. and 5.17. *prīṇāti nacamanena* is given as the etymology for *nicumpana*.
74. Commentary on ṚgVeda III 48^{2}. Max Müller edition.
75. &sacute;abarasvāmi, commentary on the *Pūrva Mimāṃsa Sūtra*, Gaekwad edition, 2.2.17. Soma is called *latā kṣīriṇī*.
76. This ascription to Soma of a 'milky' quality was probably based upon the Vedic statements that Soma was mixed with milk, or that Soma itself became white when mixed with milk, or that the juice of Soma was 'milk' in the metaphorical sense of the supreme liquid, or the liquid pressed out of a swollen container; for it must be noted that nowhere in the Vedas is the raw Soma juice itself described as white or milky, but always as yellow or brown or red or golden.
77. *Dhanvantarīyanighaṇṭu*, Ānandā&sacute;rama Series No. 33, Poona, 1896; verse 4.4.
78. *Rājanighaṇṭu*, Ānandā&sacute;rama Series No. 33; verses 3.29-30. The pertinent terms are: *mahāgulm&#257 dhanurvallī*; *katu&sacute; &sacute;itā madhurā*; *pittadāhakṛt* (or alternate reading: *pittadāhanut*); *tṛsnāvi&sacute;oṣa&sacute;amanī* (alternate reading: *kṛṣṇā vi&sacute;oṣa&sacute;amanī*); and *pāvanī* (or *pācani*).
79. *Su&sacute;rutasaṃhitā*, Education Press, Calcutta, 1834, chapter 29. I have been unable to find the quotation in other editions of this work, but it is quoted in full in the *&sacute;abdakalpadruma* (Vol. V, p. 417), Calcutta, 1814, which attributes it to the *Su&sacute;ruta*. It will be noted that several of the *Su&sacute;ruta*'s 'varieties' of Soma refer to substitutes mentioned in the *Brāhmaṇas*.
80. This lunar connection is an extrapolation of the mythological association of Soma with the moon in the Vedas, and it accounts for the name 'moon-plant' given to Soma by the Bengalis of the last century. Yet Edward Balfour, in his *Cyclopædia of India*, published in London in 1885, maintained that the Soma plant itself derived its name from the Sanskrit word for moon, *soma*, because 'it was gathered by moonlight.'
81. Cited by F. Max Müller in 'Die Todtenbestattung bei den Brahmanen,' *Zeitschrift der Deutschen Morgenländischen Gesellschaft*, No. 39, 1855, pp. XLII ff. The text reads:

&sacute;yāmalā 'mlā ca niṣpatrā kṣīriṇī tvaci māṃsalā
&sacute;leṣmalā vamanī vallī somākhyā chāgabhojanam

III. Early European References

The earliest non-Indian notices of Soma are in the Avesta, where the plant appears as Haoma, but these references are more obscure than those of the ṚgVeda; the question of the 'authenticity' of the Soma cult of the Avesta will be discussed below as it arises in the course of European discussions. The earlier parts of the Avesta - the *Yašts* - refer to Haoma as being strained for the sacrifice,[82] as the only drink which is attended with piety rather than with anger,[83] as a tall, golden plant[84] with golden eyes.[85] The *Yasna* devotes three full hymns to Haoma (9-11), which it describes as growing in the mountains,[86] pressed twice a day,[87] odoriferous,[88] possessing many trunks, stems, and branches,[89] and yielding a yellow juice which is to be mixed with milk;[90] Haoma is golden and has a flexible stem.[91] The *Yasna* seems to distinguish between Haoma and other intoxicating beverages, of which it disapproves, but it has been suggested that Zoroaster hated the Haoma drinkers as well as drinkers in general.[92] Beyond this general description, and the evidence that the Soma cult was at least Indo-Iranian rather than simply Indian in its origin, the Avesta sheds little light on the Soma problem.

Megasthenes said of the Indians, 'They never drink wine except at sacrifices,' distinguishing this sacrificial wine from their ordinary liquor - probably *súrā* - which he describes as 'composed of rice instead of barley.'[93] McCrindle suggests that this 'wine was probably Soma juice,' and as the passage is certainly pre-Tantric it must in fact refer to Soma. Thus Megasthenes - misled no doubt by the similar rites among his own people - must be held responsible for the origination of a misconception that continues to plague Vedic studies to the present day. Plutarch speaks of a plant that the Iranians dedicated to a religious use:

> For pounding in a mortar an herb called ὅμωμι [*ómomi*] they invoke Hades and darkness; then having mingled it with the blood of a slaughtered wolf, they bear it forth into a sunless place and cast it away.[94]

Bernadakis conjectured that this ὅμωμι [*ómomi*] was the same as the μῶλυ [*móly*] of the *Odyssey* X 305, a fabulous herb probably cognate with the Sanskrit *mūla* (root); Orientalists of note, including Paul Anton de Lagarde,[95] have suggested that ὅμωμι [*ómomi*] was none other than the Haoma of the Iranians, the Soma of the Indians. In 1929 Emile Benveniste dismissed this notion:

> We must beware of correcting the text on this point, as the majority of editors have done following P. de Lagarde. The substitution of the plant μῶλυ [*móly*] for the enigmatic ὅμωμι [*ómomi*] is the device of harassed interpreters and is no better than the explanation of ὅμωμι [*ómomi*] by *hauma*; the first is arbitrary, and the second absurd ... ὅμωμι [*ómomi*] is another name of *amomum* which is used in the cult of Ahriman as *hauma* is sacred to the cult of Ohrmazd.[96]

[95] *Vide infra*, p. 108.

[96] Emile Benveniste: *The Persian Religion: According to the Chief Greek Texts*, 1929, p. 74. The *amomum* is thought to be the Indian spice plant, *Nepaul cardamom*. It is mentioned in Aristophanes' *The Frogs*, 110, and in Theophrastes' *Historia Plantarum*, 9.7.2, where it is said to come from India as cardamom comes from Persia.

In 1771 A. H. Anquetil-Duperron brought out the first translation of the Avesta, after having spent some years in India in association with the Parsis. For the Haoma plant, he observed, the Parsis used a tree (*arbre*) which, they said, grew in Persia but not in India and resembled a vine but never bore any fruit. Anquetil-Duperron thought the plant resembled a kind of heather (*bruyère*), with knots very close together and leaves like those of jasmine. 'All these details lead me to believe that the *Hom* is the ἄμωμος [*ámomos*] of the Greeks and the *amomum* of the Romans.'[97] As the Indo-Iranian connection was not yet established, nor the Soma cult itself discovered, this suggestion was not pursued.

Then in 1784 the first translation of a Sanskrit work into English appeared, Charles Wilkins's rendering of the *Bhagavad Gītā*. In it he included a note: '*Sōm* is the name of a creeper, the juice of which is commanded to be drunk at the conclusion of a sacrifice.[98] This is the earliest published citation of Soma in a European language that I have found. In his 1794 translation of the laws of Manu, Sir William Jones describes Soma as 'the moon plant (a species of mountain-rue).'[99] H. T. Colebrooke then published his translation of the *Amarako&sacute;a*, saying that the *somrāj* was *Vernonia anthelmintica* (= *Conyza anthelmintica*),[100] but cautioning his readers that commentators seldom describe the plants they mention and that 'a source of error remains in the inaccuracy of the Commentators themselves ... the correspondence of Sanscrit names with the generick and specifick names in Natural History is in many instances doubtful.'[101]

In 1814, William Carey published his *Hortus Bengalensis*, which was a summary of the manuscript that William Roxburgh was to publish in 1832. Carey identified *Sarcostemma brevistigma* (= *Asclepias acida*, *Sarcostemma acidum*, *Sarcostemma viminale*, *Cynanchium viminale*) as the plant known in Bengali and Sanskrit as *somalutā*, and also remarked that *Ruta graveolens*, a rue, bore the same Sanskrit name.[102] He did not link them with the Vedas, but he did take occasion to observe that Himalayan plants do not grow in Bengal,[103] an observation that was ignored by the Vedic scholars who later used Roxburgh's work to identify Soma.

In his 1819 *Sanskrit Dictionary*, Horace Hayman Wilson identified *soma* as 'the moon plant (*Asclepias acidum*) [= *Sarcostemma brevistigma*],' *somavallī* as 'a twining plant (*Menispermum glabrum*) [= *Tinospora cordifolia*],' or 'a medicinal plant (*Serratula anthelmintica*) [= *Vernonia anthelmintica*]'; in the 1832 edition of the dictionary, he added *somarājin*, which he defined as *Serratula anthelmintica*, though he still gave this as an alternative for *somavallī* as well.[104]

Sir Graves Chamney Haughton, in his 1825 edition of Jones's *Ordinances of Manu*, had corrected Jones's 'mountain rue' to 'swallow-wort (*Asclepias acidum*) [= *Sarcostemma brevistigma*],' probably following Carey. Finally, in 1832 William Roxburgh published his *Flora Indica*; he identified *Sarcostemma brevistigma* with *somalutā* in Sanskrit and Bengali, a plant (as he said) of much milky juice of a mild nature and acid taste. He added that 'native travellers often suck the tender shoots to allay their thirst.'[105] This is hardly the description of a plant that induces religious ecstasy, but Roxburgh identifies it with *sōm* mentioned by Wilkins as the sacrificial plant. He distinguishes it from *somrāj* (as Colebrooke had done in 1808), which is *Vernonia anthelmintica*, a plant with an acid taste,[106] and he further distinguishes *Calotropis gigantea* (= *Asclepias* appears in juxtaposition with *somavallī* in the *Amarako&sacute;a*.

gigantea) as the plant used by the natives for medical purposes.

From these beginnings down to our own time Soma has been identified with various species of Sarcostemma (= Asclepiads, related to the American milkweeds), of Ephedra, of Periploca, all of them leafless climbers superficially resembling each other, yet belonging to genera botanically far apart. Botanists in India would gather specimens, identify them with scientific names, and add the vernacular names that local helpers would give them, such as *somalutā*. Linguists and serious travellers would occasionally bring back plant names picked up in the various languages spoken from India to Iran that seemed to stem back to Soma or Haoma - *e.g.*, *hum*, *huma*, *yehma*; *um*, *uma*; *um*, *umbur*[107] - and, linking them to the plant to which they belonged, present to the world another candidate for Soma. Most of these plants were or had been at some time used as substitutes for Soma or Haoma: to be eligible, plants had to meet certain requirements, which may have changed from area to area and from century to century. R. G Wasson's Brahman informants said to him that the substitute 'Somas' had to be small, leafless, and with fleshy stems, attributes that are common in varying degrees to the three genera listed above and to the traditional descriptions in the *Brāhmaṇas* and medical texts.

IV. Mid-Nineteenth Century

For the next fifty years, Sanskritists and botanists alike merely elaborated upon Roxburgh's identification. Henry Piddington gives '*Sarcostemma viminale*' for the Bengali *soom* and *Asclepias acidum*' for *somalutā*,[108] but these two names are now considered to represent the same species: *Sarcostemma brevistigma*. John Stevenson, in his translation of the *Sāma Veda*, says that Soma is '*Sarcostemma viminale*,' 'the moon-plant' and describes in some detail the method of its use, observing that according to the commentator it is pressed and mixed with barley and allowed to stand for nine days, 'but how many days precede [the ceremony] and how many follow, I do not know ... the Soma, when properly prepared, is a powerful spirit...'[109]

Vedic studies had now begun to assume considerable importance in Europe. In 1844, Eugène Burnouf published the first of a series of articles on Haoma, wherein he said that the Haoma juice, obtained by trituration, was the same as the Soma of the Vedic sacrifice, but he did not venture a botanical identification.[110] In 1845, J. O. Voigt published his *Hortus Suburbanus Calcuttensis*, a catalogue of the plants in the H. E. I. C. Botanical garden. Once again *soma-rāj* is *Vernonia anthelmintica* and *shom-luta* is *Sarcostemma brevistigma*; Voigt also mentions that farmers use the *Sarcostemma brevistigma* to rid their fields of white ants.[111] He draws attention to the use of the Asclepiads in general as emetics and to their acrid and bitter milk, and points out that in the West Indies they are a popular remedy for worms in children, given in doses of a teaspoon to a tablespoon.[112]

Friedrich Windischmann thought that the Soma plant might be *Sarcostemma brevistigma*, but he doubted that the Indian Soma was the same as the Haoma of the Persians, as the plant might have changed with the change in location. Yet he considered that the Avesta preserved the tradition of Soma and the sacrifice better than the ṚgVeda did, and he called attention to the Persian belief (remarked long ago by Anquetil-Duperron) that Soma did not grow in India.[113] Christian Lassen added his assent that Soma was *Sarcostemma brevistigma*,[114] and William Dwight Whitney wrote that Soma was:

Three Substitutes for Soma

Fig. 3. Three substitutes for Soma.

---

115. William Dwight Whitney: 'On the main results of Vedic researches in Germany, '*Journal of the American Oriental Society*, No. 3, 1853, p. 299.

Otto Böhtlingk and Rudolph von Roth accepted only tentatively *Sarcostemma brevistigma* as Soma, and perspicaciously added that it seemed to grow farther south than the Vedas indicate.[116]

Friedrich Max Müller in 1855 published an important article in which he quoted Dhūrtasvāmi's description of Soma[117] and said that this seemed to agree most strikingly with the accepted botanical descriptions of various Sarcostemmas. But he doubted whether the Vedic Soma would be found growing in Bombay (where the Sarcostemmas are found) rather than in the mountains of the North. Moreover, he asked, why would the Indians of the era of the *Brāhmaṇas* use *putīka* as a substitute for Soma if they could find 'Soma' itself- *i.e.*, Sarcostemma spp. - right in Bombay?[118]

For thirty years no notice was taken of this Āyurvedic source, nor of Max Müller's doubts. Major Heber Drury accepted *Sarcostemma brevistigma* as *shom-luta*,[119] and Walter Elliot referred *somalatā* to the same species.[120] Martin Haug believed that the Persians had probably replaced the original Haoma with something else, retaining the name, and he thought that the present-day Soma of the Indians was in fact a substitute, but that the substitute retained in a measure the qualities of the true Vedic plant, with no leaves and a bitter white sap: 'It is a very nasty drink, but has some intoxicating effect,' he wrote, having tasted it several times but being unable to take more than a few teaspoonfuls.[121]

Sir George Christopher Birdwood, in his *Catalogue of the Vegetable Productions of the Presidency of Bombay, including a list of the drugs sold in the bazaars of Western India*, included *Sarcostemma brevistigma* under 'drugs', identifying it as the *somalutā* of the Vedas, a 'fermented liquor ... mixed with barley and ghee ... This wine was drunk at all their religious ceremonies and was used as an intoxicant by the rishis... Water passed through a bundle of *somalutā* and a bag of salt will extirpate white ants from a field watered with it.'[122] Birdwood identified *Sarcostemma brevistigma* with *S. acida* and expressed the view that 'the Som of the Vedas and the Hom of the Zend Avesta' were perhaps 'the real plant ... present to the mind of the writer ... of the first chapters of Genesis,'[123] - an original contribution to the debate, and one of the few that is not echoed by anyone. In this year, Eugène Burnouf published his Sanskrit dictionary, wherein he described Soma as the juice of *Sarcostemma brevistigma*; the following year, J. Forbes Watson described the Soma plant as *Sarcostemma brevistigma*; the *somalatā* (Telegu) as the same species; and the *somalutā* (Sanskrit) as *Ruta graveolens*.[124]

Paul Anton de Lagarde (Paul Anton Boetticher) maintained that ὅμωμι [*ómomi*] was another word for μῶλυ [*móly*] or πήγανον [*píganon*], the mountain rue, and that it was a substitute used by the Greeks when they no longer had the *hōm* itself, the original sacred plant.[125] Drawing attention to the *Odyssey* verse describing the μῶλυ [*móly*] as a plant with a black root and a flower white as milk,[126] and to the mythological significance of rue,[127] Lagarde maintained that the description of the *harmal* (= *haoma* = ὅμωμι [*ómomi*] = μῶλυ [*móly*]) given by Arabian botanists described the plant precisely: a shrub with leaves like those of a willow and flowers like those of jasmine, with an intoxicating and soporific effect.[128] He added that Soma and Haoma were not the same plant, though they had the same name and use, and he linked the Soma of the ṚgVeda to rue by means of

the Vedic epithet *sahásrapājas*, 'possessing a thousand *pājas*,' which he related to the Greek term for rue, πήγανον [*píganon*].[129]

But no matter how many botanists and scholars accepted the Sarcostemma thesis, there were always reservations held in some quarters. In 1871 John Garrett declared flatly that 'the Soma of the Vedas is no longer known in India'.[130] Nevertheless J. D. Hooker elaborated upon his earlier identification of Soma with *Sarcostemma brunonianum* by observing that this plant abounded in an acid milky juice and was 'hence eaten by the natives as salad, and sucked by travellers to allay thirst, thus forming a remarkable exception to the usually poisonous nature of the Asclepiadeous juices.'[131] Still there was room for new theories: Drury suggested that the 'moon creeper' might be *Calonyction muricatum* (*Ipomoea muricata*), a plant whose swollen pedicels are cooked as vegetables and whose seeds are used as purgatives.[132] Nevertheless, Hermann Grassmann, whose Vedic dictionary is the standard work to this day, accepted the general view that Soma was a Sarcostemma.[133]

In 1873 Rajendra Lala Mitra revived the case for Soma as an alcoholic beverage. The original Indo-Aryans drank 'soma-beer and strong spirits,' which, when they moved to the hot climate of India, tended to make them ill. 'The later Vedas, accordingly, proposed a compromise, and leaving the rites intact, prohibited the use of spirits for the gratification of the senses.'[134] Soma was 'made with the expressed juice of a creeper (*Asclepias acida* or *Sarcostemma viminale*) [both = *Sarcostemma brevistigma*] diluted with water, mixed with barley meal, clarified butter [ghee], and the meal of wild paddy [*nīvāra*], and fermented in a jar for nine days. ... The juice of the creeper is said to be of an acid taste, but I have not heard that it has any narcotic property.' Mitra was of the opinion that the starch of the two meals - barley and wild paddy - produced 'vinous fermentation' and that the Soma juice promoted fermentation and flavoured the brew while checking the acetous decomposition, in the manner of hops.[135] In this way Mitra seemed to cover every likelihood - except for the possibility that Soma was not alcoholic at all, but a plant containing a psychotropic drug. It should also be pointed out that Mitra speaks of 'soma-beer and *strong spirits*.' Presumably he used this latter term in its customary sense, meaning distilled alcohol. This is an anachronism.

In 1874 Arthur Coke Burnell called attention to the fact that there were different 'Somas' in different parts of India, the Hindus of the Coromandel coast using *Sarcostemma brevistigma* in their rites, and those of the Malabar coast using *Ceropegia decaisneana* or *C. elegans*.[136] In the following year, Martin Haug elaborated on his previous descriptions by describing the Soma plant as a small twining creeper with a row of leafless shoots containing sour, milky sap; he identified the plant as *Sarcostemma intermedium*, mentioning *S. brevistigma* and *S. brunonianum* as related varieties, and he expressed his opinion that the plants denoted at the present time by the terms *somalatā* and *somavallī* were later substitutes.[137]

In 1878 Friedrich Spiegel reported that the Indian Parsis sent their priests to Kerman to obtain Haoma.[138] This was the year that saw the publication of Abel Bergaigne's *La Religion Védique*; Bergaigne thought that Soma was a fermented drink and that milk was added to it to help the fermentation process. He calls it a spirituous liquor, the word spirituous (*une liqueur spiritueuse*) being applicable in a broad sense to any volatile inebriating drink.[139]

In 1879, Heinrich Zimmer acknowledged that present-day Hindus used a kind of Sarcostemma, citing Haug and adding that the nausea Haug had experienced was consistent with the *Brāhmaṇa* descriptions of Soma;

---

129. The term *sahásrapājas*, occurring only twice in the ṚgVeda (IX 13[3] and IX 42[3]), is generally translated as 'possessing a thousand forms,' or 'colours', or 'rays'.

but he expressed doubts whether this plant, found in Bombay and all over India, could have grown in the high site of Vedic civilization. He quoted various *Brāhmaṇa* references to substitutes to support his thesis that Sarcostemma was in fact just such a substitute, which had appeared in the course of time.[140]

In 1881 Mitra reiterated his beer theory,[141] and Kenneth Somerled Macdonald wrote, 'Soma is now admitted, we believe, by the best Sanskrit scholars to have been intoxicating. The numerous references in the ṚgVeda are consistent only with such an interpretation.'[142] He proceeded to repeat Mitra's theory in great detail, though he failed to give Mitra credit for it.

The early 1880's saw the most enthusiastic and intense period of the Soma debate. Scholarly tempers flared, new and important names began to appear, and ingenious theses were advanced. Rudolph von Roth began it with an article in which he reviewed all the recent theories about Soma as well as some of the *Brāhmaṇa* information; he concluded that although *Sarcostemma brevistigma* seemed to be well established as the present-day Soma plant, there was no assurance that this plant - which grew in the plains - was the Vedic plant, which must still grow in the mountains.[143] Though he believed that the Soma of the *Brāhmaṇas* was a substitute made necessarv when the Vedic people moved away from their original home, he felt that the true Soma was probably some species of Sarcostemma or at least an Asclepiad, and he felt that any information about the present-day Soma might shed light on the Vedic plant.

In the following year, Edward William West expressed the opinion that the plants used for Soma in India and Persia at the present time were substitutes for the original Haoma-Soma plant, and he observed that the most common substitute in South and West India was the *Sarcostemma brevistigma*, 'a leafless bush of green succulent branches, growing upwards, with flowers like those of an onion,' and resembling *Euphorbia tirucalli* or thornless milk-bush when not in flower.[144] In that same year Angelo de Gubernatis, quoting Roth, expressed doubt whether the Soma plant could be identified at that time; he suggested that perhaps the Soma cult had shifted to wine in Persia, Asia Minor, and Greece, and that in India in later times its place was taken by a beverage offered to the gods and deliberately made unpalatable so that no mortal would be tempted to drink it.[145]

In 1883 Monier-Williams brought out his *Religious Thought and Life in India*. He defined Soma as *Sarcostemma brevistigma*, 'a kind of creeper with succulent, leafless stem,' but he added, 'And yet it is remarkable that this sacred plant [the original, true Soma] has fallen into complete neglect in modern times. When I asked the Brahmans of North India to procure specimens of the true Soma for me, I was told that, in consequence of the present sinful condition of the world, the holy plant had ceased to grow on terrestrial soil, and was only to be found in heaven.' Nevertheless a creeper 'said to be the true Soma' had been pointed out to him by Burnell in South India, where it was being used by orthodox Brahmans.[146]

In 1884 D. N. Ovsianiko-Kulikovskij published a book of some 240 pages devoted entirely to Soma and containing a great deal of learned and imaginative material; unfortunately, since it was published in Russian and never translated, it was not noted by subsequent scholars writing in other European languages, though Ovsianiko-Kulikovskij was familiar with all of the significant literature in German, French, and English.[147] He maintained, on grounds of sound linguistic reasoning, that the word 'soma' applied first to the plant and later to the juice[148] and went on to discuss this plant:

148. *Ibid*., p. 7.

> At the same time, the terms Soma and Haoma did not cease to signify also the divinity, whose gift or attribute the intoxicating beverage was considered to be. As concerns this last, it is presently obtained in India from a plant of the family *Asclepias acida*. Whether it was obtained from the same plant in antiquity, or from another, or if from another, from which particular one - all of these are questions that of necessity must remain for the time being without an answer. The description of the flower and the liquid of Soma in the ṚgVeda is not applicable to *Asclepias acida* and the beverage obtained from it.[149]

Ovsianiko-Kulikovskij described the sacrament of collecting Soma as taking place at night, 'in the light of the moon,' observing: 'Perhaps this feature has some link with the later identification of Soma with the moon.'[150] He continued:

> It was mixed with water, sour milk, and barley corn. Then it underwent fermentation, after which a strong, intoxicating beverage was obtained. The description of this procedure is met in a number of places in the ninth Maṇḍala of the ṚgVeda, but always in a fragmentary and often obscure form.[151]

This was the more or less conventional view of Soma, but then Ovsianiko-Kulikovskij went on to express his doubts that Soma had been a product of fermentation at all, and to suggest - in cautious but clear terms - that Soma might have been some sort of narcotic. This is by far the earliest reference to such a possibility, and it is significant that it appears in the writings of a Russian, who may have known of the Siberian cults:

> It is possible that the narcotic power of Soma was greater than the similar power of other drinks used in the time of the Veda; possibly it was of an essentially different nature. The action of Soma is always depicted in the most many-hued colours, as something fascinating, elevating, illuminating; on the other hand the action of common drink (*súrā*) is painted in far from such attractive colours ... It is also quite possible that the superiority of Soma was entirely imaginary and rested solely on that religious sanction which fell to the portion of Soma (that is, not *Asclepias acida* or any other sort of Indian plant, but - Soma, as a religious and cultural psychological conception) as early as the most remote Indo-Iranian antiquity.[152]

Roth then brought out another paper, in which he emphasized his feeling that Soma must still exist.[153] But he acknowledged that Albert Regel, the botanist employed by the Russian government, who had searched for Soma at Roth's request in the Syr Darya and Amu Darya watersheds, had reported finding no trace of a plant meeting Soma's description. Regel had expressed his opinion that the closest thing to Soma that he had found had been rhubarb, though he admitted that rhubarb was not used by the natives to make any intoxicating drink. Roth had supplied him with Vedic descriptions of Soma, and from them it was clear that none of the Asclepiads, Euphorbias, Ferulas, yellow Compositæ, or *Cannabis sativa* (hemp) conformed to the formula. Wilkens, a zoologist specializing in South Turkestan, had reported to Roth that in his opinion Soma might be *Peganum harmala*,[154] belonging to the Rutaceæ, though it lacked the sweetness and juiciness that the true Soma was thought to have had. Nothing daunted, Roth ended up with a flourish: 'Usbekistani today may drink their kumiss in cups in which Soma once gave them cheer. ... To find the Soma one need not be a botanist: the plant will have to be recognized in all its juiciness [*Saftfūlle*] by every eye.'

V. File Number 118

Charles James Lyall, Secretary to the Chief Commissioner of Assam, translated Roth's papers and forwarded them, with his own remarks, to the Afghan Frontier Delimitation Commission. They in turn handed them over to the botanist George Watt, who published them with *his* added remarks, under the heading, 'A note upon Dr. Roth's suggestion regarding the Soma Plant', in a document issued as File No. 118 of the Government of India, Revenue and Agricultural Department, Simla, August 20, 1884.

Watt felt that Roth had produced no evidence that Soma was a species of Sarcostemma or any other Asclepiad; he considered it 'a great pity that Dr. Roth, instead of propounding his own theory at such length and in attempting to confute arguments against it, did not rather publish briefly the leading passages from Sanskrit literature descriptive of the plant ... placing in the hands of the naturalist to the Commission a brief abstract from the Sanskrit authors, and thus leave his mind unbiased by any theories.' Watt was of the opinion that Soma was not necessarily a succulent, juicy plant, but that it might be rather a dry branch used in a decoction, 'either by simple maceration or boiling.' He went on: 'Can any one who has examined the bitter milky sap of the Asclepiadæ ... suppose that such a liquid could ever be used for more than a medicinal purpose, and still less become the Soma of the Vedas? It is much more likely that the oblong fruits of the Afghan grape..., imported into the plains, as they are at the present day, afforded the sweet and refreshing cup of which our Aryan ancestors became drunk while wrapt in the oblivion of religious enthusiasm.'[155] He did not pursue this suggestion, however, and considered the Compositæ or Umbelliferæ more likely than the Asclepiads as candidates for Soma.

In reply to this, Max Müller wrote to the *Academy* journal on October 20, 1884, misquoting Haug ('it was extremely nasty and not at all exhilarating', where Haug had described the Soma he tasted as 'a very nasty drink, but [it] has some intoxicating effect'), referring to the *Brāhmaṇa* substitutes and the tradition that Soma 'was brought by barbarians from the North,' and finally getting to the point - that he, Friedrich Max Müller, had published thirty years earlier the 'oldest scientific description of the Soma plant' that he knew of or had hope of finding, the Dhūrtasvāmi description of the dark creeper eaten by goats.[156]

On November 9, Roth replied in the same journal to 'the learned scholar': 'I did not, indeed, remember the passage referred to; but if it had been in my mind I should scarcely have mentioned it...' He said it was impossible to date the '*Āyurveda*', that Max Müller's passage sounded like descriptions of 'the later, even the latest date, especially in the so-called *Nighaṇṭus*,' taking exception to the adjective *vamanī* by insisting that 'it is not to be supposed that the Soma, or its principal substitute in later times, should have caused vomiting,' and, as a parting blow, correcting Max Müller's translation of *&sacute;leṣmalā* from 'destroying phlegm' to 'producing phlegm.' He concluded that the plant described was merely the 'Soma of later times which we know (that is, the *Sarcostemma acida* [*brevistigma*]), correctly described as bearing no leaves.' He still believed that the 'genuine original Soma' would bear great resemblance to its later substitute, and answered Watt's 'decoction' theory thus: 'I am sorry not to be able to conform my views to those of the distinguished botanist. The Aryans no more drank a decoction of the Soma plant than they drank tea or coffee. It would be, indeed, a disgrace to the interpreters of the Veda and Avesta if Dr. Watt were right.' He ended with the arch hope that the botanists of the Commission 'will not bring us home, as Soma, the Asafœtida, which there obtrudes itself upon one's notice, or any other Ferula.'

Max Müller replied on November 17 in another letter to the *Academy*, defending his Āyurvedic passage as the oldest *scientific* description of the Soma, standing up for his translation of *&sacute;leṣmalā* as dissolving rather than producing phlegm, and keeping his original reading for *vamanī* rather than the *pāvanī* (purifying) suggested by Roth. He admitted that 'this oldest scientific description of the Soma plant' might refer to a later substitute, and concluded: 'As to the Soma which the Brahmans knew (ṚgVeda X 85^{3}), I shall welcome it whenever it is discovered, whether in the valley of the Oxus or in that of the Neckar.'

---

155. That the Aryans knew of such a fruit and of an alcoholic drink made from it is established by Pāṇini's reference to the sweet grape juice of Kāpi&sacute;ī, north of Kabul (Pāṇini 4-2-99).
156. *Vide supra*, pp. 100 and 107.

At this point the botanists entered the forum. J. G. Baker of the Kew Herbarium wrote to the *Academy* on November 15, noting that Dr. Aitchison had been selected as the botanist to attend the Afghan Delimitation Commission and supporting Max Müller's faith in the Sarcostemma, which, he pointed out, is eaten by men and animals throughout Sindh, Arabia, and Persia. He said that the flowers of the *Periploca aphylla* are eaten by the natives of Baluchistan 'and taste like raisins.' W. T. Thiselton-Dyer of the Royal Kew Gardens then supported Watt's suggestion of the Afghan grapes: 'That the primitive Soma was something not less detestable than anything that could be extracted from a Sarcostemma I find it hard to believe. When, however, the original Soma was unprocurable, and the use became purely ceremonial, the unpalatableness of the Soma substitute was immaterial.'[157] The Sarcostemma, according to Thiselton-Dyer, was chosen when the Soma plant was forgotten (or unavailable in the hot plains) because 'there is a faint resemblance in texture and appearance, though not in form, between the joint of a Sarcostemma and an unripe green grape,' the Vedic Indians having had no word to distinguish a fruit from the stem of a plant, Thiselton-Dyer maintained.[158]

Max Müller answered this, on December 8, with a reference to the Vedic tradition that Soma juice was mixed with barley milk, a process that, he suggested, was incompatible with the grape hypothesis but not with a kind of hops; he added that 'a venturesome etymologist might not shrink even from maintaining that hops and Soma are the same word,' deriving *hops* from Hungarian *komló*, mediæval Latin *humolo*, mediæval Greek χουμέλη [*chouméli*], and ultimately Sanskrit *soma*, 'which, for a foreign word, brought from Persia into Europe, is tolerably near ... Now hops mixed with barley would give some kind of beer. Whether milk would improve the mixture I am not brewer enough to know.'

Charles G. Leland then wrote to the *Academy* to support the hops hypothesis with information about the *soma* or *sumer* ('the pronunciation is not fixed') of the Romany tongue, apologizing that 'any confirmation of this, drawn from such a very disreputable source as gypsy, is, indeed, not worth much,' but pointing out that there was much Sanskrit in gypsy words and that *soma* in Romany meant 'scent or flavour ... thus the hop gives the *suma* or *soma* to the beer, as the lemon to punch.' He added that the fact that hops do not grow in the present dwelling place of the Hindus confirms rather than disproves Max Müller's theory, since if it were still available there the Indians would be using it instead of the present substitute. At this point (December 20), A. Houtum-Schindler wrote from Teheran with a tale of a Sarcostemma that he had been shown by the Parsis in Kerman, a plant with a greenish white juice and a sweetish taste that caused vomiting when taken in amounts of more than a dozen drops, and that corresponded closely with Max Müller's Āyurvedic description - *if* it was viewed only 'several days after it had been collected,' by which time the stalk would have turned dark, the juice turned sour, and the leaves fallen off. To this ingenious postulate he added several descriptions of the *Hum* plant from various Persian dictionaries, including one of a deadly poison the fruit of which is much liked by partridges and which resembles a tamarisk tree - 'the latter qualities evidently refer to another plant.' W. T. Thiselton-Dyer then identified still another plant used by the Parsis in their rites - the *Ephedra vulgaris* which, he said, bore sweet red berries and somewhat resembled *Tamarix articulata*, like the plant mentioned by Houtum-Schindler: 'But he [Houtum-Schindler] also says it is "a deadly poison" (though apparently not to partridges). This does not agree with Ephedra, which is browsed by goats.'

On this note the *Academy* correspondence ended, but the argument continued. On January 25, 1885, Watt published his 'Second Note on the Soma Plant,' in which he said that a Dr. Dymock of Bombay had sent him a Haoma plant which was *Periploca aphylla* and had told him he thought that the plant was not used to obtain liquor but that a small portion of it was added to a liquor obtained from grain; he added that, according to the Parsis, the Haoma never decayed. This strengthened Watt's opinion that Soma was not a succulent plant, certainly not a Sarcostemma, an opinion which was further encouraged by a letter he had received from Rajendra Lala Mitra, who had suggested that Soma might have been used like hops as an ingredient in the preparation of a kind of beer, and that the Vedic phrase 'Soma juice' was merely a figure of speech. 'The word "sweet,"' Mitra wrote, 'which has so much puzzled the learned Professor von Roth, may be safely, nay appropriately, used in a poem in praise of bitter beer.' Watt was therefore convinced that the Haoma plant was the Soma after all, that 'the dry and bitter twigs' had been used to flavour some other beverages, 'much in the

158. This is not true. *Phala*, 'fruit,' recurs in the ṚgVeda, referring to the fruit of a plant (not Soma) rather than to the stem. Cf. ṚgVeda III 45[4], IV 57[6], X 71[5]. X 97[15] and X 146[5].

same way as Acacia bark is used throughout India.' In passing, Watt rejected a suggestion he had received from Benjamin Lewis Rice that Soma might have been 'sugarcane or some species of sorghum'; he concluded that *Periploca aphylla* - the Haoma of Dr. Dymock - was after all the most likely Soma plant, and he quoted Baker's description of *Periploca aphylla* as having 'flowers fragrant, eaten by natives, taste like raisins.'

Surgeon General Edward Balfour, in the third edition of his *Cyclopædia of India*, maintained that the Soma of Vedic times was a 'distilled alcoholic fluid' made from the *Sarcostemma brevistigma* which flowers during the rains in the Deccan. In the same article he referred to the Soma juice as 'a fermented liquor' and 'this beer or wine'; he believed that this liquid was used at all religious festivals and by the rishis at their meals; and he attributed to Windischmann the suggestion that the Soma plant may have been the gogard tree.[159]

In 1885 Julius Eggeling published the second volume of his translation of the *&sacute;atapatha Brāhmaṇa*, wherein he observed that the exact identity of the Soma plant was 'still somewhat doubtful,' but that every probability seemed to favour the *Sarcostemma brevistigma* or some other plant of the same genus. In answer to Watt's suggestion that the opinions of all the 'Sanskrit authors' be assembled for the botanists to use, Eggeling wrote: 'One might as well ask a Hebrew scholar to give accurate descriptions of the "lily of the valley" to enable the botanist to identify and classify the lovely flower which delighted the heart of King Solomon. It is exactly the want of an accurate knowledge of the nature of the Soma plant which prevents Vedic scholars from being able to understand some of the few material allusions to it.'[160] Undaunted, Aitchison wrote a letter to the Daily News (13 March 1885) expressing his opinion that Soma was wine after all. He modified this, however, when he returned from Afghanistan and published *The Botany of the Afghan Delimitation Commission*, wherein he informed his readers that the natives of North Baluchistan call *Periploca aphylla*, *Ephedra pachyclada*, and another *Ephedra* '*Hum*, *Huma*, and *Yehma*.' He said that the natives eat the small red fruit of these plants, but he hesitated to identify any of them with the original Soma.[161] Finally, in 1888, Max Müller republished the *Academy* correspondence in his *Biographies of Words and the Home of the Aryans*[162] with additional notes by Thiselton-Dyer, who supported Max Müller by saying that Soma 'was certainly in later times a fermented drink made from grain, to which the Soma plant itself was only added as an ingredient.' Observing that, according to Roxburgh, the Sarcostemma was 'not necessarily nauseous,' he nevertheless rejected it as a possibility for the Primitive Soma, rejecting as well Houtum-Schindler's *Hum* (which he identified as *Periploca aphylla*) and his tamarisk-like plant (which he identified as *Periploca hydaspidis*, indistinguishable he said, from *Ephedra foliata* except when in flower). He concluded with a belief that the Sarcostemma was used, like hops, to flavour the 'more effective ingredients' of fermented grain, and that it was used *not* 'as a ceremonial reminiscence of the grape' but in the absence of the original Soma plant - the hop. George Watt concluded this episode with his article on Ephedra in the *Dictionary of the Economic Products of India*, where he rejected, among other hypotheses, his own former suggestion of the Afghan grape, though he could not resist noting that wild grapes are called '*Um*, *Umbur*' in Kashmir.[163] He mentioned that *Ephedra vulgaris* grew in the Himalayas, that *Ephedra pachyclada* and *E. foliata* were found in Garhal and Afghanistan, that *Periploca aphylla* was used sometimes in Bombay, but that the Parsis *huma* was usually an Ephedra. He said that *putīkas* (Basella spp.), when stripped of their leaves, would resemble Sarcostemmas; that *Vernonia anthelmintica* and *Pæderia fœtida* are known as *somaraj* in Hindustan; that Asclepiads are emetics and are eaten by goats; and that Sarcostemma is rare but Periploca plentiful in Central Asia. He rejected the Periploca, however, on the grounds that the Aryans would have recognized it in India and not have used the Sarcostemma in its place. And from all this he concluded that Soma refers to 'an early discovery of the art of fermentation' rather than to any plant in particular. All the sound and fury had proven nothing, after all.

VI. The Turn of the Century

Still the battle raged, if more quietly, over the same ground. Adalbert Kuhn said that Haoma and Soma were separate plants resembling each other in name and external appearance, the Soma of present-day India being *Sarcostemma brevistigma* (an identification that he chose to attribute to Roth), which was not however the original or at least the only plant from which Soma was taken.[164] John Firminger Duthie then added an odd piece of information that went unnoticed: The Marwara people call the spiked grass known as *Setaria glauca* Soma.[165] Darmesteter in his translation of the *Avesta* referred to Haoma as a yellow plant with very close-set knots[166] 'like the Indian Soma'.[167] Monier-Williams' Dictionary (1891) simply gave *Sarcostemma brevistigma* for Soma, and J. Börnmuller mentioned that he had met with a Parsi priest in Yezd carrying *huma*.[168] At once he recognized it as *Ephedra distachya*, and thus he had solved at last the problem mentioned to him first by Max Müller in Oxford. He added that the plant grew all over Central Asia and that large quantities of it were dried and sent from Persia to Bombay every year.

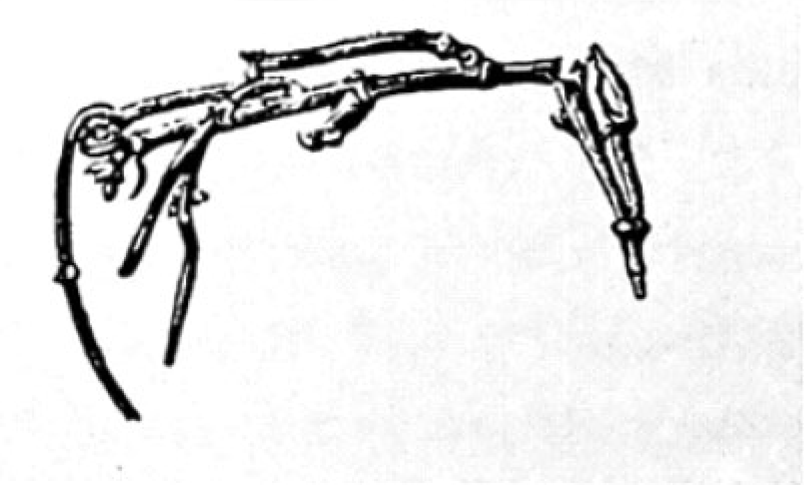

Fig. 4. 'Haoma' of the Persians. As pictured in James Darmesteter's translation of the Avesta, 1890-1892. Said to be life-size.

Alfred Hillebrandt then produced his extensive summary of the recent Soma theories and introduced his own famous theory that Soma was the moon throughout the ṚgVeda. He explained that contemporary Soma plants were probably not the same as the original, that substitutes had been used as soon as the Aryans left their homeland in the Sindh, and that the Vedas themselves were self-contradictory, since they had been compiled in various times and places.[169] He pointed out that Soma was not a blossoming plant and therefore could not be hops as Max Müller had suggested; that Soma had a red stalk and reddish brown sap; and that the epithet 'with hanging branches' (*naicā&sacute;ākhá*)[170] probably referred to the *nyagrodha* (*Ficus religiosa*) which was an important substitute. In fact, he concluded, even at the time of the ṚgVeda itself, various plants were already in use, and he cited Burnell's evidence that different Somas were used simultaneously in different parts of India.

Hermann Oldenberg devised a new theory, suggesting that the original Soma was itself a substitute, not for wine but for the Indo-European honey drink, mead or hydromel.[171] Of course it had long been recognized that

170. This word, however, occurs only once in the ṚgVeda (III 53^{14}) and its meaning is uncertain; Grassmann thinks that it may refer to the name of a sage.
171. Hermann Oldenberg: *Die Religion des Veda*, Berlin, 1894, pp. 366 ff.

the Sanskrit *mádhu*, the Greek μεθυ [*methy*], and English *mead* were cognate, and that *mádhu* was applied to Soma in the ṚgVeda (whence all the trouble over the bitterness of Sarcostemma), but *mádhu* was a general term applied to milk and rain as well as to Soma, and the simple identification of Soma with *mádhu* had still left open the botanical identification of Soma as a plant whose sap was known as honey. Oldenberg, however, avoided this difficulty by postulating mead as a forerunner and Soma as a later substitute: this distracted attention from the Soma plant itself (since it was no longer to be regarded as the *original*, the *Ur*-plant, that everyone sought) but it did not, of course, add anything at all to what was known about the Indian Soma.

This theory was to become well known and widely accepted, but it had little immediate impact. Edmund Hardy maintained that Soma was neither any form of honey nor *súrā* but most probably *Sarcostemma brevistigma* after all.[172] Vedic scholars generally clung to the Asclepiad hypothesis[173] or they hazarded even less: P. Regnaud called Soma 'une liqueur enivrante,' and cautioned against taking the Vedic texts literally when they spoke metaphorically.[174] Rustomjee Naserwanyil Khory covered some *very* old ground by considering a *Brāhmaṇa* substitute to be the original Soma;[175] he identified Soma (*somavallī* in Sanskrit, *amṛtavallī* in Bengali) as a climbing shrub called *Tinospora cordifolia*, the extract of which (called *gurjo*, *gilo*, etc.) is used as an aphrodisiac, a cure for gonorrhea, and a treatment for urinary diseases. Christian Bartholomæ in his famous *Altiranisches Wörterbuch* (1904) described Haoma as a plant used in medicine, for magic, and as an alcoholic drink, but he refrained from identifying the plant. W.W. Wilson thought Soma was the σιλφιον [*silfion*] (Latin *laserpitium*) mentioned in a fragment of Alcman as a plant that has wonderful properties, grows on mountains, is golden, and is plucked by birds.[176] He supported this argument with complex Indo-European linguistics but was cautious enough to note: 'It is not improbable that even at the time of the Vedas, use was made of more than one kind of plant. W. Caland and Victor Henry considered the question of the identification of Soma insoluble.[177] Henry maintained that the Indo-Aryans had imported Soma ever since they entered the area of Northwest India, and that the present-day Soma of India did not correspond to the Vedic descriptions of its taste or characteristics.[178] Still the old definitions persisted: K. L. Bhishagratna in his 1907 edition of the *Su&sacute;ruta* defined *somalatā* as *Sarcostemma brevistigma* and *somarājī* as *Vernonia anthelmintica*. Maurice Bloomfield referred to Soma merely as 'an intoxicating drink ... regarded as the tipple of the gods,'[179] and A. A. Macdonell and A. B. Keith concluded that the ṚgVeda descriptions were 'inadequate to identify the plant... It is very probable that the plant cannot now be identified.'[180] Then Hermann Brunnhofer came forward to defend Lagarde's 'mountain rue' (originally Sir William Jones's theory, though Lagarde did not say so and probably did not know of Jones's opinion). Brunnhofer maintained that Lagarde had already solved the Soma question forty years previously, 'though the Vedists still ignore him.'[181] He elaborated upon Lagarde's theory by mentioning Pliny's description of a plant known as ἀμβροσία [*ámvrosía*] possessing characteristics that suggested a kind of rue to Brunnhofer.[182] He then called attention to the ṚgVedic verse (IV 3^{9c}), perhaps an oblique reference to Soma, that speaks of a black cow giving white milk; Brunnhofer considered this a perfect description of the μῶλυ [*móly*], a dark plant with white milk.

In 1911 Carl Hartwich published *Die menschlichen Genussmittel*, in which he discussed various forms of tobacco, alcohol, and drugs.[183] He included 'Soma - Haoma' in his study, but was uneasy about its status as a drug or stimulant ('*Genussmittel*'); having described various accepted botanical 'Somas' (*Sarcostemma*

brevistigma, *Periploca aphylla*, *Basella cordifolia*, *etc*.), he went on to say: 'Although all of these have been tested - though not altogether thoroughly - none of them is known to have stimulating or sedative or other characteristics which could mark it as a drug or stimulant.' He therefore considered it possible that they might have been used as supplements, perhaps as spices, to the other known ingredients of the Soma drink (meal, milk, and whey) in which alcohol might have been produced.[184] The possibility that Soma might have been some other plant which *did* have 'stimulating or sedative characteristics' does not seem to have occurred to him, though he granted that the Persians used for their Haoma a different plant (*Ephedra vulgaris*) containing a drug (ephedrine) which caused dilation of the pupil.[185] One of the plants that Hartwich gave as an alleged Soma was *Vitex negundo*, whose bitter leaves and root were used against fever. Since the plant was originally native to tropical America, Hartwich dismissed it as a possible Soma, but observed in conclusion that in India it was known as *Indrahasta* and *Indrasurā* ('the hand of Indra' and 'the wine of Indra').[186] It may be that this association with Indra - together with Indra's fondness for Soma (to which Hartwich refers) - recommended the *Vitex negundo* to Hartwich, for he gives no Sanskrit names for any of the other plants he mentions. Yet in this context it is surprising that he did not mention *Indrā&sacute;ana* ('the food of Indra')[187] which was a common name for hemp, *Cannabis sativa*, the leaves of which were dried and chewed, supplying just the *Genussmittel* that Hartwich seemed to seek.

[185] *Ibid.*, p. 808.
[186] *Indrasurā* (also known as *Indrasurasa* and *Indrasurisa*) is mentioned in the *Amarako&sacute;a*, the *Su&sacute;ruta Saṃhitā*, and the *&sacute;abdakalpadruma*, but is nowhere associated with Soma.
[187] *lndrā&sacute;ana* as a name for hemp (perhaps by confusion with *Indra-&sacute;aṇa*, which woud mean the hemp of Indra) is mentioned in the *&sacute;abdamālā* (quoted in the *&sacute;abdakalpadruma*) and appears in its prākrit form - *Indrāsana* - in *Dhūrtasamāgama* 90.8.

Keith reassembled the old evidence but still considered the Soma problem insoluble,[188] and L. H. Mills produced an odd throwback in which he insisted that Haoma and Soma grew independently from the same original, and that 'nothing humorous, let us remember, attached to the idea of [alcoholic] stimulus at first in those early days'.[189] The *Oxford History of India*[190] merely observed that the Parsis say that Soma is Asclepias, and E. W. Hopkins concurred but questioned whether this was the plant referred to in the Vedas, the Avesta, and Plutarch, suggesting that the names might have been retained when substitutes for the plant were used.[191] Chapman Cohen stated without reference or explanation his belief that the Soma drink 'is prepared from the flower of the lotus,' an idea that was bound to occur to someone sooner or later, in view of the *Odyssey* tradition of the lotus-eaters and the sanctity of the lotus in India, but which seems to have attracted no supporters after this.[192] E. B. Havell then suggested that Soma was *Eleusine coracana* or *rāgi*, the common millet, an idea that he supported on the basis of Vedic characteristics (shaped like udders, tawny, growing in the mountains) and the *&sacute;atapatha Brāhmaṇa* reference to *dŭrvā* and *ku&sacute;a* as substitutes, both of which resemble *rāgi*, 'the common millet still used in the Eastern Himalayas for making the intoxicating drink called *Marua*.'[193] He mentioned that the Brahmans, while preparing Soma, 'sang a song which reminds one of a good old Aryan sailors' chantey, with a refrain, "Flow, Indu, flow for Indra".'[194] Havell admitted that, 'whether fermentation took place before or after it was so used is a point which is not very clear,' but he was clear on its history: *rāgi* had been the Aryans' principal food and drink until they moved to the Ganges Valley and switched to rice, 'and, perhaps under the influence of Buddhism, gradually gave up intoxicating liquors, or "went dry".' Then they used substitutes for the *rāgi-Soma*, forgot its name and retained contact with it only as the food of the lowest caste, the &sacute;ūdras. Havell said that *Marua* when kept too long is nauseating and evil-smelling, in keeping with certain descriptions of Soma, but when fresh 'it is an exhilarating drink that easily intoxicates the uninitiated.' He then administered the coup-de-grâce: the Indo-European myth of the bringing of Soma from heaven by an eagle is explained by the simple fact that birds lined their nests with *rāgi*. One would hardly think that this argument merited rebuttal, but it did in fact stimulate an answer that was to become the last significant theory of Soma: Mukherjee's theory that Soma was hemp, *Cannabis sativa* (= *Cannabis indica*), known to the initiate as *bhang* (the Hindi term derived from Sanskrit *bhañgá*, m., or *bhañgā*, f.), ganja, hashish, marijuana, or pot.

VII. Mukherjee and the *Bhang* Theory

Braja Lai Mukherjee[195] picked unlikely grounds on which to challenge Havell's flimsy theory, which he said was based upon considerations 'which may be supplemented by others of a more important character,' *e.g.*, that there was no reference to cows' udders in the ṚgVeda.[196] He then supplied an elaborate 25-point argument to show that Soma was in fact not *Eleusine coracana* but *bhang*: *&sacute;atapatha Brāhmaṇa* 5.1.1.12 says that Soma is *u&sacute;ānā*;[197] Soma was 'originally amongst the Kirāṭas,' a mountain tribe; amongst the Kirāṭas, *u* and *a* were articular prefixes; therefore *u&sacute;ānā* = *&sacute;aṇa*; *&sacute;aṇa* is hemp; the Tanguts call hemp by the name *dschoma*; hemp = Greek *kanna* [sic] = Sanskrit *&sacute;aṇa*; the Tibetan word for hemp is *somaratsa*; the preparation of Soma is similar to that of *bhang*; the deity Mahādeva (&sacute;iva) is a lover of *bhang*; *bhang* is used by the modern representatives of the Vedic people in the celebration of worship of the goddess Durgā, which is a Soma sacrifice.[198] The final link in the argument is this: '*Bhang* is sacred to Hindus by tradition.' In sum, 'May we not conclude that the weight of evidence is in favour of the identification of Soma with *Cannabis* (*bhang*)?' This strange argument, combining linguistic reasoning with the purest twaddle, was further developed by Mukherjee in his book, *The*

Soma Plant,[199] which was reviewed in a brief paragraph by L. D. Barnett, who said blandly that Mukherjee made out a good but not always convincing case for hemp as Soma.[200]

Sir Charles Eliot expressed 'considerable doubt that Soma could be identified. He said it was a plant with 'yellow juice of a strong smell, fiery taste, and intoxicating properties,' and that the Parsis of Yezd and Kerman used Asclepiads.[201] N. B. Pavgee rebutted Havell without proposing any alternative, using the argument merely as a foil for his own hypothesis - that Soma was indigenous to the Saptasindhu region (*i.e.*, India proper) and was not 'brought in' by 'Aryans.' The Indo-Aryans were autochthonous in India, he wrote, and 'had not immigrated'; the Iranian Soma is, of course, spurious, but kept the old name. Soma could not be any kind of liquor, for liquor is an evil, while Soma - the true Soma - was 'exhilarating yet slightly intoxicating' and 'gave moral elevation'. Pavgee does not explain how this was done, nor does he identify the Soma plant.[202]

In 1922 Jakob Wilhelm Hauer published a work that lent a kind of peripheral support to the *bhang* theory, for he referred to the Soma cult as the most highly developed form of the use of narcotics to induce ecstasy, calling particular attention to the late Vedic hymn (X 136) that describes a long-haired sage who drinks poison with Rudra.[203] Hauer believed that Soma was the most important toxic means of inducing ecstasy, but not the only such means, and he suggested that the Vedic references might be traces of a primitive ecstatic practice of hallucination caused by certain plants.[204] Whether these 'plants' were Sarcostemmas, Afghan grapes, or hemp, Hauer neglects to say, but his final remark is more suggestive of a hallucinogenic plant than of anything else: opium is no longer used in a religious context, but every time we light up a good cigar we experience a faint reflection of the splendour of the rapture of the primeval ecstatic.[205] Though this ancient Yogic cult is clearly non-Vedic, presumably pre-Vedic, Hauer does not say whether he believes the Soma plant to have been the same as the drug of the 'primeval ecstatic', or perhaps a substitute for it. Yet his remarks are provocative in the context of the search for a hallucinogenic Soma plant.

VIII. Later Researches in the 20th Century

In 1924, Gilbert Slater advanced a novel hypothesis: that *amṛta* (Soma) was Egyptian beer, a fermentation of date juice or palmyra palm or coconut palm, brought to India from Mesopotamia.[206] This theory was noted but not accepted. Georges Dumézil maintained that Soma was native to India, and that it was the Indian substitute for the Indo-European 'sacred barley beer' rather than for the Indo-European mead that Oldenberg had postulated.[207] The beer was replaced by wine in Greece and by Soma in India, and the one word for this beer, or for a beverage with a cereal base which must have preceded it, was the sacred ritual name: ambrosia, the Greek ἀμβροσία [*ámvrosía*] and the Sanskrit *amṛta*, the elixir of immortality. Barley itself must have been Indo-European, as the linguistic evidence indicates: Greek χριθή [*chrithí*], Latin *hordeum*, Armenian *gari*, and various Celtic words for beer, *e.g.*, *cervesia* (Gallic) and *cuirm* (Irish). As for the sacred position of barley in India, Dumézil referred to the tradition that barley (*yava*) had stayed with the gods when all the other plants had left them, thus enabling the gods to conquer their enemies.[208] The *Mahābhārata* relates that the gods once churned the ocean in order to obtain the *amṛta*, but a terrible poison emerged and would have destroyed them all had &sacute;iva not swallowed it and saved them; in the light of Dumézil's theory that the *amṛta* is barley beer, this myth is an expression of excessive fermentation that must be arrested.[209]

Louis Lewin's *Phantastica: Narcotic and Stimulating Drugs* included Soma in the chapter on alcohol rather than narcotics, mentioning *Periploca aphylla*, *Sarcostemma brevistigma*, *Setaria glauca*, and *Ephedra vulgaris* as plants that had been identified with Soma, but he added: 'None of these plants is able to give rise to such effects as have been attributed to Soma. ... I regard Soma as a very strong alcoholic beverage obtained by fermentation of a plant.'[210] Elsewhere he suggested that the yogis might have used some sort of narcotic such as Indian hemp or scopolamine, but he did not identify this practice with the cult of Soma.[211]

The Sarcostemma theory returned yet again, this time in a paper by L. L. Uhl, who maintained that Sarcostemma, and not Ephedra, was the original Soma, saying that he had found *Sarcostemma brevistigma* frequently at latitude 15° in South India, where it is called Soma and is used in sacrifices.[212] Arthur Berriedale Keith expressed the view that the Soma problem, though insoluble, had led to 'interesting investigations, but to no sure result, and the only thing certain is that the plant, which has been used in modern India as the Soma plant, is one which would not be considered by modern tastes as at all pleasant in the form of pressed juice mixed with water.'[213] Then, somewhat echoing de Gubernatis' reasoning, Keith went on to say that although one can't be sure what was pleasant to a Vedic Indian, nevertheless it is likely that 'the drink was originally a pleasant one; in the course of time the long distance from which the shoots had to be brought may easily have made it less attractive, as it certainly encouraged the use of various substitutes described in the ritual text books.' Keith agreed with Hauer's suggestion that ṚgVeda X 136 might be a reference to the use 'of some poison to produce exhilaration or hypnosis,'[214]relating this to a verse about hemp (*&sacute;aṇa*) in the *Atharvaveda*,[215] but not to Soma. Elsewhere he observed that the Avesta does not call Haoma mead, and suggested that mead was the Indo-European drink and that Soma was identified with it when Soma was discovered, in India, and found to produce 'a juice pleasant to drink or at least intoxicating.'[216]

In 1926 G. Jouveau-Dubreuil wrote an article suggesting that Soma was none other than a species of Asclepias after all.[217] He had discovered that the Nambudri Brahmans (on the Malabar coast, in Kerala) of Taliparamba, who practiced 'pure Vedic ceremonies,' sent to a Raja in Kollangod at the foot of the high mountains to obtain their Soma plant, a leafless, milky, green creeper that was an Asclepiad. *Plus ça change* ... Yet neither the Sarcostemma theory nor the theory that Sarcostemma was merely a substitute was incompatible with the beer theory of Max Müller and Mitra (for the beer could be made with the Sarcostemma or the plant for which it was a substitute), nor were these or the wine theory incompatible with Oldenberg's mead theory (for the mead could have been replaced by any of the above in India), and so the theories continued to live side by side. Otto Schrader and A. Nehring maintained that the Indo-European honey was replaced by the Soma plant - still called *mádhu* - in Aryan times, while wine and beer were later substituted for it throughout Europe.[218] P. V. Kane was unconvinced by any of the theories, but mentioned that in the Deccan a plant called *rānsera* was used as a substitute for Soma.[219]

In 1931 Sir Aurel Stein published a paper entitled, 'On the Ephedra, the Hum Plant, and the Soma,'[220] describing a cemetery in Central Asia filled with packets of Ephedra twigs. Recalling the evidence for Ephedra as Haoma and Soma and quoting Wellcome's *Excerpta Therapeutica* for evidence that the Chinese use an Ephedra called *Ma-huang* to get an alkaloid drug (ephedrine), he then followed this with the assertion that Ephedra could *not* have been the original Soma, for it was bitter and Soma sweet, and Ephedra was not

mountainous. He then concluded: 'The only result of these inquiries has been to direct my attention more closely to ... the wild rhubarb,' which grows in the mountains, has a fleshy stalk, and can be made into rhubarb wine, though Stein admits that the Indians do not do so.[221] Granting that the Vedic descriptions of the Soma plant could apply to Asclepias or rhubarb - or to anything else, for that matter - Stein nevertheless maintained that the descriptions of the Soma *juice* best applied to rhubarb. He added that the juice might be mixed with milk to facilitate fermentation, 'which alone could endow a juice like that obtained from the rhubarb with the exhilarating and exciting effect so clearly indicated in the Vedic hymns.'[222]

Perhaps the strangest episode in the history of Soma research came in 1933, with a truly Twentieth Century theory of Soma. Dr. Paul Lindner of Berlin published an article entitled, 'The Secret of Soma'.[223] He referred to a statement by E. Hubers that Soma was merely a decoction of barley or millet, into which the juice of the Soma plant had been added as a catalyst for fermentation (*Gärungserreger*), though it was unclear what kind of fermentation took place.[224] Lindner's own studies of the micro-organisms of the Agave in Mexico, particularly of *Thermobacterium mobile*, had brought him to the conclusion that yeast played only a secondary role in the fermentation, after the fermentation-bacteria had prepared the field. He went on to say that *Thermobacterium mobile* can produce alcohol in grapes and in cane sugar, and concluded that since the 'purity of fermentation' took precedence over the material fermented, even *Sarcostemma brevistigma*, *Calotropis gigantea*, or *Ephedra distachya*, which had been considered as 'the holy Soma plant,' might have yielded the juice 'which was enjoyed by young and old.' Lindner was convinced that *Thermobacterium mobile* was the most important fermenting agent of the tropics, and that the songs of praise to Soma really must have been 'dedicated to this *Bacterium*.' He suggested that the tropical explorers try '*TM*' in the juice of the Indian butter tree, *Bassia latifolia*, or the Ceylonese cowtree, *Gymnema lactiferum*, which have milky saps, the former sweet, the latter bitter. When Lindner himself had tried a spoonful of *TM* it had resulted in 'undiminished feeling of well-being and almost odourless excrement.'[225] Dr. Leo Kaps had treated patients in the Wilheminenspital in Vienna with *TM* beer and obtained extraordinary results, and a Swedish firm and a Viennese brewery were about to produce a *TM* beer with small alcoholic content. I have found no evidence that Soma-TM-beer was in fact manufactured nor any further reference to the Lindner theory after this initial publication.

An original and, in retrospect, provocative contribution to the argument was made in 1936 by Philippe de Félice.[226] He was unable to identify Soma but he described the plant in terms that seem remarkably up-to-date: he would probably have called Soma an 'hallucinogen', had the word existed. He deduced from the record that *Sarcostemma brevistigma* and similar plants had served to replace Soma toward the end of the Vedic period, when the Indo-Iranians in emigration were forced to use new drugs in place of Soma. Alcoholic drinks such as *súrā*, he thought, might also have come to be used. Then he continues:

> Instead of indulging in suppositions that no document supports, ought we not rather to ask ourselves whether, to arrive at the drink that plunged them into ecstasy, the ancient Indo-Iranians did not have recourse, like so many other primitive peoples, to some plant whose toxic properties they had discovered? This is what the examination of the texts seems to make clear. The liquor about which they speak is always drawn from a plant. This plant grows on the mountains which, as time passes, seem to become more and more distant, more and more inaccessible.[227] What serves to produce the mystical potion is neither the leaves nor the fruit, but always the stems. The juice is either red or clear yellow. It must be filtered or decanted, to eliminate certain elements that are disturbing or that perhaps risk rendering it too toxic.

227. The Indo-Aryans, spreading out east and south from the Indus Valley, were finding themselves increasingly remote from the Hindu Kush and the Himalayas. W.D.O'F.

> Sometimes it has a bad taste or even smacks of carrion; thus it is certainly not for pleasure that one drinks it. The inebriation that it provokes can present grave dangers: the spirit wanders, the drink can lead even to madness. It happens sometimes that the inebriation is accompanied by organic disturbances, which are in reality symptoms of an acute intoxication.
>
> Men know and fear the baleful effects of the drug, and, though he was a god, Indra himself did not escape them, since one day the Soma came forth from every opening in his body. This emeto-cathartic effect is confirmed in an old book of Hindu medicine. ...
>
> One may conclude from all this, it seems to us, that from the most remote antiquity the Indo-Iranians, when they were still dwelling together in their original home, possessed a special beverage reserved exclusively for the ceremonies of their religion and drawn from a toxic plant. The information that we possess about this plant unfortunately does not permit us to determine the species; but it is enough for us to classify it as among the toxic plants the use of which is widespread, for reasons of a mystical nature, in all parts of the world.

De Félice's reference to the emeto-cathartic effect of Soma is to the epithet *vamanī* in the Āyurvedic description and to the *Brāhmaṇa* story in which Soma injured Indra and flowed from his mouth and 'all the openings of his vital airs, and from his urinary tract'.[228]

Meanwhile the more conventional line of Vedic studies continued. L. van Itallie published an article in Dutch investigating the *Sarcostemma acidum* stalks in the light of the Soma plant; he described acids and alkaloids, carbohydrates and phytosterins, tannic acids and glycosides, but drew no new conclusions.[229] Johannes Hertel pointed out that there were many different kinds of Soma which scientific botany was unable to distinguish.[230] Henrik Nyberg referred to Soma-Haoma as an intoxicating drink made from a plant no longer identifiable, but he contributed obliquely to the *bhang* theory with his suggestion that Zoroaster was a shaman who drugged himself with hemp.[231] Nyberg himself, however, distinguished clearly between Haoma and hemp as plants, explaining Zoroaster's aversion to Haoma in the light of the belief that Haoma-drinking induced a state of intoxication (*Rausch*) rather than ecstasy.[232] Joges Candra Roy then developed Mukherjee's *bhang* hypothesis, adding to the original argument the facts that Soma is actually called *bhang* in the ṚgVeda;[233] that Soma is called a creeper nowhere in the ṚgVeda, but rather an herb (*óṣadhi*), a term which could apply to *bhang*; and finally that the Soma sacrifice 'was a feast and the drink added hilarity; *bhang* has been in use on similar occasions.'[234] Delli Roman Regni repeated the argument that Soma was not a fermented liquor but rather a

231. Henrik Samnel Nyberg: *Die Religionen des Alten Irans*, Leipzig, 1938, pp. 177, 190, 290 and 341. He cites several Avestan references to hemp, among them *Yašt* 13.124, *Vendidad* 15.14. *Vendidad* 19.20, *Yasna* 44.20, and *Vendidad* 19.41. W. B. Henning rebutted this argument in his *Zoroaster: Politician or Witch-Doctor?*, Oxford, 1951; he considered Nyberg's theory one to be rejected 'without further consideration ... if one reflects on the effects of hemp, the physical, mental and moral deterioration it brings,' and he maintained that the Avestan citations, 'if correctly interpreted, can at the most serve to show that they cultivated hemp, possibly for the purpose for which hemp is cultivated all the world over - *i.e.*, to obtain its fibre.'
232. Nyberg, *op. cit.*, p. 288.
233. ṚgVeda IX 61[13]. *Bhañgá* here seems to be an epithet meaning 'intoxicating' (from *Bhañj*, to break, *i.e.*, to disrupt the senses), but the reading occurs only once and is uncertain. Macdonell suggests that the word *bhañgá* first applied to Soma, meaning

'intoxicating,' and then 'came to designate hemp' (*Vedic Index*, Volume II, p. 93). Otto Schrader suggests that *bhang* 'was originally prized for the intoxicating effects of its decoctions' (*Prehistoric Antiquities of the Aryan Peoples*, translated from the German and published in London, 1890, p. 299), but after the one questionable Vedic occurrence, *bhañga* appears in classical Sanskrit several times only to designate the plant, with no reference to any narcotic effects. The 8th century A. D. *&sacute;ārñgadhara Saṃhitā* (Bombay 1888; 1.4.19) is the first extant source that considers *bhañgā* a drug; it likens it to'the saliva of a snake,' *i.e.*, opium (*phenaṃ cāhisamudbhavam*) and the commentator adds that the effect is like that of inebriating liquor (*madyaviṣayavat*). The *Bhāvaprakā&sacute;a* (Chowkhamba edition, 1.1) refers to *bhañgā* (*mātulāni*) as intoxicating and causing hallucination (*moha*) and slow speech (*mandavāk*); and the *Dhanvantarīya-nighaṇṭu* describes *bhañgā* as intoxicating, bitter, stimulating talk, inducing sleep, and producing hallucinations.

[234] Joges Candra Roy: 'The Soma Plant,' *Indian Historical Quarterly*, No. 15, June 1939, pp. 197-207.

non-alcoholic 'syrup-like thing,'[235] and C. Kunham Raja maintained that, according to both the Vedas and the Avesta, Soma produced happiness (*máda*) while *súrā* produced evil intoxication (*durmáda*) and that Soma was a creeper with leaves, no longer available. Soma, he reasoned, had not time to ferment and if it had been an alcoholic drink the Indians would have substituted for it another alcoholic drink when it became unavailable, instead of the known non-alcoholic substitutes that they in fact used.[236] Yet the wine hypothesis - dead and killed again so often - reappeared in Ernst Herzfeld's *Zoroaster and his World*,[237] where he remarked that in 1931 he had received a letter from a New York gentleman who believed that a plant growing only in Persepolis - the *Salvia persepolitana* - was the Haoma, but that nothing had ever come of this communication. Herzfeld maintained that Soma must be a fermentation from grapes; that *aṃ&sacute;ú* means 'shoot, tendril, or bunch of grapes; that the god Homa is the Aryan Dionysos; and that 'to thus define *homa* means to explain how wine [cultivated all over Iran before the advent of the Aryans and after] could remain unknown to the Avesta, and how the cultivation of *homa* [common in the Avesta] could disappear in Iran long before the Arab conquest. The solution is evident: *homa* is vine, wine.'[238] He adds that Haoma could not possibly be *bhang* because 'the use of hashish in Zoroaster's time is an imagination. The mysterious *homa* is wine, a reality ... Nothing is known of the use of hemp as a narcotic prior to the Arsacid period.'[239]

Still R. N. Chopra held to the Sarcostemma theory,[240] mentioning also the possibility of *Periploca aphylla*;[241] earlier, Chopra had also done extensive work with the Ephedras.[242] Karl Geldner in his translation of the ṚgVeda maintained that Soma could only be a species of Ephedra, probably *Ephedra intermedia* or *E. pachyclada*, the fruit of which is red and eaten by children and the stem of which is dried and taken in water as a treatment for fever.[243] Though he himself admitted that the juice was described as red, he nevertheless reiterated the old tradition that the 'milk' of the plant must be white, citing as support for this the verses that he had translated as Soma juice *mixed* with milk (IX 91$^{2\text{-}3}$ - '*nicht ganz klar*') or Soma delighting us with the 'milk' (*i.e.*, the expressed fluid) of the stem (IX 107^{12}).

Chinnaswami Sastri published, in 1953, an article demonstrating that Soma was not wine, reviewing the *Brāhmaṇa* substitutes, and concluding that the Soma juice was neither an intoxicant nor a stimulant.[244] The

[239] The first certain European reference to the use of hemp as a drug in India is in García d'Orta's record of a conversation with the Sultan Badar in Goa in 1563. The Sultan confessed that whenever in the night he had a desire to visit Portugal and Turkey and Arabia, 'all he had to do was to eat a little *bangue*...' In 1676 Henrich van Rheede (van Draakenstein), the governor of Malabar, published his *Hortus Indicus Malabaricus* in Amsterdam (written in Latin and Dutch), in which he called attention to a plant named *bangi* that was smoked like tobacco and caused inebriation (Vol. 10, p. 67). George Everhard Rumph in 1755 described at length, in Latin, the effect of the *Cannabis sativa* (also known as *ginji*) upon the natives, likening the plant to the Homeric νηπενθές [*nipenthés*]... For the inhabitants of these regions, not content with the natural virtue of wine, which, however, they do not possess in great quantity, or with the other types of wine tree of that place, on the ground that in their opinion it elates one for a short time only, have devised from this plant such things as are able at a moment to remove anxieties of the heart, grief, or fear of dangers; yet this cannot be, except by a violent commotion of the senses and clouding of the intellect, which they themselves call drunkenness but we call inanity, which is usually followed by mania or a stupid condition.' (Rumphius, *Herbarium Amboinense*, Amsterdam, 1755; volume 5, p. 208). By 1868 *bhang* was so well known that Lord Neaves honored it with this bit of doggerel:

The hemp - with which we used to hang
Our prison pets, yon felon gang -
In Eastern climes produces Bang,

Esteemed a drug divine.

orthodoxy of Sri Chinnaswami's position may be indicated by the fact that his article is written in Sanskrit. Reinhold F. G. Müller pointed out the references to Soma in the Hindu medical books and concluded that fermented drinks, *súrā*, and brandy could have been used as substitutes, but he remarked that evidence of the process of distillation in India before Islam had not been proven.[245] Mircea Eliade expresses the view that ritual intoxication by means of hemp, opium, and other plant drugs is characteristic of a decadent period of shamanism, and that such means were only reluctantly admitted into the sphere of classical Yoga. He remarks, however, upon Patañjali's reference to herbs as a source of meditative powers and on the ṚgVedic description of the sage drinking poison.[246] He points to the use of opium and hashish in ecstatic and orgiastic sects in India, but he does not comment on Soma's possible status as such a drug, nor indeed upon the nature of the ecstasy induced by Soma, though he treats of the Vedas - and of ecstasy - at great length.[247]

A. L. Basham says that Soma is not what the Parsis now call Haoma (for the latter has no inebriating qualities), nor is it alcoholic (for it was consumed on the same day that it was pressed), and he goes on: 'The effects of Soma, with "vivid hallucinations" and the sense of expanding to enormous dimensions, are rather like those attributed to such drugs as hashish. Soma may well have been hemp... from which modern Indians produce a narcotic drink called *bhang*.'[248] Several Indian works were then published which investigated certain previously ignored plants as possible Soma plants: Nadkarni and Nadkarni identified the 'moon-creeper' with *Pæderia fœtida* , a plant used for the treatment of rheumatism;[249] P. V. Sharma called *Crimun latifolium*, a plant whose leaves and roots are emetic and purgative, the *som-vel*.[250]

V. G. Rahurkar arose to combat the alcohol theory, insisting that the Vedic references to *ṛjīṣá* and *tiróahnya*[251] show that Soma did not have time to ferment; he supported Oldenberg's mead hypothesis and concluded: 'Soma juice, thus, seems to be an orgiastic ... non-alcoholic syrup-like ... enervating drink. It was not even a fermented liquor.'[252] B. H. Kapadia says that Soma's 'fruit' is red and fleshy and liked by children;[253] that it seems to have been a creeper (he cites *atasá* and *vána*);[254] and that it is an inflexible bush with dense, upright, leafless stalks. Still, Pentii Aalto states that Soma fermented for one to nine days; 'the alcohol percentage cannot have been high. Perhaps the juice of the plant contained narcotic ingredients.'[255]

The possible nature of these 'narcotic ingredients' was the subject of an article by Karl Hummel, who gave Vedic citations to establish that the Soma plant must be mountainous, yielding copious sap, and golden red in color.[256] Noting the opinions of Regel and Sir Aurel Stein, Hummel maintained that rhubarb best satisfied the requirements, for rhubarb is known to grow in the mountains of inner Asia, to yield a copious green-gold sap which turns reddish brown after standing for a while, and, of course, to be bright red, or, in some species, golden. Moreover, rhubarb is known to contain the drug Emodin; the problem of the supposed sweetness of the Soma juice, a quality absent from rhubarb juice, is easily solved by the assumption that the Indo-Aryans mixed Soma with honey, as well as with barley and milk. And as for intoxicating properties, also absent from the rhubarb juice, Hummel maintained that these were sufficiently supplied by the mere *sight* of the glorious

red stalks in the eyes of 'the naive people.' A more conventional source of intoxication - *i.e.*, fermentation - was cited by N. A. Qazilbash to support his choice for Soma - *Ephedra pachyclada*.[257] Qazilbash maintained that the absence of latex in the Ephedra did not disqualify' it, for only the later Sanskrit writers, and never the ṚgVeda, attributed the presence of latex to the Soma plant. *Ephedra pachyclada* grows abundantly all along the Hindu Kush and Suleman ranges and yields a number of alkaloids, including L-ephedrine, Ephedra, and Pseudo-ephedrine, which act similarly to the hormone adrenalin and are used (in the form of crushed green twigs of *Ephedra pachyclada*) in Khyber and parts of Afghanistan as aphrodisiacs; it was Qazilbash's belief that at the time of the ṚgVeda the Ephedra plant was allowed to ferment, yielding a liquor that contained alcohol and ephedra alkaloids; 'the liquor, therefore, was intoxicating and possessed invigorating and stimulating effects ... [and] ... aphrodisiacal effects.'[258]

G. M. Patil remarks upon Soma's unparalleled intoxicating and invigorating nature. 'This intoxicant made [the Vedic people] talkative and inspired them to fight. It made them forget their mental and physical agonies, and therefore, it was a wonderful herb...'[259] Jan Gonda reiterated the hydromel theory,[260] and Alain Daniélou at first supported the theory of Soma as the creeper *Sarcostemma brevistigma*,[261] but later he seems to have amended his views in favor of Indian hemp ('*le chanvre Indien*') as the plant from which the ancient Soma drink was made.[262] Yet the growing dissatisfaction with conventional theories of Soma and increasing familiarity with drug-induced religious experiences have led many modern scholars to venture onto new territory; Leopold Fischer suggests that the state of mind evinced by the Soma texts 'comes much closer to alkaloid drug experiences than to alcoholic intoxication.'[263]

It is ironic that one of the earliest Vedic beliefs about Soma - that it was brought by a bird[264] - appears as a scientific criterion in two of the most recent studies of the Soma plant. Varro E. Tyler discards *Periploca aphylla* as a possibility because it 'occurs only at low altitudes in the mountains, contains a gummy latex not utilizable as a beverage, and lacks fleshy fruits attractive to birds ... [Soma's] fruits are eaten by birds which disperse the seeds in the mountains, thereby propagating the plant.'[265] He also discards the Ephedra theory because 'it is very difficult to express much juice from these xeromorphic plants,' though he adds that *Ephedra pachyclada* when boiled in milk is used as an aphrodisiac and that 'the ash of the plant is mixed with tobacco to produce an intoxicating mixture which is applied to the gums.' Bringing similar objections against the rhubarb plant, he concludes: 'Either the ancient hymns of the *Rigveda* and the *Avesta* are gross exaggerations of fact or there grows in the vast mountain ranges of north-west India a plant whose CNS-stimulating properties, so well-known to the old inhabitants, still remain hidden from modern man.'[266]

A far more thorough article was published in the same year by J. G. Srivastava, but he too held fast to the importance of the agency of the bird, and to another long-disputed criterion: the ṚgVedic verse that some have misinterpreted as attributing to the Soma plant a thousand boughs.[267] He supports the latter implication with a verse from the *Rājanighaṇṭu* which according to him describes the climber as having 'several stems from the root-stock',[268] and with a verse from the *Su&sacute;ruta Saṃhitā* which gives the Soma plant 'a tuberous root'.[269]

---

[251] *ṛjīṣá* (which occurs only once, ṚgVeda I 32[6]) is thought by some to refer to the part of the Soma stalk left over after the juice has been expressed; Grassmann takes it to mean 'rushing forward freely', and, as it applies to Indra rather than Soma, this is more likely, *tiróahnya*, 'having lasted through yesterday', is an adjective applied to Soma.

266. *Ibid*., p. 285.
267. ṚgVeda IX 5^{10}. *Sahásraval&sacute;am*, the adjective in question, modifies *vánaspátim*, which refers to the tree of sacrifice, not to the Soma plant.
268. J. G. Srivastava, 'The Soma Plant,' *Quarterly Journal of Crude Drug Research*, No. 6 (1966), I, p. 811. This seems to be a translation of the phrase cited above and translated as 'having great clusters' (*vide supra*, p. 99).
269. Srivastava does not give the Sanskrit for this particular phrase but it may be a translation of *aṃ&sacute;uman* (*vide supra*, p. 99).

Granting however that the ṚgVeda itself never attributes to the plant the qualities of a climber or milky latex, Srivastava goes on to mention several other plants with which the Soma has been identified, including the *Centella asiatica*, *Cocculus hirsutus* (used as a laxative and a cure for venereal diseases), *Fraxinus floribundus*, *Psoralea corylifolia* (used to cure leprosy), *Cæsalpinia crista*, and *Thespesia lampas* - most of these cited by the *Āyurvedic Kosh*. He disqualifies the genus Sarcostemma and the *Periploca aphylla* because birds do not disperse their fruits; he disqualifies *Vitis vinifera* because it does not have the 'twigs and stalks' that 'the *Rig-veda* clearly states' to have been used; and finally he settles back upon the Ephedra, whose 'seeds are covered by red, succulent, edible bracts, and are dispersed by birds,' and whose medical properties - which he describes at length - are commensurate with the fame of the Soma plant.[270]

Most recently an article by J. P. Kooger appeared to summarize briefly the major Soma theories, including Wasson's *Amanita muscaria* thesis, based on the note presented by Wasson in 1966 at the Peabody Museum of Natural History at Yale University. Referring to Wasson's theory as 'sensational' (*opzienbarende*) and likely to deal a great blow to extant theories, he nevertheless concluded that the mystery surrounding the identity of the Soma plant was by no means solved.[271]

Some years ago, R. C. Zaehner revived the rhubarb suggestion by referring to Haoma in these rather qualified terms: 'The Haoma plant (from its description as yellow and glowing probably something very like our rhubarb, which is found in the Iranian mountains to this day)...'[272] More recently, he mentioned to me the possibility that Haoma might be the wild chicory, which grows in the mountains of Persia, though he considers this suggestion merely a shot in the dark. But in actual fact, what else have all the other theories been but just that? Some ingenious, some thoughtful, some obviously silly, some plausible, some vague, some stubbornly wrong-headed, some Procrustean, some groping toward the truth - but all shots in the dark.

Not knowing what plant the poets of the ṚgVeda had in mind, modern scholars have often jumped to the conclusion that the hymns are vague and obscure in speaking of Soma. The *Brāhmaṇas*, dealing as they do with involved chains of substitutes, add to the confusion in almost geometric progression; the few Avestan parallels are rendered more or less useless by the overlay of purely Iranian elements; and by the time the Europeans enter the scene, with their fixed ideas and various axes to grind, the situation approaches bedlam. Handicapped by a rudimentary knowledge of the vernacular and ancient languages of India and by inadequate communication in the academic world, scholars covered the same ground over and over again. Time and time again the same ideas appear, are disproved, and reappear as if they were proven theories; scholars draw upon the work of their colleagues and occasionally upon newly discovered primary materials, but there is remarkably little attention to the ṚgVeda itself. (Hillebrandt, Roth, and Geldner are notable exceptions.) Even within these limits, there seems to have been little contact between botanists and Vedists, Indian scholars and Europeans.

Fairly convincing evidence that Soma was not an alcoholic beverage was established quite early, yet Europeans continued to identify it with various forms of alcohol, and Indians continued to put pen to paper in order to assure the world that wine - which is of course anathema to an orthodox Hindu - was not Soma. The word for intoxication is ambiguous both in Sanskrit (*máda*) and in European languages; it denotes drunkenness or inebriation resulting from alcohol, but it may also apply to a mental state *similar* to that produced by alcohol. Thus the statement that Soma was 'intoxicating' as it appears in various discussions and in the ṚgVeda itself does not really exclude *any* plant capable of producing a state of exhilaration, including narcotic or psychotropic plants. The further vagueness of such terms as 'liquor' and 'strong spirits' blurred the distinction between fermentation and distillation, as does the uncertain connotation of the term *súrā*. All of this served to mask the inappropriateness of the identification of Soma with alcohol.

Often scholars tended to confuse the question of the identity of the plant with the nature of the process by which the drink was made from it, overlooking the fact that the beer theory, the mead theory, and the Sarcostemma theory are complementary rather than opposed, while only such theories as those postulating wine or *bhang* exclude all others. And, on the other hand, this failure to distinguish substance from method led several scholars to attempt a combination of various theories that are in fact incompatible.

It was difficult to resist the temptation to identify the Vedic plant with the plant actually used by the descendants of the authors of the Vedas, no matter how many facts argued against this identification; and in fact one is inclined to believe that there must be *some* relationship between the original and the substitutes, some quality in the substitute which resembled a quality of Soma enough for it to have been chosen in the absence of Soma, but the question remains as to which quality - taste or colour or effect or shape - this might conceivably be.

B. H. Kapadia remarked, 'Many Latin names are given for this plant like Ephedra, *etc*., but we do not know exactly about it,' and this could surely stand as the epitaph for the greater part of the research done in those halcyon days of science - the nineteenth century, particularly the nineteenth century in Germany - when one still felt that by giving a categorizing Latin name to an unknown quantity one had somehow settled something. To argue whether Soma was *Sarcostemma brevistigma*, or *Ephedra pachyclada*, or *Periploca aphylla* was to assure oneself that the Soma plant had been found and that there only remained a few messy details to be cleared up; this led to smugness and a general disinclination to delve further that might not have existed had one been forced to call the plant 'milkweed' or 'some sort of rue'. It is at first striking that *bhang* was not considered as a possibility until 1921, but it is more understandable when one takes into consideration the greater attention that the psycho-physiological effects of drug-taking have received in recent times, especially in contrast with the universal disapprobation with which they were formerly associated.[273] Only in the last few generations have the anthropologists, botanists, and pharmacologists of the West entered fully into the problems presented by psychotropic plants and their role in the history of human cultures. The use of hashish in the Middle East has, of course, long been known, but until twenty years ago only as a curiosity. The discovery of mescaline by the modern world is almost a century old, and for some years has provoked widespread attention.

Aldous Huxley, one of the leading writers on this subject in recent times, gave the name 'Soma' to an unspecified marvellous drug in his novel *Brave New World*, in 1932. In his last novel, *Island* (1962), he depicted a Utopia that is clearly Indian throughout - Sanskrit is the language of the cult, &sacute;iva is worshipped, and Yoga is essential to the philosophy of the islanders. And the drug upon which the cult of the Island is based is an hallucinogenic mushroom. That the mushroom is yellow and traditionally collected high in the mountains might suggest that Huxley had *Amanita muscaria* in mind - even that he was thinking of the Soma of the ṚgVeda, although he says expressly that the 'moksha-medicine' (as it is called) is *not* one of 'those lovely red toadstools that gnomes used to sit on.'[274] Later in 'Culture and the Individual'[275] Huxley, discussing the genesis of *Island*, says that he had been thinking of 'a substance akin to psilocybin', the active agent in the divine mushrooms of Mexico. The Wassons played a major part in the re-discovery of the Mexican psilocybin cult and Wasson himself had discussed his Mexican mushrooms and the Soma problem with Huxley in the late 1950's.

Certainly as soon as one rids oneself of the assumption that anything 'intoxicating' must be alcoholic, an hallucinogen of some kind seems the likely candidate for Soma, far more likely than millet or Afghan grapes or rhubarb or any other of the many plants that have been suggested. Few Vedic scholars knew any botany and some of them may not have realized that they were dealing with a problem primarily botanical. The botanists on the other hand could not read the ṚgVeda, by far the most important source about Soma, and so they

permitted themselves to enter upon speculations that often seem ludicrous in the light of the Vedic hymns. But on behalf of both Vedists and botanists it is only fair to recall that for the most part the Soma question had for them merely a peripheral interest. Though the identification of Soma remained a desideratum of Indian studies, no outstanding figure applied himself directly and fully to the solution of this enigma. The historians of religion seem likewise to have given it only glancing attention.

PART THREE

NORTHERN EURASIA AND THE FLY-AGARIC

I. The Fly-agaric in Siberia: the Testimony of Explorers, Travelers, and Anthropologists

In the Exhibits we have assembled all the basic sources that we could find on the use of the fly-agaric for inebriating purposes in Siberia. They include a miscellany of travelers (a few of them Innocents Abroad), explorers and scientists on governmental mission, and anthropologists; also some linguists who discuss a fascinating word cluster that relates to our theme. We have added three secondary sources for particular reasons.

The earliest of our authors **[**1**]** is a poor Polish lad, not endowed with much education, who kept a diary of his stay in Siberia as a prisoner of the Tsar. An entry in that diary records the fact that in 1658 he saw the Ob-Ugrian Ostyaks getting drunk on the fly-agaric. Our latest paper is by two Soviet scientists **[**42**]** living in Vladivostok who in the fall of 1966 contributed an epitaph to the ancient practice:

> The minor nationalities of Siberia and the Far East now do not use any psychoactive drugs. ... After the October Socialist Revolution and the establishment of Soviet Power these not numerous peoples have embarked on a new way of historical development. Formerly backward nationalities on a borderland of Russia, with the help of the Russian people and Soviet Power, they soon reached the socialist phase of social development.

The Soviet Union has never allowed foreigners to visit these 'minor nationalities'.

The testimony of our writers is of course worth only as much as the writers are worth. A few of them - notably the English-speaking contingent **[**14, 15, 20**]** and the one Frenchman **[**7**]** - lack understanding. They are superficial and disdainful, and most of their information seems to come from local Russian informants of dubious reliability, or from earlier writers whom we have also quoted, or else read and discarded as worthless. (*Vide*, *e.g.*, Kennan **[**14**]** citing Oliver Goldsmith, who in turn paraphrased von Strahlenberg **[**3**]**.) The ignorance about mushrooms of these writers in English and French seems to have been complete. We reprint what they had to say because they are often quoted as sources but they are worthless.

When Erman **[**11**]** informs us that Toyon's wife transplanted a number of baby fly-agarics from the forest to her garden where he saw them some days later flourishing in their big scarlet caps, the mycologist raises his eyebrows. When he says that a native pays a reindeer for one fly-agaric in the off-season, we accept this, as other witnesses testify to the high value placed on the marvelous plant by those who used it.

Some of the Siberian tribesmen live in filth and indulge in practices that shock and revolt those Europeans whose sense of scientific detachment is not phenomenally developed. If in addition the observer is a mycophobe, taught from childhood to turn away with a shudder from a 'toadstool', his impulses will surely overpower his objectivity. Europeans have long held the fly-agaric to be lethal. The testimony of our writers on this will certainly be found surprising. Many of them and among the most trustworthy expressly acquit the fly-agaric of causing death; in fact, they testify that, properly dried, it has no bad effects. When a few of the writers mention deaths from the fly-agaric each of those deaths should be weighed carefully. Is there a single witness (some of whom spent not months but years and even a decade among the natives) who saw a man die from fly-agaric eating, or who was present in a settlement at the time of such a death? I think not. Does the reported death come from a native informant or from a fellow European, probably a mycophobe? If the latter, is it only hearsay in the foreign community, perhaps the very same death that was reported by Krasheninnikov **[**4**]** in his book published in the middle of the 18th century, a death that he himself reported as hearsay? If the source is native, is it of the kind - highly significant - that is accepted as veridical, according to Kai Donner **[**28**]**, in the upper Yenisei among the Ket and the Selkup; *viz.*, that only shamans and those who are to become shamans can eat the fly-agaric with impunity; all others will surely die. (Lehtisalo [24] records similar shamanic beliefs.) Donner is not discussing vital statistics: he translates us to a different realm. We are in the presence of fossil survivals of remote beliefs, a sanction for violating a tabu, and it is precisely the sanction (at the time a projection of a surmise) that led my wife and me decades ago to suspect that our own remote ancestors had worshipped a mushroom and that a heavy tabu, surviving to this very day, had been laid on eating it. Death will come if the layman presumes to eat the forbidden fruit, the Fruit of Knowledge, the Divine Mushroom of Immortality that the Taoists talk about and that the poets of the ṚgVeda celebrated. The fear of this 'death' has lived on as an emotional residue, long after the shaman and his religion have faded from memory, and here is the explanation lor the mycophobia that has prevailed throughout northern Europe, in the Germanic and Celtic worlds, in particular for the macropsia with which the north Europeans - and not least the mycologists and toxicologists - have viewed the poisonous properties of the fly-agaric.

There is a consensus among our writers that the natives of Siberia consumed the fly-agaric only after drying it. Von Strahlenberg [3] says that water is poured on it, then the water and mushrooms are boiled and the liquor is drunk. He does not mention dried mushrooms, but as he is speaking of winter they must have been dried. He and von Langsdorf [10] are the only ones who mention cooking the fly-agaric. Krasheninnikov [4] says that the dried mushrooms are steeped in the must of an Epilobium, which later writers have identified as the Russian *kiprei*, *Epilobium angustifolium*. (The 'must' is *not* fermented.) Krasheninnikov is the only source to mention Epilobium, but there seems no reason to doubt his word. It is natural, given the scattered population in Siberia and the poor communications, that customs vary from settlement to settlement, and even within the same settlement, from shaman to shaman. Steller [5] says that 'the fly-agarics are dried, then eaten in large pieces without chewing, being washed down with cold water.' Georgi [6], on the other hand, is responsible for the statement that in the Narym region the natives either eat one fresh mushroom or drink a decoction of three; but he is suspect as a witness. According to von Langsdorf [10], the Kamchadal prefer to leave the mushrooms to dry in the ground, exposed to the natural air and the sun. Small ones with many warts, he says, are the best and the most powerful. They are swallowed whole, being swallowed with the juice of bilberries (*Vaccinium uliginosum*), either one large mushroom or two small. Erman [11] and von Maydell [12] mention that they are taken dry, von Maydell adding that they are smoked and shrivelled up. Enderli's [19] description is classical on this point:

> At the man's order, the woman dug into an old leather sack, in which all sorts of things were heaped one on top of another, and brought out a small package wrapped in dirty leather, from which she took a few old and dry fly-agarics. She then sat down next to the two men and began chewing the mushrooms thoroughly. After chewing, she took the mushroom out of her mouth and rolled it between her hands to the shape of a little sausage. The reason for this is that the mushroom has a highly unpleasant and nauseating taste, so that even a man who intends to eat it always gives it to someone else to chew and then swallows the little sausage whole, like a pill. When the mushroom sausage was ready, one of the men immediately swallowed it greedily by shoving it deep into his throat with his indescribably filthy fingers (for the Koryaks never wash in all their lives).

The Koryak told Sljunin [18] that the fresh fly-agarics are highly poisonous and hence they do not eat them. They are dried, either in the sun or over the fire, and then consumed with fresh water to wash them down. Karjalainen [26], speaking of the shaman's ways among the Irtysh Ostyak, says that they swallow whole either three or seven mushroom caps, which may be fresh or dried: the Irtysh usage runs counter to the trend among our witnesses in that the shaman may take fresh mushrooms. Kannisto [33] speaking of the Vogul cultures reports that the mushrooms are dry when they are used. Lehtisalo [24], discussing the Yurak shamans (northern Samoyeds), tells us that the mushrooms must be fully grown and dry. Jochelson [21] also confirms that they are taken dry. There is no aspect of the fly-agaric on which there is more testimony than this, and the witnesses are almost unanimous. Particularly impressive is the quotation that we give in [30] from an heroic hymn of the Vogul people, where the hero, the 'two-belted one', addressing his wife, says, 'Woman, bring me in my three sun-dried fly-agarics!'

THREE MAPS

The data for our maps are drawn from the following sources:

A. the ethnic distribution from the map accompanying *The Peoples of Siberia*, M. G. Levin and L. P. Potapov, Editors, originally published in Moscow and Leningrad in 1956 under the title *Narody Sibiri*; translated into English under the editorship of Stephen Dunn and published by the University of Chicago Press, 1964;

B. for the distribution of the genus Betula we have relied chiefly on *Trees & Shrubs of the USSR*, S. Ja. Sokolov, ed., Ac. of Sciences, USSR, Moscow and Leningrad, 1951, vol. II, text fig. 72, p. 267: supplementing this source by data from the Gray Herbarium;

C. for the distribution of the genus Pinus we rely on *Geographic Distribution of the Pines of the World*, by Wm. B. Crichfield and Elbert L. Little, Jr., Forest Service of the U.S. Department of Agriculture, Washington, D.C., February 1966. The distribution of firs and other conifers is generally within the confines set by the pines.

C

Thus it seems that drying is of the essence. The natives think that the fresh ones are dangerous, or at least not satisfactorily inebriating. Some say that eating many fresh mushrooms will kill you, but how do we know? I did not realise this when I went to Japan in the fall of 1965 and 1966, and with Japanese friends tried the fresh fly-agarics. The ṚgVeda had not prepared me for the drying. I had known of course that the Soma plants were mixed with water before being pounded with the pressing stones, but I had supposed that this was to freshen up the plants so that they would be capable of yielding juice when pressed. The desiccation, I thought, was an inevitable consequence of bringing the mushrooms from afar and keeping them on hand. There was nothing to tell me that desiccation was a *sine qua non* of the Soma rite. The reader may think that I should have familiarized myself with the Siberian practice before going to Japan. I agree. Imazeki, who by chance toasted his caps on one occasion before eating them, alone had satisfactory results, insistently declaring that this was nothing like alcohol, that this was far superior, in fact in a different world. Alone among us all, he has known *amṛta*, the ambrosia of the Immortals.

As for the harm that the fly-agarics might be expected to provoke, our witnesses give revealing testimony.

Georgi **[**6**]** says that the natives

> feel much less head after this method of intoxication than is produced by spirituous liquors; nor is the use of it followed by any dangerous consequences.

Kopeć's experiences **[**9**]** with the mushrooms, for what they are worth, were benign and pleasant; he was not moved to violence. Von Langsdorf **[**10**]** says that although he made great efforts to find out something about the harmful or possibly deadly effects of the fly-agaric, he could obtain no satisfactory information on the subject.

> The Koryaks [he goes on] greatly prefer fly-agarics to the Russians' vodka and maintain that after eating fly-agarics a man never suffers from headaches or other ill effects. It is true that in extremely rare cases (of which no one could recall any specific example) persons who consumed an extraordinarily large quantity of the mushrooms are said to have died in convulsions, senseless and speechless, after six or eight days. However, it is not reported that moderate consumption ever produced any harmful after-effects. If, contrary to expectations, immoderate consumption of fly-agarics should nevertheless be followed by pressure on the stomach or some other disturbance, two or three spoonfuls of fat, blubber, butter, or oil are reputed to be an infallible remedy.

(Sljunin **[**18**]** gives an alternative antidote: '... a glass of vodka or diluted alcohol. A quarter of an hour after swallowing the vodka, the Koryak who is totally oblivious of his environment under the effect of the mushroom, completely regains consciousness.') Erman **[**11**]** quotes a native informant as saying that

> mushroom intoxication had a quite different effect from alcoholic drunkenness, since the former put the Kamchatka natives into a peaceful and gentle (*skromno* in Russian) mood, and they had seen how differently the Russians were affected by spirits.

Von Maydell **[**12**]**, who passed the decade from 1861 to 1871 in Siberia, confirms the impression conveyed by his predecessors:

> ... the mushroom produces only a feeling of great comfort, together with outward signs of happiness, satisfaction, and well-being. Thus far the use of the fly-agaric has not been found to lead to any harmful results, such as impaired health or reduced mental powers.

In a footnote he adds that he had been told of one fatal case, a Russian who died after eating rather large quantities of fresh mushrooms. He 'had been told': again we are in the realm of hearsay.

Von Dittmar **[**13**]** says substantially the same:

> Mukhomor eaters describe the narcosis as most beautiful and splendid. The most wonderful images, such as they never see in their lives otherwise, pass before their eyes and lull them into a state of the most intense enjoyment. Among the numerous persons whom I myself have seen intoxicated in this way, I cannot remember a single one who was raving or wild. Outwardly the effect was always thoroughly calming - I might almost say, comforting. For the most part the people sit smiling and friendly, mumbling quietly to themselves, and all their movements are slow and cautious.

According to Sljunin **[**18**]**, the Koryak maintain that the continued consumption of the mushroom has no ill effect on the person's health. Enderli **[**19**]** reports that after a period of lethargy and monotonous singing, the mushroom eater is suddenly seized with a frenzy, raving and calling for drums, and then begins a deafening spell of singing, drumming, and running around within the confines of the yurt. He concludes with this sentence: '... immoderate consumption involves the danger of madness or death, but such cases occur rarely.' If he had seen or heard of an actual death, he is such an excellent reporter that he would certainly have told us about it. Jochelson and Bogoraz **[**21, 22**]** report no murderous outbreaks by fly-agaric eaters, and Jochelson says that to his question as to which they preferred, brandy or fly-agaric, many Koryak answered, 'Fly-agaric.' Jochelson added: 'Intoxication from the latter is considered more pleasurable, and the reaction less painful, than that following brandy.'

In these comments of various observers there is nothing that suggests the berserk-raging of the Vikings. Murderous ferocity marked the Viking seizures almost always, whereas murderous ferocity is conspicuously absent from our eye-witness accounts of fly-agaric eating in Siberia. In most of the reports the effect is soothing, *skromno*; sometimes there is a noisy inebriation. Both are familiar to us as expressions of alcoholic inebriation and both are harmless. The ardent advocate of a link between the fly-agaric and berserk-raging must content himself as best he can with the testimony of Krasheninnikov [4]: 'The Kamtschadales and the Koreki eat of it when they resolve to murder anybody.' This generalisation is hearsay: had he known of a particular episode, he would have reported it. Thus he tells us about four Russians who ate the fly-agaric, three of them in his entourage and one by hearsay. They were a menace only to themselves. This is the consensus of all the witnesses, and even here the threat to themselves is often hearsay, perhaps a reflex of the conventional attitude of Europeans when speaking of inebriation. Reguly and, after a lapse of some forty years, Munkácsi took down from native Vogul singers an Heroic Song concerning the Creation of the World. This song [30], drawn from the depths of the Vogul culture, is alone enough to demolish the berserk-raging notion of the Scandinavians. Our Hero had eaten three sun-dried fly-agarics and lay in a stupor when there bursts in upon him a messenger with news of the enemy's imminent invasion. The messenger urges the 'bemushroomed' Hero to throw off his inebriation and to come and lead the fight. The Hero replies that he has no strength and sends the messenger to rally his younger brothers. It is only on the second call that the Hero pulls himself out of the fly-agaric stupor and calls for his arms.

So far as we know, only two of our witnesses ate the mushroom: Kopeć [9], whose colourful narrative we publish for the first time in English, and Donner [28], who unfortunately and rather primly gives us no details other than that it is a powerful intoxicant. None drank of the urine. But a number of the Russians who settled in Siberia took to the fly-agaric, at least for a time. Many of our witnesses speak of this, and there is a startling sentence in Erman [11, p. 253] reading as follows:

> … the Russians of Klynchevsk, who according to the man from Yelovka pick whole packhorse loads of this valuable plant, prepare an extract by decocting it in water, and try to take away its extremely disgusting taste by mixing the extract with various berry juices.

What is surprising in this passage is the formula that the Russians hit on: extracting the juice with the help of water and adding various vehicles to make the drink palatable. In ancient times Soma was mixed with water and pounded with stones, then mixed with milk or curds or barley-water or honey; in Klynchevsk they mixed the extract with the juice of berries.

A fairly consistent picture of the fly-agaric syndrome emerges from reading the accounts of our witnesses. Krasheninnikov [4] says that in moderation it raises the spirits and makes one brisk, courageous, and cheerful, but if indulged in to excess, it leads to trembling, a merry or melancholic mood according to one's disposition, and macropsia: 'a small hole appearing to them as a great pit, and a spoonful of water as a lake.' Von Langsdorf [10] confirms the macropsia: 'If one wishes to step over a small stick or straw, one steps or jumps as though the obstacles were tree trunks.' So do von Maydell, Sljunin, Bogoraz, and Jochelson [12, 18, 22, 21]. There is often vomiting and at some stage sleep supervenes, during and after which one sees marvelous visions, *not* erotic according to von Maydell [12]; 'highly sensuous' according to Enderli [19]. Kopeć [9] seems to confirm Enderli. (We wonder how von Maydell knew the fly-agaric did not give erotic pleasure.) A number of our witnesses testify to the increase in strength that can be expected: von Langsdorf [10] met eye-witnesses who said that a man inebriated with the mushroom had been able to carry a 120-lb. sack of flour 10 miles, and Bogoraz [22] describes one under the influence of the fly-agaric:

> His agility increases, and he displays more physical strength than normally. Reindeer-hunters of the Middle Anadyr told me that before starting in canoes in pursuit of animals, they would chew agaric because that made them more nimble on the hunt. A native fellow-traveler of mine, after taking agaric, would lay aside his snowshoes and walk through the deep snow hour after hour by the side of his dogs for the mere pleasure of exercise, and without any feeling of fatigue.

Von Langsdorf [10] declares that according to the statements of the natives, those who have taken the fly-agaric in moderation feel 'extraordinarily light on their feet and are then exceedingly skillful in bodily movement and physical exercise.' Erman [11] confirms this:

> There is no doubt ... about a 'marvelous increase in physical strength', which the man praised as still another effect of the mushroom intoxication. 'In harvesting hay', he said, 'I can do the work of three men from morning to nightfall without any trouble, if I have eaten a mushroom.'

The Chukotka tribesmen personify the mushroom as little men or women. Krasheninnikov [4] was the first to call attention to this. 'It is observed, whenever they have eaten of this plant, they maintain that, whatever foolish things they did, they only obeyed the commands of the mushroom.' (We quote from the 18th century rendering by James Grieve.) Jochelson and Bogoraz [21, 22] ratify this. The former writes: 'The idea of the Koryak is that a person drugged with agaric fungi does what the spirits residing in them (*wapaq*) tell him to do;' and the latter: 'The spirits of the fly-agaric have an outward appearance similar to that of the actual mushrooms, and the agaric-eater feels impelled to imitate them.' The Koryak and Kamchadal tales that we reprint are shot through with this personification of the mushroom. Among the Ob-Ugrians Lehtisalo [24] observes the same phenomenon. The mushroom eater enters the realm of the little people, talks with them, learns from them what he wishes to know - the future, the outlook for a sick person, *etc*. Among the Ob-Ugrians the divine mushroom seems to have retained more of its sacred character. It plays a role in the myths of creation and, as we have seen, there are vestiges of stern tabus on its use by unqualified persons.

Of all the properties of the fly-agaric as it is used in Siberia, the one that has drawn the most attention is its effect on the urine of the person who eats it. The inebriating virtue of the mushroom passes into the urine, whence the custom in the Chukotka of drinking the urine. This is amply confirmed by all our best sources and there can be no doubt about its truth. No one knows to this day the chemical composition of the inebriant. No one can say whether the drug in the mushroom is identical to the drug in the urine. Perhaps alien elements in the mushroom, such as sometimes cause nausea, are filtered out in the urine. To von Langsdorf [10] alone goes the credit of having asked some of these questions:

> I was not able to ascertain whether the consumption of fly-agaric is followed by constipation or diarrhœa or by an increase or decrease in the urine.
>
> I was also unable to obtain any satisfactory answer when I asked whether the taste or smell of the urine had been changed; everyone was probably ashamed to admit that he had drunk his own or someone else's. Nevertheless it strikes me as not improbable that fly-agarics, like turpentine, asparagus, and other things, impart a special, possibly quite pleasant, smell and taste to the urine. By analogy it would be worth investigating whether other narcotic substances, such as opium, *Digitalis purpurea*, cantharides, *etc*., also retain their properties in the urine.

Many of the best names on our list of sources discuss this practice of urine drinking: von Strahlenberg [3], Krasheninnikov [4], Steller [5], von Langsdorf [10], Erman [11], von Maydell [12], von Dittmar [13], Sljunin [18], Enderli [19], Jochelson [21], and Bogoraz [22]. But those who describe the Uralic and Ket practices are silent about the urine. It is to be assumed that these tribes do not know its virtue, or that knowing it, they do not indulge in it. They are closest to Russia and perhaps have been under the Russian influence more strongly than the peoples of the far Northeast. Perhaps fly-agarics are so common in their forests that they have no need to resort to their own urine to supplement the supply. We can only regret that none of the writers about these peoples seem to have put the question to them. If we have interpreted ṚgVeda IX 74[4] correctly, the Indo-Aryans were drinking urine impregnated with the fly-agarics 3,500 years ago, and before then the Indo-Aryans had come south from a region adjacent to an Uralic people, with whom it is to be assumed that they shared their fly-agaric eating propensities, inluding perhaps the urine-drinking.

By assembling as many of the sources as I could find and laying them before the reader, his attention is called as it has never been before to the peculiar and perhaps significant role of the reindeer in the fly-agaric complex of Siberia. Reindeer have a passion for mushrooms and especially for the fly-agaric, on which they inebriate themselves. Reindeer have a passion for urine and especially human urine. When the human urine is impregnated with fly-agaric, what a regal cate is there, to be served to a favoured reindeer! Steller [5], who stayed behind in Siberia when Krasheninnikov [4] returned to Russia, was the first to call attention to this. Von Langsdorf [10] saw the importance of this and quotes Steller *in extenso* on it. Erman [11] bears independent witness to the fact in an astonishing paragraph. Bogoraz [22] stresses the passion of the reindeer for human urine, which is likely to make it dangerous to relive oneself in the open when there are reindeer around. The curious account of the death of two reindeer given by Sarychev [8], slightly garbled though it must be, seems to relate to the same phenomenon. Before I had read Steller **[**5**]** and Erman **[**11**]**, I made my suggestion on pp. 75-76 that living as some of these tribesmen do in intimacy with the reindeer, almost in a symbiotic relationship with them, they may have found it easy to indulge in the drinking of the urine in imitation of the beasts. Here then would be the genesis of the urine-drinking that has astonished the West.

What is the relationship between the hallucinogenic mushrooms of Middle America and the fly-agaric complex of Siberia?

The mushrooms are utterly different. The fly-agaric is an Amanita. The sacred mushrooms in Mexico are far removed, belonging to the Psilocybe, Stropharia, and Conocybe genera, these genera being closely interrelated. The drugs in the Mexican mushrooms are psilocybin and psilocin. We do not know what the drug is in the fly-agaric, or perhaps the drugs. The Mexican mushrooms keep one awake for about four or five hours, and then one falls into a deep, dreamless slumber for a couple of hours; there is no hangover. Though one remains awake and experiences hallucinations, one has little or no desire to move about. There is no macropsia. At the very moment one can talk about the marvels that one sees, and exchange comments with one's neighbors, but there is no kinetic agent in the mushrooms. By contrast, in Siberia some tribesmen feel an urge to talk loudly or shout and sing, to dance, to run about, to perform feats of physical activity. In Siberia stress is laid on the visions one has during a profound sleep that, according to most of our sources, comes at the end of ten or twelve hours, and also during the waking hours that follow.

There is one point of similarity. In each case nausea and vomiting occasionally occur in some persons. When the mushrooms act as an emetic immediately or a few minutes after they are ingested, it is a remarkable fact that in both cases the vomiting has no effect on the later inebriation. I have experienced this myself in Mexico. Von Langsdorf **[**10**]** is our witness for Siberia:

> ... people who have eaten a large quantity of mushrooms often suffer an attack of vomiting. The rolled-up mushrooms previously swallowed whole are then vomited out in a swollen, large, and gelatinous form, but even though not a single mushroom remains in the stomach, the drunkenness and stupor nevertheless continue, and all the symptoms of fly-agaric eating are, in fact, intensified.

There is a striking similarity in the imaginative world of the Mexican Indians and the tribesmen of Siberia: both have created a community of dwarfs who take over. In Mexico the mushrooms command. They speak through the *curandero* or shaman. He is as though not present. The mushrooms answer the questions put to them about the sick patient, about the future, about the stolen money or the missing donkey. The mushrooms take the form of *duendes*, to use the Spanish term; dwarfs in English. Similarly the eater of fly-agarics comes under the command of the mushrooms, and they are personified as amanita girls or amanita men, the size of the fly amanita.

If I am asked whether there is any genetic relationship between the two areas in the light of the similar mushroom practices, I should say that to harbor such a thought would be hazardous. The Indians of the New World have shown themselves supreme in the arts of the herbalist, discovering properties in the plant kingdom from which we Europeans have learned much. The Indians were certain to discover the divine mushrooms (as they think them to be) and it was natural, given their cultural background, that they should personify them as *duendes* and think they were speaking through the shaman's words. The same thing was true with the Siberian tribesmen. Both cults are, in my opinion, thousands of years old and autonomous in origin.

II. A Far-Reaching Siberian Word-Cluster

A remarkable pattern of linguistic evidence marks the fungal vocabulary of many Siberian tribes and the European peoples. Specialists in the Uralic family of languages have greatly contributed to the Uralic aspect of this problem, but no first class scholar has dealt with the linguistic and cultural aspects of the entire pattern of fungal words that are scattered throughout northern Eurasia from the Iberian peninsula to Bering Strait. I can do no more than assemble some of the evidence and pose the questions that call for answers.

1. The Antiquity of Fly-Agaric Inebration

In the Vogul language all words relating to drunkenness are derived from the word for fly-agaric, *paŋχ*, and its innumerable variants according to the dialect. This means that Vogul speakers, when they talk of getting drunk, say that the man is 'bemushroomed'. But it is important to note that the Vogul speaker is not aware of the etymology of the word: he uses it without thinking of the fly-agaric, whether the man was 'bemushroomed' on alcohol or fly-agaric. This is similar to our use of the word 'drunk'. If we say the shaman is getting 'drunk' on fly-agaric, it would not occur to us that he does not 'drink' the fly-agaric. If the Vogul speaker says that that foreigner was 'bemushroomed' yesterday on vodka, it never occurs to him that one drinks alcohol, instead of eating a mushroom. Just as our basic word in English is a secondary meaning derived from a beverage that one drinks, so in Vogul the basic word is derived from the fly-agaric. The fly-agaric was the original inebriant and probably the only one.

Vogul is an Ugrian language. In Zyrian (= Komi), a Finnic language, there are a number of words, *pagal-*, *pagav-*, *etc.*, meaning to lose consciousness as from alcohol. Uotila [34, 38] tells us that they are derived from ⋆*pag-*, and are cognate with the Vogul *paŋχ*. The Zyrians do not use the fly-agaric today, but these words would indicate that their ancestors did so.

It seems certain that these words go back to a time when fermented drinks (not to speak of their distillate, alcohol) were either not known at all or were unimportant, to a time when the fly-agaric was *the* inebriant. It seems that they go back to a time before the Ugrian and Finnic languages became differentiated, centuries before Christ.

But our story does not end there. Castrén [24a] in the last century reported the word *faŋkáˀam*, 'to be drunk', in the Tavgi language, belonging to the northern Samoyed group. It this attestation is sound, and Uralic scholars treat it seriously, then the beginnings go back far indeed. For between the Finno-Ugrian languages and the Samoyed languages there exists precisely the same p~t shift that we find distinguishing the Latin and Germanic languages; *e.g.*, Latin *pater*~ English 'father'. The Tavgi word, manifesting this basic shift, cannot therefore be a borrowing from Vogul or Zyrian. It goes back to a common ancestor, before the Uralic peoples divided into the Samoyed and the proto-Finno-Ugrian, certainly thousands of years before Christ. We cannot say when the fly-agaric was first used in the northern reaches of Eurasia. We can say, if Castrén is to be relied on, that it was being used when the ancestral tongue of the Uralic peoples split up. In any case we feel safe in saying, on the evidence supplied by the Uralic languages, that the fly-agaric was being invoked as a divine inebriant before the Aryans left their ancestral home and long before the ṚgVeda was composed.

2. The Distribution of Fly-Agaric Inebration

So far as I know, Franz Boas initiated the accumulation of evidence on this subject when he pointed out [31] that the three languages of the Chukchi group, in the far Northeast of Siberia, used for 'mushroom' words whose common root was *poŋ*. He made no mention of such a root in the Ob Valley, and he was probably not aware of it. His book appeared in 1922 but the materials for it had been accumulated from the turn of the century.

The Finnish linguist Artturi Kannisto [33] was gathering data among the Vogul in the first decade of this century. He recorded the names *pa:ŋχ* and *pə:ŋχ* for the 'fly-agaric' used by shamans to achieve ecstasy. His papers were published only in 1958, long after his death. Munkácsi, the Magyar scholar, working in part with collections made in the second quarter of the last century by Antal Reguly, drew attention [32] to the Ob-Ugrian and Volga Finnic cluster of fungal words having identical origin, though in Ob-Ugrian they meant a specific mushroom, the fly-agaric, whereas in Mordvin and Cheremis they were generic, 'mushroom'. He suggested an Iranian word, *banha*, as cognate with or the etymon of the Uralic words. At least one of his colleagues, Lehtisalo [24a], expressed doubt about this, and now that we know more concerning the Iranian word, Munkácsi's suggestion seems to be ruled out. Apparently Lehtisalo in 1928 [24a] was the first to bring in the Samoyed languages: it was he who drew attention to Castrén's discovery that in the Tavgi tongue (in the North Samoyed group) *faŋkáˀam* means 'to be inebriated' and that it must be cognate with the other words. Uotila in 1930 [34] then added the Southern Samoyed language, Selkup, seeing in *pöŋer* and *pəŋgar*, the 'drum' and another musical instrument used by shamans, derivatives of the root *poŋ*. He detects a connection between our cluster and the Zyrian *pagal-*, *etc.*, 'to lose consciousness'. Bouda [35] in 1941 confirmed Boas's findings for the Chukchi group and he for the first time linked the word for 'mushroom' in the far Northeast with the Uralic words that we have been discussing. Steinitz in 1944 [36] thought that the link with the Zyrian *pagal-*, *pagyr*, meaning 'to lose consciousness', *etc.*, was unclear. In a notable paper Balázs [38] in 1963 summed up the Uralic evidence. He is inclined to accept Uotila's judgment on the Zyrian words, rather than Steinitz's hesitant position. He is sceptical about Munkácsi's view concerning an Iranian origin for this cluster, leaving however the last word to Iranian scholars. Apparently he was unaware of Walter B. Henning's pronouncement, published in 1951, on the Iranian word *bang*. (*Vide* Eliade [41])

We show the distribution of these tribes in the recent past in our maps A, B, and C. They have changed their location slowly over the past centuries, and are now disappearing. The Yukagir, for example, were once an important people; now they are confined to three shrinking areas. The Finno-Ugrian peoples, on the strength of linguistic evidence as interpreted by ethno-botanists and zoologists, seem to have had their original home in the bend of the Volga River, where the Mordvin and Cheremis tribes now are. The Ob-Ugrians and the linguistic ancestors of the Magyars presumably migrated to the east, the Magyars furthest to the East. Later the Magyars under Turco-Khasar domination migrated West to the Pannonian plain where they now are. They succeeded in surviving the Turkish domination and their own language emerged as dominant.

poŋχ, *paŋχ*, *paŋga*: 'fly-agaric', 'mushroom'
bolond gomba: 'mad mushroom'
paŋga, *paŋgo*: 'mushroom'
poŋgo, *paŋgə*: 'mushroom'
pagalny: 'to lose consciousness' etc. < ★*pag*: (root)
haŋgo: 'fly-agaric'
★*poŋ*: (root, meaning 'mushroom')

In the chart facing this page we show the linguistic families and the distribution of the *poŋ* cluster. We have even added a time scale but hasten to add that it is speculative, intended to give some idea of the linguistic history that we are dealing with.

A number of conclusions seem to emerge from our evidence. The rôle of the fly-agaric has been shrinking for centuries. Until a few generations ago it was deeply rooted in the Ob-Ugrian and Samoyed cultures, the words related to *poŋ* having given to these peoples many derivatives for 'inebriation', the musical instruments of the shaman, *etc*. In the tradition reported by Itkonen [23] among the Inari Lapps that they were once familiar with the fly-agaric as an inebriant, we get some idea of the wider range that this practice enjoyed. It is to be inferred from the distribution of the *poŋ* root in the Chukotka that these peoples were once adjacent to the Ob-Ugrians, far to the west, and that they were pushed into their present location by the infiltration of Tungus and Yakut from somewhere to the south. We must not think of this movement as resulting from wars of conquest to which precise dates might be given. It is much more likely to have been a relatively peaceful occupation of inhospitable wastes punctuated by occasional clashes with the sparse inhabitants. The Tungus (with the Lamut) and the Yakut have been where they are now for as far back as we have records. Perhaps a score of centuries have passed since the peoples of the Chukotka were living adjacent to the Ob-Ugrians.

The fly-agaric was accessible to man in the forest belt ages before he knew the art of distillation. For the gathering it was available to him probably before he possessed facilities for storing berries and the juice thereof, and before he had mastered the technique of fermenting liquors. It is hard to see why the shaman should not have been resorting to the fly-agaric for inebriation and ecstasy since the receding ice-cap of the last ice-age permitted him and the birch to exist together in the northern reaches of Eurasia.

3. The 'poŋ' Cluster Among The Indo-Europeans

Now we shift the scene to the Indo-European world and Europe. In 1901 Holger Pedersen, then a young man and destined to become one of the leading figures in the comparative study of the Indo-European languages, published a lengthy paper in Polish ⟦39⟧ in which he found that the Proto-slavic ★*goHba*, the Old Church Slavonic *gǫba*, the Old High German *swamb*, the two Greek variants *sphóngos* and *sphóngê*, and the Latin *fungus* were cognates. The late V. Machek, distinguished Slavic philologist, accepted this correlation in his *Etymologický Slovník* (Prague, 1957) of the Czech language. So does Jan Otrębski, the Polish philologist, in a paper that he published in 1939 in Vilno entitled *Indogermanische Forschungen*, where he gives scores of examples of the identical metathesis. Among Slavists the weight of evidence is in favor of this interpretation; only Berneker held that, though Pedersen's case was tempting, it was 'unclear'. He did not elaborate. Boisacq, following Berneker, deduced that the Pedersen thesis should be discarded.

Professor Roman Jakobson, solicited for his opinion on this matter, said:

> The etymology of Holger Pedersen, the great Danish specialist in the comparative study of Indo-European languages, seems to me and to many other linguists, *e.g.*, the distinguished Czech etymologist V. Machek, as the only convincing attempt to interpret the fungal name of the European languages. Not one single serious argument has been brought against Pedersen's 'attractive' explanation, as Berneker defines it, and not one single defensible hypothesis has been brought to replace this one.[276]

Was not the *poŋ* cluster of the Uralic peoples borrowed, perhaps as far back as Uralic times, from the neighboring Indo-Europeans? If the thesis of this book is right, the Aryans were using the fly-agaric in their religious rites before they left their homeland. The Indo-Iranians do not possess a word of the *poŋ* cluster, because under tabu influences they had replaced it by Soma or Haoma, and the original word was lost.[277]

But even if this supposition is right, there remains the further question as to what the original meaning of *poŋ* was, and whether it designated the fly-agaric when it was borrowed. We may take it for granted that specific meanings precede generic definitions: *i.e.*, names for individuals or species precede the names for classes of things. But this is not much help, for mushroom names easily change their meaning from specific to general, and from the name of one species to another, and meanings often shift when words go wandering from one people to another.

---

276. *Vide Botanical Museum Leaflet*, Harvard University, Vol. 19, No. 7 (1961), p. 150, ftn.
277. R. L. Turner in his *Comp. Dict. of the Indo-Aryan Languages*, Entry 7643, assembles a group of cognate words in contemporary Indian vernaculars derived from Sanskrit that stem back to the hypothetical Sanskrit ★*paggala-*, 'mad', 'madness'. He suggests the possibility of a link to Sanskrit *paṅgú*, 'lame', 'crippled in the legs', of which the variant forms suggest to Turner a non-Aryan origin. May these be remote descendants of our *paŋχ* cluster?

For the cultural evolution of man, the shamanic use of the fly-agaric may have been vital, greatly broadening the range of his experience, making known to him horizons beyond any that he knew in real life, in short sparking his imagination. But there was another spark, even more vital for his very survival. We all know the two ways by which most men generated fire in early times - by percussion, or by rubbing two wooden members together. But not enough stress has been laid on the primary tinder to catch the spark, a tinder so inflammable that it bursts into flames at once. The best tinder for this purpose in northern Eurasia has always been the dried *Fomes fomentarius*. This is a shelf fungus most commonly found on birch. At Maglemose, in diggings that date from soon after the last ice age, *Fomes fomentarius* has been found close by the hearth stones. At Star Carr in Yorkshire, in diggings of the same culture but perhaps somewhat earlier, *Fomes fomentarius*, sometimes still attached to the birch host, have been found next to iron pyrites and the hearth stones. These archaælogical diggings date back almost to the last ice age, which began to recede *ca*. 12,000 B. C. As the ice cap receded and man pushed his way north, the control of fire defined his range of diffusion, and this touchwood or 'punk' (which in the style of this book we should spell *pəŋk*), this *amadou* or *yesca* or *Zunderschwamm* or *trut* or *zhagra* or *tapló* was what assured him of warmth and a cooked meal. Perhaps the men of Maglemose or Star Carr, whoever they were, as they busied themselves about those ancient hearths, were already calling their tinder 'punk'. The discovery of *Fomes fomentarius* and the simple methods of preparing punk for use had marked a long step forward in man's material progress and the comforts of human existence.

★

NOTE 1. Is *mo-ku*, written either 蘑菇 or 蘑菰 a member of the *poŋ* cluster? It is the ordinary market-place word for edible mushrooms throughout China. The word is not found in classical Chinese. The earliest citation that I can find is in the *Rules of Cooking* 飲膳正要, written in 1330 and published in 1456. These were compiled by Hu Ssu Hui 忽思慧, the senior chef of the Mongol Emperor and himself also a Mongol. (The Dynasty in 1330 was Mongol.) In Mongolian the same word in various dialectal forms is also used for mushroom. Philologists have not been sure which culture borrowed the word from the other. It seems to me that the circumstances indicate a Chinese borrowing from Mongolian. The Chinese characters possess different meanings, but in sound they lent themselves to express the Mongolian word. In Pekin *mo-ku* means specifically *Tricholoma mongolicum*, a delicious mushroom highly prized all over China, which was and still is imported in large quantities from Mongolia. It is also known as *k'ou mo* 口蘑, which means for the Chinese 'brought through the Kalgan gate'; in other words, through the Great Wall from Mongolia. With the passing of time the sense of *mo-ku* has become general, especially outside of Pekin.

If then the word is Mongolian, will the Mongolian experts tell us whether *mo-ku* could come from *poŋ*? *(s)pongos* > ⋆*bongos* > ⋆*mongo(s)* > *mogu*.

NOTE 2. In 1963 I was visiting New Zealand and on August 6 was in Rotorua, in the center of the northern island, a Maori community. I was chatting with an elder of the Maori people, Keta Ehau, 74 years old at the time. Naturally the subject came around to mushrooms and he volunteered a story that seemed to him remarkable, and to me even more so. He had been in Siberia with two Canadians and a South African during the first world war, in the Government service, and he found that the natives there were still using touchwood, as the Maoris do in New Zealand. The natives where he was called it *paŋke* or *paŋkə*. This had made an impression on him because in Rotorua the fungus that serves as touchwood is called *paŋe*, without the *k*. But of course vacillation between *ŋ* and *ŋg* or *ŋk* is frequent. This fungus grows on the *rātā* tree, *Metrosideros robusta*, a member of the myrtle family. At Ruatoria, on the coast to the east of Rotorua, touchwood is made from a fungus growing on the *tawai* tree, Nothofagus spp. There the fungus so used is called *pú:tawa*, and *paŋe* is unknown.

How strange to find a word that might be a member of the *poŋ* family among the Maori of Rotorua! I looked the word up in Williams's A *Dictionary of the Maori Language*, of which many editions have appeared since the first in 1844. *Pú:tawa* was in them all. In the fifth edition, 1917, I found '*Pangē*, *pangī*: tinder, touchwood, made from spongy fungus.' In a copy of the fourth edition, 1892, that lies in the Trumbull Library, Wellington, there are the editor's notes made in anticipation of the fifth edition, and among them is this entry written by hand, probably around 1914.

III. Europe and the Fly-Agaric

1

If I have established my case that Soma was the fly-agaric - that the *amṛta* of the Aryans was until only yesterday the divine inebriant still currently consumed by the shamans over vast reaches of Siberia, then at once the initial steps by which my wife Valentina Pavlovna and I started out on our inquiries more than forty years ago take on relevance and a cutting edge. For we did not begin by looking for Soma. Decades were to pass before Soma drew my attention. We started out by accumulating purely European ethno-mycological data, chiefly philological and folkloric, and those European data led us twenty years later to make a bold, many would say a wild, surmise: the striking pattern of our evidence would be understandable if we postulated a period when a mushroom had played a rôle in the religious life of our own remote ancestors, perhaps some 6,000 years ago, millennia before they could read and write, when the last ice-age was still yielding the frozen wastes to the pioneer food gatherers. We did not know which mushroom nor why, but it must have been hedged about with all the sanctions that attend sacred things in primitive societies. Judging by what we considered vestigial survivals in our own folkways, it must have been instinct with *mana*, an object of awe, of terror, of adoration.

Our later discoveries in Siberia and mine more recently among the Indo-Iranians were an immediate sequel to those early hesitant stumbling steps that we were taking in the 1930's, and they lend credence to our 'wild surmise' about our own European ancestors, for it is unlikely that a foolish misinterpretation of evidence would lead us to these rich finds. It is therefore in order to re-examine our early evidence, constituting as it does an exploration into the pre- and proto-history of our own European stock.

My wife and I embarked on this our intellectual foray late in August 1927. A little episode started us on our way. Valentina Pavlovna was Russian, a Muscovite by birth. I was of Anglo-Saxon ancestry. We had been married less than a year and we were now off on our first holiday, at Big Indian in the Catskills. On that first day, as the sun was declining in the West, we set out for a stroll, the forest on our left, a clearing on our right. Though we had known each other for years, it happened that we had never discussed mushrooms together. All of a sudden she darted from my side. With cries of ecstasy she flew to the forest glade, where she had discovered mushrooms of various kinds carpeting the ground. Since Russia she had seen nothing like it. Left planted on the mountain trail, I called to her to take care, to come back. They were toadstools she was gathering, poisonous, putrid, disgusting. She only laughed the more: I can hear her now. She knelt in poses of adoration. She spoke to them with endearing Russian diminutives. She gathered the toadstools in a kind of pinafore that she was wearing, and brought them to our lodge. Some she strung on threads to hang up and dry for winter use. Others she served that night, either with the soup or the meat, according to their kind. I refused to touch them. ... This episode, a small thing in itself affecting only a peripheral aspect of our busy lives, led us to make inquiries, and we found that the northern Slavs know their mushrooms, having learned them at their mother's knee; theirs is no book knowledge. They love these fungal growths with a passion that, viewed with detachment, seemed to me a little exaggerated. But we Anglo-Saxons reject them viscerally, with revulsion, without deigning to make their acquaintance, and our attitude is even more exaggerated than the Slavs'. Little by little my wife and I built up extensive files concerning this modest corner of human behaviour, not only about the Slavs and Anglo-Saxons but about all the peoples of Europe, even to the Basques, the Frisians, the Lapps, and the Albanians.

Years passed. We had reached the 1940's before we pronounced our 'wild surmise', and we then gave utterance to it only to each other, since we were afraid of appearing ridiculous to our friends, perhaps even a trifle touched. Our evidence was airy and insubstantial, but it possessed a poetic consistency that carried conviction with us. We resolved to cast our net further afield and to explore the tribal cultures of Siberia. What was our amazement when we found, right on the doorstep of Europe, a mushroom - the fly-agaric - occupying the center of the stage in the shamanism of many northern tribes. We were hitting pay dirt and for long we thought we had reached the end of our road.

In 1952 our attention was diverted to Mexico, where we learned that there was a mushroom cult to be explored and studied *in situ*, both historically through the centuries or even the millennia, and also as a living anthropological practice in many Amerindian cultures of Oaxaca, Puebla, and Vera Cruz. The mushrooms used in Mexico were not the fly-agaric of Siberia and we could not discover any umbilical cord linking the Mexican and Siberian cults, but we enjoyed ample opportunity to dissect the modalities of a divine mushroom inebriant. The ten rainy seasons - 1953 to 1962 - spent in the remote mountains of Mexico[278] were a rewarding experience but they were only a diversion from our Eurasian preoccupations. In the course of these years Valentina Pavlovna's fatal illness manifested itself: she died on the last day of 1958, in the evening. Meanwhile we had rushed our *Mushrooms Russia & History* into print in May 1957. In it we expressed our 'wild surmise' hesitantly, by implication rather than directly, and not a single reviewer caught it. We were still unwilling to sponsor openly the notion of a divine mushroom among our own ancestors. Only one critic, a first-class mycologist, hinted at the point when he said that we had not succeeded in establishing our theory as to the origin of 'fly-agaric'.[279] The scientific mind is prone to measure evidence by austere scientific standards, by calibrating quantitative phenomena. But the myths and verbal origins of pre-literate communities are sheer poetry, to be understood only by poets and those with a gift for the play of imagery. There are values in those societies that do not lend themselves to quantitative calibration. This is where our critic went wrong. We were certain that the 'fly' of divine possession was the fly of the fly-agaric, and this fly has now led me to Soma.

I do not recall when the Soma possibility first drew my attention: it was certainly after our first book went to press. My wife had never heard of the Soma mystery. My brother Tom and I, we had been told about Soma by our father in the first decade of this century, but in my case the question had lain dormant in the depths of sleeping memory until the '50's. From 1955 on I was in intermittent correspondence with Aldous Huxley, and often when he visited New York he would come down to Wall Street and have lunch with me. Perhaps it was he who revived my interest in this strange historical enigma. One day he and I were discussing the hallucinogens,[280] and I remember tossing out the fanciful suggestion that Soma might prove to be the fly-agaric, and describing to him the red and yellow phases of this remarkable mushroom, and its rôle in Siberia, with which I think he was already acquainted. I knew nothing about Soma at that time, and to aspire to the Soma secret was to be reaching for the moon. When *The Island* appeared some years later, I was surprised to discover that Huxley had set his story in an Indian setting, with &sacute;iva being worshipped and yoga being practiced, and the drug that is the focus of the cult in the story is a yellow mushroom, surely the yellow fly-agaric: Huxley says expressly that it is the yellow mushroom rather than the red one on which gnomes sit! In his story he was coming close to the truth: he possessed the poet's intuition. Later, in 'Culture and the Individual' Huxley explained[281] that he had had in mind the mushrooms that yield psilocybin, the Mexican mushrooms that my wife and I had played a part in rediscovering and making known to the world. ... I remember that in these same years, in the late '50's, I also discussed the Soma problem with Mr. John P. C. Train, of New York.

After my conversations with Huxley and about the time when *The Island* appeared, in 1962, but before I had read it, in July, I engaged Wendy Doniger to write a *précis* of the Soma question, and she submitted her report on February 16, 1963. It was 33 pages of single-spaced typescript. In it she called my special attention to ṚgVeda IX 74*[4]*, where the priests urinate Soma. This had astonished her and left her nonplussed: little did she suspect what it would mean for me, with my Siberian background. Her report lay dormant for months until I finally retired from my bank at the end of June of that year and translated myself to the Orient for a stay of some years.

---

[278] These expeditions remain to be written up and I plan to do this in the coming years.

[279] R. W. G. Dennis: *Kew Bulletin*, No. 3, 1957 (1958); pp. 392-395.

[280] At this particular Huxley luncheon Stephan F. de Borhegyi was also present. ... 'Hallucinogen' and 'hallucinogenic' were words coined by a group of physicians preoccupied with these mysterious drugs - Abram Hoffer, Humphrey Osmond, and John Smythies in America, and Donald Johnson in England. To Johnson goes priority. In 1953 he brought out a pamphlet. *The Hallucinogenic Drugs*, published by Christopher Johnson in London. But he says he picked up the word from the others, who however did not get into print until January 1954, in an article on 'Schizophrenia: A New Approach', in *The Journal of Mental Health*, London, Vol. C. The word quickly took hold and now trips off everyone's tongue as though it had been used for generations. The uninitiated layman is apt to think of the hallucinogens as merely a new kind of alcohol but by devising a fresh name the radical difference is established from the start. For those who know their effects, 'hallucinogens' may seem inadequate but it fits so long as one remembers that the hallucinations affect all the senses and also the emotions.

[281] *Vide supra*, p. 146.

I shall begin by saying where in Europe's past I have *not* found the cult of a sacred mushroom.

1. Mushrooms do not figure in the various witchcraft epidemics that raged in Europe in the late mediæval and renaissance times. The evidence here is voluminous and circumstantial, extending from Spain to Hungary and from France to Scotland and Sweden. That a rôle for mushrooms is never mentioned seems to me conclusive.

2. I have found no mushrooms in the records that we possess of the shadowy Druids. Our sources are meager. If we knew more, mushrooms might figure, but the evidence now is negative.

3. In Viking times, from the 8th to the 10th centuries, there was a special category of the Viking warriors known as the Berserks. Big powerful men, they fought in the forefront of the battle with a wild fury. They would 'go berserk' and this berserk-raging made them famous and feared. Today the belief prevails in certain Scandinavian circles that this berserk-raging was provoked by the fly-agaric. In Sweden and Norway even text-books and encyclopædias assert this as a fact. Samuel Ödman, a Swede, first propounded **[**43**]** the idea in 1784, deriving the notion from the accounts of travellers in Siberia earlier in the century. He cites Georgi **[**6**]** and Steller **[**5**]**, and there is every reason to assume that he knew von Strahlenberg **[**3**]** and Krasheninnikov **[**4**]** also. A century later, in 1886. Fredrik Christian Schübeler, a Norwegian, expressed the same view. In Exhibits **[**43**]** throug **[**46**]** we give in translation the principal statements in favor of the fly-agaric, for the reader to pass on their merit. The opposition has not been without able advocates, notably Fredrik Grøn, a specialist in the medical history of Norway, and Magnus Olsen, the authority on Norse traditions and literature.

Certain it is, in my opinion, that the fly-agaric was *not* used by the Berserks, and no time should be lost in expunging this yarn from the reference books. My reasons are two-fold.

First. The fly-agaric is never mentioned in the Sagas or Eddas. Of the fungal world only punk or touchwood (*knösk* and dialectal variants thereof) appears in them. No mysterious or unidentified plant plays a part in the berserk-raging. The early historians Saxo Grammaticus and Olaus Magnus made no mention of any such agent. There is no record of an oral tradition antedating the 19th century of such a practice. Ödman said expressly that he was basing his view on Georgi's **[**6**]** and Steller's **[**5**]** account of the Siberian shamanic usage.

The advocates of the fly-agaric as the cause of berserk-raging are constrained to place excessive weight on a shadowy episode alleged to have taken place in 1814. The story goes that in a brief war between Norway and Sweden the Swedish soldiers of the Värmland regiment were seen by their officer to be seized by a raging madness, foaming at the mouth. On inquiry the officer is said to have learned that the soldiers had eaten of the fly-agaric, to whip up their courage to a fighting pitch. But this episode has not been substantiated. On November 1, 1918, a Swedish physiologist named Carl Th. Mörner read a paper on the higher fungi before a learned society in Upsala. In the oral discussion that followed the paper a meteorologist, H. Hildebrandsson, disclosed for the first time the story of the Värmland regiment. Later, when Mörner published his paper, he cited what Hildebrandsson had said, and this is our only evidence for what had happened. But Mörner did not seize the opportunity, at that time possibly available, to ascertain Hildebrandsson's source and to confirm his story with additional details. No one has ever heard of the episode other than from Hildebrandsson's account told offhand, in the discussion that followed a lecture, more than a century after the event and half a century ago. Bo Holmstedt, Professor of Toxicology at the Karolinska Institute of Stockholm, has lately made rigorous efforts to verify it in Värmland or elsewhere, without success. We must remember that Professor Hildebrandsson was speaking outside the field of his special competence and was merely contributing to an oral discussion.

Second. The symptoms of fly-agaric inebriation are the opposite of berserk-raging, and the Norwegians and Swedes who imagine that they are the same would do well to read Exhibits **[**1**]** through **[**38**]**. The effect of the fly-agaric is soothing, comforting, quieting, tranquillizing. At one stage there is a feeling of physical exhilaration, but in our case-histories there is not a single report of wild bellicosity. In an heroic hymn **[**30**]** of the Vogul a myth is told: the Hero has consumed three sun-dried fly-agarics and is lying in a stupor. A messenger rushes in, announces the imminent approach from the North of the fearful Mocking-bird Host with the red rump, and calls on the Two-Belted One to go forth and fight. But though the enemy is at the very gate, our Hero says he cannot stir because of his inebriation, and sends off the messenger to seek out his two younger brothers. The peril grows desperate and the messenger, returning, implores the Hero to fight. This time he *throws off* his inebriation, sallies forth, and slays the enemy right and left. The testimony of the myth only confirms what the travelers tell us over and over again. Not one of them describes a syndrome corresponding in the remotest degree to berserk-raging.

At the session of the Société Mycologique de France held on October 6, 1910, there was presented to the attendance a photograph of a Romanesque fresco from a disaffected chapel that had belonged to the Abbaye de Plaincourault in the center of France. It was later the subject of a note published on pp. 31-33, Vol. XXVII, of the *Bulletin* of the Société. The fresco, crude and faded, is of the familiar temptation scene in the Garden of Eden. The gentlemen who presented the fresco to the Société Mycologique made the sensational statement that, instead of the customary Tree, the artist had given us the fly-agaric. A serpent was entwined around a gigantic fly-agaric and was engaged in a colloquy with Eve.

The interpretation put on the fresco by the mycologists has made an impression on their colleagues, particularly in England. Thus John Ramsbottom endorses the fungal message in *Mushrooms & Toadstools*[282] and in *A Handbook of the Larger British Fungi*;[283] also R. T. and F. W. Rolfe, in *The Romance of the Fungus World*;[284] *The Illustrated London News*, Nov. 21, 1953; finally, Frank H. Brightman more recently in *The Oxford Book of Flowerless Plants*, in 1966.[285] My wife and I visited the Plaincourault chapel on August 2, 1952. It is in the Berry, between Ingrandes and Mérigny, facing the Val de l'Anglais, hard by the Château of Plaincourault. The Chapel bears the date 1291 and the fresco must come down from that time or thereabouts. On April 2, 1959, Mme Michelle Bory, of the Muséum National d'Histoire Naturelle, visited the chapel at my request, and made the copy of the fresco that we offer our readers in Plate XXI.

The mycologists would have done well to consult art historians. Here is an extract from a letter that Erwin Panofsky wrote me in 1952:

> ... the plant in this fresco has nothing whatever to do with mushrooms ... and the similarity with *Amanita muscaria* is purely fortuitous. The Plaincourault fresco is only one example - and, since the style is provincial, a particularly deceptive one - of a conventionalized tree type, prevalent in Romanesque and early Gothic art, which art historians actually refer to as a 'mushroom tree' or in German, *Pilzbaum*. It comes about by the gradual schematization of the impressionistically rendered Italian pine tree in Roman and Early Christian painting, and there are hundreds of instances exemplifying this development - unknown of course to mycologists. ... What the mycologists have overlooked is that the mediæval artists hardly ever worked from nature but from classical prototypes which in the course of repeated copying became quite unrecognizable.

Professor Panofsky gave expression to what I have found is the unanimous view of those competent in Romanesque art. For more than half a century the mycologists have refrained from consulting the art world on a matter relating to art. Art historians of course do not read books about mushrooms. Here is a good example of the failure of communications between disciplines.

The misinterpretation both of the Plaincourault fresco and of berserk-raging must be traced to the recent dissemination in Europe of reports of the Siberian use of the fly-agaric. I think the commentators have made an error in timing: the span of the past is longer than they have allowed for, and the events that they seek to confirm took place before recorded history began.

Traditionally the European peoples vary like night and day in their attitude toward wild mushrooms. There are two areas that are on excellent terms with them. The northern Slavs and Lithuanians, and the Mediterranean littoral from Majorca and Catalonia to Provence and including apparently the whole of the *langue d'oc* area of France: these are the areas where wild mushrooms are considered friends, where children gather them for fun before they can read and write, where no adult feels the need of a mushroom-manual, where immense quantities of mushrooms are prepared for the table in innumerable ways, and where accidents are unknown. The gentle art of mushroom-knowing is a universal accomplishment. Mushrooms are a conversation piece among men and women. Novelists introduce them into their narratives, poets into their verses; and they recur in proverbs and ditties. Moreover - and here is the telling thing - all the references are friendly, favorable, wholesome.

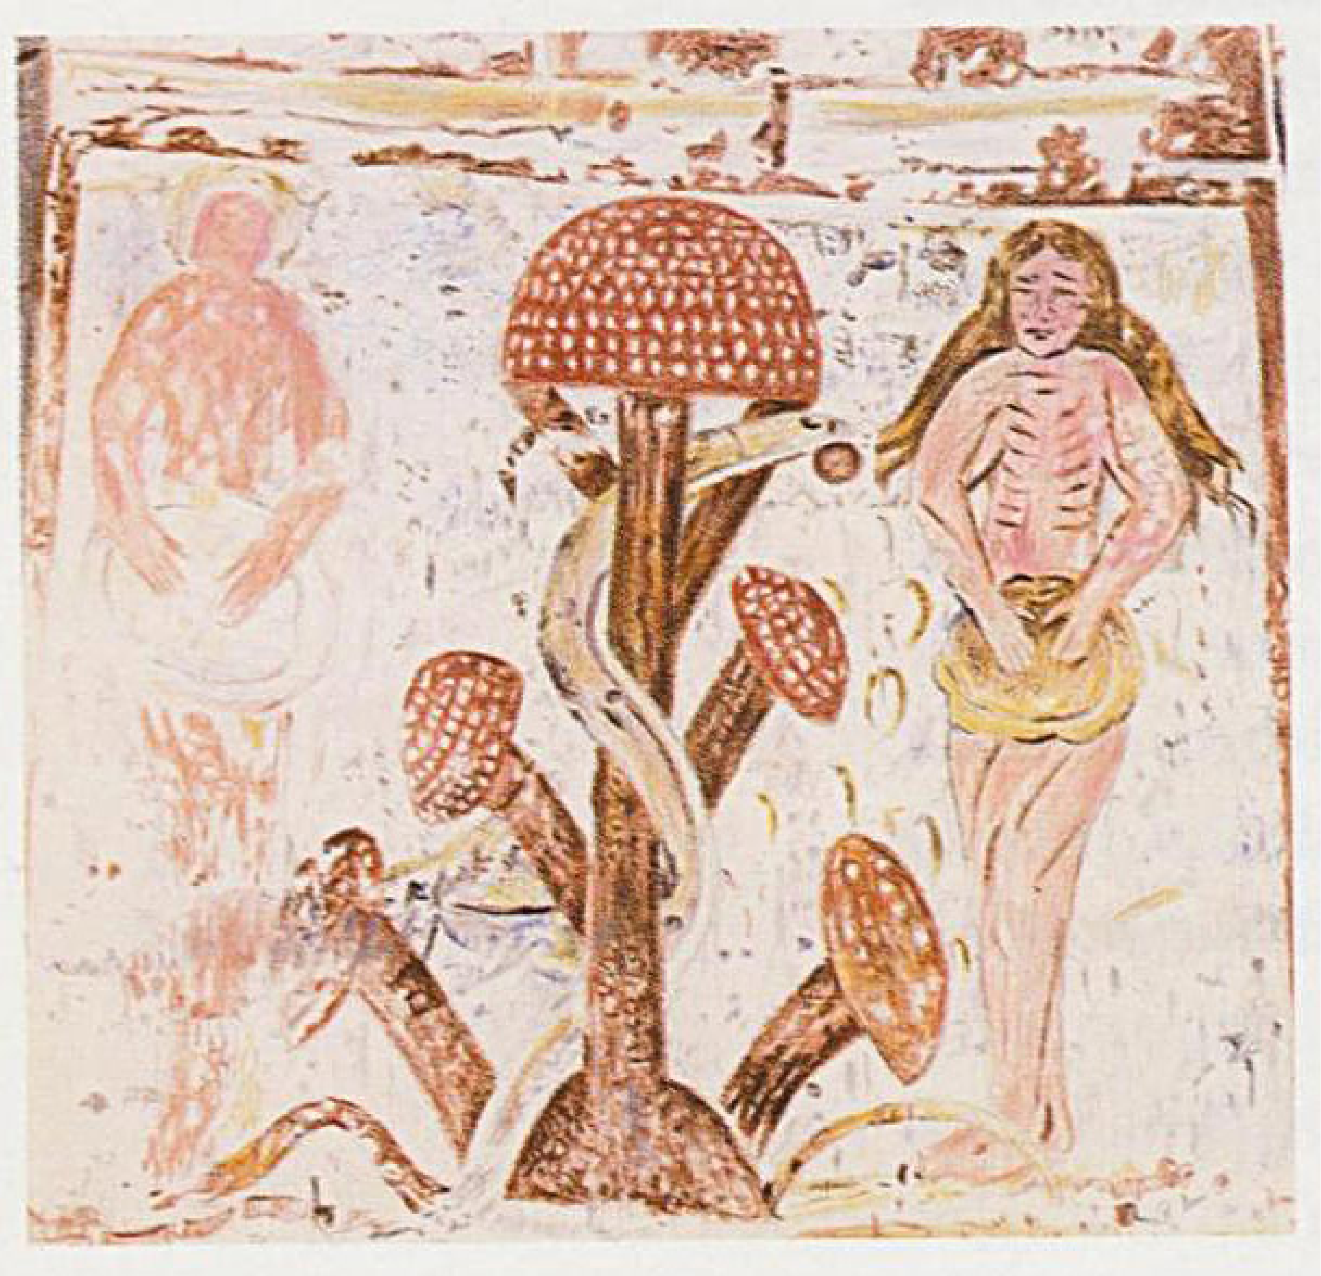

Plate XXI - Fresco of Plaincourault. Abbaye de Plaincourault. Mérigny, Indre, facing the Val de l'Anglais, in the Berry. (Copied April 2, 1959, by Mme Michelle Bory, staff member of the Laboratoire de Cryptogamic, Muséum National d'Histoire Naturelle, Paris)

On the other hand the Germanic and Celtic peoples are infected with a virulent mycophobia, coming down from pre-history. In recent generations there has been some improvement as the traveled and educated classes have begun to spread a different gospel, and as groups of zealous mushroom amateurs have begun to leaven the mass of the population. The criterion by which to judge this aspect of a people's culture is the pronouncements of the older writers and of the untutored country folk. The educated element does not offer a pure strain of the native ways. In *Mushrooms Russia & History* we presented an anthology of many such expressions and I have assembled other quotations since that book appeared. Here I shall cite only a few.

The English people to begin with had no name for a mushroom that would permit them to eat it: 'toadstool' was our chief word and one does not eat a toadstool. The Court under French influence in the 15th century introduced *mousseron*, which became 'mushroom', and from then on the English, or at least a few of the more enlightened ones, could consume one or two species. But even the French were unenthusiastic. The *Grete Herball* of 1526, a translation from the French, voices the hostility of both peoples:

> ... Fungi ben mussherons ... There be two maners of them; one maner is deedly and sleeth them that eateth of them and be called tode stooles, and the other dooth not. They that be not deedly haue a grosse gleymy [slimy] moysture that is dysobedyent to nature and dygestyon, and be peryllous and dredfull to eate & therefore it is good to eschew them.

So mushrooms are of two classes, those that are deadly and those that had best be eschewed. In Diderot's *Encyclopédie* the Enlightenment had not yet spread to mycophagy:

> But whatever dressing one gives to [mushrooms], to whatever sauce our Apiciuses put them, they are really good but to be sent back to the dung heap where they are born.[286]

For Keats, in *Endymion* a 'fungous brood' sends up, 'sickly and pale, Chill mushrooms coloured like a corpse's cheek.' Tennyson makes one of his heroines, Lynette, turn away from Gareth as though she smelled 'a foul-flesh'd agaric', deeming it 'carrion of some woodland thing'. Spenser in *The Shepheardes Calendar* identified the 'grieslie Todestool' with winter, and so does Shelley, thus also doing violence to nature, in *The Sensitive Plant*:

And agarics and fungi, with mildew and mould,
Started like mist from the wet ground cold;
Pale, fleshy, as if the decaying dead
With a spirit of growth had been animated!

Their moss rotted off them, flake by flake,
Till the thick stalk stuck like a murderer's stake,
Where rags of loose flesh yet tremble on high,
Inspecting the winds that wander by.

Montaigne, that giant of the Renaissance, pouring forth the rich contents of his mind and feelings in his Essays, ignores the fungal world. Here is a son of Périgord who never mentions truffles. Rabelais presents to his readers an obnoxious character called Lent-observer who has a *potiron*, mushroom, for a chin, and whose excrement consists of morels and toadstools. There is never a kind word for mushrooms in Rabelais, this native of Chinon in the heart of France. So far as I know, neither Chaucer nor Milton mentioned them, and Shakespere barely.

For the modern poets mushrooms are unchanged. Emily Dickinson repeats the old refrain:

Had nature any outcast face,
Could she a son contemn,
Had nature an Iscariot,
That mushroom - it is him.

Or D. H. Lawrence in *How Beastly the Bourgeois Is*:

---

[286] Article on *Champignons* by Louis Jacourt, 1753: Mais quelqu'apprêt qu'on leur donne, à quelque sauce que nos Apicius les puissent mettre, ils ne sont bons réelement qu'à être renvoyés sur le fumier où ils naissent.

How beastly the bourgeois is
especially the male of the species -
Nicely groomed, like a mushroom
standing there so sleek and erect and eyeable -
and like a fungus, living on the remains of bygone life,
sucking his life out of the dead leaves of greater life than his own.

And even so, he's stale, he's been there too long,
Touch him, and you'll find he's all gone inside
just like an old mushroom, all wormy inside, and hollow
under a smooth skin and an upright appearance.

Full of seething, wormy, hollow feelings
rather nasty -
How beastly the bourgeois is!

Standing in their thousands, these appearances, in damp England
what a pity they can't all be kicked over
like sickening toadstools, and left to melt back, swiftly
into the soil of England.

The poets invoke mushrooms only when they seek a loathsome figure of speech. Of course mushrooms decay, but why pick on mushrooms? Everything that lives will rot. The poets never see the infinitely subtle, fresh colouration, quivering with life, of the mushroom world, varying from species to species and from individual to individual; the delicate softness of their texture, their shapes, graceful, grotesque; the aroma of each species different from all others, conveying by its scent its own proper signature.

Wild fungi are an emotional trip-hammer for mycophile and mycophobe alike, and in the poets with their heightened sensibilities the contrast in the response to fungi is sharpest. Professor Roman Jakobson was spending the summer of 1919 in Pushkino, near Moscow, with the poet Vladimir Majakovskij, who would go out almost daily into the forest to look for mushrooms. He would usually return with a large basket-full of them. He knew them all and where to look for every kind. He told his companion that mushroom gathering offered the ideal accompaniment for the composition of poetry, and in the course of that summer he composed the best parts of his epic, *150 Million*, while engaged in this pastime. During the previous season, in 1918, he had conceived his play *Mystery Bouffe* in the woods among the mushrooms.

In the beginning the Germanic world was steeped in darkest mycophobia. Certainly nowhere in European literature is there a more perfect expression of loathing for mushrooms - all the more eloquent because taken for granted - than in the writings of Saxo Grammaticus, the Danish historian who flourished about A. D. 1200. He was telling of a military campaign waged in Sweden by Hadding the Dane in the 10th century, and how the Danes ran out of provisions, and were driven to the last extremities of hunger. Here in Book 1: VII: 7 of his *Saxonis Gesta Danorum* we discover the low opinion in which the Danes of olden times held wild mushrooms:

> ... After the spring thaw, Hadding returned to Sweden and there spent five years in warfare. By reason of this lengthy campaign, his soldiers, having consumed all their provisions, were reduced virtually to starvation, and resorted to forest mushrooms to satisfy their hunger. Finally under pressure of extreme necessity they ate their horses, and in the end they satisfied themselves with the carcasses of dogs. Even worse, they did not scruple to eat human limbs.

Now that the passing centuries have dimmed for us the personal sufferings of Hadding's host, we may permit ourselves to be amused by the graduated stages of their desperation as reflected in their diet, and our thoughts turn to what soldiers of other origins would have done in a like pass. Had they been Celts, they would surely have eaten horses, dogs, and each other before turning to the foul fungi of the forest. If they had been Slavs of the North, they would have been feasting on those noble mushrooms from the outset of their long campaign, and, fortified by the delectable fare, would have engaged the enemy like lions, and most certainly turned the tide of war. Until General Bernadotte, a son of Pau in the Pyrenees who became King of Sweden, spoke well of ceps, neither Lapps nor Swedes ate mushrooms. We know this because Linnæus tells us so. In the section on the fungi in his *Flora Lapponica*, he observes that in Sweden only foreigners consider mushrooms fit for eating, nor does he except himself from the general rule. What a pity that the great Linnæus was a mycophobe! It is said that when he was naming the famous *Lactarius deliciosus*, he thought he was naming a Lactarius of the Mediterranean that had been described to him as excellent eating: he thought the specimen before him was the same *because it smelled as though it ought to taste good*.

4

Members of a community observing a tabu are far from sensing that it is a tabu. Their obedience to the tabu is in the natural order of things. It lies along the grain of the wood. As I am writing for the English-speaking world, I fear my readers will put aside my book, saving: 'The poor idiot just doesn't know you may get poisoned from mushrooms. Come, what'll it be, a highball or a Martini?' The breathtaking aspect of it is the unanimity of the witnesses. Those from mycophilic peoples are invariably mycophile; those from mycophobic races are invariably mycophobe. The only exceptions are those who have traveled and read widely, and because they have traveled, at least intellectually, they are not really exceptions. In the 1920's and 1930's this subject was a frequent conversation piece in gatherings frequented by White Russians, but it was only table-talk. My wife and I thought it deserved better than that. Today everyone is aware that deep-seated emotional attitudes acquired in early life are of profound importance. It seems to me that when such traits betoken the attitudes of whole tribes or peoples, and when those traits have remained unaltered throughout recorded history, and expecially when they differ sharply from one people to a neighboring people, then you are face to face with a phenomenon of profound cultural importance, whose primal cause is to be discovered only in the well-springs of cultural history. In this instance we are exploring from the inside (not through cave paintings or mute archæological artifacts) one aspect of the religious life of our ancestors in protohistory.

'Toadstool' is an astonishing folk-word. For centuries it has incapsulated the inspissated loathing and fear of the English-speaking people for wild mushrooms. For the Englishman, as commonly used it means any mushroom he does not know and therefore distrusts, which means all or almost all wild mushrooms. One of the two most important words in the fungal vocabulary of Europe, it has nevertheless lost almost everywhere its application to a particular species. For the sinister mark of the toad is not confined to the English fungal vocabulary. You will find it in Norwegian and Danish, though not in Swedish; in Low German, Dutch, and Frisian; in Breton, Welsh, and Irish. It cannot be translated into standard French, and the other Romance languages know it not. Nor does it survive in standard High German, though it lingers on in High German dialects. Thus the citadel of the 'toadstool' is in the ring of peoples who dwell around the shores of the North and Irish Seas, a gigantic and evil fairy-ring, as it were, embracing the surviving Celts, many of the Germanic peoples, provincial France (where the 'toad' figure may have come down from the Gauls), and the Spanish Basque country of Guipuzcoa and Biscay. The Bretons, let it be remembered, emigrated from Britain to their present home across the Channel in the fifth and sixth centuries after Christ, and are thus remote heirs, folkwise, of old Britain.

Not all of these peoples use the figure of the toad's stool. The Norwegians and Danes speak of the toad's hat; the Low Germans, of the frog's stool; the Dutch say toad's stool; and the Frisians refer to an old fungus as a toad's hide. The Irish term is the frog's pouch; the Welsh, toad's cheese; the Bretons, toad's cap, but by the addition of a single initial sibilant, their term becomes toad's stool, and this is a recognized variant in their language. Here are the words in these tongues: in Norwegian and Danish, *paddehat*; in Low German, *poggenstohl*; in Dutch, *paddestoel*; in Frisian, *poddehûd*; in Irish, *bolg losgainn*, with *bolg* meaning pouch; in Welsh, *caws llyffant*, with *caws* meaning cheese; in Breton, *kabell tousec*, and also *skabell tousec*. The Pennsylvania Dutch speak a dialect of High German that comes down from the language of the Palatinate in the 18th century, and in Pennsylvania Dutch we find both toad's stool and toad's foot: *grottestuhl* and *grottefuss*. We know that toad's bread, *pain de crapault*, was used for wild fungi in 16th century France, and this same expression has been reported in modern times in the Calvados region of Normandy. All these names hinging on the toad seem indefinite in their application, and all of them are pejorative. But there are two contiguous or almost contiguous areas that give the term specific meaning. The fly-agaric is called *crapaudin* in many parts of France and in the form *grapaoudin* this word has been reported as far south as the Hérault, on the Mediterranean. In the Basque of Guipuzcoa and Biscay the fly-agaric is the *amoroto*, the precise equivalent of *crapaudin*, 'the toad-like thing'. Often the peripheral cultures of the world preserve archaic traits and meanings better than the throughways of trade and communication, and when we find that the toad is linked to the fly-agaric in Basque and in French provincial usage, our attention is alerted.

All these words, in varying degrees, exhale a bad odor. They designate wild fungi that the speaker considers, rightly or wrongly, inedible and dangerous. The English toadstool, freighted with evil, is typical of the class. In the dialects of England there are numerous variants, and these are interesting because they echo the figures of speech that are current in our list of foreign words. Thus we find toadcheese or taddecheese, toad's bread, toad's cap or toadskep, and toad's meat. For the toad itself there is an ancient variant, pad or paddock, which gives us paddock-stool and puddock-stool. This 'pad' is the same word for toad that the Dutch and Frisians, the Norwegians and Danes, use. This is the witches' word in the opening scene of *Macbeth*:

Padock calls anon: faire is foule, and foule is faire,
Hover through the fogge and filthie ayre.

Here in our argument we interrupt its course for a necessary diversion.

Today civilized men have a kindly feeling for the toad. Lewis Carroll and Kenneth Grahame have planted the seeds of their benign influence in the minds of successive generations of well brought up English-speaking children. The Victorians were inclined to foster sympathy for the whole animal world. (Was this because the industrial revolution released increasing numbers of men from slavery to the soil, from intimate conflict with cantankerous nature?) As for the toad, there has been an additional influence: men of science have undertaken to show that it is the farmer's friend.

Far different was the repute of the toad in times past. There was no other member of the animal kingdom that inspired such revulsion and fear. Chaucer spoke of the 'foule tode', and Spenser of the loathly and venomous toad. 'A pad in the straw' was what our ancestors said when they meant 'a nigger in the woodpile'. (Now that this last phrase is banned in polite society and perhaps vanishing, why not revive the earlier expression?) Shakespere reveled in the toad as a potent term of abuse. In *Richard III* the toad is a recurring theme, as is fitting for a play about a king described as:

That bottel'd Spider, that foule bunch back'd Toad.

Among all of Shakespere's many references to the toad, there is not one that is neutral, much less friendly. Edgar in *King Lear* denounces Edmund as 'a most toad-spotted traitor'; and the witches in *Macbeth*, when they concoct their hellish brew, give to the toad pride of place in the cauldron:

Toad, that under cold stone
Days and nights hast thirty-one
Swelter'd venom sleeping got,
Boil thou first i' the charmed pot.

Not only were toads venomous; to the mediæval mind they were also a symbol of lechery, as were warts and moles, with which toads were supposed to be covered.

The evil repute of the toad is not yet dead. There are English circles where 'Toad!' flung in anger would be a fighting insult now. The derivative 'toady' brings to mind the sycophantic and hypocritical squat of the creature, with its upturned watchful eyes. The bad name of the toad survives among untutored countryfolk in England and the United States, where farmers cling to the belief that the spittle of toads is poisonous, and that warts will grow on the skin where a toad has touched. French peasants down to recent times, and perhaps even now, put toads to death by methods shocking for their cruelty, methods that reveal an ingenuity in torture ordinarily reserved by man for his fellow-man.[287]

The unpleasant abuse heaped on the toad, as well as the serpent, seems to have been a fruit of Christianity. In Old French *le bot* was a name for Satan, resorted to as an evasive term, a word derived from a Germanic root, meaning the club-footed one, or the splay-footed, or the limping one. (Among Satan's traditional attributes was a bad foot causing him to limp.) That same word *bot* was a designation also for the toad and the toadstool, constituting thus a sinister trinity linked together in verbal identity. In the Carpathians and the Ukraine the

287. *Vide Le Folklore de France*, by Paul Sébillot, vol. III. *La Faune et la Flore*, Paris, 1906; pp. 280 ff.

toad theme recurs in the mushroom vocabulary in conjunction with the 'mad-mushroom', which as we shall see can be traced to the fly-agaric, *poŋχ*, *paŋχ*, of the Ostyak. Surprisingly, in China the common name for the fly-agaric is 蛤蟆菌, *ha-ma chün*, 'toad-mushroom';[288] in that country suffering from deforestation the fly-agaric today is found chiefly in Manchuria, along the Amur River. But the foul reputation of the toad in Western Europe is absent, significantly, in Russia and China.

One asks oneself why the early Churchmen in the West convicted the toad of heinous crimes. Was it because the toad occupied an honoured place in the Pagan pantheon? So it seems. In a remarkable paper[289] Marija Gimbutas has shown how paganism lingered on in Lithuania long after it had disappeared elsewhere, until the last century, and one can study the surviving practices there. The Lithuanian peasants in the conservative areas continued to regard toads and snakes gently, encouraging them to live in their homes and considering their welcome presence a happy augury. Only a hundred years ago these peasants were still making wooden grave markers carved in the shape of stylized birds and of toad's hind legs (Fig. 6). Professor Gimbutas shows her readers prehistoric pottery from central Europe with the toad motif incised on the clay (Fig. 7). The toad seems to have been a beneficent deity, a chthonic spirit compact with earth force and sexuality; the snake likewise. But Christianity changed all that, and not for the better.

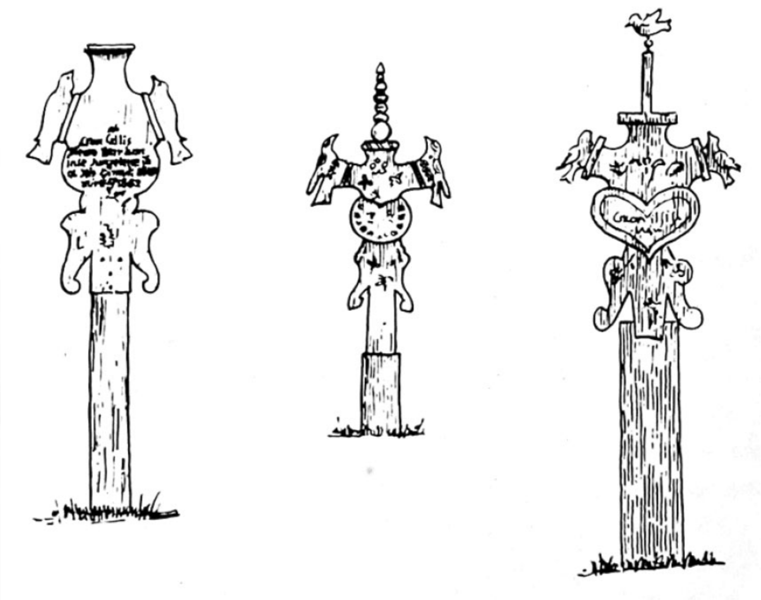

Fig. 6. Wooden grave markers carved in bird and toad's leg motifs from the 19th century cemeteries in Lithuania Minor. (After Marija Gimbutas: *Ancient Symbolism in Lithuanian Folk Art*, p. 32, Mem. of Amer. Folklore Society, Philadelphia, Vol. 49, 1958).

How strange it is that the most spectacular, the most potent, mushroom lacks a name in the English language. A people priding ourselves on our love of nature has not bestowed a name on this regal plant bedecking our woods in the fall of the year. (For 'fly-agaric' of course is not a name. I use it in this book as a term of convenience. It has no circulation among the genuine country-folk of the English-speaking world. A post-Linnæan invention, 'fly-agaric' has led its exsanguinated existence mostly between the pages of pallid mushroom manuals.) On the other hand, the most important fungal word in English, 'toadstool', has no specific meaning; though on the Continent, in those regions where it retains a specific association, the link with the fly-agaric is unmistakable. Our earliest citations for the word are of course after the Christian fathers had introduced writing into northern Europe, and already it had lost its moorings. I suggest that the 'toadstool' was originally the fly-agaric in the Celtic world; that the 'toadstool' in its shamanic rôle had aroused such awe and fear and adoration that it came under a powerful tabu, perhaps like the Vogul tabu where the shamans and their apprentices alone could eat of it[290] and others did so only under pain of death; that people hesitated to

pronounce the very name of this mushroom, so that in time it became nameless and the name it formerly carried hovered thereafter ambiguously over the whole fungal tribe so that all the mushroom world fell under the same floating tabu. This tabu was a pagan injunction belonging to the Celtic world. The shamanic use of the fly-agaric disappeared in time, perhaps long before the Christian dispensation. But in any case the fly-agaric could expect no quarter from the missionaries, for whom toad and toadstool were alike the Enemy. (We remind the reader of St. Augustine's censure of mushroom-eating by the Manichæans supported much later by the excoriations of St. François de Sales and of Jeremy Taylor, p. 71.) Today we are dealing with a deep-seated emotional attitude born in a tabu long forgotten, a tabu on a Sacred Element, the fly-agaric, a tabu overlaid by and mixed up with the venom of the Christian Church's anathema.

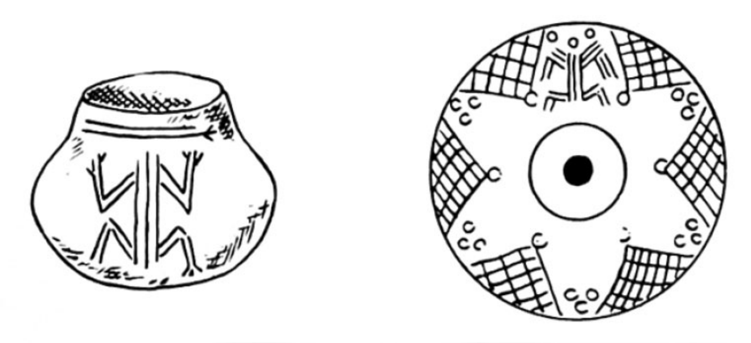

Fig. 7. Toad motif on prehistoric pottery. Left: Neolithic pot with incised toad form. Second half of 3rd millennium B. C. Danubian I culture in Czechoslovakia. Folklore Society, Philadelphia, Vol. 49, 1958).

The truly lethal mushrooms - *Amanita phalloides*, *A. verna*, *A. virosa* - have played virtually no role in Eurasian history. They are of importance only to the rare individual who eats one of them and dies from it, and to his kin. (They have occasionally served the assassin's purpose.) In many of the languages of Europe the peasants have no name for them: they pass them by and ignore them. But everyone knows the notorious reputation of the fly-agaric and shudders at the thought of eating it. Thus in our own day a sanction having its origin in a purely religious tabu thousands of years old is better known and more effective than the lethal properties of the deadly species.

5

In the spring and again in the summer of 1967 I visited Dr. János Gulya, in Budapest, to consult with him in the field where he is the master, the Finno-Ugrian languages, and especially the Ugrian cluster - Magyar, Ostyak, and Vogul. Out of his knowledge of these, to us, remote languages he drew to my attention a usage in Ostyak that may have relevance for our inquiry into the fly-agaric. The word *tul-paŋχ*[291] occurs in two Heroic Songs, in one as part of the hero's name, and in the second, repeatedly in the course of the narrative. In both cases the word signifies the fly-agaric, '*tul*-' meaning 'fool' and 'foolish'; *paŋχ* means of course 'fly-agaric'. This serves to nail down the meaning of expressions that have circulated in past centuries in many parts of Europe, but whose specific sense has long been up in the air.

In Magyar there is a phrase, a conversational cliché, *bolond gomba*, 'fool-mushroom', circulating especially in rural areas, as when one asks of a person behaving foolishly, 'Have you eaten of the fool's mushroom?', or when one rejects a proposition by saying, 'Do you think I have eaten a fool-mushroom, that I should do such a thing?' Or again, 'He is laughing as though he had eaten fool's mushrooms.' In Hungary the 'wise-woman', *javas asszony*, is said to use this same mushroom in love philtres, and the angry lover sends the philtre on to the object of his passion. At our request considerable effort has been made in Hungary to find out whether peasants in any region of that country identify the *bolond gomba* with a particular species, but with no success. This is why Dr. Gulya's discovery of a linguistic link with the Ob-Ugrian peoples is gratifying. The link bridges the centuries and securely fixes a knowledge in former times of the properties of the fly-agaric in the Pannonian Plain among the Hungarian people.

[291] The citations are in *Osztják Hösénekek* [Ostyak Heroic Songs], Reguly A. és Pápay J. hagyatéka [*The Legacy of Anton Reguly and J.Pápay*]. I. kötet. [Vol. I.] Reguly Könyvtár I. [Reguly Library I.] Edited by Miklós Zsirai, Budapest, 1944. The first citation is from the first heroic song, pp. 2-165, on pp. 2-3. The second citation is from the second song, pp. 392, 398, 400. The first song was from Obdorsk, now Salehard. The second was from the northern Sosva river basin.

The fly-agaric's peculiar virtue was widely known. In Yugoslavia one still says, *Najeo se ljutih gljiva*, 'He has eaten enough of the fool-mushroom'. In Vienna one may hear, *Er hat verrückte Schwammerl gegessen*, 'He has eaten the mad mushrooms,' and all Germans recognize the meaning of *Narrenschwamm*, 'fool-mushroom'. John Parkinson in his *Theatricum Botanicum* (1640) speaks of the 'foolish mushroom', but he is leaning on his Continental sources. The 17th century Polish poet Wacław Potocki warns his readers in *The Unweeded Garden* against a kind of mushroom called *szmer*, lest it render the reader foolish (*szaleć*), 'as from opium'. He was clearly passing on hearsay, since no mushroom could be confused with opium. A Slovak informant from near the Tatra Mountains tells us that rejected mushrooms are variously called by his people *žabací huby*, toad-mushrooms, *hadáci huby* and *hadúnke huby*, both meaning viper-mushrooms and *šalené huby*, mad-mushrooms. The toad and serpent, prehistoric deities chased away by Christianity, are thus associated with the inebriating mushrooms. To the east of Slovakia, in the Ukraine, the natives today call any wild mushroom that they reject *zhabjachyj hryb* - the toad-like mushroom.

The Hungarians invaded Europe and settled in the Pannonian plain late in history, at the end of the 9th century. Their 'mad mushroom', *bolond gomba*, establishes a link with the fly-agaric of the Ob-Ugrians, but not with European pre-history. Whether the verbal traces of the 'mad-mushroom' that we have found are all derived from Ugrian sources, *via* the Magyar peoples, we cannot say. It seems probable that a knowledge of the properties of this extraordinary fungus survived independently. How otherwise are we to explain the name of the fly-agaric in Catalan - *oriol foll*, the 'mad-oriole', the 'oriole' being *Amanita cæsarea* and the fly-agaric thus being the 'fool's *A. cæsarea*'; or the *mujolo folo* around Toulouse, or the *coucourlo fouolo* in the Aveyron, or the *ovolo matto* in the Trentino, all meaning 'mad mushroom'? In the dialect of Fribourg, Switzerland, the fly-agaric is the 'devil's hat', *tsapi de diåblhou*. Eugène Rolland reports *bò* as a designation for any gilled fungus in the Haute Saône and *botet* in the Loire, both presumably meaning originally the Satanic mushroom, by way of *bot*, 'toad' and Satan in Old French. In the Aude two words designate the fly-agaric, *mijoulo folho*, the 'mad-mushroom', and *tuo-mouscos*, the 'fly-killer'; they are synonyms.

6

This discussion of the fungal vocabulary of Europe has finally brought us to the second of the two important mushroomic words of the European languages - *Fliegenpilz* (or *Fliegenschwamm* in the older tongue), the 'fly mushroom' of the Germans and corresponding words in all the other Germanic languages, except English in which I find no trace of the 'fly' figure. The word in the Germanic languages is simply 'fly-mushroom'. In Russian and French the mushroom is popularly called the 'fly-killer'. In Russian *mukhomor* is the only name for this conspicuous and decorative mushroom. In French, as we have seen, *tue-mouche* competes with the more important *fausse oronge*, the 'false Caesar's amanita', and also with the *crapaudin* of the provinces.

In *Mushrooms Russia & History* we gave what for our time was a new explanation of the German 'fly-mushroom': the fly, in our opinion, was certainly the fly of madness, of divine possession. The association of madness with insect activity, and particularly with the fly, *sensu lato*, is exceedingly old and can be documented throughout Eurasia. In the course of our Siberian readings we found Jochelson ⁅21, p. 267⁆ reporting in the Chukotka that if the eater of the fly-agaric vomits, the people believe that the spirits of the demonic mushroom can be found in the vomit as 'worms', which then quickly vanish into the earth. He was speaking of the Koryak. Bogoraz in turn says of the Chukchi ⁅22, p. 277⁆ that the shamans think psychic disturbances are caused by insects, and they use insects in their treatment of mental disorders. The shaman catches an insect from off his drum, swallows it, spits it up, and applies it to the head of the victim. He then sucks the sick man's head. Sometimes the insect is imaginary, sometimes real. This widespread notion that insects cause madness was based, as I will venture to suggest, on a natural phenomenon: the herdsmen saw their reindeer and sheep driven into a frenzy when insects lodged in their nostrils and procreated there, and the animals did not recover until the new generation emerged from the nose.

Bugs, flies, moths, all kinds of larvæ - in short, the insect world - constituted for our ancestors until recent times an order of nature instinct with supernatural powers, mostly malevolent and always awesome. Their strange shapes and stranger behaviour, their incredible numbers and countless kinds, perhaps most of all their undeniable faculty of metamorphosis, may be at the root of this rôle that they played in the thinking of untutored mankind. The fly was divinely possessed and so was the *Fliegenpilz*. Already in the Old Testament the neighbors of the Israelites worshipped Beelzebub, whose name meant the Lord of Flies. In the Greek New Testament, where that heathen god does not appear, the same name was used as a synonym for the Prince of Demons. The Biblical term crops out in modern literature, as in line 1334 of Goethe's *Faust: Wenn man euch Fliegengott, Verderber, Lügner heißt*... 'When one calls you Fly-god, Destroyer, Liar...' In Nordic mythology the god Loki assumes the appearance of a 'fly' to enter the tightly closed apartment of the sleeping goddess Freya. He pricks her, and when she starts, deftly detaches her necklace and steals it. Whatever that 'fly' was, no one thought of it as a housefly, for the housefly does not bite.

In the Middle Ages and the Renaissance it was the convention to represent demons in the shape of flies. Hieronymus Bosch, the greatest of Europe's painters of the demonic world, presents us with a superb illustration of flies in their demonic rôle. We find it in the left hand panel of the Hay Wain, where the momentous events that took place in the Garden of Eden leading up to Man's First Fall are portrayed with moving beauty. We reproduce the upper portion of that panel in Plate XXII, wherein the observer sees that the angels expelled and tumbling down from Heaven assume the form of 'flies' - a diverse lot of winged demons, Beelzebub's host. In recent times the poet echoes this theme skeptically when, a few years ago, he uttered in *The Times Literary Supplement* the following sprightly lines:

> Has Freud not hit the Devil on the snout?
> Is not Beelzebub destroyed by Flit?
> Are we important? Do we really sprout
> Immortal souls that priests may manumit?
> *H. S. Mackintosh, issue of Oct. 2, 1953*.

Sometimes accidents of sound led to confusions in names. In English 'flea' and 'fly' are words of different origins, but the phonetic similarity caused them sometimes to be used one for the other. When in *Henry V* Falstaff lay dying, he saw a 'flea' stick upon the toper Bardolph's flaming nose, whereupon he said it was a 'blacke Soule burning in Hell'. What he saw was of course a fly, and the black soul in hell was, according to the beliefs of that day, its incorporeal counterpart, the Demon domiciled in every fly. Though in English the fly is not linked with the fly-agaric, the supernatural associations of the word survive. The Oxford Dictionary reports that 'fly' has always been a designation for a 'familiar spirit', and one still hears occasionally 'fly' as an adjective meaning nimble, dextrous, sharp, with the suggestion of an uncanny faculty in those directions.

One of the most interesting examples of the Satanic fly in European literature is to be found in that classic of the Danish stage, Ludvig Holberg's *Jeppe of the Hill*, first produced in 1722. Two physicians are conversing. One of them speaks of his Lordship, who has had a strange, ugly dream, which so excited him that he imagines himself a peasant. Whereupon the other physician recalls a remarkable case ten years back: '... a man who thought his head was full of flies. He could not rid himself of the delusion, until a most clever doctor cured him in the following manner. He covered his patient's whole head with a plaster in which he had embedded masses of dead flies. [Query: were they the Spanish flies of the Pharmacopæia?] After a while he removed the plaster and showed the flies to the patient, who naturally believed that they had been drawn from his own head and therefore concluded that he was cured.' Here is a beautiful instance of the way a dramatist (or physician) puts to use an outworn belief that lingers on in the penumbra of man's consciousness: an outworn belief, but one that has survived until only yesterday, as we have just seen, in the Chukchi country.

In the Middle Ages delirium, drunkenness, and insanity were attributed to insects that were loose inside the head of the victim. This belief, strange for the modern mind, survives in many familiar locutions. A man has a bee in his bonnet, a fly (or bug) in his ear, or demonic bats (= 'bots') in his belfry. The Norwegians get flies into their heads or put flies into others' heads. To 'put a bee on someone' means to fix him willy nilly for a given purpose: in this locution the demonic intent is scarcely fossilized. It used to be said in French, when a man was becoming angry, that *la mouche lui monte à la tête*, a fly is climbing up into his head. Down to recent times *avaler les mouches* was a phrase for saying that someone had summoned up his courage, and the flies thus swallowed were of course demonic. Rabelais at the very end of Book IV makes the coward Panurge protest that, far from being afraid, he is braver than if he had eaten all the flies cooked in the pastries of Paris betwixt St. John's Day and All Saints'. There is a colloquial expression that circulates around Lyons and perhaps elsewhere: *Ne prends pas la mouche*: don't catch a fly, don't get excited.

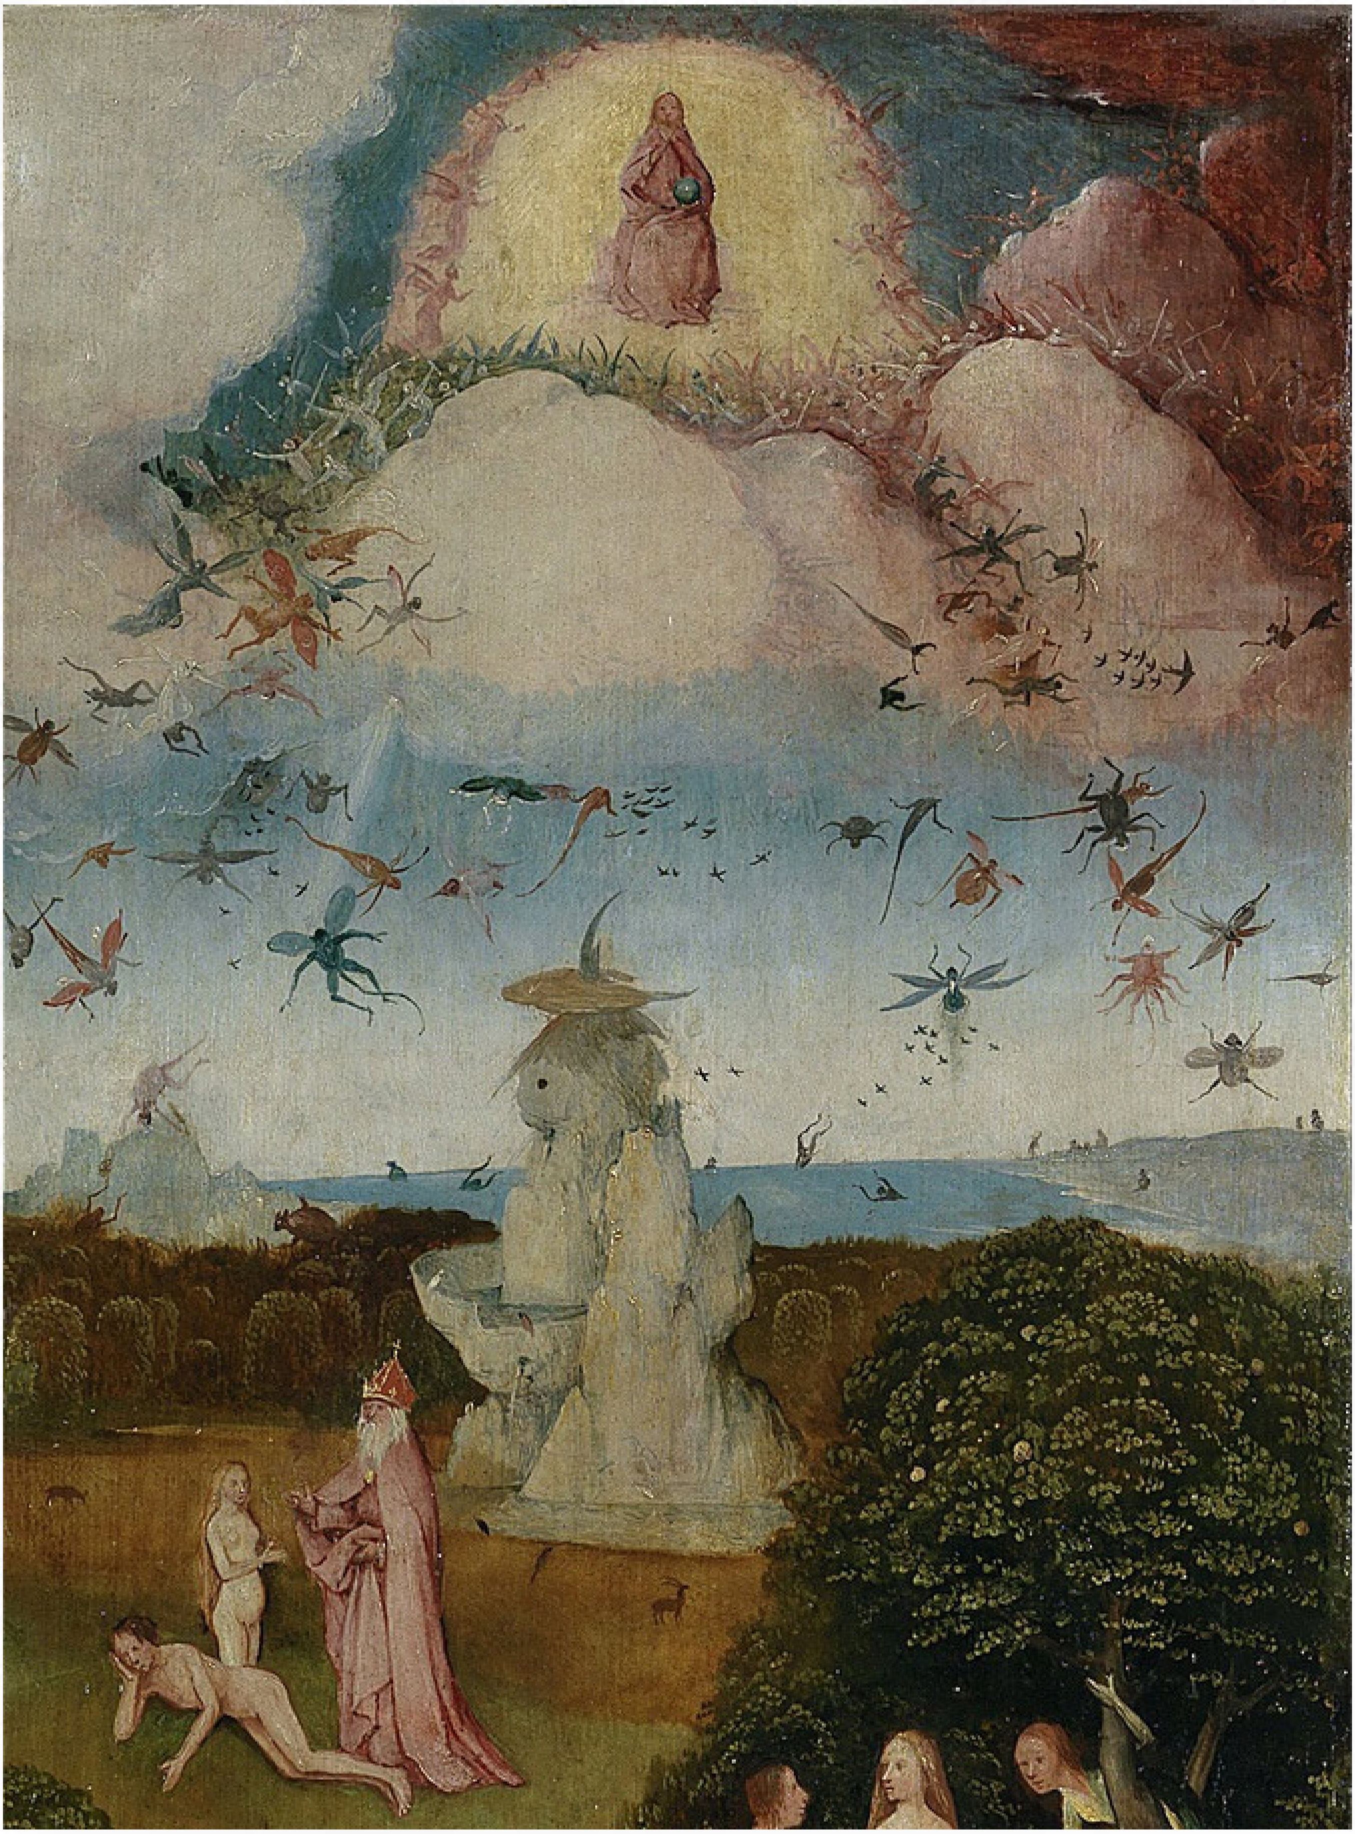

Plate XXII - Hieronymus Bosch: the Hay-wain.
Upper part of left panel of triptych.
(*Courtesy of Prado Museum, Madrid*)

Of a man who is unbalanced one says, *Il a I'araignée dans le plafond*, he has a spider in his ceiling, *i.e.*, in his upper story. The Czechs use an identical phrase: *míti mouchu* (or *pavouka*) *na mozku*, to have a fly (or spider) on the brain. The Italian is apt to say, *Gli è saltata la mosca al naso*, the fly jumped to his nose, that is to say, he became upset. When the Dutch say, *Hij ziet ze vliegen*, he sees them flying, he has bats in the belfry, does not the turn of phrase refer to the 'flies' that he sees? In Russian they say of a man who is tipsy: *on c mukhoj*, so-and-so is 'with fly'. There is a gesture peculiar to the Russians that we feel sure stems from this association of psychic possession with flying insects. The Russian when he suggests having an alcoholic drink is like as not to perform a fillip against his neck below the ear: this is so habitual that it is become a Pavlov reflex. Does not that familiar fillip invoke the demonic 'fly' entering the mind? According to the Icelandic-English lexicon of Cleasby-Vigfusson, under *fluga*, in Icelandic belief sorcerers would bewitch flies and send them to kill their enemies. This explains the modern Icelandic phrases, 'to swallow the fly' or 'to carry the fly', meaning 'to be the tool of another man in a wicked business'. In Basque folklore, sorcerers and other malevolent beings would work their will through demons that assumed the shape of flies, and sorcerers would carry the demonic creatures in a sheath such as anglers use for their flies today.

7

Everyone who knows the first thing about wild mushrooms knows why the fly-agaric is so called: it kills the flies that feed on it and until modern times it was used as a household insecticide on the Continent. This is what all the books say. What is more, there is a large part of Europe where the untutored rustics, the people who read no books, also accept the story as part of their legacy of folk knowledge. It belongs to that curious fund of 'facts' that people keep repeating to each other and believing, without verification or analysis, like the saying that all Russians are good linguists. The area of Europe where our folk belief prevails is extensive but not all-inclusive. It embraces the Slavic world, the Germanic world except the British Isles, the Vosges, where Franco-German bilingualism prevails, and one or two enclaves elsewhere in France. The ancient authors, though they have much to say about the fungi, never refer to a fly-killer, and in modern Italy among the country folk we believe the association with the fly is unknown, but our inquiry has not been exhaustive. It is unknown among the Basques, and apparently to all the rural population of the Iberian peninsula. If we judge by Eugène Rolland's evidence in his *Flore Populaire*, in France the name *tue-mouche*, 'kill-fly', is indigenous only in Alsace and the Aude, though thanks to the mushroom manuals it is now familiar to a sprinkling of educated Frenchmen elsewhere. (Rolland reports that at Val-d'Ajol in the Vosges the natives hang the fly-agaric from the ceiling, where, he says, it draws flies to their death.) By contrast the German *Fliegenpilz* or 'fly-fungus' has its variants in all the German dialects, and also in Dutch and the Germanic languages of Scandinavia, but not in English.

Albertus Magnus, the Universal Doctor of the Church, supplies us with our earliest citations[292] attributing insecticidal properties to the fly-agaric; his writings date from the 13th century. Other learned clerks follow suit down the centuries. They differ in details disconcertingly. The distinguished Carolus Clusius, for example, whom some consider the father of mycology, describes the fly-killing fungi as a genus having five or six species, of which one is the fly-agaric.[293] Clusius was a widely travelled man and he places the use of the fly-agaric for fly-killing only in Frankfort-on-the-Main. The great Linnæus in *Flora Svecica* repeated the statement about killing flies, but instead of Frankfort he said it was a custom in Smolandia, a Swedish province where he had spent his childhood. This is not the only reference to the insecticidal agaric in Linnæus. In his famous *Skånske Resa* ('Journey through Scania') published in 1751, on page 430, he tells how a certain Swede in Upsala got rid of bedbugs from two of his rooms by the use of *Amanita muscaria*. He describes the remedy and then concludes with what we consider a most significant statement:

> One takes in the autumn fresh specimens of the fly amanita, pounds them with a pestle quite small in a jar, lets them stand well closed until they become slimy or like gruel. Then one takes a feather or brush and smears all the cracks and corners where they (the bedbugs) keep themselves, and this procedure is repeated several times at monthly intervals. The room stinks for two or three days, but then the smell disappears. These nasty creatures die of it as if the

---

[292] *De Vegetabilibus*, Book II, Chap. 6:87; Book VI, Chap. 7:345.
[293] *Rariorum Plantarum Historia*, 1601, Genus XII of the Pernicious Mushrooms.

> plague had come amidst them, and whole bug-families perish as if from the Black Death. Although this remedy is simple, it is surer than anything else hitherto invented, and with its aid several houses in Upsala have now become free of bugs.

In a note on the next page Linnæus adds that he has learned of this method for the first time from a Mr. Bern, Cashier of Interests in Upsala. The text is in Swedish.

For us the striking thing about this description is that it is a report on a novelty. Certain families of Upsala were putting the popular reputation of the fly-agaric to a test, and their first impression was enthusiastic. Why had they not been using it for centuries? What were their final conclusions, say five years later? The answers to these questions are not vouchsafed to us. Was not Europe in these last centuries finally reaching a standard of living that made people more impatient with insect pests, and as the older and original meaning of *Fliegenpilz* was being forgotten, were they not now misinterpreting the name, and experimenting here and there to try out the mushroom's insecticidal virtues, only to discover that they were of no practical value?

After Linnæus the references to the fly killing potency of the fly-agaric in mushroomic writings are innumerable. All the mycologists believe in it - with one dissenting voice. None puts it to a test - with one exception. The French mycologist Jean Baptiste Bulliard, in his *Histoire des Plantes Vénéneuses et Suspectes de la France*, which he finished in 1779, dares to strike a sceptical note. Speaking of the fly-agaric, he says:

> I have never noticed that it kills flies, as several authors assert. I have had specimens, raw and cooked, for long periods in my apartment. Flies light on them, and seem even to eat them, without bad effects. But I intend to repeat this experiment with certain new precautions.

We know not the results of the promised experiments, but we know that when Bulliard died in 1793, he held the view that a new scientific name should be bestowed on *Amanita muscaria*, and he suggested '*Agaricus pseudo-aurantiacus*', presumably because he considered the old name false. The mycological world has not deferred to his wishes, nor until the last few years even tested his premises. In the last fifteen years steps have been taken to remedy this. As long ago as 1953, on our suggestion, the mycologist F. E. Eckblad of the Botanical Museum of Oslo, working under Professor Rolf Nordhagen, performed experiments leading him to the tentative conclusion that there was no evidence of insecticidal virtue in the fly-agaric. More recently Professor Roger Heim has supervised experiments by some of his assistants seeking the answer to the problems that we have raised,[294] and work has been in progress also in Switzerland, Japan, and England. It seems that the complex chemical make-up of the fly-agaric varies, perhaps materially so far as the fly-killing and the inebriating constituents are concerned, according to place and season of growth.

Albertus Magnus was relying on hearsay, and so indeed was Linnæus when he quoted a Mr. Bern about bedbugs. Most writers have placed the fly-killing at a distance from themselves in time or place, Clusius in

---

[294] The Eckblad results are in a letter that he wrote me dated Sept. 8, 1953, and that we summarized in *Mushrooms Russia & History*, p. 213.

More recently, the *Revue de Mycologie*, Roger Heim editor, has carried the following articles under the general heading of '*Un Problème à éclaircir: celui de la Tue-mouche*':

Tome XXX (1965), Fasc. 1-2, July 15, 1965:
- L'Amanite tue-mouche, bien ou mal nommée? by Gabrielle Bazanté, pp. 116-121.
- Etude de l'action de l'*Amanita muscaria* sur les mouches, by Monique Locquin, pp. 122-123.

Tome XXX (1965), Fasc. 4, I966:
- L'Amanite tue-mouche nord-américaine n'est pas la *Muscaria*, by Roger Heim, pp. 294-298. This is a *mise au point* of the various forms of *A. muscaria* that have been reported in the journals.

Tome XXXI, Fasc. 3, Nov. 30, 1966:
- Continuation of Gabrielle Bazanté's paper, pp. 261-268.
- Continuation of Monique Locquin-Linard's paper, pp. 269-276.

Tome XXXII (1967), Fasc. 5, July 1968:
- Continuation of Monique Locquin-Linard's paper, pp. 428-437.

For the papers of the Eugster-Waser team in Zürich, the Bowden team in England, and the Takemoto team in Japan, *vide* bibliographies that accompany the papers by Conrad H. Eugster and Peter G. Waser published in *Ethnopharmacologic Search for Psychoactive Drugs*, a volume edited by Daniel H. Efron, Bo Holmstedt, and Nathan S. Kline, 1967, Public Health Service Publication No. 1645; being the 'Proceedings of a Symposium held in San Francisco, Calif., January 28-30, 1967.'

Frankfort, Linnæus in Smolandia, John Ramsbottom in Poland, Bohemia, and Rumania. Mr. Ramsbottom[295] also says that the fly-agaric was 'formerly' used in England and Sweden for killing bedbugs, as though it had been an habitual practice in those places, thus justifying the occasional use of the name 'bug agaric'. But Linnæus was reporting a novelty in Sweden, and 'bug agaric' in English cannot be old, since Linnæus by his great authority imposed the name 'agaric' on the gilled fungi and 'bug' for 'bedbug' is a modernism in the English language. Only Bulliard put the fly-agaric to the test, and his findings were negative. But in support of Bulliard's scepticism we can add a story told to us by a Russian friend, Ekaterina Apollinarievna Bouteneff. Her nurse in childhood was an unlettered peasant woman from the region of Riazan. Our friend remembers having seen this good woman time and again put out a saucer with a crushed cap of the fly-agaric in it, a lump of sugar on top of the fungal mess. This was going to kill the flies, she would always say. But our friend always observed that the flies did not die. When she would ask her nurse why they did not die, the reply was always the same: 'They are sure to die later.'

In the past ten years much work has been done on the chemistry and pharmacology of the fly-agaric by Drs. Conrad H. Eugster and Peter G. Waser of the University of Zürich, Switzerland, and by Dr. T. Takemoto and his colleagues at Sendai University in Japan. An acid has been isolated from *Amanita muscaria* which the Japanese named 'ibotenic', and it possesses slight insecticidal properties. Under favorable conditions flies, imbibing the juice of the freshly cut specimens, fall into a stupor. In the stupor they are apt to succumb to their enemies, but if not, they recover after some hours or even days.

8

Twenty-five years ago we had gathered, Valentina Pavlovna and I, much of the information that has been offered to the reader in this chapter. 'Toadstool' and *Fliegenpilz* were folk-words coming down to us from our remotest ancestors, for whom they were freighted with supernatural meaning. To amplify our information concerning them we set out to explore the primitive cultures of Siberia, with the results that now lie before the reader. This in turn led me to work up and here present an interpretation of certain aspects of the ṚgVeda, and of the Soma that lies at the core of the ṚgVeda. Out of the depths of Asia we gain the vast perspective of an ancient cult, now finally disappearing, and what it must have meant for man's imagination and emotional life in the pre-literate phases of his past. How strange and stirring that the Soma of the Aryans should be linked to the 'toadstool' of our day in subtle ways that no one has suspected until now!

The primordial inebriant of northern Eurasia was the fly-agaric. This was the divine inebriant that inspired the astonishing lyrics of Maṇḍala IX of the ṚgVeda, and the Heroic Hymns of the Vogul in our own time. Through a different set of circumstances the same inebriant was responsible for laying a blight on the mushroom world throughout the English-speaking world. I suppose that the 'toad' figure of the 'toadstool' was peculiarly the property of the Celts, and the tabu must have been enforced by singularly effective religious sanctions. The high reverence that must have accompanied the tabu changed to intense revulsion when the divine inebriant became under the Christian dispensation demonic possession. These are only speculative guesses, of course, but the strength of the tabu even today is impressive. In the English-speaking world there are victims of allergy who are peculiarly sensitive to mushrooms. It is even said that among mycologists there are those who, poor souls, must retrain from eating the objects of their study, for fear of reactions. My wife, who was a physician specializing in allergies and with a large Russian practice, had never heard of a Slav who complained of sensitivity to mushrooms. There have been many distinguished mycologists in the English-speaking world, but would not incomparably more talent have flowed into this field if 'toadstools' had not been of its theme?

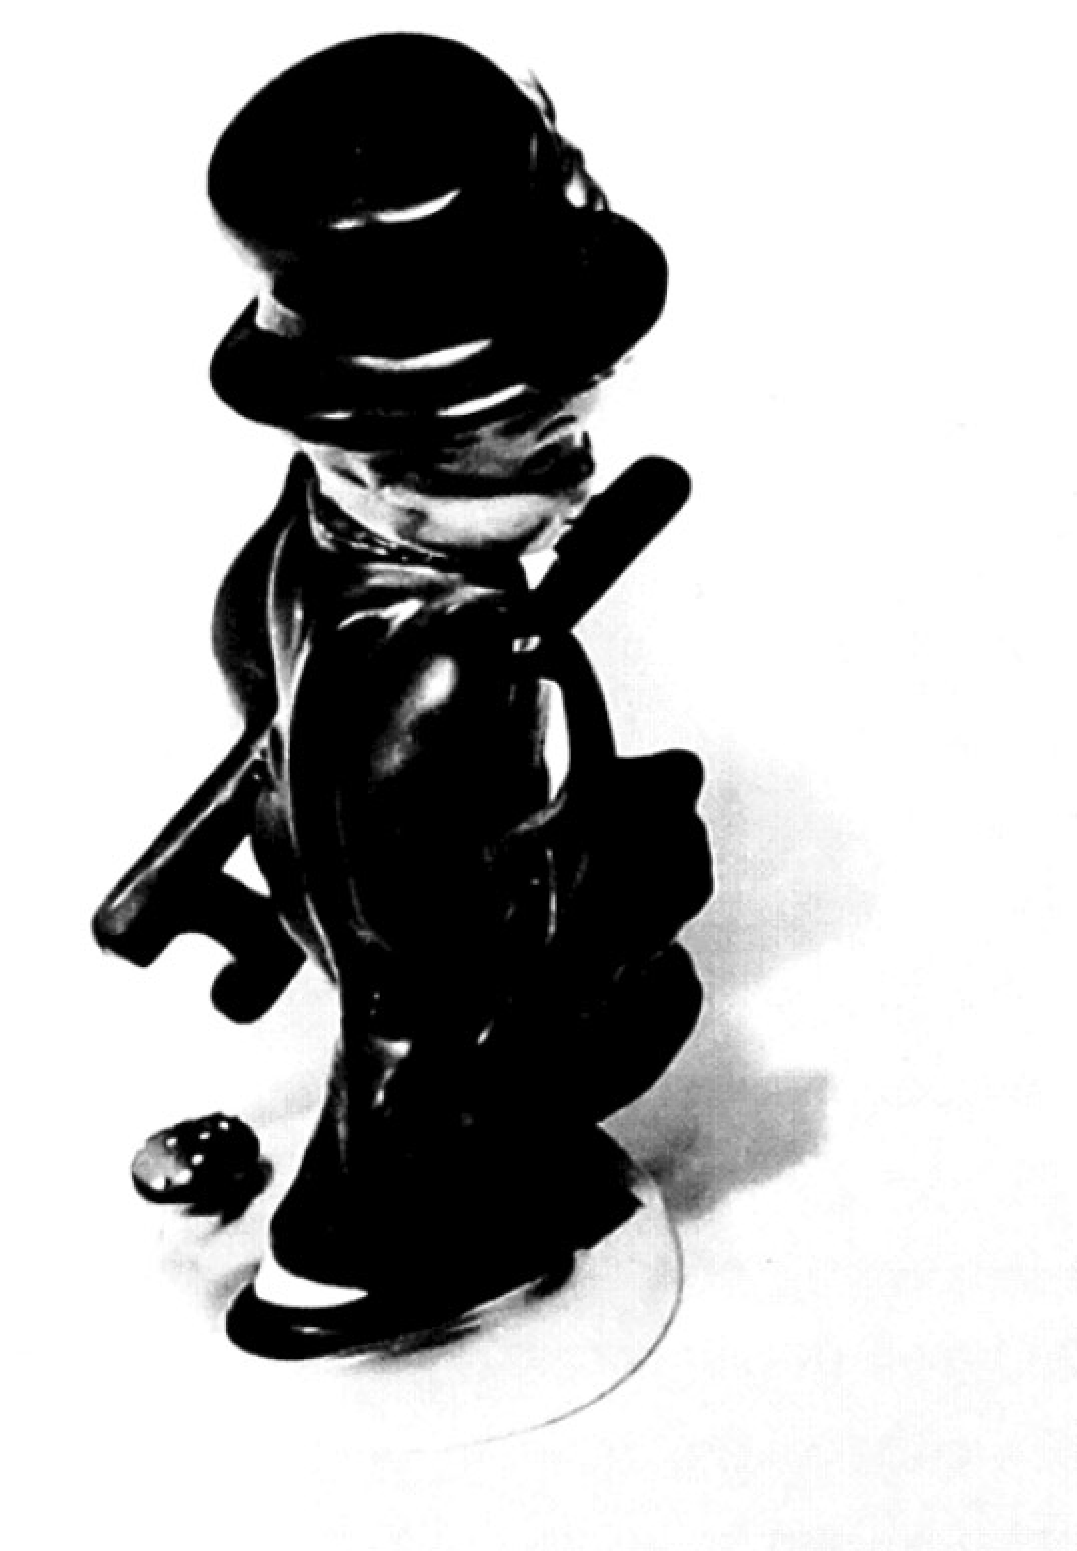
The attitude of the Germanic world has been somewhat different from the English. Whether Albertus Magnus believed the story of the fly-killing mushroom we cannot say. As time has gone on and the world has become increasingly fly-conscious it has become easier to believe that the fly-agaric is so named because it kills flies. Perhaps this alternative explanation served the Church's purpose, diverting attention from the awesome truth. Certainly in recent generations, when with increasing education the fly has come to be considered a pest, this watered-down meaning of the name has completely won the day for mothers, governesses, nursery maids (now called baby-sitters), and children.

---

[295] *Vide* his *Poisonous Fungi*, Penguin Books Ltd., 1945, p. 21.

There is a further distinction to be drawn between the *Fliegenpilz* and the 'toadstool'. No one eats the fly-agaric in Germany, of course, but the attitude toward it is not unfriendly. The red mushroom with white spots appears frequently on greeting cards to convey good wishes and a seasonal message of happy augury, precisely as the *ling chih* is used in China and throughout the Chinese orbit.

A noteworthy thing: this attribute of happy augury belonging to the *Fliegenpilz* is regarded by chimney-sweeps as peculiarly theirs. The chimney-sweep pursues an ancient craft that still lingers on in Central Europe. One occasionally sees its devotees hurrying through the streets of the ancient cities, dressed in their formal black garb, the leader wearing his top-hat, with ladders and brushes, the utensils of their trade. The fire of the hearth is their traditional preoccupation. Has the chimney-sweep made the fly-agaric his own for the same reason that the Vedic poet identified Soma with Agni?



Epilogue: The Tree of Life and the Marvelous Herb

In *Part Three* and the Siberian Exhibits I have laid before the reader evidence for the part played by the fly-agaric as a divine inebriant in the proto- and pre-history of Eurasia. A recapitulation of this evidence will bring out aspects that the more detailed account tended to obscure and will chart the course for further inquiries.

Our surprising discovery in Siberia is linguistic. Just as we of Indo-European stock say today that so-and-so is 'drunk', a word derived from the fermented beverage that we 'drink', and just as we say of the Siberian shaman that he gets 'drunk' on fly-agaric without giving thought to the semantic contradiction, so the corresponding word in the Ob-Ugrian and one (at least) of the Samoyed languages can be translated as 'bemushroomed', and where that word survives it is used for alcoholic inebriation with no awareness of philological anomaly. Moreover we can assert that that word goes back far into the past. The Finno-Ugrian languages and the Samoyed group together make up the Uralic family. There is a characteristic consonant shift between Samoyed and the other languages of the family: an 'f' in Samoyed turns up as 'p' in the others. As the reader will perceive when he reads **[**34**]**, the Ob-Ugrian root *paŋχ* appears as *faŋkáˀam* in Tavgi, a north Samoyed language, both of them connoting inebriation. (This happens to be precisely the same shift that occurs between the Latin and Germanic families, - *e.g.*, the 'p' in *pater* and the 'f' in 'father'.) The cluster of words that interests us shows this characteristic shift, and therefore it was not borrowed at some later time but must go back to common Uralic. According to the weight of scholarly opinion, Uralic ceased to be spoken *ca*. 6000 B. C., or according to some authorities as recently as 4000 B. C. At that remote period there was not yet writing in the world: the Sumerians seem to have been the first to devise a method for making speech visible, and this they did shortly before 3000 B. C.

The use of the fly-agaric as an inebriant therefore dates back to the period when common Uralic was last spoken, but this is the minimum age. There is no reason to suppose that the peculiar virtue of this miraculous herb went for long undiscovered after it became common in the birch and pine forests as these spread over the Siberian plains in pursuit of the retreating ice cap of the last glacial age, *ca*. 10,000 B.C. After all, the first inhabitants probing the northlands were food gatherers, and how could they fail to see this spectacular plant with its solar disk growing around the base of the noble birch? And given their mental equipment and physical appetites, how could they fail to discover and then to take advantage of its inebriating qualities? None of our writers, not even the able anthropologists Bogoraz and Jochelson (who as Russians were surely mycophiles), seem to have discerned the rôle that it must have played in the past of the north-Eurasian peoples. Perhaps the Soviet authorities, now that they are under less pressure from urgent problems, will be disposed to allow able, sympathetic observers to go among the tribesmen and learn what they still know about their former practices with the fly-agaric, the normal inebriant over that vast expanse of the earth's surface for thousands of years.

We must be thankful for the anthropological testimony that we possess but we must not exaggerate its importance. For a shamanic practice that has lasted six, or eight, or ten millennia our soundings reach back only three centuries, ripples on time's surface. Some of the observers were supercilious and none of them saw the implications of their observations. None of them seems to have been prepared in botany and none probed the questions that are compelling for us. The circumstances that brought them on the scene were at the same time bringing about the end of the beliefs and performances for which they were to be the sole witnesses. They were observing the fly-agaric cult only in its dying phase, when the area of its diffusion was being lopped away, when in some places the integrity of belief in it had been undermined, and when the tribes themselves were mostly in a pitiful state of physical and psychological disarray. There is ample evidence that the ethnic movements, often gradual and more or less peaceful, in the inhospitable tundra and taiga of Siberia have been continuous, and we are far from unraveling them. In recent centuries the peoples practicing the fly-agaric cult have been living in areas to the north of where they were in their heyday, some of them on or close to the Arctic Ocean. They have been displaced from their former homes by Altaïc tribes who do not, apparently, take the fly-agaric[296] but who have absorbed into their shamanic practices the corpus of beliefs that go with the

---

296. For this conclusion we rely chiefly on negative evidence. Anthropologists like S. M. Shirokogorov, who specialized in the Tungus and Yakut cultures, make no mention of the fly-agaric. Ivan A. Lopatin, also with extensive personal experience, has assured me in a personal communication that the Tungus shamans know nothing of the practice. *Vide* also Brekhman and Sem **[**42**]** p. 334.

fly-agaric, beliefs that seem to accompany the ecology of the forest belt, especially the reverence for the birch. For the historian of human cultures it is a matter of regret that the impact of the modern world is inevitably brutal, bulldozer-like, in its disregard and contempt for the beliefs and ways of life of primitive peoples whom our industrial civilization wrenches from their traditions and tries, usually without success, to bring into step with our contemporary ideas. This holds true for the communist as well as the capitalist world: witness the authors that we quote in [42].

In northern Europe there is circumstantial evidence that in former times, long before the advent of literacy, the fly-agaric held sway over our own ancestors. This evidence, suggestive but falling short of proof, was enough to launch us on our inquiry, and the collateral confirmation that we found in Siberia buttresses our initial supposition as to our own ancestors. The picture that begins to emerge of a united field in Eurasia where the fly-agaric evoked religious adoration is mightily reenforced by my discovery that the Aryans, hailing from northern Eurasia and settling in the second millennium before Christ on the Iranian plateau and in the Indus Valley, brought down with them as one of their gods the fly-agaric, incorporating it into their elaborate religion of basic Indo-European pattern. The fly-agaric appears to have given those who ate it (or drank its juice) a feeling of elation, of ecstasy, so powerful that they felt they were sharing, for the nonce, the life of the immortals. As we shall see, we think that the renown of this divine inebriant spread far beyond northern Eurasia and the Aryan world. We have already suggested that under the First Emperor of China, Shih-huang, toward the end of the third century before Christ, rumours about the marvelous herb erupted in the Imperial Court and led to the conception of the *ling chih*, the 'Divine Mushroom of Immortality', which the Taoists made peculiarly their own and which survives to this day throughout the orbit of Chinese culture.

There is I think an inference that we may draw: a plant with properties that could be plausibly named the Herb of Immortality responded to one of man's deepest desires in the early stages of his intellectual development. The superb fly-agaric gave him a glimpse of horizons beyond any that he knew in his harsh struggle for survival, of planes of existence far removed and above his daily round of besetting cares. It contributed to the shaping of his mythological world and his religious life.

Now that the hallucinogens are again becoming familiar to us all, perhaps vicariously we are vouchsafed a glimpse into the subjective life of peoples known to us heretofore only by the mute artifacts uncovered by the archæologists. To weigh the effects of those hallucinogens is a formidable task, today rendered doubly difficult (perhaps even impossible) by the emotions they inspire in our own community, not least among the students of religion. Some of these seem loath to admit even the possibility that the hallucinogens encouraged the birth of religion, and may have led to the genesis of the Holy Mysteries. For them the hallucinogens are the abomination of abominations. Moreover, the fixation of our Western world on alcohol, often a stultifying intoxicant and seldom an invigorating one, closes our minds to other inebriants, older perhaps for the race than our fermented drinks and in their effects utterly different.

In the face of the Siberian testimony and the Vedic hymns, I am at a loss to explain what I write down as the partial failure of my own experiments with the fly-agaric. True, these experiments have confirmed that its reputation as a lethal mushroom is only a superstition, a tabu handed down to us from our remote forebears. (I use 'tabu' not as a figure of speech but in its strictest anthropological sense.) But why did we not feel the elation that the writers and poets describe, comparable with what my companions and I experienced after eating the hallucinogenic mushrooms of Mexico? Is there a difference between the fly-agaric of continental Asia and the Japanese and European specimens? This is possible; we must remember that von Langsdorf [10, p. 240] thought the Siberian fly-agaric displayed a 'navel' lacking in the European ones, in short, to use the mycologists' word, that it was 'umbonate'. But it seems unlikely. There was the divergent experience that Rokuya Imazeki once enjoyed, on October 1, 1965, in Sugadaira. (*Vide* p. 75) All the fly-agarics that we have eaten were gathered in October. We find evidence[297] that at the end of the season their potency falls off. We must either greatly increase the dose or try specimens gathered in summer. The affirmative testimony about the fly-agaric in Siberia is compelling, not to speak of the astonishing lyrics addressed to Soma in the ṚgVeda.

---

297. *Vide* Brekhman and Sem [42] p. 335; also [10] p. 247. Dr. Conrad Eugster informs me that chemical analysis shows more ibotenic acid in the fly-agarics gathered in mid-summer.

In her recent little book[298] Miss Barnard has driven home brilliantly the need to seek the genesis of myths in natural phenomena. Let us see how this fits the case of the Tree of Life and the Wondrous Herb of Immortality.

In the Siberian and Altaïc cultures, wherever the birch grows it plays an exalted rôle, sometimes also the pine, more rarely the fir. The tall Siberian birch with its delicate dancing foliage and its dazzling white bark is a thing of ethereal beauty, and this alone is enough to give it a favored place in the affections of the Russians. But beyond the Urals it enlisted more than the affections of the tribesmen: it is the nodal point for their shamanism, for their beliefs about the supernatural. All or almost all of the serious writers about these cultures speak of the conspicuous place of the birch in their practices and thoughts.[299] Yet not one of them links that special place with the fly-agaric. Not one of them perceives why the birch is the Tree of Life.

The fly-agaric lives in mycorrhizal intimacy with the birch, especially the birch; sometimes with the pine, occasionally with the fir. Moreover, while *Fomes fomentarius* grows on several kinds of trees, it is popularly associated with the birch because the birch is the most common of its hosts. *Fomes fomentarius* is the shelf fungus, often reaching huge size, that has always supplied the north Eurasian tribesmen with punk or touchwood, the primary tinder that catches the spark from the fire-drill and bursts into flames. This also has a mystic rôle to play: among many primitive peoples the procreation of fire is analogous to the sexual act. In French 'punk' is *amadou*, a word that goes back to Latin *amare*, and in English a 'punk' until only a few centuries ago was the harlot who sparked her lover into flame. The parallel 'spunk' has to this day the scabrous meaning of 'semen', and 'spark', a different grade of the same word, carries various erotic meanings. We shall see that in Siberia the same associations hold good. In the northern latitudes it was only a ready fire that made life livable and punk (cognate as I have suggested with Ob-Ugrian *paŋχ*, *poŋχ*; with Chukchi *poŋ*) seems to have captured men's emotions. The birch, parent to both fly-agaric and punk, naturally held pride of place as the Tree of Life, providing in punk the key to fire for the body[300] and in the fly-agaric fire for the soul.

What must have been conspicuous facts of nature for the Siberian food-gatherers are almost completely ignored by the Europeans who have visited them. This is not surprising. Europe's intellectuals are largely recruited from the urban culture and are or soon become strangers to the countryside. Of all the writers about the fly-agaric in Siberia that we assemble in the Exhibits, only three mention its connection with the birch. Von Maydell in 1893 wrote of the fly-agaric that 'it is said to occur only among birch trees', and almost a century earlier, in 1809, von Langsdorf observed that 'isolated fly-agarics grow in Kamchatka, in birch forests and on dry plains'. (Probably the 'dry plains' of von Langsdorf were the habitat of the dwarf birch of the Arctic regions, *Betula nana*; for the fly-agaric will grow with any species of birch.) But even von Maydell did not perceive the implications of the accurate observation that he reported as having been made to him by others. Von Dittmar also associated the fly-agaric with birch forests but vaguely.[301] Even the Russians and Poles failed to point out the connection between the fly-agaric[302] and the place of the birch in Siberian folklore. Since 1885 mycologists have recognized the mycorrhizal relationships between certain species of mushrooms and certain species of trees, but this important advance in their science did nothing to broaden and deepen the knowledge of anthropologists because mycologists are prone to keep to themselves, and they often look down their noses

[298] Mary Barnard: *The Mythmakers*, Ohio University Press, 1966.

[299] Here are three secondary works that will introduce the reader to the vast bibliography of primary sources about the place held by the birch among the Siberian peoples:
a. *The Mythology of All Races*, John Arnott MacCulloch, Editor; Vol. IV, *Finno-Ugrian, Siberian*, by Uno Holmberg, Chap. V, 'The Tree of Life'. Archæological Institute of America, Boston, 1927.
b. Jean-Paul Roux: *Faune et Flore Sacrées dans les Sociétés Altaïques*. Adrien-Maisonneuve, Paris, 1966. *Vide* pp. 52-62, 81, 89, 186, 359-361.
c. Mircea Eliade: *Shamanism: Archaic Techniques of Ecstasy*, Bollingen Series LXXVI, Pantheon Books, New York, 1964; pp. XIV, 70, 116-120, 244-246, 403. Translated from the French, *Le Chamanisme: Les Techniques Archaïques de l'Extase*, Payot, Paris, 1951; pp. 9, 78, 116-120, 245-246, 362.

[300] *Vide* **[**4**]**, the Editor's note on *zhagra*, a Russian word for 'punk', p. 238; also Jochelson **[**21**]**, p. 269.

[301] *Vide* **[**12**]**, p. 254; **[**10**]**, p. 247, and **[**13**]**, p. 256.

[302] There is a traditional saying, exceedingly old, in Russian:

Po veleniju shchuch'emu,	On the pike's bidding,
Po prikazu mukhomorovu.	On the fly-agaric's orders.

The pike plays a potent rôle in Russian folklore. Here it is yoked with the fly-agaric. Is this couplet borrowed from a Finnic or Ob-Ugrian people? Do we hear in the fly-agaric's 'orders' a distant echo of the orders of the fly-agaric that are reported in Jochelson and Bogoraz? *Vide* **[**21**]**, pp. 268 ff.; also **[**22**]**, pp. 274 ff.

on 'folklore' about mushrooms as a childish and irrelevant diversion from the grave questions of taxonomy and scientific nomenclature that preoccupy them; and most anthropologists, strangely, seldom study botany and never mycology. I say 'strangely' because plants fill a large part of the universe of the peoples we commonly call primitive.[303]

The birch is preeminently the tree of Siberian shamanism. This is so widely recognized that I need not argue the case and will only summarize it. We read, for example, that among the Buriat northwest of Lake Baïkal the inhabitants bow morning and evening to two birches that they have planted in front of their huts. We read that the birch with seven or eight or nine branches is favoured, these symbolizing the successive gradations in ascending to the ultimate heaven; and it is held that the trees' roots penetrate to the very depths of the earth. As though to symbolize the reach upwards and the reach downwards, an eagle (or a mythological bird that we conventionally call an eagle) surmounts the tree and a serpent dwells at its roots. Again we read that the shaman selects a stout birch, fells it, and places it in the center of the yurt that he is going to build for his performance. He cuts seven or eight or nine notches in it, representing the seven or eight or nine heavens through which he will ascend. Later in the course of his ecstatic performance he climbs this tree making use of the steps, and passes through the hole in the roof through which the smoke from the fire finds its way, going on his symbolic journey to the other world.[304]

Uno Holmberg in the *Mythology of All Races* summarizes the Siberian myths about the birch in his chapter on the Tree of Life. The spirit of the birch is a middle-aged woman who sometimes appears from the roots or the trunk of the tree in response to the prayers of her devotees. She emerges to the waist, her eyes are grave, she has flowing locks, her bosom is bare, and her breasts are swelling. She offers milk to the Youth who approaches her. He drinks and his strength grows a hundred-fold. This myth, which is repeated in myriad variations, clearly refers to the fly-agaric. But none of Holmberg's sources have called this to his attention. What are the 'breasts' but the 'udders' of the ṚgVeda, the swelling pileus of the full-grown fly-agaric? In another tale the tree yields a 'heavenly yellowish liquid.' What is this but the tawny yellow *pávamāna* of the ṚgVeda? Repeatedly we hear of the Food of Life, the Water of Life, the Lake of Milk that lies, ready to be tapped, near the roots of the Tree of Life. There where the Tree grows is the Navel of the Earth, the Axis of the World, the Cosmic Tree, the Pillar of the World. The imagery is rich in synonyms and doublets.

Mircea Eliade believes that this cosmological scheme probably has an oriental origin, or that its mythical features go back to a 'palæoriental' prototype (a toponymic designation that I have difficulty in assigning to a specific location; apparently it lies somewhere between the eastern Mediterranean and China), or (after Uno Harva) that the ensemble of initiation rites among the Siberian tribes comes down from a Mithraïc source.[305] It is the consensus of all who have written on the matter that the Siberians could not have fathered the myths and practices that they have made their own. Or, to put the thought more accurately, the very idea of such a possibility seems not to have been entertained by them.

On the contrary I now suggest that the source and focus of diffusion of all these myths and tales and figures of speech - all this poetic imagery - were the birch forests of Eurasia. The peoples who emigrated from the forest belt to the southern latitudes took with them vivid memories of the herb and the imagery. The renown of the Herb of Immortality and the Tree of Life spread also by word of mouth far and wide, and in the South where the birch and the fly-agaric were little more than cherished tales generations and a thousand miles removed from the source of inspiration, the concepts were still stirring the imaginations of poets, story-tellers, and sages. In these alien lands, far from the birch forests of Siberia, botanical substitutions were made for Herb and Tree. Here is where absurdities were introduced into the legends, where fabulous variations proliferated, where peoples who had never known the North such as the Semites were influenced by the ideas and in one way or another incorporated them into their religious traditions. The end-products of these extravaganzas have caused scholars much (and I think needless) trouble as they subjected them to sober exegesis and tried to reconcile them.

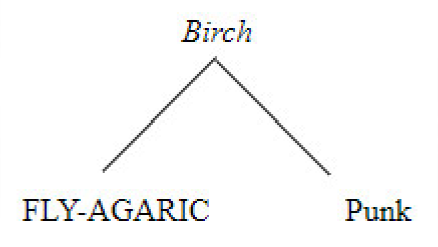
---

[303] There are of course notable exceptions to this criticism of anthropologists; *e.g.*, the studies in ethno-botany carried out by Harold C. Conklin among the Ifugao on the island of Luzón, in the Philippines. *Vide* (1) *Studies in Philippine Anthropology; in honor of H. Otley Beyer*, edited by Mario D. Zamora, pp. 204-262; and (2) 'Ifugao Ethnobotany 1905-1965: the 1911 Beyer-Merrill Report in Perspective', *Economic Botany*, Vol. 21, No. 3, July-September 1967, pp. 243-272.

[304] J.-P. Roux, *Faune et Flore Sacrées dans Sociétés Altaïques*, Paris, 1966, pp. 54, 59. M. Eliade, *op. cit.*, pp. 9, 116-122; French edition, pp. XIV, 116-120.

[305] Mircea Eliade, *op. cit.*, pp. XIV, 245-6, 60-70, 120. French edition, pp. 9, 247, 79, 121.

In the north to this day we find a notable consistency in the myths and poems of the Siberian people, having regard to the facts of nature. Their imagination never takes them more than one or two removes away from the life history of the fly-agaric, the birch (or pine or fir), and punk. The contradictions and wild embellishments begin only when the corpus of myths is translated to the exotic world of the Near East, Mesopotamia, Iran and India, and China; in short when the umbilical cord with the natural phenomena is broken. Here then is nature's triangle:



The fly-agaric holds the place of honour in this Trinity: without it there would be nothing. Its beauty matches its magic powers. The birch is also indispensable. Some will find it astonishing that the Siberian peoples observed and understood, according to their lights, the mycorrhizal relationship, only rediscovered by mycologists in 1885. For the tribesmen the roots of the birch tapped the lake of the Waters of Life and filled to overflowing with tawny yellow milk the breasts of the fly-agaric. The noble stance of the superb birch befitted its rôle as host and divine guardian. The punk is the least of the Trinity, vital in the North but meaningless in the South where other methods for making fire were used. But we must not disregard it. Here for example is a legend about punk that survives in many recensions from Central Asia.

Speaking of the Uighur, a Mongolian tribe, Marco Polo tells us that

> They say of their Khan who first ruled over them that he was not of human origin, but was born of one of those excrescences on the bark of trees, and that we call *esca*. From him descended all the other Khans.[306]

In another version of the same myth we learn that two trees played a part in procreating the royal family of the Uighurs, a birch and an evergreen resembling a pine.[307] *Esca* is the Italian word for 'punk', in Siberia *Fomes fomentarius*.

J.-P. Roux, the latest writer on the rôle of the flora among the Altaïc peoples, raises the inevitable question. Speaking of the place that the birch holds in the shamanic *séances* and at the animal sacrifices, he observes:

> Nothing permits us to think that the tree is chosen because of its capabilities or its appearance or because it acquires by reason of the ceremony the nature of a venerated tree. The only point that merits our attention is perhaps without value, the effect of a simple coincidence: the shamanic tree is most often a birch, that is to say, as everyone knows, a tree whose bark is whitish. With people who accord so great an importance to the colour white, is not the choice of the birch motivated by its flashing bark?[308]

No one had pointed out to M. Roux that the birch is host to the fly-agaric and touchwood. True, the quality of whiteness has an almost magical meaning for the northern Eurasians. But the question presents itself whether this is not secondary, and whether whiteness enjoys its exalted status partly because it characterizes the host to the fly-agaric and punk. Or, to put it differently, the fly-agaric and punk are primary in the hold of the birch on the souls of the natives and it must follow as night the day that the whiteness of the birch is in most fitting and wonderful harmony with its supernal attributes.

---

[306] The Italian text reads:

> Raccontano che il re che li resse per primo non era di origine umana, ma era nato da una di quelle escrescenze che la linfa produce sulla corteccia degli alberi, escrescenze che noi designiamo col nome di esca. - *Il Libro di Messer Marco Polo*, edited by L. F. Benedetto, Treves-Treccani, Milan and Rome, 1932, p. 73.

[307] J.-P. Roux, *op. cit.*, p. 359.

[308] J.-P. Roux, *op. cit.*, p. 186.

The Siberian legends and myths as we possess them were recorded in recent generations. They never cite the link that ties the fly-agaric to the birch. Perhaps this is because for the Siberian tribesmen the connection was self-evident: any cretin would know as much. Students of the Siberian cultures, unaware of the thesis that I am developing, have only by chance, occasionally, asked a few of their Siberian informants a few of the relevant questions, and they have not followed through. The inquirer who goes among primitive people must know the questions to pose, must see the implications of the answers he receives, must probe slowly with utmost patience and tact, especially where religious beliefs and practices are concerned. (The anthropologist has a thankless calling: no matter how thorough he is, his successors are certain to reproach him for not having put all the questions that later seem imperative.) Even so we could hardly ask for better than Holmberg's essay on the Tree of Life in Siberia, as it is presented in the *Mythology of All Races*. The fly-agaric and the Soma hymns of the ṚgVeda supply the key that unlocks the myths of his tribesmen.

The word for 'birch' in Sanskrit is *bhūrja*. Scholars have sometimes expressed mild surprise that the Aryans remembered, after their long migration, this Indo-European name, with cognates in almost all Indo-European tongues; in fact, the birch is, significantly, one of the few trees of which this can be said. The migration of the Aryans must have lasted for generations, even centuries. Yet when they first caught sight of the birch in the Hindu Kush or the Himalayas, we must assume that right away they exclaimed, 'What, the *bhūrja*!' Of course communications with the homeland may have been better in pre-literate Asia than we imagine: we may be victims of the bias of the literate world against periods in man's past about which we know almost nothing. But even if there was complete isolation, *bhūrja* as the Tree of Life held a place in their subjective life that they would not quickly forget. On the other hand *bhūrja* is not mentioned in the ṚgVeda, and Abel Bergaigne a century ago pointed out how trifling was the rôle of the Tree of Life in the Vedic hymns.[309] This should also not surprise us. In the mythological pattern that we are discussing the fly-agaric held the central position and the Tree of Life was secondary. The Indo-Aryans possessed the Marvelous Herb, which they bought from aborigines high in the mountains. With the fly-agaric in hand, what need had they of the birch? What was out of sight was for the moment out of mind. But elsewhere in the Near and Middle East the poets and sages had neither and from the renown of both their imaginations could embroider endless patterns.

On pp. 77-84 we gave three recensions - Indian, Iranian, Chinese - of the same tale going back to the Soma~fly-agaric of the Aryans. These versions came down from the second half of the first millennium after Christ. Thus they were late, and we may ask ourselves how many at that time in the Southern latitudes had knowledge of the fly-agaric. In each of these versions a novel element was introduced: the notion that the leaves of the Herb of Immortality, it placed on corpses, would restore them to life. This absurd accretion was however of ancient provenience: we can trace it back a thousand years before the Vedic hymns were composed, to the Sumerian fragments of the Epic of Gilgamesh.[310] The Soma hymns are unique and precious for their textual integrity, but tales of the Herb of Immortality (that is, of the fly-agaric) long antedate the ṚgVeda.

When man first devised a method of inscribing words on clay, *ca*. 3000 B. C., he poured forth on his tablets, among other items, the ideas that seemed to him deserving of perpetuation, but ideas not necessarily indigenous, derived from sources not necessarily known to the learned men who were shaping the characters. There is a scholarly bias, as understandable as it is mistaken, to trace the origin of ideas according to the literacy of peoples, and sometimes to give to the Near Eastern and Mesopotamian cultures credit for conceptions that they were merely the first to record. This is, I suggest, the case with the Herb of Immortality and the Tree of Life, whose archetypes were brought down from the forests of Siberia in the fourth millennium before Christ or earlier. The Hittites and the Mitanni rulers were Indo-European invaders from the north who preceded the Aryans, and the Sumerians long preceded them, and there were doubtless others even earlier of whom we have no historical knowledge. We must avoid the temptation of supposing that the tribesmen of Siberia could not have possessed a rich world of the imagination simply because, not having mastered the art of writing, they are for us inarticulate. When the Sumerians wrote down the Epic of Gilgamesh, we should not think of it as a fresh creation. It already belonged to the world of mythology and he is a rash scholar who today would say with assurance that that corpus of myths first saw the light of day in the Near East or Mesopotamia.

[309] Abel Bergaigne: *La Religion Védique*, Vol. I, p. 199.

[310] Geo Widengren: *The King and the Tree of Life in Ancient Near Eastern Religion* (King and Saviour IV), Uppsala Universitets Årsskrift 1951:4. Acta Universitatis Upsaliensis; p. 21. In the Near and Middle East graves of prehistoric cultures running back to *ca*. 6500 B. C. have been found in which the corpses were painted with ochre or cinnabar. It has been suggested to me that this practice may have had its origin in the crimson fly-agaric, the Herb of Immortality, and in the notion that the 'leaves' of the sacred *oṣadhi* if placed on a corpse would in some way assure it of Eternal Life.

Was Uno Harva mistaken and did the Mithraïc beliefs and rites come down from the forests of what we now call Siberia? Let us look again at what is known of the Orphic mysteries, and reconsider the archetype of our own Holy Agapé. On what element did the original devotees commune, long before the Christian era? Certainly the overt vocabulary relating to the birch and the fly-agaric carried great prestige over millennia throughout the south and east of Asia: the Tree of Life, the Pillar of the World, the Cosmic Tree, the Axis of the World, the Tree of the Knowledge of Good and Evil - all these were variations stemming back to the birch and the fly-agaric of the northern forests. The Herb (or Plant) of Life, the Herb of Immortality, the fruit of the Tree of Life, the Divine Mushroom of Immortality - these are alternatives ultimately representing the fly-agaric, no matter how far removed the poet or sage or king might be from the real thing. In remote China we have seen the devotees of the Manichæan sect as late as the 12th century eating 'red mushrooms' in such quantity as to arouse the indignation of a pillar of the Chinese Establishment: is not this an echo of Siberian shamanism, not having passed direct from Siberia to China, but tortuously, through successive Middle Eastern religions, until we reach the last of Mani's followers, far from his Iranian home? The Water (or Milk) of Life and the Food of Life are doublets, the former being the *pávamāna* expressed from the latter, the resplendent Soma. If I am right, here is striking confirmation of the ideas advanced by Miss Barnard. When we seek the source of myths, we should *chercher*, not *la femme*, but *un phénomène de la nature*.

In the opening chapters of Genesis we are faced with the conflation, clumsily executed, of two recensions of the fable of the Garden of Eden. The Tree of Life and the Tree of the Knowledge of Good and Evil are both planted in the center of Paradise. They figure as two trees but they stem back to the same archetype. They are two names of one tree. The Fruit of the Tree is the fly-agaric harboured by the birch. The Serpent is the very same creature that we saw in Siberia dwelling in the roots of the Tree.

Of arresting interest is the attitude of the redactors of Genesis toward the Fruit of the Tree. Yahweh deliberately leads Adam and Eve into temptation by placing in front of them, in the very middle of the Garden, the Tree with its Fruit. But Yahweh was not satisfied: he takes special pains to explain to his creatures that theirs will be the gift of knowledge if, against his express wishes, they eat of it. The penalty for eating it (and for thereby commanding wisdom or education) is 'surely death'. He knew the beings he had created, with their questing intelligence. There could be no doubt about the issue. Yahweh must have been secretly proud of his children for having the courage to choose the path of high tragedy for themselves and their seed, rather than serve out their lifetimes as docile dunces. This is evidenced by his prompt remission of the death penalty. ... It is clear that among community leaders the hallucinogens were already arousing passionate feelings: when the story was composed the authentic fly-agaric (or an alternative hallucinogen) must have been present, for the fable would not possess the sharp edge, the virulence, that it does if surrogates and placebos were already come into general use. The presence of the serpent is a happy necessity, for throughout Eurasia the serpent is intimately associated with the fungal nomenclature of the mushroom world, or with particular species of mushrooms, though in nature as it happens they have nothing to do with each other. Only in regions where snakes are unimportant, as in the British Isles, is the serpent replaced by the toad. The toad is then made heir to the curse visited on the serpent, and in turn the toad infects and infests the toadstool. The snake, the toad, and the toadstool are alike chthonic spirits.

If these perceptions are right, then the mycologists were right also, in a transcendental sense of which neither they nor the artist had an inkling, when they saw a serpent offering a mushroom to Eve in the Fresco of Plaincourault. And Ponce de León early in the 16th century was still seeking in Florida the pool of living water that he might have discovered in the Siberian taiga, the pool where Gilgamesh finally found his Herb of Immortality thousands of years earlier, only to lose it again to the Serpent who was more subtle than any beast of the field, the very same Serpent who engaged Eve in pleasant conversation, whose habitation is in the roots of the towering Siberian birch.

Acknowledgements

As everyone who knows me will realize, my dependence on others with specialized knowledge in different fields has been complete. In Sanskrit and Vedic I have enlisted the cooperation of Dr. Wendy Doniger O'Flaherty, and I have consulted Professor Daniel H. H. Ingalls of Harvard University, the late Professor Louis Renou of the Sorbonne, and Professor Georges Dumézil of the Collège de France. For my first steps in this field I am under obligations to Professor Bart van Nooten, now on the faculty of the University of California. In matters of general Indo-European linguistics my friend and revered mentor has been Professor Georg Morgenstierne of Oslo, who has guided my footsteps in the Indo-Iranian field, the Kafir and Dardic languages, and the older tongues of Scandinavia and the Northern Seas. Mrs. Inger Anne Lysebraate, mycologist of Oslo, has volunteered to help me in pointing up the possible references to mushrooms in the early literatures of Iceland and Scandinavia.

For my Chinese inquiries I am indebted to Wango Wêng 翁萬戈, of New York, to Chou C'hi-k'uên 周啟昆, formerly of the faculty of Hong Kong University, better known to his English-speaking friends as Steve Chou, now of Leeds University, to Professor Kao Yao-lin 高耀琳, formerly of Nanking University, now living in Hong Kong, and particularly to Kristofer M. Schipper, élève de l'Ecole Française d'Extrême Orient, who on the occasions of my repeated visits was living in Tainan, Taiwan. Mr. Wêng has written all of the Chinese characters that appear in my book. For guidance in Japanese fungal matters I have had the valuable assistance of Professor Yoshio Kobayaski of Ueno Museum, and of Rokuya Imazeki, co-author with Tsuguo Hongo of the standard manual in two volumes on Japanese mushrooms, an excellent field guide that the English-speaking world has yet to equal.

Dr. János Gulya of Budapest has generously given me days of his time reviewing with me many problems pertinent to my theme in the Uralic (especially the Ob-Ugrian) languages; and Tamás Radványi also, who has served us as a gifted and gracious interpreter. The Publishing Office of the Magyar Academy of Sciences has kindly consented to let me re-publish in English extracts from their *Glaubenswelt und Folklore der Sibirischen Völker*, edited by V. Diószegi and originally published in 1963. I wish also to record here my appreciation of the help given me in former years by the late Dr. Sándor Gönyey, formerly of the Ethnographical Museum of Budapest, and by Dr. Gabriel Bohus, of the Botanical Department of the Museum of Natural History, also of Budapest. Professor Robert Austerlitz managed to find time from the crushing pressure of administrative and teaching duties at Columbia University to guide my steps in matters of Siberian linguistics.

In the area of library research for efficient and intelligent service I thank Marcelle Lecomte Drakert of New York. Miss Mary Mahoney and Mrs. Evelyn Waters of Ridgefield, Connecticut, have laboured long and hard in the preparation of the manuscript for the printer.

The Human Relations Files of New Haven, Conn., were helpful to me in canvassing sources about the remote peoples of Asia, especially of Siberia. I am grateful to them for introducing me to Philip Lozinski; it was he who put me on the trail of St. Augustine and the Chinese Manichæans, and he has shown a continuing interest in my mushroom inquiries.

For a financial grant that aided my travels in the Far East I am beholden to the Bollingen Foundation of New York; and for my appointment as an Honorary Curator of Botany, to the Milwaukee Public Museum and its Director, Dr. Stephan F. de Borhegyi.

The Botanical Museum of Harvard University has graciously appointed me to its faculty as Research Fellow, and the New York Botanical Garden has made me Honorary Research Associate. These dignities have served to open doors for me in the Far East where I had been unknown. It has also been a privilege to enjoy the facilities of these two institutions and to have had access at all times to the guidance and counsel of Professor Paul C. Mangelsdorf, until lately director of the Museum, and of Dr. Richard Evans Schultes, its Curator of Economic Botany and now also the Executive Director of the Museum.

It is always a pleasure for me to express my continuing gratitude to Professor Roger Heim, Membre de l'Institut, for his help in furthering my inquiries. He and his excellent staff at the Laboratoire de Cryptogamie, of the Muséum National d'Histoire Naturelle, seem always delighted to work on my questions, little and big, and the reception that they accord me on my frequent visits to Paris moves me deeply. From the beginning Professor Heim has shown a particular interest in every aspect of my researches into the strange problem of the fly-agaric: he has initiated his own programme of experimental studies, which are being reported from time to time in the *Revue de Mycologie*. In pursuit of our mutual interests he and I have traveled together to the farthest reaches of the inhabited world.

Among those to whom I am beholden for collaboration I cannot refrain from citing Dr. Giovanni Mardersteig of Verona. Eminent typographer, scholar, and artist, he has not only shown endless patience in the printing of my manuscripts: on numerous occasions out of the store of his learning he has contributed to my argument, and he and his family by their kindnesses make my visits to Verona memorable events in my life. What a pleasure it is, when probing the unknown in the cultural history of our race, to be brought into touch with men like Professor Heim and Dr. Mardersteig.

I had hoped that this treatise on the Herb of Longevity would appear in 1966, on the occasion of the 70th birthday of Roman Jakobson, to whom I have dedicated it. But in 1968 it is by two years that much more appropriate. May the Tree of Knowledge, possessed as it is of a private line to the Herb, continue for many years to bestow abundant blessings on a favoured son!

1. The fly-agaric in Siberia

Preliminary Note

We have assembled here the writings of those who have described the practice of eating the fly-agaric in Siberia. In Section A we include explorers, travelers, and anthropologists, as well as a few native folk tales and a Vogul hymn gathered and translated by the anthropologists and linguists. In Section B we have grouped together linguists - mostly Finnish and Hungarian - who give us evidence of a fly-agaric word pattern that presents us with a fascinating aspect of social history. Of the many writers about the peculiar mushroomic habits of the Siberian tribesmen who have passed on the information at second or third hand, we have chosen three for particular reasons to include in our Section C. One is Carl Hartwich, whose *Die menschlichen Genussmittel* set a landmark in the history of pharmacology; it was published in 1911. Another is Professor Mircea Eliade, who enjoys wide renown as a student of the history of religions and religious practices throughout the world. The third is a paper by two Soviet scientists.

Undoubtedly there are primary sources that have eluded us, perhaps important ones. We have searched diligently, but the sea of writings about Siberia is so vast, the sources so widely scattered, that some could easily have escaped our net.

We have arranged the selections roughly in their chronological order.

A. Explorers, Travelers, Anthropologists

[1] Kamieński

> KAMIEńSKI-Dłużyk, Adam. Dyarusz więzienia moskiewskiego, miast i miejsc. (A Diary of Muscovite Captivity, Towns and Settlements) In *Warta*. A collection of articles. Edited by the Rev. A. Maryański. Poznań, Poland. Published in 1874. pp. 378-388; the passage relating to mushrooms is on p. 382.

[This is the earliest report that we have found of fly-agaric eating among the tribesmen of Siberia. It is an entry in the journal of a Polish prisoner of war made in 1658. He is describing the habits of the Ob-Ugrian Ostyak of the Irtysh region in Western Siberia, tributary to the River Ob. - RGW]

... They neither sow nor plow; they live only on fish and fowl of which there is a great wealth there, namely swans, geese, ducks such as we don't have. These very Ostyaki go about in fish skins and they have footwear from the same and parkas from geese and swans. They dwell in camps on islands. They smoke various fish for the winter and tear off the fat from the fish into a birchbark vessel, two vessels full; and they drink it warm by the quart, to our great astonishment. And they make nets from nettles and some have shirts from nettles. They eat certain fungi in the shape of fly-agarics, and thus they get drunk worse than on vodka, and for them that's the very best banquet.

[2] 'Denbei', a Japanese castaway

> OGLOBLIN, N. 'The First Japanese in Russia in 1701-1705.' *Russkaya Starina*. October 1891, pp. 19-24.

[This article in the Russian review contains as Section V the story of 'Denbei', the first Japanese to arrive in Russia. He came from Osaka; and his vessel after leaving Yedo (Tokyo) in the last years of the 18th century was thrown off course by storms. The crew finally sighted Kamchatka and took refuge in the estuary of a small river. The natives, who are called in the text Kuril Islanders, took three of the Japanese prisoners, of whom two later died, Denbei being left. The Russian explorer Atlasov, passing that way, heard tell of the prisoner, and the latter was led to him. After further vicissitudes Atlasov took him to Moscow where he was presented to Peter the Great, who insisted that he learn Russian and that he teach his own language - Japanese - to a few Russians. He gave an account of what had happened to him. Though he learned some Russian and could make himself understood in the language of Kamchatka, his account is filled with discrepancies attributable to errors in communication. 'Denbei' is the name of this Japanese merchant in the Russian transcription: his Japanese name is unknown to us. His testimony is almost, but not quite, worthless. We have included it for the sake of completeness and because it establishes the earliest date on record when the Russian Imperial Court was apprised of the Siberian practice of eating the fly-agaric. In telling of his misfortunes among the inhabitants of Kamchatka, he had this to say, according to the Russian text. - RGW]

They [the natives of Kamchatka] place their fish in pits, covering them on top with twigs and grass, and when the fish turn all mouldy, they put them into wooden troughs, add water, and heat this concoction with hot stones, also mixing in some fly-agarics. They drink this brew, and treat their guests with it, and get drunk on it. However he [Denbei] and his companions could not drink this concoction but ate roots and fish which were not yet too mouldy.

[3] von Strahlenberg

> STRAHLENBERG, Filip Johann von. An Historico-Geographical Description of the North and Eastern Parts of Europe and Asia; But more particularly of Russia, Siberia, and Great Tartary; etc. ... London. 1736. Second printing, 1738. Originally published in Stockholm in 1730. Translated also into French. p. 397 of the English edition.

[Von Strahlenberg was a Swedish Colonel who passed twelve years in Siberia as a prisoner of war. He was chiefly in Tobolsk where he assembled much accurate and valuable information about the peoples of Siberia. He is describing the practices of the Koryak tribe in the extreme northeast of Siberia. - RGW]

The Russians who trade with them [Koryak], carry thither a Kind of Mushrooms, called, in the Russian Tongue, Muchumor, which they exchange for Squirils, Fox, Hermin, Sable, and other Furs: Those who are rich among them, lay up large Provisions of these Mushrooms, for the Winter. When they make a Feast, they Pour Water upon some of these Mushrooms, and boil them. They then drink the Liquor, which intoxicates them; The poorer Sort, who cannot afford to lay in a Store of these Mushrooms, post themselves, on these Occasions, round the Huts of the Rich, and watch the Opportunity of the Guests coming down to make Water; And then hold a Wooden Bowl to receive the Urine, which they drink off greedily, as having still some Virtue of the Mushroom in it, and by this Way they also get Drunk. In Spring and Summer they catch a large Quantity of Fish, and digging Holes in the Ground, which they line with the Bark of Birch, they fill them with it, and cover the Holes over with Earth. As soon as they think the Fish is rotten and tender, they take out some of it, pour Water upon it, and boil it with red-hot Pebbles (as the Finnlandians do their Beer) and feed upon it, as the greatest Delicacy in the World. This Mess stinks so abominably, that the Russians who deal with them, and who are none of the most squeamish, are themselves not able to endure it. Of this Liquor they likewise drink so immoderately, that they will be quite intoxicated, or drunk with it.

[4] Krasheninnikov

> KRASHENINNIKOV, Stepan. Opisaniye Zyemli Kamchatki. (Description of Kamchatka Land) St. Petersburg. 1755.

[Translations into English, French, and German appeared in the 18th century. We have had made a fresh translation from the Russian, finding that the 18th century translations corrupted the meaning and shortened the text. The edition that we used was edited under the auspices of the Soviet Academy of Sciences, with notes, and published in Moscow and Leningrad in 1949. - RGW]

Chapter 14
CONCERNING THE FEASTS AND GAMES OF KAMCHATKA

They hold feasts whenever the people of an *ostrog* [stockade] wish to entertain their neighbors, especially whenever there is a wedding or some successful trapping venture, and these are spent, for the most part, in overeating, dancing, and singing. On such occasions the guests are treated by their hosts to large goblets of *opanga* so generously that they have to vomit more than once.

Sometimes for their enjoyment they also use the *mukhomor*, the well-known mushroom that we ordinarily use for poisoning flies. [*Mukhomor* - fly-agaric] It is first soaked in must of *kiprei* [*Epilobium angustifolium*], which they drink, or else the dried mushrooms are rolled and swallowed whole, which method is very popular.

The first and usual sign by which one can recognize a man under the influence of the *mukhomor* is the shaking of the extremities, which will follow after an hour or less, after which the persons thus intoxicated have hallucinations, as if in a fever; they are subject to various visions, terrifying or felicitous, depending on differences in temperament; owing to which some jump, some dance, others cry and suffer great terrors, while some might deem a small crack to be as wide as a door, and a tub of water as deep as the sea. But this applies only to those who overindulge, while those who use a small quantity experience a feeling of extraordinary lightness, joy, courage, and a sense of energetic well-being, such as the Turks are said to experience when they have partaken of opium.

It is worth noting that all those who have eaten the *mukhomor* unanimously affirm that all their extravagant actions at the time are carried out on orders of the *mukhomor*, which secretly commands them. But all their actions are so harmful to them that, if there were no one to look out for them, not many of them would remain alive. Concerning excesses of the Kamchadals, which happen among them, I will make no mention, since I have not witnessed any personally and the Kamchadals do not like to talk about this; but then it could be, too, that it does not come to such extremes among them, either because they have become accustomed to the *mukhomor*, or because they do not use it to excess. However, in respect to the Cossacks who have eaten the above mushroom, I shall report some wild behavior, some of which I personally have witnessed, and some of which I heard from the perpetrators of those actions, or from other trustworthy persons.

An orderly of Lieutenant-Colonel Merlin who was with the investigation in Kamchatka was commanded by the *mukhomor* to strangle himself under a delusion that this would cause other people to admire him. This, in fact, might have come to pass, had not his friend restrained him.

Another of the local residents [Cossacks] had a vision of Hell and a terrifying fiery chasm into which he was to be cast; for which reason, following the orders of the *mukhomor*, he was forced to get down on his knees and confess all the sins that he could remember committing. His friends, of whom there were many in the common room where the intoxicated man was confessing, heard this with great amusement, while he seemed to believe that he was confessing his sins in the privacy of the sacrament to God alone. Because of this he was made the butt of much deliberate ridicule, since, among other things, he related some things which should have best remained unknown to others.

A certain soldier, they say, used to eat the *mukhomor* in moderate quantities whenever he had to go on a long journey, and thus was able to cover great distances without any fatigue; but, ultimately, having indulged to the point of delirium, he crushed his own testicles and died.

The son of a Cossack from Bolsheretsk, who was in my employ as an interpreter, had been made drunk on *mukhomor* without his knowledge, and attempted to cut his own abdomen on the *mukhomor*'s orders, from which he was barely saved in the last minute, for his hand was restrained in the very act.

Kamchadals and settled Koryaks also eat *mukhomor* while planning to kill somebody. Incidentally, among the settled Koryaks the *mukhomor* is held in such high esteem that those who are intoxicated are not allowed to urinate on the ground but are furnished by others with a dish for this purpose, which urine they drink and also do wild things like those who have eaten the mushroom; for they get the *mukhomor* from Kamchadals, as it does not grow in their own country. Four mushrooms, or less, constitute a moderate use, but for a high degree of intoxication up to ten mushrooms are usually consumed.

Members of the female sex neither indulge in eating to excess nor partake in *mukhomor* consumption, owing to which all their amusements consist of talking, dancing, and singing ...

[In the above account Krasheninnikov tells of four Europeans who ate the mushroom. Three were certainly exhibitionists, such as make a show of themselves in the West with alcohol. The third, who is said to have died, was reported as hearsay. Krasheninnikov was a careful author, and he concedes that such extravagant behaviour may not occur among the natives. He adds that the Kamchadal and the settled Koryak eat the fly-agaric 'while planning to kill somebody'. He gives no examples and as no subsequent writer, not even his own colleague Steller, repeats the statement, much less documents it, we may disbelieve this. Krasheninnikov wrote early and is of historical importance but we possess later informants immeasurably better equipped to tell us about the tribesmen. This single sentence, familiar to Ödman [*vide infra*, **[**43**]**) may be responsible for the belief that berserk-raging came out of Siberia. But Krasheninnikov nowhere makes mention of wild ferocious behaviour suggestive of berserk-raging. - RGW]

[In 1949 a definitive edition of Krasheninnikov was published by the Soviet Academy of Sciences, edited by Lev Semenovich Berg. In this edition Berg shows himself aware of the cultural significance of the fungi in the Kamchadal society in a note, p. 236, on a passage in Krasheninnikov where the latter speaks of the Kamchadal as 'omnivorous creatures, for they pass by neither *zhagra* nor *mukhomor*, though the former has no taste and does not satisfy hunger, and the latter is obviously harmful'. Berg's footnote on this passage follows: - RGW]

The Kamchadal... will pass by neither *zhagra* nor *mukhomor*. *Zhagra*, according to the Dictionary of Dal', is another name for punk, touchwood, tree fungus, Polyporaceæ. Referred to here is the white agaric (family Polyporaceæ), which grows on trees. The body of the fungus Fomes sp. was formerly used as tinder; some of them have medicinal application. Certain species of the genus Polyporus are edible. Concerning the use of the variety of fungi Polyporus that grows on birch trees (*der weisse Baum-Schwamm* in German) for alimentary purposes, Steller has this to report (p. 92): the Kamchadal knock them off birches with sticks, break them up with axes, and eat them frozen. S. Yu. Lipshitz and Yu. A. Liverovskiy (1937, p. 197) report that ashes of the fungus Polyporus (Polyporus sp.) are used in Kamchatka as snuff. Concerning the use which the Kamchadal make of the 'birch tinder' as a pain killer, Krasheninnikov reports on p. 443. Concerning fungi Polyporus of Kamchatka see: A. S. Bondartsev: *Fungi of the Family Polyporaceæ, Telephoreæ, and Hydneæ, Collected in Kamchatka by V. P. Savich*. (From the Expedition to Kamchatka of F. P. Ryabushinskiy. Botanical Series, Part 2, Moscow, 1914. pp. 525-534.) The most wide-spread fungus in Kamchatka is *Fomes igniarius* (L.), harmful to rock birch, white birch, alder, and aspen. *Fomes fomentarius* (L.) is found on both varieties of birch. There are many other species of this genus and also other genera. Of the genus Polyporus in Kamchatka, *Polyporus sulfureus* (Bull.) is found on the larch and *P. varius* Fries on the poplar.

Steller also reports (pp. 92-93) on the use of the *mukhomor* (fly-agaric) as an intoxicant by Kamchadal, Koryak, and Yukagir. See also L. S. Berg, *Discovery of Kamchatka* ..., Third Edition, 1946, pp. 163-164.

[*Zhagra* in Russian is a synonym of *trut*, the former being derived from a root 'to burn' and the latter from 'to rub'. Both mean primarily *Fomes fomentarius*, the shelf fungus that grows on many trees but that is primarily linked with the birch because the birch is its commonest host in the forest belt of Eurasia. Many species of fungus have been used as the primary tinder in the making of fire, but for 'touchwood' or 'punk' *Fomes fomentarius* has enjoyed primacy from the beginning. At Star Carr in Yorkshire quantities of *Fomes fomentarius* were found in the site of a settlement dating from 9,000 to 10,000 years ago, some still attached to birch logs, along with flint. The touchwood was adjacent to the hearthstones. (*Vide* J. G. D. Clark and others: *Excavations at Star Carr*, Cambridge University Press, 1954, pp. 17-18; also E. J. H. Corner: 'Report on the Fungus-Brackets from Star Carr, Seamer,' in the 'Preliminary Report on the Excavations at Star Carr, Seamer, Scarborough, Yorkshire', *The Prehistoric Society*, XVI, 1950, pp. 123-4.) The British Isles were still attached to the Continent by land, and the site was early Mesolithic, apparently a temporary camp of hunters, not long after the last ice age. The culture was the same as had been previously described at Maglemose (the 'Great Bog'), Denmark, where also *Fomes fomentarius* was found adjacent to the hearth stones. (*Vide* N. Fabritius Buchwald and Sigurd Hansen: 'Om Fund af Tøndersvamp fra Postglacialtiden i Danmark', *Danmarks geologiske Undersøgelse*, IV Række, Bd. 2, Nr. 11, 1934.)

[The fungus that the Kamchadal knock off birches and then eat frozen is certainly different, probably *Polyporus betulinus*, a soft, white, rather spongy or rubbery growth on the birch, without much taste, which is sometimes eaten raw or cooked by mycophiles in Europe and the United States. - RGW]

[5] Steller

> STELLER, Georg Wilhelm. Beschreibung von dem Lande Kamtschatka, dessen Einwohnern, deren Sitten, Nahmen, Lebensart und verschiedenen Gewohnheiten. (Description of Kamchatka, its Inhabitants, their Customs, Names, Way of Life, and Different Habits) Leipzig. 1774. pp. 92-93.

[Steller, a member of the Krasheninnikov expedition, stayed on and later published a valuable account of his life in Kamchatka. - RGW]

Among the mushrooms the poisonous fly-agaric (in Russian *muchamoor*, in Italmen [Kamchadal] *ghugakop*) is highly valued. In the Russian settlements this habit has been lost for a long time. However, around the Tigil and towards the Koryak border it is very much alive. The fly-agarics are dried, then eaten in large pieces without chewing them, washing them down with cold water. After about half an hour the person becomes completely intoxicated and experiences extraordinary visions. The Koryak and Yukagir are even fonder of this mushroom. So eager are they to get it that they buy it from the Russians wherever and whenever possible. Those who cannot afford the fairly high price drink the urine of those who have eaten it, whereupon they become as intoxicated, if not more so. The urine seems to be more powerful than the mushroom, and its effect may last through the fourth or the fifth man. Despite the fact that I have personally made these observations in 1739, some people have contradicted my experiences. I have therefore taken great pain to establish the truthfulness of what has been recorded here. Reports from persons whose authority cannot be attacked have confirmed my findings. Thus a man from the lower gentry named Kutukov, having to guard the reindeer herd, has noticed that these animals have frequently eaten that mushroom, which they like very much. Whereupon they have behaved like drunken animals, and then have fallen into a deep slumber. When the Koryak encounter an intoxicated reindeer, they tie his legs until the mushroom has lost its strength and effect. Then they kill the reindeer. If they kill the animal while it is drunk or asleep and eat of its flesh, then everybody who has tasted it becomes intoxicated as if he had eaten the actual fly-agaric.

[6] Georgi

> GEORGI, Johann Gottlieb. Russia: or, A Compleat Historical Account of all the Nations which Compose that Empire. London. 1780. First published in German in St. Petersburg, 1776-1780. pp. 189-190.

Their drink [of the Ostyak] is water, broth, and fish-soups, a great deal of milk, and brandy whenever they are rich enough to buy any. The Ostyaks are very fond of getting drunk; and, as they have but seldom the means of procuring strong liquors for that purpose, they get intoxicated by smoking a great quantity of strong tobacco, and by chewing a kind of mushroom called the fly mushroom. ... Numbers of the Siberians have a way of intoxicating themselves by the use of mushrooms, especially the Ostyaks who dwell about Narym. To that end they either eat one of these mushrooms quite fresh, or perhaps drink the decoction of three of them. The effect shews itself immediately by sallies of wit and humour, which by slow degrees arises to such an extravagant height of gaiety, that they begin to sing, dance, jump about, and vociferate: they compose amorous sonnets, heroic verses, and hunting songs. This drunkenness has the peculiar quality of making them uncommonly strong; but no sooner is it over than they remember nothing that has passed. After twelve or sixteen hours of this enjoyment they fall asleep, and, on waking, find themselves very low-spirited from the extraordinary tension of the nerves: however, they feel much less head-ache after this method of intoxication than is produced by spirituous liquors; nor is the use of it followed by any dangerous consequences.

★

From the author's chapter on the 'The Yakoutes' , Vol. 2, p. 394:

They never wash their hands or any part of their person. Their skin-sacks that hold the milk stink abominably, and communicate a horrid taste to their contents. In the summer season they drink so much koumiss, and smoke tobacco so constantly, that they are frequently drunk. When they intend to get fuddled in a decent manner, they endeavour to procure the Russian brandy; but, as they are but seldom able to obtain it, they supply this want by mushrooms of an inebriating quality, as the Ostyaks, and several other people of Siberia do.

[So far as I know, this is the only passage in the Siberian texts that attributes the eating of the fly-agaric to the Yakut, whose language belongs to the Altaïc family. Perhaps fringe settlements of Yakut had taken to the habit from their neighbors, *e.g.*, the Yukagir, who apparently in the 18th century were still eating the *mukhomor*. (Sten Bergman's statement **[**27**]** about the Lamut addiction to the fly-agaric falls into the same category of isolated testimony.) Or in Georgi's case he may simply be mistaken. His book with its wealth of detail about the peoples of Siberia holds the reader's attention but it is exasperating in that it is inadequately documented: the reader usually does not know what the author observed personally and what he took from others, nor who the others were nor whether they were reliable. The diaries of his travels in Siberia would be most interesting, but we do not know whether they survive. - RGW]

[7] de Lesseps

> LESSEPS, Jean Baptiste Barthélemy, Baron de. Journal historique du voyage de M. de Lesseps. ... Paris. 1790. Translated into German and English. The English edition appeared in 1790 in two volumes in London, entitled 'Travels in Kamchatka, during the Years 1787-1788'. The following is from the English edition, Vol. 2, pp. 90-91 and 104-5.

[How supercilious and superficial are this French aristocrat's remarks about the fly-agaric, which he seems not to have recognized as a mushroom common in his own country. - RGW]

Their passion for strong liquors, increased by the dearness of brandy, and the difficulty of procuring it on account of their extreme distance, has led them to invent a drink, equally potent, which they extract from a red mushroom, known in Russia as a strong poison by the name of *moukhamorr*.[311] They put it in a vessel with certain fruits, and it has scarcely time to clarify when their friends are invited to partake of it. A noble emulation inflames the guests, and there is a contest of who is best able to disburden the master of the house of his nectar. The entertainment lasts for one, two, or three days, till the beverage is exhausted. Frequently, that they may not fail of being tipsy, they eat the raw mushroom at the same time. It is astonishing that there are not more examples of the fatal effects of this intemperance. I have seen however some amateurs made seriously ill, and recovered with difficulty; but experience does not correct them, and upon the first occasion that offers, they return to their brutish practice. It is not from absolute sensuality, it is not from the pleasure of drinking a liquor, that by its flavour creates an irresistible craving for more; they seek merely in these orgies a state of oblivion, of stupefaction, of total brutishness, a cessation of existence, if I may so call it, which constitutes their only enjoyment, and supreme felicity.

★

... On the eve of their magic ceremonies, they pretend indeed to fast all the day, but they make up for this abstinence at night by a profusion of the *moukamorr*, the intoxicating poison I have described, which they eat and drink to satiety. This preparatory intoxication they consider as a duty. It is probable that they feel its effects the next day, and that they derive from it an elevation of spirits that contributes to derange their minds, and give them the necessary strength to go through their extravagant transports.

---

[311] It is used in the Russian houses to destroy insects.

[8] Sarychev

> SARYCHEV, Gavriil Andreevich. Achtjährige Reise im Nordostteil Sibiriens das Eismeer und den Östlichen Ozean (1785-1793). (An Eight-Year Voyage in Northeastern Siberia, on the Arctic Ocean and the Northeast Pacific) Leipzig. 1905-15. Translated from the Russian original published in 1802 in St. Petersburg. pp. 274-5.

[There is no direct reference to the fly-agaric, but on pp. 274-5 of the reprint published in 1954 we find a curious report of the death of two reindeer in the Chukchi country. Their death is attributed to an excessive intake of human urine. It sounds as though the urine in question was impregnated with the metabolite of the fly-agaric. - RGW]

In the last few days the Chukchi have had two dead reindeer and take the cause to be that they had given them too much human urine to drink. They give them some from time to time in order to make them strong and improve their staying-power. The fluid has the same effect on the reindeer as intoxicating drink has on people who have fallen victim to the drinking habit. The reindeer become just as drunk and have just as great a thirst. At night they are noisy and keep running around the tents in the expectation of being given the longed-for fluid. And when some is spilled out into the snow, they start quarreling, tearing away from each other the clumps of snow moistened with it. Every Chukchi saves his urine in a sealskin container which is especially made for the purpose and from which he gives his reindeer to drink. Whenever he wants to round up his animals, he only has to set this container on the ground and slowly call out 'Girach, Girach!', and they promptly come running toward him from afar.

[9] Kopeć

> KOPEć, Joseph. Dziennik ... (Diary of a Journey Along the Whole Length of Asia...; in Polish) Wrocław. 1837. An amplified text was published in Berlin, in 1863, from which this translation from Polish, done by Prof. Wiktor Weintraub, was made. pp. 198-202.

[Joseph Kopeć, a Brigadier in the Polish army, was a man of letters. According to Professor Wiktor Weintraub of Harvard University, he was mentally unbalanced and prone to exaggeration but in spite of his weaknesses his good faith can be relied upon. He was not a liar and he ate the mushrooms. The year is 1797 or perhaps 1796. Kopeć is in Kamchatka. He is ill and running a fever. He arrives with his companions at a native settlement covered with snow-drifts and enters the yurt, as is customary, through the opening at the top of the roof from which the smoke of the fire emerges. He then describes what happens. - RGW]

Hardly a few moments had passed when a sudden change of air brought about a great change in my sick body. The air of this closed *yurta*, always stinking, mixed with the acrid scent of whale-fat used as lamp oil, made me so weak that I thought the hour of my death would strike. Thus abandoning the fire and tea I called for my evangelist in the hope of getting some help from this man, a bit more educated, as I understood, than other people in the art of healing. After having learned about my mishap, the evangelist comes a little later, he approaches the fire, and ordering me to sit up he tells me first to drink my tea. While I am doing this, the Kamchadals bring from the middle of the tent a large number of ermine hides and deer skins. Feeling a bit revived, I ask what is the meaning of this. To which the evangelist, complying with my curiosity, says to me:

'Before I give you the medicine, I must tell you something important. You have lived for two years in Lower Kamchatka but you have known nothing of the treasures of this land. Here,' opening some birch bark in which a few mushrooms were wrapped, 'are mushrooms that are, I can say, miraculous. They grow only on a single high mountain close to the volcano and they are the most precious creations of nature.'

'Take into account, Sir,' the evangelist goes on, 'that the hides brought by local people I receive as gifts in exchange for these mushrooms. They would even give all their possessions, had I many of them and if only I sought to take advantage of the situation. These mushrooms have a special and as though supernatural quality. Not only do they help the man who uses them but he sees his own future as well. Since you are weak you should eat one mushroom. It will give you the sleep you are lacking.'

Hearing so many strange things about the merits of that mushroom, I was in doubt for a long time whether I should make use of it. However, the wish to recover my health and above all to sleep overcame my fears, and so I ate half my medicine and at once stretched out, for a deep sleep overtook me. Dreams came one after the other. I found myself as though magnetized[312] by the most attractive gardens where only pleasure and beauty seemed to rule. Flowers of different colours and shapes and odours appeared before my eyes; a group of most beautiful women dressed in white going to and fro seemed to be occupied with the hospitality of this earthly paradise. As if pleased with my coming, they offered me different fruits, berries, and flowers. This delight lasted during my whole sleep, which was a couple of hours longer than my usual rest. After having awakened from such a sweet dream, I discovered that this delight was an illusion. I was distressed that it had disappeared, as if it had been true happiness. These impressions made pleasant for me the few hours that remained until the end of the day. Having receive such bewitching support from the miraculous mushroom and even having been fortified by sleep such as I had not had for a long time, I started to have confidence in its supernatural qualities (as my evangelist had taught me to do), and with the approach of night I asked my physician for a second helping. He was pleased with my courage and at once bearing the offering of his friendly benevolence, he gave me a similar whole mushroom. Having eaten this stronger dose, I fell soundly asleep in a few minutes. For several hours new visions carried me to another world, and it seemed to me that I was ordered to return to earth so that a priest could take my confession. This impression, although in sleep, was so strong that I awoke and asked for my evangelist. It was precisely at the hour of midnight and the priest, ever eager to render spiritual services, at once took his stole and heard my confession with a joy that he did not hide from me. About an hour after the confession I fell asleep anew and I did not wake up for twenty-four hours. It is difficult, almost impossible, to describe the visions I had in such a long sleep; and besides there are other reasons that make me reluctant to do so. What I noticed in these visions and what I passed through are things that I felt I had seen or experienced some time before, and also things that I would never imagine even in my thoughts. I can only mention that from the period when I was first aware of the notions of life, all that I had seen in front of me from my fifth or sixth year, all objects and people that I knew as time went on, and with whom I had some relations, all my games, occupations, actions, one following the other, day after day, year after year, in one word the picture of my whole past became present in my sight. Concerning the future, different pictures followed each other which will not occupy a special place here since they are dreams. I should add only that as if inspired by magnetism I came across some blunders of my evangelist and I warned him to improve in those matters, and I noticed that he took these warnings almost as the voice of Revelation.

It is not for me to argue about the usefulness and the influence on human health of this miraculous mushroom. But I can state that its medical usefulness, had it been known among more educated peoples, should have earned it a place among so many known remedies of nature in the matter of fighting human maladies. Can anyone deny that in spite of our vast knowledge (relative to our forces) of natural phenomena, there still exist almost countless phenomena about which we can only guess? Can one put a limit to nature at a point that delimits the possibilities of inquiries and discoveries of human research? Innumerable effects of recently discovered magnetic forces, effects that cannot be detected by physical means nor pinpointed with any degree of precision to some specification on the human body, seem to reconcile in some measure the controversy concerning this mushroom. It is then possible that in the sleep brought by the influence of this mushroom, a man is able to see at least some of his real past and if not the future at least his present relations. If someone can prove that both the effect and the influence of the mushroom are non-existent and erroneous, then I shall stop being defender of the miraculous mushroom of Kamchatka.

Whatever may be the nature and qualities of the above-mentioned mushroom, I must confess that the taking of it had a powerful effect on my mind, as well as a strong impression [on my senses], so that I grew disquieted to a certain degree, from which passing into anxiety I became finally gloomy. This credulity having even the power of faith was based first of all on the conviction of the evangelist that my truthful visions were a true warning of heaven, and, secondly, on a conviction coming from within me, when later I perceived, being awake, the confirmation of what the dreams had predicted. This led me to have confidence in the dependability of my dreams about the future. However, as time passed, during my travels, this faith started to slacken and when its influence on my mind ended, a peace of soul returned to me together with better health.

---

312. When Kopeć wrote, 'magnetism' had recently caught the attention of scientists and intellectuals in Europe: this explains his usage of the word. - RGW.

[10] von Langsdorf

> LANGSDORF, Georg Heinrich von. Einige Bemerkungen, die Eigenschaften des Kamtschadalischen Fliegenschwammes betreffend. (Some Remarks Concerning the Properties of the Kamchadal Fly-Agaric) Wetterauischen Gesellschaft für die gesammte Naturkunde. Annalen, Vol. I, No. 2, Frankfurt M. 1809. pp. 249-256. Paper submitted by the author in French to the Russian Imperial Academy of Sciences in St. Petersburg.

The plant kingdom is of immeasurable influence and usefulness for mankind, since it supplies most of our clothing, food, drink, and shelter. The medical science of primitive peoples consists entirely in their knowledge of the more or less efficacious plants, and everyday experience confirms the fact that even a number of plants native to our own regions are known to many uneducated nations almost more thoroughly than they are to us.

To demonstrate this assertion, I should like to say at this point something about the nature and effects of the fly-agaric, which we regard as extremely poisonous but which is used by various inhabitants of northeastern Asia as an intoxicant just as wine, brandy, arrack, opium, kava, and the like are used by other nations. During my stay in Kamchatka I had the opportunity to gather detailed information on the effects of this mushroom, and today I shall try to tell you the most important points as briefly as possible.

Ordinarily it would be necessary first to make a closer examination of the nature of the mushroom, in so far as possible, and thereby show whether, and to what extent, the mushrooms found in those areas differ from our own.

However, since time is too short at this moment, I shall not give any detailed description of the ordinary fly-agaric and shall confine myself to pointing out that, at least on the basis of four dried specimens which I brought with me from Kamchatka and of a drawing made there by Privy Councillor Tilesius, it does appear that some difference exists between Kamchadal mushrooms and those of our own country: the Kamchadal mushroom has a cap with a navel-like protuberance in the middle, its stalk seems to grow thicker towards the base, and, in particular, the lamellæ may be yellowish rather than white. However, since this cannot be stated with any certainty until the living mushroom has again been observed in Kamchatka, we shall regard it for the time being as a special variety:

Amanita muscaria var. *Camtschatica*.

Isolated fly-agarics grow almost everywhere in Kamchatka, in birch forests and on dry plains. They are found most abundantly in the central part of the peninsula, especially around Vishna Kamchatka and Milkova Derevna. In some years they are seen in great numbers, but in others they are extremely scarce.

The Kamchadals gather them usually during the hottest months of July and August; they maintain that those that dry by themselves in the earth, on the stalk, and that are somewhat furry and velvety to the touch on the under side of the cap have a far stronger narcotic effect than those picked fresh and strung up to dry in the air.

The size is variable, with diameters ranging from 1-1½ to 5-6 inches.

The smaller mushrooms, which are bright red and covered with many white warty protuberances, are said to be far stronger in narcotic power than the larger ones, which are pale red and have few white spots.

Since the establishment of closer contacts with the Russians, the Kamchadals have taken particularly to drinking vodka and have left the consumption of fly-agarics to their wandering neighbors, the Koryaks, for whom they gather the fly-agarics and trade them very profitably for reindeer.

The usual way to consume fly-agarics is to dry them and then to swallow them at one gulp, rolled up into a ball, without chewing them; chewing fly-agarics is considered harmful, since it is said to cause digestive disturbances.

Sometimes these mushrooms are cooked fresh and eaten in soups or sauces, since they then taste more like the usual edible mushrooms and have a weaker effect, so that when the mushrooms are prepared in this way, a larger amount can be eaten without harmful results. Occasionally, too, fly-agarics are soaked in berry juice, which one may thereafter drink at his pleasure as a genuine intoxicating wine. Juice squeezed from bilberries (*Vaccinium uliginosum*) is said to be most suitable for this purpose because it heightens the intoxicating effect, so that one may expect to achieve a more potent result with a smaller quantity.

The body's predisposition or susceptibility to the intoxicating effect of fly-agarics apparently is not the same at all times, since the same person may sometimes be very strongly affected by a single mushroom and at other times remain completely unaffected after eating twelve to twenty of them. Ordinarily, however, one large fly-agaric or two small ones are enough to make an enjoyable day.

The narcotic effect is also said to be heightened by the drinking of large quantities of cold water afterwards.

The narcotic effect begins to manifest itself about a half hour after eating, in a pulling and jerking of the muscles or a so-called tendon jump (although sometimes these effects appear only after an hour or two); this is gradually followed by a sense of things swimming before the eyes, dizziness, and sleep. During this time, people who have eaten a large quantity of mushrooms often suffer an attack of vomiting. The rolled-up mushrooms previously swallowed whole are then vomited out in a swollen, large, and gelatinous form, but even though not a single mushroom remains in the stomach, the drunkenness and stupor nevertheless continue, and all the symptoms of fly-agaric eating are, in fact, intensified. Many other persons never vomit, even after eating copiously of the mushrooms.

The nature of the ecstasy or drunkenness caused by the fly-agaric resembles the effects of wine and vodka to the extent that it renders unconscious the persons intoxicated with it and arouses in them feelings that are mostly joyful, less often gloomy. The face becomes red, bloated, and full of blood, and the intoxicated person begins to do and say many things involuntarily.

In the milder stages, as I have said, there are tendon jerks, but in the more advanced stages there are jerky movements of the limbs, and then the intoxicated persons often appear to be dancing and making the most outlandish pantomime movements with their hands. Similarly, the head and neck muscles are also in a constantly convulsive state; if a person has eaten musrooms to excess, he goes into genuine convulsions.

According to their own statement, persons who are slightly intoxicated feel extraordinarily light on their feet and are then exceedingly skillful in bodily movement and physical exercise.

The nerves are highly stimulated, and in this state the slightest effort of will produces very powerful effects. Consequently, if one wishes to step over a small stick or a straw, he steps and jumps as though the obstacles were tree trunks. If a man is ordinarily talkative, his speech nerves are now in constant activity, and he involuntarily blurts out secrets, fully conscious of his actions and aware of his secret but unable to hold his nerves in check. In this condition a man who is fond of dancing dances and a music-lover sings incessantly. Others run or walk quite involuntarily, without any intention of moving, to places where they do not wish to go at all.

The muscles are controlled by an uncoordinated activity of the nerves themselves, uninfluenced by and unconnected with the higher will-power of the brain, and thus it has occasionally happened that persons in this stage of intoxication found themselves driven irresistibly into ditches, streams, ponds, and the like, seeing the impending danger before their eyes but unable to avoid certain death except by the assistance of friends who rushed to their aid. In this intense and stimulated state of the nervous system, these persons exert muscular efforts of which they would be completely incapable at other times; for example, they have carried heavy burdens with the greatest of ease, and eye-witnesses have confirmed to me the fact that a person in a state of fly-agaric ecstasy carried a 120-pound sack of flour a distance of 10 miles, although at any other time he would scarcely have been able to lift such a load easily.

But the strangest and most remarkable feature of the fly-agaric is its effect on the urine. The Koryaks have known since time immemorial that the urine of a person who has consumed fly-agarics has a stronger narcotic and intoxicating power than the fly-agaric itself and that this effect persists for a long time after consumption. For example, a man may be moderately drunk on fly-agarics today and by tomorrow may have completely slept off this moderate intoxication and be completely sober; but if he now drinks a cup of his own urine, he will become far more intoxicated than he was from the mushrooms the day before. It is not at all uncommon, therefore, that drunkards who have consumed this poisonous mushroom will preserve their urine as if it were a precious *liqueur* and will drink it as the occasion offers.

The intoxicating effect on the urine is found not only in the persons who have eaten the fly-agaric itself but also in every person who drinks the urine. Among the Koryaks, therefore, it is quite common for a sober man to lie in wait for a man intoxicated with mushrooms and, when the latter urinates, to catch the urine secretly in a container and in this way to obtain a stimulating drink even though he has no mushrooms.

Because of this peculiar effect, the Koryaks have the advantage of being able to prolong their ecstasy for several days with a small number of flyagarics. Suppose, for example, that two mushrooms were needed on the first day for an ordinary intoxication; then the urine alone is enough to maintain the intoxication on the following day. On the third day the urine still has narcotic properties, and therefore one drinks some of this and at the same time swallows some fly-agaric, even if only half a mushroom; this enables him not only to maintain his intoxication but also to tap off a strong liquor on the fourth day. By continuing this method it is possible, as can easily be seen, to maintain the intoxication for a week or longer with five or six fly-agarics.

Equally remarkable and strange is the extremely subtle and elusive narcotic substance contained in the fly-agarics, which retains it effectiveness permanently and can be transmitted to other persons: the effect of the urine from the eating of one and the same mushroom can be transmitted to a second person, the urine of this second person affects a third, and similarly, unchanged by the organs of this animal secretion, the effect appears in a fourth and a fifth person.

For still another remarkable observation concerning the nature of the fly-agaric I am indebted to Steller, who, in his description of the Kamchatka region [p. 240] states the following: 'It was related to me by reliable people, among both the Russian and the Koryak nation - indeed, by a man from the lower gentry named Kutukov, who has charge of the Cassa reindeer herd - that reindeer often eat this mushroom, among others (for they have a great appetite for mushrooms), after which they fall down and thrash about for a while as if they were drunk and then fall into a deep sleep. When the Koryaks find a wild reindeer, therefore, they tie its feet until it has slept off the effects and the mushroom has lost its potency, and only then do they kill the reindeer; for if they killed such an animal while it was sleeping or still raving, everyone who ate its flesh would go into a similar frenzy, as if he had actually eaten the fly-agaric himself.'

Although I made great efforts to find out something about the harmful or possibly deadly effects of the fly-agaric, I could not obtain any satisfactory information on the subject.

The Koryaks greatly prefer fly-agarics to the Russians' vodka and maintain that after eating fly-agarics a man never suffers from headaches or other ill effects.

It is true that in extremely rare cases (of which no one could recall any specific example) persons who consumed an extraordinarily large quantity of the mushrooms are said to have died in convulsions, senseless and speechless, after six or eight days. However, it is not reported that moderate consumption ever produced any harmful after-effects.

If, contrary to expectations, immoderate consumption of fly-agarics should nevertheless be followed by pressure on the stomach or some other disturbance, two to three spoonfuls of fat, blubber, butter, or oil are reputed to be an infallible remedy that can relieve any ill effects.

There are some people in Kamchatka who drink a glass of bilberry [*Vaccinium uliginosum*] juice in which fly-agarics have been soaked whenever they have a stomach-ache, colic, or other ailment and who regard it as a universal remedy; however, I was not able to ascertain whether the consumption of fly-agaric is followed by constipation or diarrhœa or by an increase or decrease in the urine.

I was also unable to obtain any satisfactory answer when I asked whether the taste or smell of the urine had been changed - everyone was probably ashamed to admit that he had drunk his own urine or somebody else's. Nevertheless, it strikes me as not improbable that fly-agarics, like turpentine, asparagus, and other things, impart a special, possibly quite pleasant, smell and taste to the urine; by analogy, it would be worth investigating whether other narcotic substances, such as opium, *Digitalis purpurea*, cantharides, *etc*. also retain their properties in the urine.

The nature of the fly-agaric, therefore, offers the scientist, physician, and naturalist a great deal of food for thought: our *materia medica* might perhaps be enriched with one of the most efficacious remedies, and judicious physicians might find in the fly-agaric the most potent remedy to apply to the body in cases of paralysis and other diseases of the extremities.

[11] Erman

> ERMAN, Adolph. Reise um die Erde durch Nord-Asien und die beiden Oceane in den Jahren 1828, 1829 und 1830 ausgeführt. (A Journey around the World through Northern Asia and both Oceans in 1828, 1829 and 1830) Berlin. 1833-48. p. 223.

[The author speaks of the fly-agaric among the Kamchadal and Koryak peoples. - RGW]

My companions had eagerly been gathering fly-agaric (*Amanita muscaria* Esenb.; in Russian, *mukhomor*, *i.e.*, fly pest) both in the woods through which we had ridden in the morning and now at the foot of the Northern Baidar mountains. Because of its brilliant red color they caught sight of every one of them from afar and this always caused a sudden halt in our caravan which at first surprised me. They now confirmed what had already been told me in Tigilsk about the intoxicating properties of this mushroom and said that it was not eaten in Sedanka but only gathered for the Koryaks, who in wintertime often paid a reindeer for a single dried piece. *Mukhomor*, they said, was much rarer in northern Kamchatka and the Koryaks had only learned about its properties because the meat of reindeer which had eaten it had an effect that was as intoxicating as the mushroom itself. It was this experience that had caused them to use it most sparingly and with maximum advantage and here was why they even collected the urine of persons who had managed to come by a *mukhomor*, and mixed it with their drink as an intoxicant that was still very effective.

★

P. 259. On the same day I tasted for the first time a plant eaten by all Kamchadals, learning in the days that followed to appreciate it - in addition to other fine qualities - for the ease with which it could be carried because of its unusual lightness, and with which it could be used since it required no preparation. I am referring to a felt-like substance made from the stalks of the so-called *kiprei* (*Epilobium angustifolium*). Several of the stalks are laid on top of one another and squeezed and beaten in layers two to three inches wide so that the sweet sap inside penetrates the green bast and the pieces of woody cortex; thereafter this turns into firm dark-green pleasant-smelling strips made up into lengths of four to six feet and the width already mentioned. These are eaten raw but always smeared with butter or seal fat, and, with this addition, I too now found them palatable, easily digestible and nourishing.

The example of the Russians [from the southern tip of Kamchatka] had caused the Yelovka natives to try an agricultural experiment during this same year, for they had planted some potatoes on a plot between their houses. The plants seemed, however, in a very sad state, owing no doubt to incorrect cultivation, and on part of the plot they had already been replaced by much more carefully tended mushrooms. These belonged to Toyon's wife, who had picked them in the woods in the Spring and transplanted them when they were tiny, and now she pointed out to me with special pride the big size of their scarlet caps and their many white spots, which are considered to presage a powerful effect. She spoke with the most unrestrained enthusiasm of her love for this intoxicant, and I noticed she had a glassy look in her eyes and copper-red cheeks, which no doubt came from excessive indulgence although I did not see the same symptoms in many other mushroom-eaters I met later.

★

Pp. 304-306. Thereafter in one of those open places in the woods we gathered twenty mushrooms, to the immense joy of the older of my companions who, as an enthusiastic devotee of this intoxicant, again praised its powers and its benefits. He affirmed, from his own experience, the most varied effects of this mushroom on herbivorous animals: wild reindeer that have eaten some of them are often found so stupefied that they can be tied with ropes and taken away alive; their meat then intoxicates everyone who eats it, but only if the reindeer is killed soon after being caught; and from this it appears that the communicability of the narcotic substance lasts about as long as it would have affected the animals' own nerves. He also said that this mushroom intoxication had a quite different effect from alcoholic drunkenness, since the former put the Kamchatka natives into a peaceful and gentle (*skromno*) mood, and they had seen how differently the Russians were affected by spirits.[313]

... There is no doubt, however, about a 'marvellous increase in physical strength,' which the man from Yelovka praised as still another effect of mushroom intoxication. 'In harvesting hay,' he said, 'I can do the work of three men from morning to nightfall without any trouble, if I have eaten a mushroom.' Of the various ways of using *mukhomor* he said that the best was the simplest way, *viz*., drying it, swallowing it raw, and washing it down with water. On the other hand, the Russians of Klynchevsk, who according to him pick whole packhorse loads of this valuable plant, prepare an extract by decocting it in water, and try to take away its extremely disgusting taste by mixing the extract with various berry juices.

★

P. 312. Sept. 5. Although all we could boast of were a few exertions, but no unusual adventures, our old hunter nevertheless felt himself entitled to be rewarded with the pleasures of intoxication. Immediately after our arrival he exchanged some of the mushrooms we had gathered for dry ones, of which he at once swallowed three small pieces (one and one-half mushrooms) and washed them down with water. When it is fresh, the *mukhomor* is so sticky and of such loose consistency that it is hard to swallow without chewing. This, however, makes the unpleasant taste of the *mukhomor* so disgusting that it is considered impossible to cope with any real quantity of them in this condition.

The strong will that is here displayed in order to obtain pleasant excitation is even more striking when one observes that this sets in only long after the narcotic is used and certainly not without troublesome transition. Thus, a good hour after he had eaten the mushrooms they had shown no effect on his mood, and he told me then that he would have to lie down quietly and sleep till the next morning in order to see the most pleasant things, some of them in dreams while asleep and others after waking next day.

[12] von Maydell

> MAYDELL, Baron Gerhard von. Reisen und Forschungen im Jakutskischen Gebiet Ostsibiriens in den Jahren 1861-1871. (Journeys and Investigations in the Jakutskaia Oblast' of Eastern Siberia in 1861-1871) Published as Vol. 1-2 in Series IV of Beiträge zur Kenntniss des Russischen Reiches und der angrenzenden Länder Asiens, St. Petersburg. 1893. Vol. 1, pp. 298-300.

At the Paren' I also obtained some dried fly-agaric (*Amanita muscaria*), which is very highly prized among the Koryaks for its intoxicating effect. It is not eaten in the fresh state, in which it is believed to be poisonous, but always hung up to be smoked until it is shriveled and quite dry so that it will keep well. It is said to occur only among birch trees and hence is confined to a few localities, among which I heard Penzhinskoye and Markovo mentioned in particular. When a Koryak consumes the fly-agaric, he chews the dried mushroom and then drinks it down with water. After a while he becomes greatly stimulated, converses with people whom he sees although they are not there at all, tells them with much satisfaction about his great wealth, and so on. He can also be asked questions by the people present, and he will sometimes answer them quite sensibly but always with reference to the things which he imagines and which, in his intoxication, seem real to him. During the intoxication he is quite capable of walking from place to place without staggering, but the mushroom seems to produce a peculiar effect on his optic nerves which makes him see everything on a greatly enlarged scale. For this reason it is a common joke among the people to induce such an intoxicated man to walk and then to place some small obstacle, such as a stick, in his way. He will stop, examine the little stick with a probing eye, and finally jump over it with a mighty bound. Another effect of the mushroom is said to be that the pupils become much enlarged and then contract to a very small size; this process is said to be repeated several times. When the drunken man has sobered up, he feels no bodily discomfort at all but only regrets that his beautiful visions have given way to harsh reality; in reply to questions he will say that he has been in pleasant company, that he was the owner of fine herds, and the like. However, the effect of the mushroom seems to differ from that of opium: the visions are not of an erotic nature; instead the mushroom produces only a feeling of great comfort, together with outward signs of happiness, satisfaction, and well-being. Thus far the use of the fly-agaric has not been found to produce any harmful results, such as impaired health or reduced mental powers; this is probably due to the fact that, in general, the Koryaks are seldom able to indulge their passion for the mushroom, since it is found only in a few places, and even there only in small quantities.[314]

---

[313] ... As to the effects of *mukhomor* on the Russians who always ate too many of them (up to ten mushrooms, whereas I never saw a Kamchadal use more than two), Krasheninnikov tells of some cases in which the most intense excitement ended in the fury of the intoxicated man directed against himself. According to him, a young Cossack from Bolsheretsk, after eating many mushrooms, was restrained with difficulty from putting a knife into his abdomen, while another actually killed himself by self-castration. [*Vide* **[**4**]** - RGW]

The Chukchis - at least those I have encountered - were completely unacquainted with this intoxicant; however, it was said in Markovo that when the people of the town happened to be unable to get brandy, they would sometimes resort to eating fly-agarics.

[13] von Dittmar

> DITTMAR, Carl von. (Karl von Ditmar) Reisen und Aufenthalt in Kamtschatka in den Jahren 1851-1855. (Journey and Sojourn in Kamchatka in 1851-1855) Published as Vol. 8 in Series 3 of Beiträge zur Kenntniss des Russischen Reiches und der angrenzenden Länder Asiens. St. Petersburg. 1900. Part II, Section 1, pp. 98-100.

Finally, I should mention one other plant of this region of meadows and birch forests which plays a role in the life of the peoples living here. This is the fly-agaric, *Amanita muscaria*, which the local inhabitants often call *mukhomor*. These mushrooms are fiery red with many large white spots; they are not rare and can be recognized from far away in the rich green of somewhat shady and damp places. The Kamchadals themselves have little use for the mushrooms, but they like to gather them in order to sell them in a dried state to the Koryaks and Chukchis, who buy them eagerly. Although this mushroom is a great favourite in the North, it appears not to occur there at all, or at least to be a great rarity; however, the intoxicating and nerve-stimulating effect of the *mukhomor* is known far and wide among the Northern peoples, and they are very fond of it. Both Koryaks and Chukchis like to carry with them a small box made of *Betula nana* in which they carry small bits of chopped-up dried fly-agaric, so that they may have their favorite intoxicant always ready to hand. Another such box contains tobacco, which they enjoy in three different ways - smoking it, chewing it, and taking it as snuff. On the other hand, the *mukhomor* is only chewed, and the juice is then swallowed. The mushroom plays an important role at every celebration, especially among the shamans, but it is also very frequently enjoyed at other times by anyone who has become addicted to this pleasure and can no longer get along without it, just as the alcoholic cannot get along without his alcohol or the opium-addict without his opium. Anyone who indulges freely in this pleasure soon becomes a slave to it and is willing to give anything to enjoy the intoxication again.

Mukhomor-eaters describe the narcosis as most beautiful and splendid. The most wonderful images, such as they never see in their lives otherwise, pass before their eyes and lull them into a state of the most intense enjoyment. Among the numerous persons whom I myself have seen intoxicated in this way, I cannot remember a single one who was raving or wild. Outwardly the effect was always thoroughly calming - I might almost say, comforting. For the most part the people sit smiling and friendly, mumbling quietly to themselves, and all their movements are slow and cautious. Walking seems to be uncomfortable to them, although they are quite capable of it. They have a glassy, almost imbecilic look in their eyes, as if they scarcely noticed their surroundings, and their facial features are somewhat distorted. People generally claim that the effect of the mushroom poison becomes more intense and more beautiful when it has already passed through another organism. Thus an intoxicated man will often be followed by someone else who wants to collect his urine, which is supposed to possess this effect to a particularly high degree. Similarly, the meat of reindeer that have accidentally eaten of the mushroom is said to possess the intoxicating effect in a very pleasant form. The use of the *mukhomor* seems to be a very old practice, since all the early authors, such as Pallas and Krasheninnikov, tell the same and similar stories.

---

[314] I was told of only one fatal case that resulted from eating fly-agaric but it was explained as having been due to the fact that the man in question - a Russian - had taken fresh instead of dried mushrooms in rather large quantities.
The mushroom has a surprising effect on urine; *i.e.*, it seems as if the intoxicating effect of the narcotic contained in the mushroom passes principally into the urine. It is a well-known fact that as soon as a Koryak feels that his state of intoxication is beginning to ebb, he drinks his own urine if he has no more mushrooms, and the effect is restored. This cannot be repeated, however, for the urine has no effect a second time. I was told about a man who, while riding with a Koryak, stopped at a yurt near which a man, another Koryak, was sitting. He was thoroughly intoxicated and therefore in a very happy mood. The Koryak who had been riding naturally asked him for a piece of mushroom, which the latter deeply regretted he could not give because he had none left. However, he went and urinated, and then gave the product to his guest, who drank it all and now became intoxicated also. After a little while the host became sober while the guest's intoxication continued, and when the former complained about not being able to return to his pleasant state, the guest now gave him some of his urine, which however no longer had any effect.

[Ten years earlier, in 1890, von Dittmar had published his *Historischer Bericht*, 'Historical Report', according to the diary of his travels in Kamchatka, through the same publishing channels, in St. Petersburg. On pp. 524 and 590 there are two entries pertinent to our inquiry into the fly-agaric in Siberia. - RGW]

... I learned that shamans are very eager to take in a certain quantity of *Amanita muscaria* in order to get themselves into a stupor resembling complete insanity. The Koryak were complaining about the fact that this drug was not available at the time and that, as a rule, it was difficult to obtain in Taigonos. The mushroom does not grow on the peninsula and has to be brought from Kamchatka, where there is much of it and it is very effective. From Kamchatka this precious merchandise has to make its way all around the Penzhinsk Gulf, from peddler to peddler, and since everybody is wild about it, not much of it gets here.

... As I approached her [a drum-beating widow who hopes to resuscitate her dead husband by shaman's exercises - Translator], I immediately noticed that she was drunk with fly-agaric, a fact that was corroborated by the others. As a matter of fact, it is quite common here among the Koryak, and especially among the Chukchi, to produce small, round boxes made of birch bark containing small dried pieces of fly-agaric. People sniffing tobacco take out their little boxes, so these people take out theirs containing the mushroom. They chew the pieces, keeping them in their mouths for a long time without swallowing. They assert that this practice puts them into a state of bliss during which they see the most beautiful visions. They sit peacefully, without ranting and raving, their eyes wide open and staring, as if they no longer belonged to this world ...

[14] Kennan

> KENNAN, George. Tent Life in Siberia and Adventures among the Koraks and other Tribes in Kamtschatka and Northern Asia. New York and London. 1871, pp. 202-204. The journey was made in 1865-1870.

[To one versed in the literature this account by an American a century ago of his experience among the Koryak sounds disturbingly superficial and wrong-headed. Why was he astonished by the practice of eating the fly-agaric, when every prepared traveler in the region had known of it for generations? Why does he think that the 'natives' speak Russian? 'Muk-a-moor', as he writes the word, is Russian, not Koryak. Note his prudish reticence about the urine-drinking. - RGW]

... We... were surprised, as we came out into the open air, to see three or four Koraks shouting and reeling about in an advanced stage of intoxication - celebrating, I suppose, the happy event which had just transpired. [A wedding] I knew that there was not a drop of alcoholic liquor in all Northern Kamtchatka, nor, so far as I knew, anything from which it could be made, and it was a mystery to me how they had succeeded in becoming so suddenly, thoroughly, hopelessly, undeniably drunk. Even Ross Browne's beloved Washoe, with its 'howling wilderness' saloons, could not have turned out more creditable specimens of intoxicated humanity than those before us. The exciting agent, whatever it might be, was certainly as quick in its operation, and as effective in its results, as any 'tangle-foot' or 'bottled-lightning' known to modern civilization. Upon inquiry we learned to our astonishment that they had been eating a species of the plant vulgarly known as toadstool. There is a peculiar fungus of this class in Siberia, known to the natives as 'muk-a-moor', and as it possesses active intoxicating properties, it is used as a stimulant by nearly all the Siberian tribes. Taken in large quantities it is a violent narcotic poison; but in small doses it produces all the effects of alcoholic liquor. Its habitual use, however, completely shatters the nervous system, and its sale by Russian traders to the natives has consequently been made a penal offence by Russian law. In spite of all prohibitions, the trade is still secretly carried on, and I have seen twenty dollars worth of furs bought with a single fungus. The Koraks would gather it for themselves, but it requires the shelter of timber for its growth, and is not to be found on the barren steppes over which they wander; so that they are obliged for the most part to buy it, at enormous prices, from the Russian traders. It may sound strangely to American ears, but the invitation which a convivial Korak extends to his passing friend is not, 'Come in and have a drink', but, 'Won't you come in and take toadstool?' Not a very alluring proposal perhaps to a civilized toper, but one which has a magical effect upon a dissipated Korak. As the supply of these toadstools is by no means equal to the demand, Korak ingenuity has been greatly exercised in the endeavor to economize the precious stimulant, and make it go as far as possible. Sometimes, in the course of human events, it becomes imperatively necessary that a whole band shall get drunk together, and they have only one toadstool to do it with. For a description of the manner in which this band gets drunk collectively and individually upon one fungus, and keeps drunk for a week, the curious reader is referred to Goldsmith's *Citizen of the World*, Letter 32. It is but just to say, however, that this horrible practice is almost entirely confined to the settled Koraks of Penzhinsk Gulf - the lowest, most degraded portion of the whole tribe. It may prevail to a limited extent among the wandering natives, but I never heard of more than one such instance outside of the Penzhinsk Gulf settlements.

[14] Lansdell

> LANSDELL, Henry. Through Siberia. London. 1882. Vol. II, pp. 644-5.

[Note the English author's unfamiliarity with the common fly-agaric; also his prudery. - RGW]

Among the flora, however, of North-Eastern Siberia is a peculiar mushroom spotted like a leopard, and surmounted with a small hood - the fly-agaric, which here has the top scarlet, flecked with white points. In other parts of Russia it is poisonous. Among the Koriaks it is intoxicating, and a mushroom of this kind sells for three or four reindeer. So powerful is the fungus that the native who eats it remains drunk for several days, and by a process too disgusting to be described, half-a-dozen individuals may be successively intoxicated by the effects of a single mushroom, each in a less degree than his predecessor.

[16] Jadrintsev

> JADRINTSEV, Nikolai Mikhailovich. Sibirien: geographische, ethnographische und historische Studien. (Siberia: Geographical, Ethnographic, and Historical Studies) Jena. 1886. p. 337.

[The only reference that the author makes is the following: - RGW]

... Furthermore, the natives are passionately addicted to the fly-agaric (*i.e.*, to a decoction of *Amanita muscaria*), which replaces liquor and is also sold to merchants.

[17] Patkanov

> PATKANOV, Serafim Keropovich. Die Irtysch-Ostjaken und ihre Volkspoesie. (The Irtysh Ostyak and their Folk-Poetry) St. Petersburg. 1897. p. 121.

[The only reference to mushrooms is in a discussion of shamanism. - RGW]

The shaman must get himself into an exalted state to be able to talk to the gods. To achieve this he consumes several (either seven or fourteen or twenty-one) fly-agarics, which are capable of producing hallucinations.

[18] Sljunin

> SLJUNIN, Nikolai Vasil'evich. Okhotsko-Kamchatskii krai. Estestven-noistoricheskoe opisanie. (The Okhotsko-Kamchatskii Kraj. An Essay in Natural History) St. Petersburg. 1900. In two volumes. Vol. I, pp. 654-655.

The population dislikes mushrooms and therefore does not gather them. An exception is the fly-agaric (*Amanita muscaria*), widely used by the Koryaks because it produces a peculiar inebriation. They are so fond of this mushroom that they will pay considerable sums of money (in local terms, hides of foxes and sables) to obtain it. Exploiting this weakness, some people have set up a highly profitable commerce. Thus a certain Tykaniev, a Koryak of the Olyutorskoye settlement, made a fortune (a herd of reindeer) selling these mushrooms. Although the law forbids the trade in fly-agarics and other poisonous herbs and plants, it is almost impossible to enforce this law under the local conditions of life and the distances involved. The orders of the district commander (including the explanation of the noxious effect of the fly-agaric on the human organism) are completely ignored.

The effect of the fly-agaric is quite peculiar and reminds us of the scenes of inebriation, delirium, and hallucinations which we have frequently witnessed in Chinese opium dens. An excellent antidote is a glass of strong vodka or diluted alcohol. A quarter of an hour after swallowing the vodka, the Koryak who is totally oblivious of his environment under the effect of the mushroom, completely regains consciousness. He laments the disappearance of his world of dreams, because when inebriated he loses the concept of time and all objects appear to him greatly magnified (an effect similar to the one produced by hashish), which is the source of many jokes.

The Koryaks maintain that fresh fly-agarics are highly poisonous and hence do not eat them. They are first dried for a long time in the sun and over the fire in the tent. Only then is the mushroom consumed, together with fresh water to wash it down. The Koryaks claim that continuous consumption of the mushroom has no ill effect on the person's health. We have seen addicts, however, whose emaciated aspect, yellowish colour of the skin, and uncertain gait can only be attributed to protracted consumption of the fungus. Its inebriating effect is of short duration since the poison (an alkaloid) is rapidly eliminated by the urine which, if drunk, produces an effect similar to that of the mushroom itself.

[19] Enderli

> ENDERLI, J. 'Zwei Jahre bei den Tschuktschen und Korjaken.' (Two years among the Chukchi and Koryak) Petermanns Geographische Mitteilungen. Gotha. 1903. pp. 183-184.

[This is one of the most valuable accounts that we have. - RGW]

Very little alcohol is brought up to the North, at least around Gizhiga, but the Koryak know how to make intoxicating drinks from various kind of berries. In addition, however, they have another substance with which they can produce a narcotic intoxication, *viz.*, the fly-agaric. This mushroom is seldom found in those areas. It is collected by the women in the autumn, dried, and eaten on ceremonial occasions in the winter.

At the man's order, the woman dug into an old leather sack, in which all sorts of things were heaped one on top of another, and brought out a small package wrapped in dirty leather, from which she took a few old and dry fly-agarics. She then sat down next to the two men and began chewing the mushrooms thoroughly. After chewing, she took the mushroom out of her mouth and rolled it between her hands to the shape of a little sausage. The reason for this is that the mushroom has a highly unpleasant and nauseating taste, so that even a man who intends to eat it always gives it to someone else to chew and then swallows the little sausage whole, like a pill. When the mushroom sausage was ready, one of the men immediately swallowed it greedily by shoving it deep into his throat with his indescribably filthy fingers, for the Koryaks never wash in all their lives.

The effects of the poison became evident by the time the men had swallowed the fourth mushroom.[315] Their eyes took on a wild look (not a glassy look, as may be seen in drunken men), with a positively blinding gleam, and their hands began to tremble nervously. Their movements became awkward and abrupt, as if the intoxicated men had lost control of their limbs. Both of them were still fully conscious. After a few minutes a deep lethargy overcame them, and they began quietly singing monotonous improvised songs whose content was approximately 'My name is Kuvar, and I am drunk, I am merry, I will always eat mushrooms,' and so on.

---

[315] Different values have also been mentioned for this dose.

The song grew more and more lively and loud, sometimes interrupted by words shouted out at lightning speed; the animal-like wild look in the eyes grew stronger, the trembling of the limbs grew more intense, and the upper body began to move more and more violently. This condition lasted about ten minutes. All at once the men-first the Reindeer-Koryak and a little later the other man - were seized with a fit of frenzy. They suddenly sprang raving from their seats and began loudly and wildly calling for drums. (Every family owns disk-shaped drums of reindeer hide, which are used for religious purposes.) The women immediately brought two drums and handed them to the intoxicated men. And now there began an indescribable dancing and singing, a deafening drumming and a wild running about in the yurt, during which the men threw everything about recklessly, until they were completely exhausted. Suddenly they collapsed like dead men and promptly fell into a deep sleep; while they slept, saliva flowed from their mouths and their pulse rate became noticeably slower.

It is this sleep that provides the greatest enjoyment; the drunken man has the most beautiful fantastic dreams. These dreams are highly sensuous, and the sleeping man sees whatever he wants to.

After a half hour the two men awakened at almost the same time. The effects of the poison had subsided and both men were in possession of their senses, but their walk was uncertain and convulsive. Soon, however, the effects of the poison became apparent again; the drunken men were seized with a new but weaker fit of frenzy. Then they fell asleep again; they awakened for a short period to full consciousness, which was again succeeded by another fit. The attacks continued in this way a few more times, growing less violent each time. They probably would have stopped entirely after a few hours if these intoxicated men had not used another method which renewed the intensity of the intoxication.

It appears that the poison of the fly-agaric is excreted in the urine, and this, when a man drinks it, produces the same effects as the fly-agaric itself. Since fly-agarics are relatively rare in those regions, they are highly prized by the Koryaks, and they therefore consider it too expensive to waste their urine, whose effects are entirely similar to those of the mushroom.

I noticed now that a woman brought the awakened man a small sheet-metal container, into which the man voided his urine in the presence of everybody. The container is used exclusively for this purpose, and Koryaks carry it with them even when they travel. The drunken man (or, more properly, the poisoned man) put the container down next to him; the urine was still warm and the steam was rising densely in the cold yurt when the second mushroom-eater, who was just awakening, saw the urine container near him, seized it without a word, and drank a few large gulps. Soon after this the first man, the actual 'owner of the urine,' followed the other's example. After a few moments the urine they had drunk began to do its work, and the symptoms of the intoxication grew more violent, as they had before. Sleep alternated with attacks of frenzy and moments of complete calm. The intoxication was intensified each time by drinking urine. The frenzied dances and the drinking-bouts continued in this way all through the night, and it was almost evening of the next day before the Koryaks recovered from their stupor. The remaining urine was carefully preserved for a short time, to be used again on the next occasion. Even while traveling, when the Koryak leaves his settlement in a half-drunken condition, he never squanders his urine; he continues to collect it in the container which he carries with him for the purpose.

This is the greatest enjoyment, the merriest entertainment, that the Koryak knows, and he waits for it impatiently all year long. It is true that he likes alcoholic drinks better because of their milder form (this refers only to 95% pure alcohol [sic!], which many people drink without any admixture of water), for the effects of fly-agaric poisoning, in the form of heart palpitations and nausea, often last one or two days, and immoderate consumption of the mushroom involves the danger of madness or death. Such cases, however, occur very rarely.

But the natives believe that the fly-agaric, unlike alcohol, has the power to reveal the future to the man who consumes it; if, before eating the mushroom, the man recites over it certain definite formulas stating his wish to see the future, the wish will come true in his dream.

[20] Vanderlip

VANDERLIP, Washington B. In Search of a Siberian Klondike. New York. 1903. pp. 214-215.

[The author places the following episode in the Koryak village of 'Kaminaw', presumably Kaminov. - RGW]

A peculiar custom sometimes to be noted among these people [Koryaks] is that of drinking a kind of liquor made from a large species of mushroom. The effect is, in some respects, similar to that produced by hashish. At first the imbiber shakes as with the ague; and presently he begins to rave as if in delirium. Some jump and dance and sing, while others cry out in agony. A small hole looks to them like a bottomless pit, and a pool of water as broad as the sea. These effects are produced only when the beverage is used to excess; a small quantity has much the same effect as a moderate amount of liquor. Curiously enough, after recovering from one of these debauches, they claim that all the antics performed were by command of the mushroom. The use of it is not unattended by danger, for unless a man is well looked after he is likely to destroy himself. The Koryaks sometimes take this drug in order to work themselves to the point of murdering an enemy. Three or four of the mushrooms is a moderate dose, but when one wants to get the full effect one takes ten or twelve.

[Vanderlip offered his book to the public as an account of the author's experiences in Siberia, but the excerpt that we have quoted ought by rights to be relegated to the secondary sources, since the statements in it can be traced without exception to others, notably Krasheninnikov **[4]**, with only minimal changes in wording. Vanderlip could have compiled his paragraph in the Reading Room of the New York Public Library. - RGW]

[21] Jochelson

JOCHELSON, Waldemar. (Iokhel'son, Vladimir Il'ich)
1. The Koryak: Memoir of the American Museum of Natural History, New York. A publication of the Jesup North Pacific Expedition. Vol. VI, Part I Religion and Myth, New York, 1905. Part II. Material Culture and Social Organization of the Koryak, 1908. pp. 582-584.

[Vladimir Bogoraz and Vladimir Jochelson were two distinguished Russian anthropologists. On the invitation of the American Museum of Natural History, the Imperial Academy of Science designated them to collaborate with the Jesup North Pacific Expedition, they to contribute the studies of the tribes of the Maritime Provinces of Siberia and the extreme tip of Siberia opposite Alaska. They wrote more extensively about the fly-agaric practices of these tribes than anyone else has done, and with keener discernment. They were in the field at the turn of the century. We reprint in full what they had to say about the fly-agaric habit and we bring to the reader's attention a number of folk tales in which the fly-agaric figures. We have simplified their phonetic transcription of native names and words. - RGW]

The Koryak are most passionate consumers of the poisonous crimson fly-agaric, even more so than the related Kamchadal and Chukchee, probably because the fungus is most common in their territory. Some travellers, as Krasheninnikov and Dittmar, were of the opinion that the fly-agaric was bought by the Koryak from Kamchatka. Thus, Dittmar says that there is no fly-agaric on the Taigonos Peninsula,[316] and that it is brought there from Kamchatka; while Krasheninnikov[317] asserts that in general the Koryak have no fly-agaric, and that they get it from the Kamchadal. My own observations, however, have convinced me that not only is fly-agaric abundant all over the Koryak territory, but that the Koryak supply the Chukchee with it. In the middle of the month of August I saw in the valley of the Varkhalam River, not far from its mouth, an extensive field dotted with the characteristic crimson caps of the fly-agaric, with their white spots. In the villages of the Maritime Koryak, along the whole western coast of Penshina Bay, I knew individuals who were engaged in gathering and drying fly-agaric, and who carried on a very profitable trade in it. One Koryak from Alutorsk, who dealt in fly-agaric, is mentioned by Sljunin.[318]

---

[316] Dittmar, p. 451. [Our ref. **[13]** p. 256 - RGW]
[317] Krasheninnikov, II, p. 150. [Our ref. **[4]** p. 237 - RGW]
[318] Sljunin, I, p. 654. [Our ref. **[18]** p. 260 - RGW]

The Koryak do not eat the fly-agaric fresh. The poison is then more effective, and kills more speedily. The Koryak say that three fresh fungi suffice to kill a person. Accordingly, fly-agaric is dried in the sun or over the hearth after it has been gathered. It is eaten by men only; at least, I never saw a woman drugged by it.[319] The method of using it varies. As far as I could see, in the villages of Penshina Bay, the men, before eating it, first let the women chew it, and then swallow it. Bogoraz[320] says that the Chukchee tear the fungus into pieces, chew it, and then drink water. Sljunin describes in the same way[321] the Koryak method of using fly-agaric. In describing the use of fly-agaric by the Chukchee and Koryak, Dittmar[322] says that they chew it, and keep the quid in their mouths for a long time without swallowing it. Krasheninnikov[323] says that the Kamchadal roll the dried fungus up in the form of tube, and swallow it unchewed, or soak it in a decoction of willow-herb and drink the tincture.

Like certain other vegetable poisons, as opium and hashish, the alkaloid of fly-agaric produces intoxication, hallucinations, and delirium. Light forms of intoxication are accompanied by a certain degree of animation and some spontaneity of movements. Many shamans, previous to their seances, eat fly-agaric in order to get into ecstatic states. Once I asked a Reindeer Koryak, who was reputed to be an excellent singer, to sing into the phonograph. Several times he attempted, but without success. He evidently grew timid before the invisible recorder; but after eating two fungi, he began to sing in a loud voice, gesticulating with his hands. I had to support him, lest he fall on the machine; and when the cylinder came to an end, I had to tear him away from the horn, where he remained bending over it for a long time, keeping up his songs.

Under strong intoxication, the senses become deranged; surrounding objects appear either very large or very small, hallucinations set in, spontaneous movements, and convulsions. So far as I could observe, attacks of great animation alternate with moments of deep depression. The person intoxicated by fly-agaric sits quietly rocking from side to side, even taking part in the conversation with his family. Suddenly his eyes dilate, he begins to gesticulate convulsively, converses with persons whom he imagines he sees, sings, and dances. Then an interval of rest sets in again.

However, to keep up the intoxication, additional doses of fungi are necessary Finally a deep slumber results, which is followed by headache, sensations of nausea, and an impulse to repeat the intoxication. If there is a further supply of fungi, they are eaten. At the beginning of winter, when the supply is still large, old men begin their carousals. In Kuel there are two elders of the Paren' clans, and during my sojourn in that village I was sometimes unable to hold conversation with either of them for days at a time. They were either intoxicated by the fungi or in a bad mood from the after-effects. At the same season the Reindeer Koryak resort to the coast settlements to purchase and eat fly-agaric. To regale a guest with fly-agaric is a sign of special regard. Dr. Sljunin says a small glass of brandy or diluted alcohol serves as a splendid antidote in cases of fly-agaric poisoning.[324]

There is reason to think that the effect of fly-agaric would be stronger were not its alkaloid quickly taken out of the organism with the urine. The Koryak know this by experience, and the urine of persons intoxicated with fly-agaric is not wasted. The drunkard himself drinks it to prolong his hallucinations, or he offers it to others as a treat. According to the Koryak, the urine of one intoxicated by fly-agaric has an intoxicating effect like the fungus, though not to so great a degree. I remember how, in the village of Paren', a company of fly-agaric eaters used a can in which California fruit had been put up, as a beaker, into which the urine was passed, to be drunk afterwards. I was told of two old men who also drank their own urine when intoxicated by brandy, and that the intoxication was thus kept up.

From three to ten dried fungi can be eaten without deadly effect. Some individuals are intoxicated after consuming three. Cases of death rarely occur. I was told of a case in which a Koryak swallowed ten

---

319. Krasheninnikov (II, p. 150) says that the Kamchadal women do not eat fly-agaric, but Dittmar (p. 106) cites the case of a Koryak woman (a shaman) who was intoxicated by it. [Our ref. **[4]** p. 237; **[13]** p. 257- RGW]
320. Bogoraz, The Chukchee, Vol. VII of this series, p. 205. [Our ref. **[22]** p. 273 - RGW]
321. Sljunin, I, p. 655. [Our ref. **[18]** p. 261 - RGW]
322. Dittmar, p. 506. [Our ref. **[13]** p. 256 - RGW]
323. Krasheninnikov, II, p. 147. [Our ref. **[4]** pp. 235-236 - RGW]
324. Sljunin, I, p. 654. [Our ref. **[18]** p. 261 - RGW]

mushrooms without feeling their effect. When he swallowed one more, vomiting set in, and he died. In the opinion of the Koryak, the spirits of the fly-agaric had choked him. They related that these spirits had come out with the matter vomited, in the shape of worms, and that they vanished underground.

The Koryak were made acquainted with brandy by the Russians and by American whalers. Despite the prohibition issued by the Russian Government against the importation of brandy, it often finds its way in winter into the Koryak villages and camps, being taken there on trading-trips by Russian merchants. Whalers take it to the coast settlements in summer. Like all other primitive tribes, the Koryak are passionate consumers of brandy, and dealers often obtain an arctic or red fox in exchange for one wineglassful of brandy. To my question as to which they preferred, brandy or fly-agaric, many Koryak answered, 'Fly-agaric.' Intoxication from the latter is considered more pleasurable, and the reaction is less painful, than that following brandy. Like fly-agaric, brandy is drunk chiefly by elderly men. Old people do not give it to the young, that they themselves may not be deprived of the pleasure; and if young people or women happen to obtain brandy, they frequently give it up to the older members of the family. Two herd-owners whom I met on the Palpal were entirely unacquainted with this drink. Some Koryak in the coast villages have learned from the Russian Cossacks how to make brandy of blueberries. They subject the berries to fermentation, and by means of a pipe distil the liquid from one iron kettle into another, the latter serving as a refrigerator. The result is a rather strong liquor of such disgusting taste and odor that the mere attempt to taste it nauseated me. Krasheninnikov[325] says that the Cossacks in Kamchatka and, following their example, the Kamchadal, distilled brandy from 'sweet grass' (*Heracleum sphandilium*).

Pp. 120-121. Among the objects believed by the Koryak to be endowed with particular power is fly-agaric (wa'paq, *Agaricus muscarius*). The method of gathering and the use made of this poisonous fungus will be described later on. It may suffice here to point out the mythologic concept of the Koryak regarding fly-agaric. Once, so the Koryak relate, Big-Raven had caught a whale, and could not send it to its home in the sea. He was unable to lift the grass bag containing travelling-provisions for the whale. Big-Raven applied to Existence to help him. The deity said to him, 'Go to a level place near the sea: there thou wilt find white soft stalks with spotted hats. These are the spirits wa'paq. Eat some of them, and they will help thee.' Big-Raven went. Then the Supreme Being spat upon the earth, and out of his saliva the agaric appeared. Big-Raven found the fungus, ate of it, and began to feel gay. He started to dance. The Fly-Agaric said to him, 'How is it that thou, being such a strong man, canst not lift the bag?' - 'That is right,' said Big-Raven. 'I am a strong man. I shall go and lift the travelling-bag.' He went, lifted the bag at once, and sent the whale home. Then the Agaric showed him how the whale was going out to sea, and how he would return to his comrades. Then Big-Raven said, 'Let the Agaric remain on earth, and let my children see what it will show them.'

The idea of the Koryak, is, that a person drugged with agaric fungi does what the spirits residing in them (wa'paq) tell him to do. 'Here I am, lying here and feeling so sad,' said old Euwinpet from Paren' to me; 'but, should I eat some agaric, I should get up and commence to talk and dance. There is an old man with white hair. If he should eat some agaric, and if he were then told by it, "You have just been born," the old man would at once begin to cry like a new-born baby. Or, if the Agaric should say to a man, "You will melt away soon," then the man would see his legs, arms, and body melt away, and he would say, "Oh! why have I eaten of the agaric? Now I am gone!" Or, should the Agaric say, "Go to The-One-on-High," the man would go to The-One-on-High. The latter would put him on the palm of his hand, and twist him like a thread, so that his bones would crack, and the entire world would twirl around. "Oh, I am dead!" that man would say. "Why have I eaten the agaric?" But when he came to, he would eat it again, because sometimes it is pleasant and cheerful. Besides, the Agaric would tell every man, even if he were not a shaman, what ailed him when he was sick, or explain a dream to him, or show him the upper world or the underground world, or foretell what would happen to him.'

P. 483. When the reindeer feed exclusively on lichens, they acquire a special longing for the urine of human beings. This longing attracts them to human habitations. Fig. 9 represents a vessel (the name in Koryak signifies 'the reindeer's night-chamber') made of seal-skin, which every herdsman carries suspended from his belt, and of which, he makes use whenever he desires to urinate, that he may keep the urine as a means of attraction in capturing refractory reindeer. Quite frequently the reindeer come running to camp from a far-off

---

325. Krasheninnikov, II, p. 406.

pasture to taste of snow saturated with urine, a delicacy to them. The reindeer have a keen sense of hearing and of smell, but their sight is rather poor. A man stopping to urinate in the open attracts reindeer from afar, which, following the sense of smell, will run to the urine, hardly discerning the man, and paying no attention to him. The position of a man standing up in the open while urinating is rather critical when he becomes the object of attention from reindeer coming down on him from all sides at full speed.

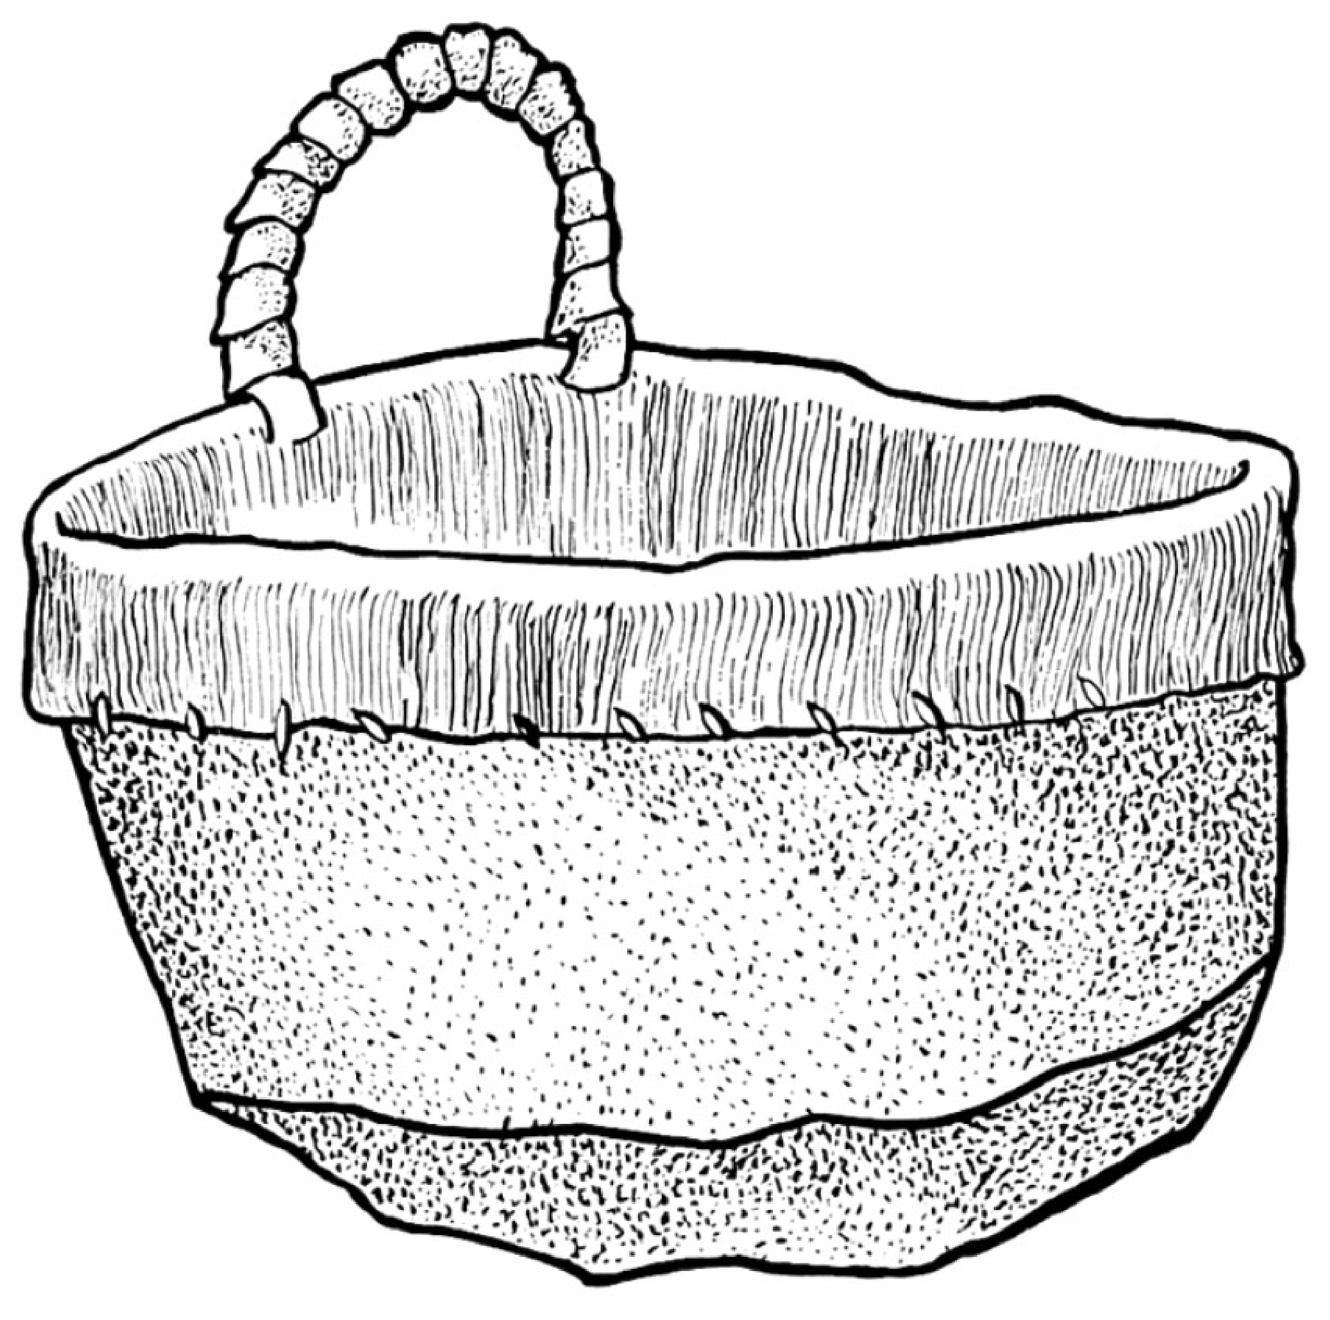

Fig. 9. Seal-skin vessel for gathering urine impregnated with inebriating virtue derived from fly-agaric, in use among the Koryak. (After Waldemar Jochelson, *The Koryak*, p. 483; Mem., Amer. Museum of Natural History, 1908)

P. 565. At the present time the use of sulphur or Swedish matches is quite widespread. Even when obtaining the sacred fire, some Koryak turn the drill for a short time as a formality only, and the fire is really kindled with a match; but they cannot always obtain matches, so that the most common means of obtaining fire is the strike-a-light. Although not much used, the strike-a-light seems to have been known to the Koryak prior to their encounter with the Russians, having been introduced by the Tungus, who had received it from the Amur tribes. Even now, merchants often import from Vladivostok steel and flint of Chinese origin. Tinder is prepared from a fungus which grows on the stumps of birch-trees. [*Fomes fomentarius* - RGW] The fungus is stripped of its hard outer layer, and the inner spongy mass is boiled in water. Then it is dried; and a light, brittle, and highly inflammable punk is thus obtained.

Fire-making tools are more often needed by the nomadic Reindeer Koryak than by the sedentary Maritime people. A new fire need rarely be made in the underground houses of the Maritime Koryak. The women are very skilful in keeping up the fire of the hearth. They cover the embers with ashes; and when reviving the fire, they rake it up, put small chips of wood on the glowing embers, and fan them until they burst into flame. The Maritime Koryak need fire-tools only on journeys. However, when in possession of matches, they are very fond of striking them to light their lamps or pipes, even when the fire is burning on the hearth. On the other hand, if the fire goes out entirely, and neither match nor tinder is on hand, the ancient method of obtaining fire by means of the drill-bow is resorted to. This, however, happens very rarely.

[In the Koryak village where Jochelson was staying, the ceremonies attending the 'home journey of the white whale' were being celebrated. - RGW]

P. 74. The old men ate fly-agaric, and, when the intoxication had passed, they told whither the 'Fly-Agaric Men' (Wapa'qala'nu) had taken them, and what they had seen. The women and the young people sang and beat the drum.

[There had been a pestilence and the community were arranging for the cremation of a child. All kinds of gifts were being sent to be placed on or near the pyre, some for the dead child and others for the child to take to relatives who had died in the pestilence. - RGW]

P. 112. Two agaric fungi were sent to one old man who had been very fond of agaric intoxication.

[In the following extract about the 'water of life' we are reminded of the fly-agaric in one of its manifestations, as a liquid, either derived directly from the mushroom, or the urine of the reindeer that has imbibed the mushroom, or human urine. Should we not consider the possibility that this conception, so widespread in Eurasian and American folklore, had its origin in the fly-agaric? Here is what Jochelson says: - RGW]

P. 351. We find in American tales some elements that occur in the myths of the Old World, but they are absent in the Koryak tales recorded here. For instance, 'the water of life,' which a hero procures to restore dead bodies to life, or to revive bones, figures frequently in Indian myths on both sides of the Rocky Mountains, and is also one of the favorite episodes of the myths of the Old World.[326] Another case in point is the cosmogonic tale about the raven, or some other bird or other animal which dives into the water to obtain some mud, out of which the earth is created. This tale is popular in many parts of North America, and is found as well among the Chukchee and Yukagir.

[Speaking of the lack of cleanliness among the Koryak, the author says: - RGW]

P. 416. The kettles in which the food is cooked are full of reindeer and dog hair, which fall from the clothes and fill the air of the Koryak house. The Koryak kill lice, which are regarded by them as properly belonging to a healthy man, with their teeth. There is a prevailing belief among them, as well as among the Yukaghir, that when a man is deserted by lice he will soon die. They eat also the large larvæ which develop from the eggs deposited by the reindeer-flies in the hair of the reindeer. No matter how putrid food may be, the Koryak have no aversion to it, and they will even drink the urine of persons intoxicated with fly-agaric.

Pp. 417-8. People addicted to the use of fly-agaric can be detected by their appearance. Even when they are in a normal condition, a twitching of the face is observable, and they have a haggard look and an uneven gait.

P. 115. In the beginning of things, at the mythological time of the Big Raven, the transformation of animals and inanimate objects into men was a natural occurrence. 'At that time, man also possessed the power of transforming himself. By putting on the skin of an animal, or by taking on the outward form of an object, he could assume its form. Big Raven and Eme'mqut turned into ravens by putting on raven coats. Kĭlu´, the niece of Big Raven, put on a bear-skin and turned into a bear. Eme'mqut put a dog's skin on his sister, and she became a dog. Eme'mqut and his wives put on wide-brimmed spotted hats resembling the fly-agaric, and turned into those poisonous fungi.[327] The belief in the transformation of men into women after putting on a woman's clothes, and *vice versa*, is closely related to this group of ideas.'

---

[326] It seems that in the Koryak tales the blood of the reindeer takes the place of 'the water of life'. It must be noted here that in one Chukchee tale we find 'bladder with living water' (Bogoraz: Chukchee Materials, p. XXIV); and in one Yakut tale (Khudyakov, p. 127) 'three bottles with living water' are mentioned. As to the Chukchee, Mr. Bogoraz considers the passage as borrowed from the Russian.

> 2. The Yukaghir and the Yukaghirized Tungus. Vol. IX of the Jesup North Pacific Expedition, p. 419.

They [the Yukagir. - RGW] do not eat mushrooms regarding them as unclean food growing from dogs' urine. However, according to traditions, they used to intoxicate themselves with the poisonous fly-agaric, which is still eaten by the Koryak and Chukchee. The Yukaghir call mushrooms *can-pai*, *i.e.*, tree girl.

[22] Bogoraz

> BOGORAZ, Vladimir Germanovich. (Bogoras, Waldemar) The Chukchee. Memoir of the American Museum of Natural History. Jesup North Pacific Expedition. Parts 1, 2, and 3. New York. 1904-1909. pp. 205-207.

INTOXICANTS. - Fly-agaric is the only means of intoxication discovered by the natives of northeastern Asia. Its use is more common in the Koryak tribe, as agaric does not grow outside of the forest border. For the same reason only the Southern Pacific Chukchee - *e.g.*, those around the Anadyr, Big River, and Opuka River - are supplied with the intoxicating mushroom. They do not compare with the Koryak, however, in their passion for agaric.

The Russianized natives of the Anadyr until recently shared in the consumption of this intoxicant, but now they have almost wholly given up its use. The reason of this change is that they consider the strong intoxication produced by this stimulant as shameful for a Christian. They also realize that the consumption of fly-agaric involves some danger. With a person unaccustomed to its use it may even cause death. The abstinence from agaric is also noticed among the northern Kamchadal, and to some degree among the Maritime Koryak of northern Kamchatka, though all of these people gather it assiduously in order to trade it to their less civilized reindeer-breeding neighbors.

Fortunately for the tribes consuming the fly-agaric, it grows only in certain places, and the supply is often limited. The mushrooms are usually dried up and strung together in threes, that number being an average dose. Some of the natives of course require much more to produce any effect. The intoxication may be followed by sickness, or the after-effect may be very slight. When eaten, the mushrooms are torn to small shreds, and these are chewed piece by piece, and swallowed with a little water. Among the Koryak the woman chews the mushroom, and offers the ready quid to her husband to swallow.

I witnessed a few times the progress of intoxication by means of agaric. The symptoms are analogous to those produced by opium or hashish. The intoxication comes on rather suddenly, in about a quarter of an hour after the consumption of the mushrooms. Usually the person remains awake; but the natives say that if a person falls asleep immediately after eating mushrooms, they will work more effectively, and in a short time he will awaken more thoroughly under their influence. The intoxication has three stages. In the first the person feels pleasantly excited. His agility increases, and he displays more physical strength than normally. Reindeer-hunters of the Middle Anadyr told me that before starting in canoes in pursuit of animals, they would chew agaric because that made them more nimble on the hunt. A native fellow-traveller of mine, after taking agaric, would lay aside his snow-shoes and walk through the deep snow hour after hour by the side of his dogs for the mere pleasure of exercise, and without any feeling of fatigue. During this period the agaric-eater sings and dances. He frequently bursts into loud peals of laughter without any apparent reason. It is a state altogether of noisy joviality. His face acquires a darker hue and twitches nervously; his eyes are now contracted, and again almost bursting from their sockets; his mouth puckers and grins or spreads into a broad smile.

---

[327] Tale 12.

Flashes of the second stage often appear early, shortly after the first traces of intoxication become visible; indeed, all three stages are frequently intermingled. This is noticeable especially among elderly inveterate agaric-eaters. During the second stage the intoxicated person hears strange voices bidding him perform more or less incongruous actions; he sees the spirits of fly-agaric and talks to them. He still recognizes surrounding objects, however, and when talked to is able to answer. All things appear to him increased in size. For instance, when entering a room and stepping over the door-sill, he will raise his feet exceedingly high. The handle of a knife seems to him so big that he wants to grasp it with both hands.

The spirits of fly-agaric have an outward appearance similar to that of the actual mushrooms, and the agaric-eater feels impelled to imitate them. For example, I saw one man suddenly snatch a small narrow bag and pull it with all his might over his head, trying to break through the bottom. He was evidently imitating the mushroom bursting forth from the ground. Another walked around with his neck drawn in, and assured every one that he had no head. He would bend his knees and move very quickly, swinging his arms violently about. This was in imitation of the spirits of fly-agaric, who are supposed to have no necks or legs, but stout cylindrical bodies which move about swiftly.

The spirits of fly-agaric are fond of playing practical jokes on men under their influence. They begin with asking for homage either for themselves or for surrounding objects, - the hills, the river, the moon, *etc*. Then they show some of the objects under a delusive aspect. When asked why this strange change has occurred, the spirits answer that it portends danger to the man's life unless he makes obeisance in a particular way. To illustrate. An intoxicated man, while talking to me reasonably enough, suddenly leaped aside, and, dropping on his knees, exclaimed, 'Hills, how do you do? Be greeted!' Then he stood up, and, looking at the full moon, asked, 'O Moon! why are you waning so fast?' He told me that the spirits answered, 'Even so will your life wane, unless you show the moon your bare buttocks.' This he did, and then, suddenly recovering his senses, began to laugh at his foolish actions.

In the third stage the man is unconscious of his surroundings, but he is still active, walking or tumbling about on the ground, sometimes raving, and breaking whatever happens to come into his hands. During this period the agaric spirits take him through various worlds and show him strange sights and peoples. Then a heavy slumber ensues, lasting for several hours, during which it is impossible, to rouse the sleeper. How persistent are the spirits' commands is shown by the following instance of a man, who, when about to retire, was ordered to lie down in the midst of his dog-team. Although he was attacked by the dogs, we could not keep him away from them. He finally succeeded in staying with the dogs all night.

On awakening, a general weakness and heavy headache ensue, accompanied by nausea, often violent vomiting. The drunken state can be renewed by a single mushroom. In this manner inveterate agaric-eaters keep up their intoxication day after day.

Drinking the urine of one who has recently eaten fly-agaric produces the same effect as eating the mushroom. The passion for intoxication becomes so strong that the people will often resort to this source when agaric is not available. Apparently without aversion they will even pass this liquor around in their ordinary tea-cups. The effect is said to be less than from the mushrooms themselves.

I have already spoken about the amount of trade in strong liquors carried on in northeastern Siberia. The Chukchee, as well as all other inhabitants of the country, are eager for a chance to drink spirits. In all my journeys through these countries I met people in only two places who knew nothing about strong liquors. In one case they were some Maritime Koryak in small villages on the northern border of the Kamchatka district. These people were far from the Kamchatka towns and from Gishiginsk trading-settlements. At the same time, they were so poor that nobody sought to bring liquors to them. The other case was that of the Kerek of the southern shore of Anadyr Bay.

P. 282. Thus, for instance, the intoxicating mushrooms of the species fly-agaric are a 'separate tribe' (*ya*'*nřa-va*'*rat*). They are very strong, and when growing up they lift upon their soft heads the heavy trunks of trees, and split them in two. A mushroom of this species grows through the heart of a stone and breaks it into minute fragments. Mushrooms appear to intoxicated men in strange forms somewhat related to their real shapes. One, for example, will be a man with one hand and one foot; another will have a shapeless body. These are not spirits, but the mushrooms themselves. The number of them seen depends on the number of mushrooms consumed. If a man has eaten one mushroom, he will see one mushroom-man; if he has eaten two or three, he will see a corresponding number of mushroom-men. They will grasp him under his arms, and lead him through the entire world, showing him some real things, and deluding him with many unreal apparitions. The paths they follow are very intricate. They delight in visiting the places where the dead live. These ideas are illustrated in a sketch (Fig. 10) drawn by a Chukchee.

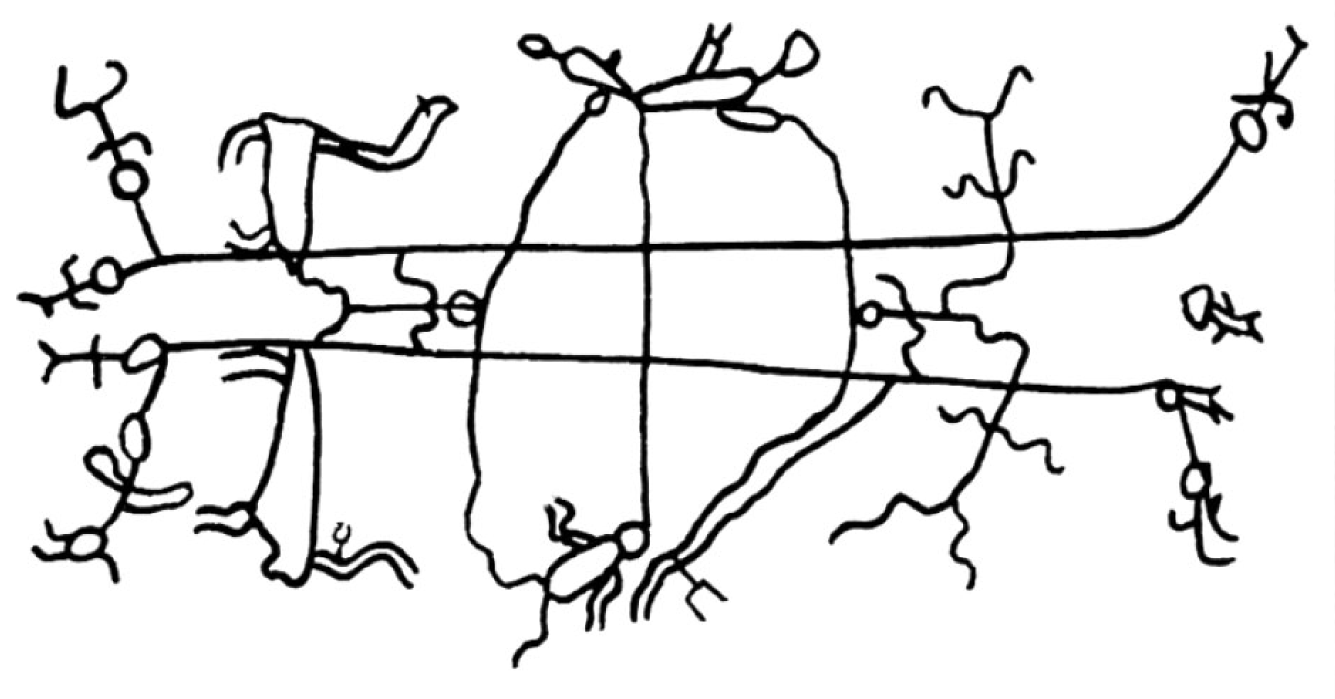

Fig. 10. Drawing made by a Chukchee of the wanderings of 'fly-agaric men'. (After Waldemar Bogoraz, *The Chukchee*, p. 282; Mem., Amer. Museum of Natural History, Vol. VII, Part 2).

Pp. 322-323. Thunder is said to be produced by the passing of the thunder-bird. Others attribute it to the rattling noise made by girls playing on a spread sealskin. Rain is the urine of one of the girls. In one tale the lightning is described as a one-sided man who drags his one-sided sister along by her foot. She is intoxicated with fly-agaric. The noise caused by her back as it strikes the floor of heaven is thunder, her urine is rain. Obsidian is said to be the stone of the thunder, which falls from the sky in round balls, or even in roughly chipped arrow-heads and lances. Perhaps the idea of stone arrow-heads falling from the sky, so common in the Old World, is borrowed from the Tungus or from the Russianized natives.

Intoxicating mushrooms form a 'separate tribe' (*ya'n řa-va'rat*). We have already noted that they are very strong, and that, when coming out of the earth, they can lift a large tree-trunk on their head, or shatter a rock into pieces. They appear to intoxicated men in strange shapes.

On one sketch (Fig. 10) there are represented the tracks of a man who is led around by mushrooms. He thinks that he is a reindeer, then he is 'submerged,' and after a while he comes out laboring under the same idea. The path of his tracks connects all men and all beasts seen during the trance.

P. 414. I saw a shaman trying to recall to her senses a sick woman who had fallen into a heavy swoon. To do this he began to beat the drum with the utmost force. Then he pretended to catch something from the drum and to swallow it hurriedly. Immediately afterward he appeared to spit it out into the hollow of his hand, and then in the quickest possible way pretended to empty his palm over the head of the patient. After that, he began to mumble and gibber over the crown of the patient's head. In order to prevent the soul from leaving, he breathed into the hollow of his hand, and then applied his palm to the breast of the patient. At intervals he pretended to suck out the source of the suffering from the crown of her head. For this he made sucking motions with his mouth at some distance from her head. From time to time he made grimaces, and pretended to be choking, evidently for the purpose of showing that something bad had entered his mouth. At last he spat violently, and then began again the whole process.

From my own observation I know that a real insect is sometimes used in treatments of such a kind. This is brought near to the breast or to the head of the patient, and then vanishes, deftly abstracted by the shaman, who pretends that it has entered the body.

[Bogoraz in the following passage gives a classic description of the whalebone device used by the tribesmen of the north, in both Eurasia and America, for killing wolves. The Chukchee call it *wapaq*, which is also their name for the fly-agaric, presumably because the wolf after swallowing the *wapaq* jumps wildly around and then quiets down, exhausted. Bogoraz assumes that the primary meaning of the name is fly-agaric but does not discuss this. In the absence of further information it seems possible that the name of the device was transferred as a figure of speech to the mushroom. The mushroom with its religious associations is likely to attract to itself under tabu influence various names and *wapaq* would have been the current one in the time of Bogoraz. Here is how he describes the *wapaq*. - RGW]

P. 141. Till recent times the well-known spit of whalebone,[328] identical with that of the American Eskimo, was used to catch wolves. It consisted of a slender rod of whalebone, with sharp-pointed ends, folded together several times, and bound with a thin thread of sinew well saturated with oil. Afterward it was several times soaked in water and allowed to freeze. The whole object was then well covered with blubber, tallow, meat, or such like. These folded spring-spits were often joined in strings of five or six, and hung on a bush on the wolf's trail, but so high as to be out of reach of foxes; or they were laid in a hole in the ice and water was poured over them, so that it would freeze to a transparent protecting cover strong enough to resist the attacks of smaller animals. The wolf would break through the ice and swallow all the spits, which would unfold in the stomach, and, breaking through its walls, cause the speedy death of the animal. But with only one or two spits it was able to walk away for a considerable distance, even so far that it would never be found by the hunter.

[Bogoraz mentions in the foregoing footnote that mice store up the fly-agaric in their winter holes. He has more to say about this on p. 198: - RGW]

The roots of *Claytonia acutifolia* Willd, *Hedisarum obscurum*, *Polygonum viviparum*. *Polygonum polymorphum*, *Pedicularis sudetica*, *Potentilla fragiformis*, *Oxytropis*, various species of *Carex*, and several others, are used by the Chukchee. They are the only vegetable food that is really relished. During the summer women often go digging roots. They use a digging-pick, which in former times consisted of a handle with bone point or simply of a sharp-pointed piece of antler, while at present it has an iron point tied to a wooden handle. Nests of mice are also robbed. It is considered dangerous, however, to take all the roots from the nests, because the owner might retaliate by means of magic. Moreover, the Chukchee believe that some of the roots and herbs found in the storehouses of mice are poisonous, and are gathered by the mice partly for the purpose of poisoning the robbers, partly as an intoxicant, like fly-agaric (*Agaricus muscarius*), which is used by man.

[On p. 148 Bogoraz quotes in Chukchee a riddle: - RGW] 'I have a headache. I am bleeding from my nose. Stop my nose bleeding! … What is it?' Answer: 'Fly-agaric.' He explains this riddle with the following note: 'The eating of the fly-agaric causes, after the intoxication has passed, a violent headache, which may be assuaged by a new dose of the same drug.'

[Bogoraz devotes considerable space to recording the life of the reindeer herdsmen and their tribulations. He says that one of their hardships comes with the mushroom season in the fall, when presumably the herds become unruly. Another is the insects, two species of which lay their eggs under the skin of the animals and another in the nostrils. Here is what he says about the nostril infestation: - RGW]

Another fly, of smaller size and darker color (*Ædemagena tarandi* Slunin), lays its eggs in the reindeer's nostrils. The larvæ go up to the throat, and penetrate the cartilage. The next year, when the maggots are full-grown, they cause a constant cough, which continues until the last one drops to the ground. The Yukaghir and the Tungus, following the example of Yakut cattle-breeders, try to protect their reindeer from obnoxious insects by a smudge of smouldering dung, or of a fire covered with green leaves. But with the wild and large herds of the Chukchee such fires are of little value, and not without danger. Thus, some five years ago, Tungus herdsmen who were tending the herd of a rich Chukchee on the Alaseya River tried to surround it with fires, and finally burned the whole pasture, and injured half of the animals.

---

[328] Its name in Chukchee is wa'pak, which means literally 'fly-agaric' (an intoxicating mushroom). The Chukchee and the Koryak are very fond of this mushroom; and when they find it in the woods, they pick it off just as eagerly as the wolves snatch after the greased whalebone spits. The Chukchee believe, moreover, that mice, when gathering roots for the winter, bring in some unknown intoxicating herbs which they use in their ceremonials. These herbs also serve to protect their stores from intruders, because they are said to act as poison on most other animals, including man. These herbs are called by a name derived from that of the intoxicating mushroom, - elhi-wapak ('white agaric'), - and a similar name is given to the whalebone spit on account of its power of killing the animal that swallowed it.

[23] Itkonen

> ITKONEN, T. I. Heidnische Religion und späterer Aberglaube bei den Finnischen Lappen. (Heathen Religion and Late Superstitions of the Finnish Lapps) Mémoires de la Société Finno-Ougrienne LXXXVII. Helsinki. 1946. p. 149.

[The author is a well known and reliable Finnish scholar. - RGW]

... When speaking of sorcerers, reference must be made to the custom of Siberian shamans of eating fly-agarics to get into an ecstatic stupor; the Ob-Ugrian sorcerers, for instance, consumed each time three or seven mushrooms. It is interesting to note that according to a tradition among the reindeer Lapps of Inari, Lapp sorcerers used to eat fly-agarics with seven dots.

[24] Lehtisalo

> LEHTISALO, T. Entwurf einer Mythologie der Jurak-Samojeden. (Outline of Yurak Samoyed Mythology) Mémoires de la Société Finno-ougrienne. Vol. LIII. Helsinki. 1924.

The forest Yurak magicians also knew the custom of eating fly-agarics. These were eaten when they were dry and fully grown; the small capless mushrooms were too potent, and it is said that a female magician died from eating them. Only someone who is familiar with the origin of the fly-agaric can eat it 'with fortunate results,' but if in his intoxication he does not see the mushroom spirits properly, they may kill him, or he may go astray in the dark. The number of mushrooms eaten is usually two and a half, *i.e.*, only half of the last mushroom is eaten. The magician sees man-like creatures appearing before him, as in a dream; they number as many as the mushrooms he has eaten, and the half-mushroom is represented by a half-man. They run away quickly, along the path which the sun, after it has set in the evening, travels in order that it may rise again in the morning, and the magician follows them. He is able to stay close on their heels only because the half-spirit runs slowly and keeps looking back as if it were waiting for its other half. It is dark there, and the magician cannot see anything. Along the way the spirits of the fly-agaric tell him what he wants to know, *e.g.*, the possibilities for curing a sick person. When they come out into the light again, on the spot where God created the fly-agarics, there is a pole with seven holes and cords. After the magician ties up the spirits, the intoxication leaves him and he awakens. Now he sits down, takes in his hand the symbol of the Pillar of the World, the four-sided staff with seven slanting crosses cut into each side at its upper end, and he sings of what he has seen and heard.

[25] Dunin-Gorkavich

> DUNIN-GORKAVICH, A. A. Tobol'skij Sever. (The Northern Region along the Tobol) St. Petersburg. 1904. p. 95.

[The author is discussing the Ob-Ugrians. - RGW]

The shaman first eats some *panga* (dried mukhomor [fly-agaric]) and becomes drunk on it. After this he works his magic, that is to say, he utters peculiar cries and plays on the tambourine.

[26] Karjalainen

KARJALAINEN, K. F. Die Religion der Jugra-Völker. (Religion of Ugrian Folk) Helsinki. 1927. pp. 278-280.

The use of the fly-agaric, *paŋχ*, as an intoxicant is a wide-spread custom among the Ugrians and is most firmly established in the southern regions. The custom was mentioned even in the Berezov area, but with the additional comment that it was rare; in the Obdorsk area, on the other hand, it is unknown. The significance of the *paŋχ* is also confirmed to a certain extent by the fact that in the songs of the North Voguls the spirits are described as consuming it as a delicacy. When the Man who Observes the World is called, he may be in a state of 'intoxication caused by the one-footed notched-edged sevenfold *paŋχ*.' However, this is not said to his shame; on the contrary, it is supposed to indicate his power and wealth. This intoxicant has been used by magicians[329] for their own special purposes; they use it along the Tremyugan, and even more along the Vasyugan; it is an ordinary stimulant along the Irtysh, and it is also used for the same purpose in some places in the Vogul region. The only edible part of the *paŋχ* is the upper part of the cap, stripped of the stalk and covering; it may be eaten raw, direct from the forest, but in most cases - and along the Tremyugan almost exclusively - it is eaten after it has been dried in the sun or in an oven; winter supplies, of course, are always dried. Even when it is eaten in the ordinary manner, various precautionary rules must be followed; these rules arose from the relatively high toxicity of the mushroom, but in later times they took on a religious character. If the magician eats of the mushroom, this always has a *cultic significance*, which is only natural, since by eating he creates helpers for himself, or, as the people of Tsingala put it, '*paŋχ* enters into him' through the eating. Along the Irtysh fly-agarics are usually eaten in the evening. The number of mushrooms or bites eaten is three or seven, and according to Patkanov, even fourteen, twenty-one, or more; these numbers should be taken *cum grano salis*, since the effect of such a large number of whole mushrooms can seldom be tolerated even by a person accustomed to eating them. Sometimes the mushrooms are spread with butter or fat before eating, but usually they are eaten simply with bread, and water is drunk to make them easier to swallow. According to the Vasyugan people, the power of the mushroom derives from the fact that it was created from the spittle of the God of Heaven, and the mushroom is so potent that the Devil was unconscious for seven days and nights after eating it. For this reason, men also must not eat much of it. If anyone consumes too much of it, his teeth become clamped together, foam comes out of his mouth, his eyes bulge, and he can be saved only by the forcible administration of milk or salt, for '*paŋχ* wants nothing to do with' these substances. The most potent is the 'king fly-agaric,' which is small in stature, with a high stalk and only one single white spot in the center of the cap; ordinary, smaller specimens grow in a circle all around it. These ideas of the Vasyugan people are legendary, but we see from their ceremonies that they maintain a careful reserve with regard to the *paŋχ*. When the Vasyugan magician eats the mushroom, he always leaves the second half of the last mushroom and hides it, for then the *paŋχ* cannot use its full power to harm him. Eating the mushroom results in intoxication, and in the case of the *paŋχ* this includes a compulsion to sing which only a few can resist. The effect lasts 'from morning to sundown,' according to one informant. The Tremyugan magician eats *paŋχ* at any time of the day and does not hide the other half; instead, he cuts out a piece of the middle of each mushroom, 'the crown of the *paŋχ*'s head,' and throws it into the fire or onto a clean spot in the yard. The man who is intoxicated from eating fly-agarics sees the *paŋχ* 'dancing' before his eyes, invisible to others; that is to say, they move in the direction of the sun and sing a song, which the intoxicated Ostyak repeats after them word for word, so that the *paŋχ* act as 'singing-leaders' for the prophesying magician. At the same time the *paŋχ* tell the magician what he wants to know.[330]

Drum, zither, and *paŋχ* are the 'great' material means by which the Ugrian magician attempts to communicate with the spirits and obtain the information he needs. There are also many other means, both material and mental, used for uncovering mysteries. One such means which is found everywhere and is certainly very ancient is the *dream-vision*, possibly the natural forerunner of artificially stimulated ecstasy; another is soothsaying based on dreams, and this is what soothsaying with the aid of the *paŋχ* essentially amounts to.

---

[329] Shamans. - RGW.

[330] Concerning a stimulant of his own, the Swedish officer in 1714 (?) reports: 'We gave them *šaar* (tobacco); they smoked it and inhaled the smoke and thereupon fell to the ground quite unconscious, as if they were dead; afterwards they said that Shaitan had tormented them.' However, to judge by the name used for tobacco, this description most probably refers to the Ostyak Samoyeds [= Selkup].

Pp. 306-8. The ceremonies of the Irtysh Ostyaks are very different from the foregoing in certain respects. When *t'ərtəŋ-χoi* is brought into the house where he is needed (so it was said along the Demyanka), he takes resinous tree bark and fills the hut with smoke, waving everywhere in the hut the cloth which has been hung up as a sacrifice to Säŋkə. At his direction home-made beer is brewed and in the evening the bath is heated for him. After the bath the magician eats three or seven fly-agaric caps on an empty stomach - for he has fasted all day long - swallowing them either fresh or, in most cases, after they have been dried in the sun or sometimes in an oven, and then he lies down. When he has slept for a while, he springs up and begins to shout and walk to and fro, his whole body trembling with excitement. As he shouts, he reports what the spirit has revealed to him through his emissaries,[331] which spirit should be offered a sacrifice, what is to be sacrificed, which man has spoiled the luck of the hunt, how the luck can be regained, and so on. After the 'emissaries' have told everything, they depart and the magician sinks into a deep sleep, from which he does not awaken until morning. In the morning the appropriate spirit is entertained with home-made beer, porridge, and bread at the rear window, *i.e.*, in the icon corner, and is given the promise that the desired sacrifice will be made as soon as the animal designated has been procured.

The procedure is essentially the same in Tsingala; *t'ərtəŋ-χajat* eats three dried *paŋχ* with bread, half a mushroom at a time, and then goes to sleep; after he awakens, he shouts out what has been revealed to him. Before this proceeding, 'three seven kopeks'[332] (= three copper two-kopek pieces) are placed on the table, 'in the way of the *paŋχ*,' as a sacrifice for Säŋkə, and while the magician begins to tell his story, both he and the money are smoked with *pikhta* [spruce bark]. This questioning does not take place until evening, when night is falling. In the same village Schultz personally witnessed a questioning of the following nature: The magician was an old woman who, before beginning her magic, placed candles in front of the icons and a loaf of bread on the table; she made seven indentations in the loaf, naming Astanai and other Ostyak epic folk heroes. An old man who served as the sacrificer or priest in the village smoked the old woman, the bread, and all those present, using spruce bark smoke. The old woman ate three dried fly-agarics, a bite at a time, taking a swallow of water after each bite. After three or four minutes she began to hiccup; the hiccuping was following by shouting, and this in turn by a kind of singing. This went on for about half an hour. The hiccuping and singing gradually died away, and the whole proceeding ended when the old woman drank water and bowed before the icons. The others followed her example. The subject of the old woman's song was not she herself but 'the spirit of the fly-agaric.'- In the Zavodniya yurt there exist today women who undertake such investigations; they too eat *paŋχ* and then tell their revelations in song after a short sleep, during which they visit Säŋkə.

Pp. 315-316. The procedure followed by the Vasyugan fly-agaric soothsayer is quite simple, simpler than it is, for example, in the Irtysh region. Such a man was asked to give information about the mental disturbance suffered by a woman. Towards evening, he ate two and a half *paŋχ* and slept for a little while; after awakening, he sat down in the corner of his birch-bark yurt and began to sing, keeping his eyes closed and shaking his body to and fro. The intoxication did not seem to be very strong, since after he stopped singing, he was able to speak clearly with the spectators and take snuff into his nose. He continued singing in this way until morning, narrating the events of his journey, telling how far the *paŋχ* had brought him, through many districts and different countries, how it had led him into a church, and so on. - In spite of all his efforts, however, this time he did not reach the goal of his journey, *viz.*, the place where the information was available. The reason for this unfortunate conclusion was that ill-behaved people had shown the hidden half-*paŋχ* to me, and this had angered those *paŋχ* that had been eaten.

As can be seen from the foregoing, the manipulations of the Ugrian shamans may be quite different in the various regions, and special features in customs and ideas are found particularly in the southern Ostyak regions. Customs that may doubtless be regarded as late additions from the Irtysh region are *bathing in the bath-room, the deposition of sacrifice gifts, smoke-curing, and the entertaining of the Säŋkə*, although the latter, *e.g.*, in Tsingala, is not asked directly for information at all. The entire questioning of the *paŋχ*, for example, is also something that came into use in later times; the Voguls and Ostyaks know this to some extent

---

331. 'Little spirits' appear in person, while 'great spirits' only send their messengers, about whom nothing more specific is known.
332. 'drei sieben Kopeken.' - RGW.

from the Surguts, it has spread to some extent along the Tremyugan, and it has become predominant among the Irtysh Ostyaks.

It is not impossible that this custom is a coalescence of the dream-vision and the earlier intoxication; this is suggested by the fact that after consuming the *paŋχ* the magician always sleeps for a while; to my mind, this is needed not for evoking and intensifying the effects of the fly-agaric, but for evoking dream-visions in order to give information and make prophecies. The representation of the magician's assistants that has become established along the Vasyugan, a representation which is late in its present form, was also apt to influence the prevailing ideas concerning the magician's method, contribute a new nuance to them, and give rise to additional features, even though a great deal that is native may essentially be found in the ceremonies, as a comparison with North Ostyak customs shows.

A method that was already used by magicians in early times but was not their only method was magic *in the dark*, which is still practiced today in many regions, both among the Voguls[333] and among the Ostyaks. I am inclined to believe that the Tsingala custom of questioning the *paŋχ* in the evening, when night is coming on, is also a remnant of this. In such cases, the magician is often tied up with ropes, a custom for which Novitskij and Müller cite examples from the West and which is still prevalent along the Vasyugan.

[27] Bergman

> BERGMAN, Sten. Vulkane, Bären und Nomaden. (Volcanoes, Bears, and Nomads) Stuttgart. 1926. pp. 159-160.

On the day after the celebration a Koryak visited the Lamut camp. He came with his dog and apparently had no other purpose than to sit and chat for a while. When the loud barking of the dogs announced his arrival, we went out of the yurt to welcome him. It was a Koryak named Akei, who owned a large herd of reindeer and a yurt in the vicinity. He was small and sinewy, his face was leather-colored, and his features were not unlike those of an American Indian. His movements were slow and awkward. He walked to the yurt with a gently rolling gait.

'Priyatel′, have you any fly-agarics for me?' was the first thing he asked after exchanging greetings. Priyatel′ is the form of address used by the Koryaks and Lamuts to everyone and means simply 'friend.' He apparently took me for a trader, for when these men travel to the mountains, they usually carry fly-agarics with them; the Koryaks and Lamuts[334] are passionately fond of using these as an intoxicant.

[28] Donner

> DONNER, Kai.
> 1. Ethnological Notes about the Yenisei-Ostyak (in the Turukhansk Region) [Yenisei-Ostyak = Ket] Mémoires de la Société Finno-ougrienne. Vol. LXVI. Helsinki. 1933. pp. 81-2.

Haŋgo is a mushroom, the flybane [= fly-agaric], eaten by the shamans. Seven such mushrooms are eaten, whereupon human beings become 'mad'. Those who are not, or are not going to be, shamans die from eating these mushrooms. The shamans, specially those of the Ostyak-Samoyed (= Selkup) in the Narym district, were known for consuming flybanes as a means of intoxication before starting the shamanizing. At present (1912-1914) it is not so much practised.

[In the preceding extract, note the telltale marks of a folk belief: those who are shamans or who are going to be shamans eat the mushrooms with impunity, but others die from them. Donner mentions the same belief as being present in the Selkup culture, a Samoyed group that are neighbors to the Ket. We quote the passage in the third of our extracts from Donner; *vide infra*. It seems to have lingered on among the Samoyed and Ket of the upper Yenisei. - RGW]

---

[333] Munkácsi mentions that in the case of sacrifices the magic is practiced during the day in front of the spirits' food-storehouse or at some other place that is sacred to a spirit, while in other cases it is usually practiced at night in a dark yurt, where the fire on the open fireplace is extinguished while the magic is going on.

[334] Bergman alone among our sources includes the Lamut among those who use the fly-agaric. The Lamut are closely related linguistically and culturally to the Tungus. - RGW.

> 2. Bei den Samojeden in Sibirien. (Among the Samoyed in Siberia) Stuttgart. (Our copy is dated 1926. First published in Swedish in 1918). p. 110.

The performance always takes place in the evening, when darkness is falling, and may last all night long. When the performance is about to start, the shaman calls his assistants, who bring out the drum and slowly warm it at the fire in order to stretch the skin as tight as possible. Along the Ket the shaman makes no preparations of any kind, but in other places he often eats several fly-agarics in order to go into a trance more easily. These mushrooms contain a very strong poison, and I can say from personal experience that it is highly intoxicating. The natives often use it to get drunk on when they have no alcohol.

> 3. La Sibérie: La Vie en Siberie: les Temps anciens. Translated from the Finnish by Léon Froman. Paris, Gallimard, Nouvelle Revue Française. 1946. p. 225.

Even one who otherwise would find it easy to enter into rapport with the world of spirits would not enter into ecstasy in a state of trance indispensable for this purpose without having acquired the habit. Nor must it be so easy to absorb a sufficient dose of fresh fly-agarics, or preferably dried specimens, to enter into the necessary state of drunkenness or stupor. Among the Samoyed-Ostyak of the Yenisei [Selkup], the mushrooms should number from two to seven, but one says that he who is not a shaman and who eats them falls sick and dies, which is probably true for the poison of the mushrooms is violent and one could not absorb a strong dose without being used to it. The absorption of fly-agarics - as of all direct stupefying agents - must have been especially current among the Samoyed of the region of Narym. Nevertheless there are many shamans who feel that they have no need of inebriating substances or other similar products to provoke a change of state permitting them to pass into the other world, where they will meet later with all the spirits that influence the condition and life of mankind.

[29] Worth and Jochelson: Koryak and Kamchadal Tales

> Koryak and Kamchadal Tales, taken down by Waldemar Jochelson in the original languages.

[Among Jochelson's mss. found after his death there were a number of tales in the Kamchadal language. Professor Dean S. Worth took them in hand and has published them in a beautiful edition in 1961, produced by Mouton in The Hague. Professor Worth has edited them in the Kamchadal language with literal interlinear translation in English, followed by a smooth translation. Jochelson also took down many Koryak tales. His mss. in the original language do not survive, but he turned many of them into English and published them in his work on the Koryak. The fly-agaric figures in eight of these tales, four of them among those in the Kamchadal language and four translated into English from the Koryak, and with the permission of Mouton & Co. we reproduce them here.

The only alteration that we have made in the text of these tales is a simplification of the spelling of native words, or in some cases the suppression of the native name where it is irrelevant to the theme of our book. - RGW]

KAMCHADAL TALES
A - Czelkutqu and the Amanita Girls

There lived Czelkutq. He wooed Kutq's daughter Sinanewt and worked for her. He brought in much wood. Czelkutq married Sinanewt. They began to live. They amused themselves well. Sinanewt gave birth; a son was born. Czelkutq set off into the woods, where he met the beautiful Amanita girls. Czelkutq stayed with the girls and forgot his wife. Sinanewt thought of her husband and waited for him. She thought: 'Where is he, long ago he was killed!'

With them there lived an old aunt of hers, Kutq's sister, who said: 'Well, Sinanewt, stop waiting for your husband; long ago he stayed with the Amanita; send your son to his father.'

The little boy set off to his father. He began to sing: 'My father is Czelkutq, my mother is Sinanewt, father has forgotten us.'

Czelkutq heard his son singing and said to the girls: 'Go and burn him with burning brands, and tell him that I am no father to him.'

The girls took the burning brands and burned the boy all over, they burned his little hands all over. 'It is hot! Mother, they burn me!' he cried, and back he went to his mother. She asked: 'Well, what did your father say?'

'He said: "I am no father to you;" he ordered the Amanita girls to burn me with hot brands; he burned my hands all over; it is hot and hurts me. I will not go to my father again, or they will burn me with hot firebrands.'

The next day his grandmother sent him to his father again, saying: 'Go once more, sing again, say "Father, tomorrow all of us will leave, you will stay in the forest here with the Amanita; afterwards you will surely starve"'.

The little boy set off to his father and began to sing: 'Father, tomorrow all of us will leave together. You will remain in the forest with the Amanita; afterwards you will surely starve.'

Czelkutq, hearing his son singing, became angry and said: 'Go, girls, and beat him thoroughly with a leather strap and burn him with fire; tell him to stop coming here.'

Thus the girls took firebrands and a leather strap and began to beat him and burn him; thus they drove him away. The boy cried, and started back to his mother. He was burned all over when he arrived, but his grandmother blew at him and made him well. The old woman said: 'Well, Sinanewt, let us get ready to go, we shall go into the woods.'

They began to get ready; they tied up all the animals and took them all, leaving nothing. They started into the woods. When they arrived, they picked out a high mountain, climbed up to the top, and poured water all over the mountain, making a sheet of ice.

Czelkutq began to go into the woods. He did not kill any animals at all; all the traces had gotten lost. He and the girls began to starve. What could they eat? Then Czelkutq remembered his wife and son and went home. He came to his house, but did not find his wife and son. He began to weep: 'Where did all my people get lost? I am starving, Sinanewt, I am hungry. Where did you and our son go away?'

He followed his wife by their traces, and reached that high mountain. 'How to get up? The ice is very slippery.' From below he called up: 'Sinanewt, pull me up!'

Sinanewt threw down a leather cord and called out: 'Well, Czelkutq, catch the cord!'

He caught the cord. She began to pull him up to the top of the mountain, but when he was ready to step onto the top, she cut the cord with a knife. Czelkutq flew downwards, he fell, he died, he revived, and again he called out: 'Sinanewt, pull me up, I am starving!'

'Why don't you live with the Amanita? Why don't you live with the Amanita? Why do you come to us? You tortured your son, and now you are being paid back; it's you yourself who began that sort of life.'

'Sinanewt, stop being angry, pull me up, I am hungry!'

She threw down the cord again, saying: 'Well, catch, I shall pull you up now.'

Czelkutq caught the cord and she pulled him up. When he got near the top, she again cut the cord with a knife; he flew down, he fell, he died, he lay there, he came to life again, and cried out: 'Sinanewt, stop being angry!'

'If I pull you up, will you go on living like that afterwards?'

'No, I won't, Sinanewt, I shall stop living like that.'

She threw down the cord, he was pulled up, dried out, and became happy; he ate, he became satiated. Again they began to live as before, amusing themselves. The Amanita dried up and died.

B - Ememqut and his Wife Yeltalnen

Kutq lived with his wife Miti. They had a girl-child, Yeltalnen. There was also an old woman, Kutq's mother, who lived with them. Many suitors came, but the old woman ate them all up, letting nobody pass by. The old woman was a cannibal. Ememqut heard of the very pretty girl Yeltalnen. He made ready to go there, and caught a wild reindeer. When he went, he took the reindeer with him. When he came near, he drove the reindeer on ahead of him. The old woman ate up the reindeer, but Ememqut passed by without her noticing him. He came to Kutq and asked: 'Kutq, where is your girl?'

Kutq said: 'We have no girl.'

Yeltalnen was in another house. Ememqut began to live with Kutq. He certainly wanted to get to Yeltalnen, but she did not accept him. Ememqut thought this over, turned himself into an old woman, and made a violent snowstorm. He came to Yeltalnen again and began to plead, 'Let me in, Yeltalnen, I am suffering from the cold.'

She let him in. Yeltalnen did not recognize Ememqut, but thought he was really an old woman and said: 'Old woman, sit down there by the door.'

Ememqut lulled Yeltalnen to sleep. She fell fast asleep and felt nothing. Ememqut did what was needed and then left. Thus Yeltalnen became pregnant. Yeltalnen realized she was pregnant and made baby clothes. Miti came in and said: 'Well, Yeltalnen, what are you doing? What are you thinking about?'

Yeltalnen answered: 'Yes, Mother, I am pregnant. I certainly slept with nobody. I only let a little old woman in here once during a violent snowstorm.'

Miti said: 'That must have been Ememqut.'

Yeltalnen gave birth to a very pretty child. She said to her mother and father: 'Well, tell my suitor that Yeltalnen says, "All right, I accept."'

Kutq and Miti answered: 'Marry Ememqut if you wish.'

Ememqut married her. He began to live well. Ememqut said: 'Well, let us start home.' They began to get ready. Ememqut went out into the yard and whistled; three pair of reindeer arrived, and they started home. Yeltalnen's friends told her: 'You are happy now, but later your snot will dangle on your whip.'

They came home. Many ravens had soiled Ememqut's house with excrement. Ememqut fixed up the house. He began to arrange a feast and invited everybody. The cossacks came. Cickimcican came, acting as if he had eaten Amanita. He said: 'Yeltalnen, urinate into a scoop of horn, and I shall drink your urine, since we used to sleep under the same covers.'

Yeltalnen said: 'Cickimcican, you are lying.'

Ememqut became angry with his wife and abandoned the feast; all the guests went back home without having feasted. Ememqut lay down all the time, he stopped getting up altogether; he was angry because of Cickimcican's remarks. He stopped looking at his wife and was angry all the time. Yeltalnen said: 'Ememqut, you are angry with me all the time; I shall go home to my father.'

Ememqut said: 'Well, go ahead.'

Yeltalnen began to cry and went out into the yard. She whistled, and two pair of reindeer arrived. She went back into the house and said: 'Well, good-by, Ememqut, I am going.'

Ememqut tried to grab his wife by the skirt, but he couldn't hold her. Then Yeltalnen drove off with the reindeer and disappeared. She began to weep; a snot was dangling on her whip. She said: 'My girl-friends were really telling the truth.'

She came to her father and mother, and began again to live in the other house.

It grew warm. In the yard the sun was warm. Sinanewt said: 'Ememqut, it is warm in the yard; I shall carry you out there.' Ememqut didn't want to go out, but Sinanewt carried him out anyway, together with his bedding. Ememqut's whole side had been fouled by lying down. He began to sit there in the yard, and said: 'Sinanewt, get my arrows. I shall count them and see whether any got lost.'

Sinanewt brought him the arrows and Ememqut began to count them. A piece of grass was dangling on the arrows; he could not untie it, so he cut it off with a knife and threw it behind him. Then somebody began to cry behind him, saying: 'I take pity on you, Ememqut; you have cut me loose with a knife.'

Ememqut looked back and saw a little old spider-woman. The spider-woman got up and went around Ememqut three times. Then he improved and got well. He remembered his wife, and started off to see her. He arrived there, but was not let in. He began to live there. He worked for Kutq three years, but his wife was not given back to him. Ememqut dug a passage under the earth to his wife. He went through the passage secretly and slept there with his wife. Three years went by, and Ememqut's wife was given back to him. They started home. They came home, and began to live well again. Again he arranged a feast, and invited all the people. Many guests came. The bad man Cickimcican came again. Ememqut grabbed him and threw him somewhere far away. He began to feed the guests. When they stopped eating, they began to wrestle. Nobody could compete with Ememqut; they all fell. They stopped wrestling and began to toss each other on a skin. Again nobody could compete with Ememqut; they all fell down. They stopped playing this game. They all began to urinate. Ememqut urinated very far: nobody could compete with him, and he beat them all. Ememqut began to live and to rejoice.

C - Kutq, Miti, and the Little Louse

Kutq lived with his wife Miti. Their children were Ememqut and Sinanewt. Ememqut used to go hunting in the woods. He started out to spend the autumn in the woods. At home, Kutq used to carry in wood. He grew tired, and once he said: 'Miti, you give birth to a small louse.'

'Eh, stop talking nonsense, Kutq!'

Kutq went to get wood, and Miti gave birth to a small louse. She looked and saw that it was very bright, like the sun. Then Miti began to sneeze. She swaddled the louse and hid it. Kutq came home and said: 'Ah, I am tired; take the load of wood, Miti.'

Miti said: 'Put it up yourself, Kutq: I already gave birth to a louse.'

'Yes, you gave birth; well, I shall have a look at the child.'

'It is very ugly.'

'Well, Miti, I shall see.'

Miti unwrapped the louse. Kutq looked, and fell on his back. He said: 'Hide the child, Miti, it is too bright.'

Then Miti hid the louse. Kutq said: 'I shall make another dwelling for the louse.'

'Well, make it.'

Kutq began to work and made the dwelling. The louse began to live there secretly.

Emenqut came home. Nobody told him anything, and he did not know about the louse. Miti used to bring food to the louse. Ememqut watched where his mother went with the food. Once Ememqut ate and then went out to the yard and hid among the piled-up logs. Miti took food to the louse and opened the door of the dwelling. A light shone out; then Miti covered up the entrance and went back into her house. Ememqut found the dwelling, opened the door, and saw his sister, who shone like the sun. Then Ememqut fell down and died. Kutq and Miti said: 'Where did Ememqut go off to?'

Miti got up early and looked for Ememqut. She found him, but he had already died. Miti began to weep, and Kutq also wept; they grieved for Ememqut. Kutq said: 'Miti, let us go and look for pleasure.'

They got ready to go. Ememqut was carried into the house and covered over. Outside they blocked up the whole door with wood. They set out. When they looked back at the house, they again began to weep. They met the people called Raven's Berries, who invited them to stay there to live with them. Kutq did not want to do this. They went on, and met the storks, who also asked them to live there with them. Kutq said: 'The heart does not want to live here.'

They went farther on, crossed mountain ridges, and met the Amanita. There they found pleasure. They stayed there: they were well met. Kutq began to live there with his family. They were rejoicing. However, when they remembered Ememqut, then they wept. The sun and the moon said: 'Where did Ememqut get lost? He is not to be seen. Maybe he has died somewhere.'

The sun said: 'Moon, let us go look for Ememqut.'

The moon said: 'Well, let us go.'

They began to get ready, and set out. They went around the whole universe, but Ememqut was nowhere to be found. The sun said: 'Well then, let us go to Kutq's house.'

They set off to Kutq's house, but when they got there they found the house all blocked up with wood. They threw down the wood and went into the house. They saw that Ememqut was dead. The sun said: 'Moon, let us revive Ememqut. You go around him beating the drum.'

The moon said: 'I am not strong: I appear, wax, and wane, without warming anybody,' and added: 'You warm everyone better, sun.'

The sun said: 'You try first.'

Then the moon began to go around Ememqut, beating his drum and kicking him, but he could not revive him. Again he went around him, beating the drum and kicking him, but again he did not revive him. A third time he went around him beating the drum and kicking him, but Ememqut only moved his little finger. The moon became tired. Then the sun began to go around Ememqut beating the drum and kicking him; Ememqut opened his eyes. The sun went around a second time, beating the drum and kicking him; Ememqut sat up. The sun went around a third time beating the drum and kicking Ememqut; Ememqut then got up and said: 'Yes, I have been asleep for a long time.'

The sun and the moon said: 'If we hadn't come you would have slept forever.'

The three of them began to make a summer-hut. They made it on three portable posts. All kinds of animals came and sat down: migratory geese, swans, cuckoos, and grebes, all came and sat down to sing songs. The only animals they did not seat were the bears. They set out to Kutq; they sat down to amuse themselves. The bears stretched up against the house; they too wanted to sit down. The cuckoo began to laugh at the bears. The sun said: 'Cuckoo, stop laughing, or we will throw you out.'

Wherever they passed by the people heard them and came out to see. Old men and women were carried out in their bedding; for the first time they heard of such pleasure. They came to Kutq. Kutq and Miti saw that everyone was having a good time, and began to weep, saying: 'If only Ememqut were alive he too would be sitting here enjoying himself!'

Kutq wept again; they all began to climb down from the summer-hut. There they saw Ememqut. Kutq and Miti began to be very happy. Then the sun married the louse and the moon married Sinanewt. Ememqut married the Amanita. All the people began to rejoice and started back to Kutq's house. They all became Amanita. They all began to live there and to rejoice.

D - The Codfish, the Rams, and the Amanita

Codfish lived with her son Ilaqamtalxan. The Amanita girls lived there too, and gathered berries. The rams courted the girls, but the girls did not wish to marry. Codfish slept all the time. When it rained the Amanita set out to gather berries. They got soaking wet. When they came back they went into the codfish's ear and built a fire to dry themselves. The codfish woke up and said: 'Ow, it's hot, there's a fire in my ear.'

His mother said: 'Come here; I shall see what's the matter.'

She looked, but nothing was burning. 'You are lying,' she said.

Again the codfish fell asleep. The girls went out and ran farther away. Codfish woke up and saw the girls, saying: 'So, it was you who built a fire in my ear.'

'Well, we were only drying ourselves out.'

Codfish said: 'Come here and eat.'

The girls said: 'We don't want to eat.'

The girls went home. Again the rams came, and then the girls married them. They invited the codfish to the wedding. It ate up everything and became satiated; then it went home and fell asleep. The rams began to live well and to rejoice.

KORYAK TALES

A - Little-bird-man and Raven-man

Raven-Man said once to Little-Bird-Man, 'Let us go to Creator's to serve for his daughters.' Little-Bird-Man consented, and they started off to go to Creator. 'What have you come for?' he asked them. 'We have come to serve here,' they answered. 'Well, serve,' he said. Then he said to Miti, 'Let Little-Bird-Man serve at our house, and Raven-Man at sister's.' - 'No,' replied Miti, 'let Raven-Man serve here, and Little-Bird-Man there.' Raven-Man and, Little-Bird-Man began to serve. A violent snowstorm broke out, which lasted several days. Finally Creator said to the suitors, 'Look here, you, who always keep outside, stop the storm.' Raven-Man said, 'Help me get ready for the journey.' They cooked all sorts of food for him. He took his bag, went outside, stole into the dogkennel, and ate all his travelling-provisions. When he had finished eating, he returned to the house, and said, 'I have been unable to stop the snowstorm.' Creator said to Little-Bird-Man, 'Now it is your turn to go and try to put a stop to the storm. The women shall cook supplies for your journey too.' Little-Bird-Man replied, 'I don't need anything. I will go just as I am.' He flew away to his sisters. They asked him, 'What did you come for?' He answered, 'I am serving at Creator's for his niece, and he has sent me to stop the snowstorm.' Then his older sister knocked him over the head and stunned him. Little-Bird-Man broke in two, and the real Little-Bird-Man came out from within. His sisters brought him a kettle of lard and some shovels, and went with him to the land of the sunrise. There they covered up all the openings with snow, caulked the cracks with fat, and it stopped blowing. It cleared up. Little-Bird-Man went home with his sisters, caught some reindeer, and drove to Creator's. On his way he ate some fly-agaric which his sisters had gathered, and became intoxicated. He arrived at Creator's, and noticed that his entire house was covered with snow. He shovelled off the snow, and shouted to his bride, 'Kĭlu′, come out! untie my fur cap.' The people came out of the house to meet him, and saw that it had cleared up.

Soon after that, Raven-Man and Little-Bird-Man married, and on that occasion ate some fly-agaric. Raven-Man said, 'Give me more. I am strong, I can eat more.' He ate much agaric, became intoxicated, and fell down on the ground. At the same time, Creator said, 'Let us leave our underground house, and move away from here. The reindeer have eaten all the moss around here.'

They called Raven-Man, but were unable to wake him. They struck his head against a stone, and it split, so that his brain fell out. Creator left him in that condition, saying to a post in the house, 'When he recovers his senses, and calls his wife, you answer in her place.' Thereupon Creator wandered off.

When Raven-Man came to, he cried, 'Yiñe'a-ñe'ut!' The Post replied, 'Here I am.' - 'Have I become intoxicated with fly-agaric?' - 'Yes, with fly-agaric,' the Post replied. Then he noticed his brain, and asked, 'Have you made a pudding for me?' - 'Yes, I have,' the Post replied again. Raven-Man took his brain and ate it. Then he came to his senses. He felt of his head, and discovered that his skull was split, and that there was no brain in it. 'Whither shall I fly now?' he thought. He flew up to a mound and sat down. 'My sister Mound,' he said, 'I have come to you. Give me something to eat.' She replied, 'I have nothing. All the birds sit here upon me, and they have eaten all the berries.' - 'You are always stingy!' said Raven-Man. 'I will fly to a place from which the snow has thawed off.' He arrived at another place, and said, 'Sister, give me some berries to eat.' - 'I have nothing,' that place replied. 'Every bird sits here, and they have eaten everything.' - 'You, too, are stingy,' said Raven-Man. 'I will go to the beach.' He flew down there, and said, 'Sister, give me something to eat.' - 'Eat as much as you please,' said the Beach. 'I have plenty of seaweed.'

And Raven-Man remained on the seashore. That's all.

Told by Kučã̆'ñin, a Reindeer Koryak woman,
in camp on Chaibuga River, April, 1901.

B - Ememqut and Sun-man's Daughter

It was at the time when Creator lived. There was no village and no camp near him. One evening his son Ememqut was returning home. It was getting dark. Suddenly he noticed sparks coming out of a marmot's hole. He went into the hole, and saw Marmot-Woman sitting there. He married her, and took her home. On the following day he again went hunting, met Sphagnum-Woman, took her for his wife, and also conducted her home.

Ememqut's cousin Illa′ envied his success in having found pretty wives for himself, and conceived a plan to kill him in order to take away his wives. Illa′ said to his sister Kĭlu′, 'Go and call Ememqut. Tell him that I have found a tall larch-tree with gum. Let him go with me to take out the gum; and while there, I will throw the tree upon him and kill him.' She went and called Ememqut, and he and Illa′ started off to the woods. They began to pick out the gum. Suddenly Illa′ threw the tree down upon Ememqut and killed him.

Illa′ ran home, singing and repeating to himself, 'Now Marmot-Woman is mine, and Sphagnum-Woman is also mine.' He came running home, and said to Kĭlu′, 'Go into Creator's house and tell Ememqut's wives, your future sisters-in-law, to come to me.'

Kĭlu′ came into Creator's underground house, and saw Ememqut lying in bed with his wives, and all of them chewing larch-gum. She returned to her brother, and said, 'Ememqut is at home alive, and lying with his wives.' - 'Well; said Illa′, 'now I will kill him in another way.'

On the next day Illa′ sent his sister to Ememqut to tell him that he had found a bear's den. Illa′ added. 'He shall go with me to kill the bear.' Kĭlu′ delivered the message to Ememqut. Ememqut came, and went to the woods with Illa′. As soon as they reached the den, the bear jumped out, rushed upon Ememqut, and tore him into small pieces.

Illa′ ran home again, singing and repeating, 'Now Marmot-Woman is mine, and Sphagnum-Woman is also mine.' He came running home, and said to his sister. 'Go and call your sisters-in-law.' She went into Creator's house, and saw Ememqut sitting at the hearth, and his wives cooking bear-meat. Kĭlu′ came home, and said to her brother, 'Why, Ememqut is alive at home, and his wives are cooking bear-meat.'

'Well,' said Illa′, 'now I will put an end to him.' He dug a hole in his underground house, and made an opening which led to the lower world, and put a reindeer-skin on top of the hole. 'Go and call Ememqut to play cards with me.' Thus said Illa′ to his sister. Ememqut replied, 'I am coming.' When Kĭlu′ was gone, Ememqut said to his wives, 'He is likely to kill me this time, for he has made a hole for me which leads to the lower world. I shall go now. If I do not come back for a long time, go out and look at my lance which is standing there. If it should be shedding tears, then I am no longer among the living. Then tie some whalebone around your bodies, which will wound him when he lies down to sleep with you.'

Ememqut went away. When he entered Illa′'s house, Kĭlu′ said to him, 'There is a skin spread for you: sit down on it.' As soon as Ememqut stepped on the skin, he fell down into the lower world.

Soon his wives went out, and, seeing that tears were running from his lance, they said, 'Our husband is dead now.' Then they tied some whalebone around their bodies. After a while, Kĭlu′ came and said to them, 'Come, Illa′ is calling you.' They went. Illa′ said to his sister, 'Make a bed for us: we will lie down to sleep.' Kĭlu′ made the bed, and Illa′ lay down with Ememqut's wives. They tried to lie close to Illa′, and pricked and wounded him all over. After a while, when they went outside, both stepped accidentally upon the skin, and fell down into the lower world.

Having fallen into the lower world, Ememqut found himself in a vast open country. He walked about, and came upon a dilapidated empty underground house. This was the abode of Sun-Man's daughter. Her name was Mould-Woman. Sun-Man covered her with a coating of mould, and let her down into the lower world, that the people on earth might not be tempted by her dazzling beauty. Ememqut stopped near the house, and began to cry. Suddenly he heard Mould-Woman's voice behind him, saying, 'You are such a nice-looking young man, why do you cry?' Ememqut answered, 'I thought that I was all alone here. Now, since I have seen you, I feel better. Let us live together. I will take you for my wife.' Ememqut married her, and they settled down to live together.

When Ememqut's wives fell down into the lower world, they also found themselves in a vast open country. They wandered about, and soon fell in with Mould-Woman. They said to her, 'We are Ememqut's wives.' She replied, 'So am I.' - 'Well, then don't tell your husband that we are here. You are bad-looking; and when he finds out that we are here, he will desert you and come to look for us.' Mould-Woman returned home. After she had met the two women, she used to go out to visit them; and Ememqut noticed her frequent absence. He asked her, 'Is there some one near our house?' - 'No, there is no one there,' she replied.

Once when she went out, Ememqut followed her stealthily. She sang as she went, 'My husband is a valiant man: he kills all the whales; he kills all the reindeer!' and Ememqut walked behind her, and laughed. She heard his laughter, turned around, but there was no one to be seen, for Ememqut had suddenly turned into a reindeer-hair. Then she said to her buttocks, 'Buttocks, why do you laugh?' She went on singing. Ememqut again laughed behind her. She looked back again, but Ememqut had turned into a little bush.

Thus she reached the place where Ememqut's former wives were. Ememqut suddenly jumped out in front of her. She was so much frightened that she fell down dead. Then the coating that covered her cracked, broke in two, and the real handsome and brilliant daughter of Sun-Man appeared from it. Ememqut took all his three wives and settled down.

Once Ememqut said to his wives, 'The Fly-Agaric-Men (Wapa'qala'nu) are getting ready to wander off from here into our country: let us move with them.' His wives prepared for the journey, and made themselves pretty round hats with broad brims and red and white spots on them, in order to make themselves look like agaric fungi. Then they started, and the Fly-Agaric people led them out into their country, not far from Creator's underground house.

Illa′ and Kĭlu′ went to gather agaric fungi. Suddenly Ememqut and his wives jumped out from among the fungi. Then they took Illa′ and Kĭlu′ home. Ememqut put them upon the Apa'pel,[335] on which they stuck fast. Ememqut said to his wives, 'Boil some meat in the large kettle, and scald Illa′ and Kĭlu′ with the hot soup. In the morning pour out over their heads the contents of the chamber-vessels. Put hot stone-pine-wood ashes from the hearth also on their heads.'

They did as they had been told. Finally Ememqut's aunt Hanna said to him, 'You have punished them enough; now let them off.' Ememqut let them off, and they lived in peace again.

---

[335] Apa'pel (from A'pa, 'grandfather' or 'father' [Kamenskoye]) is the name given to sacred rocks or hills.

Ememqut took his wife to Sun-Man's house, then he came back with Sun-Man's son, who married Yiñe'a-ñe'ut. Thus they lived. That's all.

Told by Kučã'ñin, a Reindeer Koryak woman,
in camp on Chaibuga River, April, 1901.

C - Ememqut and White-Whale-Woman

It was at the time when Big-Raven lived. A small spider was his sister, and her name was Amıʹḷḷu. Pičvuʹčin wished to marry her. At that time Big-Raven became very ill, and was unable to leave his bed. 'Pičvuʹčin,' he said, 'you are my brother-in-law-to-be. Do something for me, go in search of my illness.' Pičvuʹčin beat his drum, found the illness, and said to Big-Raven, 'Take your team tomorrow and go to the seashore.' In the morning Big-Raven started with his team of dogs. After a while he was able to sit erect upon the sledge; then he tried to stand up; and soon he was able to run along, and direct his dogs. At the mouth of the river he saw a water-hole, and in that hole he found a White-Whale woman, Miti by name, whom he took for his wife. He carried her home. In due time she gave birth to Ememqut, who soon grew to be a man, and also took a White-Whale woman for his wife. Then Ememqut went for a walk, and found there Withered-Grass-Woman whom he also took for his wife. After that he brought home Fire-Woman, and then Kınčesaʹtı-ñaʹwut.

These four women lived together without quarrelling, until finally Ememqut found Dawn-Woman. She began to quarrel with all the others. The White-Whale woman said, 'I am his first wife. I am the oldest woman. I will go away.' Big-Raven's people sat up for several nights watching, to prevent her leaving the house. At last Big-Raven's lids dropped, and he said, 'I want to sleep.'

Then she ran away. She reached a lake, and there her heart was swallowed by a seal. She transformed herself into a man, and married a woman of the Fly-Agaric people. Ememqut went in search of her. While on his way, he found a brook from which he wanted to take a drink of water. He smelled smoke coming up from beneath. He looked down, and saw a house on the bottom. His aunt Amıʹḷḷu, and her servant Kıhıʹḷḷu, were sitting side by side in the house. While he was drinking from the brook, his tears fell into the water, and dropped right through into his aunt's house, moistening the people below.

'Oh!' they said, 'it is raining.' They looked upward, and saw the man drinking. 'Oh!' they said, 'there is a guest.' Then Kıhıʹḷḷu said, 'Shut your eyes, and come down.' He closed his eyes, and immediately found a ladder by which he could descend. 'Give him food,' said Amıʹḷḷu. The servant picked up a tiny minnow from the floor, in the corner, all split and dried. She brought also the shell of a nut of the stone pine and a minnow's bladder not larger than a finger-nail. Out of the latter she poured some oil into the nutshell, and put it before Ememqut with the dried fish. 'Shut your eyes, and fall to.' He thought, 'This is not enough for a meal;' but he obeyed, and with the first movement dipped his hand into the fish-oil, arm and all, up to the elbow. He opened his eyes, and a big dried king-salmon lay before him, by the side of the oil-bowl. He ate of the fish, seasoning it with oil. Then his aunt said 'Thy wife is on the lake, and her heart has been swallowed by a seal. She has turned into a man and wants to marry a woman of the Fly-Agaric people.' He went to the lake and killed the seal. Then he took out his wife's heart, and entered the house of the Fly-Agaric people. An old woman lived in the house. He put the heart on the table, and hid himself in the house. His wife, who had assumed the form of a man, lived in that house; and in a short time she came in from the woods, and said, 'I am hungry.' - 'There is a seal's heart on the table,' said the old woman. 'Have it for your meal.' She ate the heart, and immediately she remembered her husband. He came out of his hiding-place. They went home, and lived there. That's all.

Told in the village of Pallaʹn.

D - Raven and Wolf

Raven said to his wife, 'I want to go coasting. Give me a sled!' She gave him a salveline. He refused to take it, and said, 'It is too soft: it will break into pieces.' Then she gave him a seal. He rejected it also, saying, 'It is too round: it will roll away.' Then she gave him an old dog-skin. On this he coasted down hill. A Wolf passed by, and said, 'Let me, too, coast down hill.' - 'How can you? You have no sled: you will fall into the water.' - 'Oh. no! My legs are long: I will brace them against the stones.' Wolf coasted down the hill, fell into the water, and cried. 'Help me out of this! I will give you a herd of water-bugs!' - 'I do not want it!' - 'Help me out, and I will give you a herd of mice!' - 'I do not want it!' - 'Help me out, and I will give you my sister, the one with resplendent (metal) ear-rings!' Then Raven helped him out. Wolf said, 'Fare thee well! I am an inlander. I will go inland, far into the country. Where are you going?' - 'I belong to the coast. I will stay here, close to the seashore.' Wolf went his way. Raven transformed himself into a reindeer-carcass, and lay down across Wolf's path. Wolf ate of it. Then Raven revived within his belly, and cried. 'Qu!' Wolf started to run. Raven tore out his heart, and dashed it against the ground. Wolf died. Raven dragged the body to his house, and said to Miti, 'I have killed a wolf! Dance before the carcass!' Miti began to dance, and to sing, 'Haˊke, haˊke, ka haˊke! Huk, huk! My husband killed one with a long tail!' Wolf's brothers followed the trail; but Raven dropped on the trail a couple of whalebone mushrooms.[336] They swallowed them, and were killed. Raven's people dragged them into the sleeping-room of Raven's daughters. Yiñˊîa-ñeˊwhut and Čannaˊy-ñaˊwut, pretending that these were the girls' bridegrooms. The oldest of Wolfs brothers, whose name was Long-Distance-between-Ears (literally 'large-[between-the]-ears-interval'), followed Raven's trail. Again Raven dropped a couple of whalebone mushrooms. Wolf, however, did not swallow them, but took them to Raven's house. 'What are these?' he asked Raven. 'These are my children's toys.' - 'And where are my brothers? Their trail seems to lead here.' - 'No, they did not come here.' Wolf and his hosts went to sleep. In the night-time Wolf stole into the girls' sleeping-room, wakened his dead brothers, and they led the girls away.

Told in the village of Opuˊka.

[30] Shamanic Hymn translated from the Vogul

> VOGUL Hymns and Heroic Songs. Antal Reguly and Bernát Munkácsi. Vogul Népköltési Gyűjtemény. (An Anthology of Vogul Folklore) Vol. 1. Regék és Énekek a Vilag Teremtéséről. (Sagas and Songs about the Creation of the World) Published in fascicles from 1892 to 1902. Vol. II. Istenek Hősi Énekei, Regéi és Idéző Igéi. (Heroic Songs, Sagas, and In vocative Spells of Gods) 1892. Budapest.

[There survives a substantial corpus of texts in Vogul and Ostyak taken down by Antal Reguly and Bernát Munkácsi from native singers. Reguly, a man of remarkable character, was working among the Vogul in 1843-1846, and he died prematurely in that decade without having published the Vogul texts that he had recorded. In 1888-1889 Munkácsi, with Reguly's notes, visited the Vogul country and, seeking out the same singers or their successors, had them repeat the same songs. With the lapse of time there were naturally variations. In the two volumes before us Munkácsi published Reguly's texts, his own texts, and translations of his own texts into Magyar. He also brought out volumes of textual exegesis. Hungarian scholars merit our gratitude for having preserved these texts for posterity and annotated them, publishing a large part of them.

In these native texts there is a category that scholars call in German *Fliegenpilzlieder*, 'fly-agaric-songs', songs composed under the influence of the fly-agaric. I have unfortunately not had an opportunity to explore these songs, which lie hidden behind linguistic barriers for the English-speaking world. Apart from their general interest for the world of scholarship, they may well contain important treasures for the ethno-mycologist; and if the thesis of this book turns out to be right, it will become imperative that the West gain access to this store-house of fly-agaric poems. After all, of the Siberian peoples who knew the fly-agaric, the cult among the Vogul in recent centuries was the strongest: it pervaded their religious life, their vocabulary, their songs. The sanctions for the abuse of the fly-agaric still held the people in thrall into this century: anyone not a shaman who ate the fly-agaric did so at peril of death.

In May 1967 I spent three days in Budapest with Dr. János Gulya, of the Linguistic Institute of the Hungarian Academy of Sciences, the outstanding Vogul scholar. With the help of Tamás Radványi, university instructor in English, we concentrated our attention on passages from one of the three Heroic Songs that Munkácsi had discussed in his paper on mushroom inebriation. (*Vide* **[**32**]**) This song is of particular interest for the light it sheds on the question of the bellicosity of the man under fly-agaric inebriation. Our Hero, the Two-Belted One, has eaten three sun-dried fly-agarics. News comes that the Mocking-bird Army from the north is invading the country and our Hero is desperately needed to lead the fight against the invaders. But he is in a fly-agaric stupor and sends the messengers to his younger brothers. Later they return and implore him *to throw off his stupor* and come and fight. This he does: he sallies forth and slays the enemy right and left. The Song exists in two recensions, Reguly's and Munkácsi's: the meaning of both is the same. Here is the English translation in prose of Munkácsi's recension of the Song (Vol. I, pp. 113, 115, 117) as we worked it out in Budapest. - RGW]

---

[336] A well-known contrivance, made of a slender spit of whalebone bent around, tied with sinew, and then covered with hard, frozen tallow. When swallowed by a wolf, the tallow melts, the sinew string gets loosened, and the sharp ends of the spit break through the walls of the stomach.

> The men keep going on. Whether for a long time or a short time, they keep going on. To their fortress Jäkh-tumen they returned, they got home. Their mother, a woman of the Kami [river], sets up a kettle [for brewing beer] so big that it could not be used up by the whole town. For three nights and three days people keep drinking. The ecstasy of the ecstatic would not come to the eldest man, the inebriation of the inebriated one would not come. The Sovereign of the Lake to his daughter, to his wife, goes home, comes up to them, says, 'The inebriation of the inebriated man has not come to me; listen, woman, go out, fetch me in my three sun-dried fly-agarics!' She answers, 'Perhaps in your folly you wish to drink the blood of your paternal line, perhaps in your folly you wish to drink the blood of your maternal line!' He says, 'Why have you vexed me, the Two-Belted One, so long as I was calm? Do I ask you whether I wish to drink the blood of my paternal line? I do not ask you. Woman, now fetch me in my three sun-dried fly-agarics!' She throws them before him. He, putting them into his mouth with the ten bear-teeth, chews them, and the ecstasy of the ecstatic man comes upon him.

★

> The big larch-wood door is kicked open. 'Oh, Uncle, don't carouse with the drunkenness of the drunken man! From northern regions the mocking-bird army with the red rump has flown here and they have all occupied your seven silver-headed posts that you yourself set up in the age of your increasing manhood [childhood]'. 'I have not strength enough, because of my inebriation [heat] of the inebriated [heated] man. Carry the news to the two younger sons of my father!'.

★

> The big larch door is again opened, 'Oh, Uncle, don't carouse with the drunkenness of the drunken man! From northern regions the mocking-bird army with red rump has flown here and they have all occupied, surrounded, your seven silver-headed posts! 'The man says, 'Bring me my armour...'

[The Hero then goes forth and wreaks havoc on the enemy.... The reader will have noticed that the Hero has asked for his three *sun-dried* fly-agarics. When he is urged to leave off his 'carousing with the drunkeness of the drunken man', in the Vogul original the three operative words are all derivatives from *paŋχ*, 'fly-agaric'. Dr. Gulya informs me that the Vogul no longer think of the fly-agaric when they use these words: the root gives them their everyday word for inebriation and its source is not present in their minds. One can become 'bemushroomed' on alcohol. - RGW]

B. The Linguistic Aspect

Preliminary Note

In this section we do not translate our authors. We paraphrase them, eliminating passages where they quote their predecessors, simplifying (sometimes radically) their phonetic representation of the original words, and standardising their various systems. We have reduced the number of dialectal differences or eliminated them. So far as we know, we have included every philologist who has dealt with the *poŋ* cluster. Linguists who interest themselves in the problems that the cluster raises will wish to consult the original sources.

The special characters that we use are:

ə : 'shwa', pronounced like the vowel in 'but'.
ɔ : an open *o*, pronounced like the vowel in 'awl'.
ŋ : a nasal; thus we write 'siŋer' for 'singer' but 'fiŋger' = 'finger'.
ł : a 'dark' *l* as in American English, rather than the French *l*.
χ : the Greek chi is pronounced as the *ch* in Loch Lomond.
ñ : as in Spanish; *cf*. *ny* in 'canyon'.
ˀ : glottal stop; as the word 'bottle' is pronounced by Scots. - *botˀl*.
ä : the sound of the vowel in 'let'.

A vowel long in quantity is indicated by the colon that follows it.

One of our linguistic contributors, Artturi Kannisto, contributes important, even sensational, ethno-mycological data. His information is dependable, and he dug out the fact that the Voguls of the Sosva and the upper Lozva use mushrooms other than the fly-agaric for shamanistic ends. In the valley of the Pelymka it is not clear whether the sexual distinction between male and female corresponds to different species of mushrooms or to some conventional distinction in the specimens of *A. muscaria*. Kannisto gathered his information in the first decade of this century, though it saw the light of day only in 1958. Even now it may not be too late for Russian mycologists to learn the precise species that the Vogul shamans were utilizing in Kannisto's day. It is to be hoped that they will not let these clues go unexplored.

Independently of Kannisto, I have received confirmation from Ivan A. Lopatin, the authority on Siberian cultures, that mushroom species other than the fly-agaric are used for their psychic effects. His personal communications to me were dated January 28, 1963, and July 19, 1966.

In these pages 'the Chukotka' will occasionally be found as a convenient geographical term. It is used in the Soviet Union to embrace all lands of the Chukchi, Koryak, Kamchadal, and Yukagir, in the Far Northeast of Siberia.

[31] Boas

> BOAS, Franz. Handbook of American Indian Languages. Part 2. Washington, Government Printing Office. 1922.

On p. 693 Boas arrives at the stem *poŋ* as meaning 'mushroom' in the Chukchi, Koryak, and Kamchadal languages. There is a duplication of the syllable in those languages, *poŋpoŋ* and *poŋpo*, *etc*., and this is discussed on p. 688, where however the meaning of the word receives a specific sense: the fly-agaric. Boas gathered his data at the turn of the century.

[32] Munkácsi

> MUNKÁCSI, Bernát. 'Pilz' und 'Rausch'. ('Mushroom' and 'Intoxication') Keleti szemle. (Oriental Review) Vol. VIII. Budapest. 1907. pp. 343-344.

[This paper by Munkácsi was the first of a number that discuss the *paŋχ* cluster of words in some of the Altaic languages. We call attention to a sentence in it that we print in italic. This sentence seems to give justification for the Scandinavian belief that the fly-agaric can incite furious behaviour - berserk-raging - in the eater, and as we were dealing with a traditional Heroic Song issuing from the very entrails of the Vogul culture, rather than with the questionable observations of foreign travelers, it was vital to determine the facts. This led me to Budapest in the spring of 1967, where I worked out a translation from Vogul into English with the help of Dr. János Gulya, which we give in **[**30**]**. As the reader will perceive, the sense of the poem is utterly different from Munkácsi's one-sentence synopsis of it: in a stupor from three sun-dried agarics, our Hero is unable to respond to the call to arms. But time passes and the urgency grows, and when the messengers press their appeal to throw off his stupor he finally calls for his arms. The distinguished Magyar scholar had certainly never heard of the debate in Scandinavia and wrote out his summary without regard to it: even today it seems to be unknown to Altaic specialists in Hungary. The poem exists in two recensions, Reguly's and Munkácsi's, but the sense of both is identical. - RGW]

In Vogul the fly-agaric (*Amanita muscaria*) is called in the northwest dialect *pa:ŋχ*, and in the Middle Lozva West dialect *pə:ŋk*. This word is probably identical with the North Ostyak *poŋχ*, 'mushroom, fly-agaric', the Irtys Ostyak *pa:ŋχ, paŋχ*, 'fly-agaric'; the Yugan Ostyak *paŋga*, 'fly-agaric'; the Mordvinian *paŋga, paŋgo*, 'mushroom'; the Cheremis *poŋgo, poŋgə*, 'mushroom'. In North Vogul the word *paŋχ* also means 'intoxication', 'drunkenness'; whence *pa:ŋχeŋ χum*, 'drunken man'. In the Lozva *pa:ŋχli, pa:ŋχeta:li*, and in the Pelymka *pə:ŋkˀli* mean 'he is drunk, intoxicated (*jolpa:ŋχles*, 'he has gotten drunk'; *pa:ŋχlim χɔtpä*, Lozva, *pə:ŋkˀlemkˀɔr*, a drunken man).

The connection between these similarly pronounced words can be explained by the fact that among the Voguls and Ostyaks in earlier times the fly-agaric played the same role as brandy plays today. As Patkanov reports ('A type of Ostyak Epic Hero,' pp. 5, 39: Irtysh Ostyaks 1: 121), it is said that singer of heroic songs or a shaman would, in order to bring himself to a state of exaltation, consume 7, 14, or even 21 fly-agarics, which had been dried for this purpose and either soaked in water or spread with butter or fat before consumption. After consuming this narcotic, a person becomes almost crazy, undergoes severe hallucinations, and sings in a loud voice all night long until, completely exhausted, he finally falls helpless on the ground and lies unconscious for a long time. Gods also find pleasure in this narcotic. Thus a hymn addressed to the 'Man-Who-Observes-the-World' (*mir susne-χum*) contains the following lines:

> While you, in the corner of your seven-sided holy house that came from your father *Numi-Tɔrem* [Upper Heavens], your seven partitioned golden house, on your seven golden-footed tables, on your seven golden-lidded chests, run about in ecstasy caused by seven one-footed glasses, as you are running about in ecstasy caused by seven one-footed notch-edged fly-agarics (akw laˀylep lar'siŋ χu:rpä sa:t pa:ŋχ se:ŋwen χajtnen χalt), may your holy little ear, which is as big as a lake, as big as the Ob, nevertheless hearken here. May your golden eyes, which reflect the Ob, sparkle in this direction!
> (Vogul Népköltési Gyűjtemény, 11:314)

This thought is expressed in another hymn to the same deity as follows:

> While you run about in the ecstasy of your intoxication caused by seven fly-agarics with spotted heads (kumliŋ puŋkep sa:t pa:ŋχ kus'män, se:ŋχwen χajtne χalt), may your mind, demanding blood sacrifice, may your mind, demanding food sacrifice, like the swelling water of the Ob, like the swelling water of the Lake, direct itself here. (*Ibid*., 11:362)

In the song about the creation of the heavens and the earth, recorded by Reguly, we are told of the Kami woman's oldest son, who later turned into a bear, that when after a three-day beer feast he had not yet achieved the intoxication he had been longing for, *he asked his wife to bring him three fly-agarics that had been dried in the sun* (χɔ:tel tɔ:sem χu:rem pa:ŋχ), *and that after he consumed these, he few into such a rage* *that he mercilessly slaughtered a great crowd of people*. (*Ibid*., 1:114)

In the name *paŋχ* of this narcotic we recognize the Old Persian word *baŋha-*, whose meaning, according to Bartholomæ (Altiranisches Wörterbuch, 925), is the following: '1. Name of a plant (and its juice) which was also used for producing abortions; 2. Name of a narcotic made from that plant and also a designation of the state of narcosis produced thereby.' Other instances of this word are: Sanskrit: *bhaṅga-*, *bhaṅgā-*, meaning 'hemp; a narcotic prepared from hemp seeds'; modern Persian: *bang*, 'henbane' [*Hyoscyamus niger*] (*bangī*, 'senseless'); Armenian: *bang*, 'hyoscyamus'; Afghan: *bang*, 'hemp' (Horn, Modern Persian Etymology, 53; Uhlenbeck, Etymological Dictionary of the Old Indian language, 194). According to Wilhelm Geiger (East Iranian Culture in Ancient Times, p. 152), hemp is used in Persia for making 'the notorius hashish, the use of which deranges the human organism in the most frightful manner'. From all this we conclude that the Vogul word *paŋχ*, Ostyak *poŋχ*, 'mushroom, fly-agaric', as well as the Mordvinian word *paŋga*, and the Cheremis *poŋgo*, 'mushroom', according to their original etymon, have properly the meaning 'intoxicating', 'narcotic', and that the knowledge of this culture product among the Finnish peoples comes from the Aryans, just as this may be assumed to be true with regard to 'beer' (Vogul, Zyrian, Votyak *sur*, Vogul *sor*, Ostyak *sɔr*, Hungarian *ser*, *sör*, Sanskrit *súrā*, Avestan *hura*, 'a spirituous drink, chiefly brandy' or 'beer'.)

[33] Kannisto

> KANNISTO, Artturi. E. A. Virtanen and Matti Liimola, editors. 'Materialien zur Mythologie der Wogulen gesammelt von Artturi Kannisto.' (Materials on the Mythology of the Vogul Gathered by Artturi Kannisto) Mémoires de la Société Finno-ougrienne. Vol. 113, pp. 419-420.

In order to become intoxicated, the Vogul shaman employs or used to employ, above all things, the fly-agaric (*paŋχ*, *pə:ŋk*,[337] *etc*.); after having eaten them, he becomes intoxicated. He must be in this state when he begins to exercise his functions [as shaman]. From the area around the river Sosva we have the report that fly-agarics grow out of a single 'foot,' six or seven of them together; when they are dry, they are yellowish brown. Around the Upper Lozva, the term *pa:ŋχ* refers to a small mushroom (not the beautiful many-colored fly-agaric) that grows at the base of a tree stump and the like in clusters, as if out from a single root; the *ña:it-χum*, 'shamans', dry and eat them. In the area around the Lower Konda the *pa:ŋχ* are collected after St. Peter's Day and dried in the hut. The shaman *ñoait-χar* or *käiləŋ-χar* eats seven of them when he begins his séance. Before they are eaten they are soaked in water; if there is butter on hand, they are eaten with butter; otherwise without. Once the fly-agaric has begun to affect the shaman, one says: *pa:ŋχŋə joχtwəs*, 'the fly-agaric has come into him'. After the shaman has eaten the fly-agaric he walks around the room, sings, and continues the séance. Around the river Pelymka, the fly-agaric is called *saittoal pə:ŋχ*, the fly-agaric that causes loss of sense'. There are male and female fly-agarics (respectively *kum-pə:ŋk* and *ne:-pə:ŋk*); the former are eaten by male shamans and the latter by female shamans. One must eat either three or seven of them. Nowadays fly-agarics are no longer used around the Pelymka. When the shaman 'makes the room dark' and eats fly-agaric before his séance, he must don *wa:rim u:lamt*, 'sacrificial clothes' (Upper Lozva).

P. 286. Around the area of the Lower Konda he [*käiləŋ* 'the shaman'] says which sacrifice is to be made after he has eaten fly-agaric, and he sleeps after having eaten them.

Pp. 429-430. Around the area of the Lower Konda there are shamans who are married, unmarried, or who have been married in the past, as well as male and female shamans. The *käiləŋ* (shaman) also performs the following: he eats seven fly-agarics on the preceding evening, walks about the room, leaves the room a number of times, looks at the sky, yells something, enters, lies down, and remains in that position until morning. Then he tells what he knows and gives advice.

---

[337] *pa:ŋχ* and *pə:ŋk* are the same term in two dialects.

[28a] Donner

> DONNER, Kai. 'Ethnological Notes about the Yenisey-Ostyak (in the Turukhansk Region)' Mémoires de la Société Finno-ougrienne LXVI. Helsinki. 1933, pp. 81-82.

Donner here says that *haŋgo* means 'fly-agaric' in the dialect of Ket spoken in the Turukhansk region. We have already given the quotation under **[**28**]**.

[24a] Lehtisalo

> LEHTISALO, T.
> 1. Juhlakirja Yrjö Wichmannin kuusikymmenvuoti-späiväksi. (Publication in honor of Yrjö Wichmann's 60th birthday) Mémoires de la Société Finno-ougrienne. Vol. LVIII. Helsinki. 1928, p. 122.

On this page there is a note on a word reported by Castrén in the Tavgi tongue, one of the Samoyed languages, called in the Soviet Union today the language of the Nganasan people. That word is: *faŋkáˀam*, 'to be drunk'. He sees parallels with this word in various Finno-Ugrian languages:

Mordvinian:	paŋgo, 'mushroom, lichen'
Cheremis:	poŋgə, 'mushroom'
Vogul:	paŋχ, piŋka, 'fly-agaric'
Ostyak:	pa:ŋχ, pɔ:ŋk, paŋχtəm, puŋkłəm, depending on the dialect; the meaning is 'fly-agaric'

From the wide dissemination of this word the author concludes that intoxication from eating the fly-agaric goes back probably to pre-Uralic times.

The similarity of this word to the Latin *fungus*, Greek σπόγγος [*spóngos*] may be merely accidental. Munkácsi's assumption that the Finno-ugrians borrowed the word from Indo-Iranian is not likely, the author holds, giving as the example in Sanskrit *bhaṇga-s*, 'hemp and the narcotic substance made from it'.

> 2. 'Sampa, sammas'. Virittäjä. Helsinki. 1929. pp. 130-132. Translated from the Finnish.

Our language has many words phonetically reminiscent of the term *sampo* in the Kalevala. They may all belong to the same word family. Of these only one has been compared with an equivalent in the more distant related languages, *viz*., the word *sammakko*, *sammakka* ('frog', 'toad') [and other related words - RGW], which has been linked to Lapp *cuobo*, gen. *cubbu*, 'frog', 'toad'. (*Vide* E. N. Setälä, 'Zur Etymologie von *Sampo*, FUF II, pp. 146 ff.) In this paper I will present a form from Samoyed that corresponds to another word in this Finnish family. Since the word I am writing about must be kept distinct phonetically from *sammakko*, *etc*., we must reckon with two word families of the type *sampa*.

Let us look at the following Samoyedic forms. Yurak Samoyed: *sa:mpa:*, 'to carry the ghost-soul of the deceased to the hereafter to the accompaniment of the shaman's drum', ... [and other dialectal forms] meaning 'to sing an incantation to the accompaniment of the shaman's drum', 'he who sings an incantation to the accompaniment of the shaman's drum', 'shaman', *etc*. - On the Finno-Ugric side, we are immediately reminded of the Ostyak word (Konda dialect) *paŋχtəm*, 'to sing and shamanize after having eaten fly-agaric; to cure with incantations'. This word is of course related to Ostyak *paŋχ*, 'fly-agaric'. (*Vide* NSFOu Dol. 58, p. 122.) Bearing this in mind, the next step is to look for a word meaning 'fungus' or 'mushroom' that might be phonetically linked with the Samoyed words mentioned above. Thus we come upon the Finnish words *maansampa*, 'puffball', and *puunsampa*, 'a white pinhead-sized efflorescence on birches, alders, and willows', in which we propose that the element *sampa* originally meant 'fungus' or 'mushroom'. The Samoyed words go back to the initial palatalized sibilant ★*s*-, which distinguishes them, on the evidence of Lapp, from the word *sammakko*, which goes back to ★*č*-.

Closely related to the meaning 'fungus', 'mushroom', 'efflorescence', are the disease names *sampa*, *sammas*, *sampaat*, 'childhood disease affecting the mucus membrane of the mouth; swollen glands in the jaw' (Mikkeli area); 'glands in the jaw' (Häme, Savo); 'a disease of horses' (Viitasaari). From this we proceed further to the word *sammasvesi*, 'water from a certain spring used to cure *sammas*' (Sääksmäki); 'water from a hole in a rock used to wash out the mouth of a child suffering from *sammas*' (Luopioinen). According to Gottlund, the word *sammaslahde* is used to designate medicinal springs where a specified amount is paid when water is taken from them.

It might be mentioned also in passing that it would be tempting to link *tatti*, 'fungus', 'mushroom', with the following Samoyed word: Yurak Samoyed ... [The author supplies various words from Samoyed dialects meaning 'shaman'. But he concludes that this is rendered somewhat uncertain as *tatti* might be related to a different Yurak Samoyed word, though in turn there are counter-arguments that the author gives. - RGW]

We may furthermore bear in mind that I have linked the Tavgi Samoyed *faŋkáˀam*, 'to be inebriated', with the words in the Finno-Ugric family of languages meaning 'mushroom' and 'fly-agaric'; *cf.*, *e.g.*, Mordvin *paŋgo*, 'mushroom', Ostyak *pa:ŋχ*, 'fly-agaric' (*vide* NSFOu LVIII, p. 122). [The writer now quotes Donner and others whom we have translated. - RGW] We may regard it as certain that in the dim antiquity of the Proto-Uralic period the Finnic shaman ate intoxicating fly-agaric during his sorcery sessions. We now understand how it was that later, when the shaman had stopped eating the fly-agaric and was beating his drum, he relapsed in the course of his sorcery session into a state resembling madness and finally fell unconscious to the ground ('falling into a trance').

[34] Uotila

UOTILA, T. E. 'Etymologioita.' ('Etymologies') Virittäjä. Helsinki. 1930, pp. 176-7.

Some Asian and notably Finno-Ugric peoples use the fly-agaric for inebriating purposes. Here are the members of this word family:

Mordvinian (Mokša)	- paŋga, 'mushroom'	
(Erza)	- paŋgo, 'mushroom, lichen'	
Cheremis	- poŋgo, paŋgə, 'fungus'	
Ostyak (North)	- poŋχ, 'mushroom, fly-agaric'	
(Irtysh)	- paŋχ, 'fly-agaric'	
Other Dialects	- paŋχ, 'fly-agaric'	
	- pɔŋk, 'fly-agaric'	
	- paŋχtəm	'to shamanize while singing after having eaten the fly-agaric:
	- puŋkłəm	to cure by shamanizing'
Vogul (North)	- paŋχ, piŋka, 'fly-agaric'	
Tavgi	- faŋkáˀam, 'to be drunk'	
Selkup	- pöŋer, 'drum'	
	- pəŋgar, 'a special Selkup musical instrument'	

These words belong to the Uralic family ★*p8nk8* (the '8' - back vowel). To it belong the following Zyrian forms:

(Sysola dialect)	- pagalny, 'to lose one's consciousness'
	- pagavny, 'to poison oneself, to kill oneself'
(Luza)	- pagyr, 'bitter taste in beer', 'sour, sharp, penetrating'

After giving some more derivatives, the author says that they reflect the effect of the fly-agaric on those who have eaten it. From the Uralic root ★*p8nk8* Uotila derives the ★*pag* form meaning the fly-agaric; and *pagyr*, bitter, from 'having the taste of fly-agaric', and *pagal*, 'the power to inebriate'.

[35] Bouda

BOUDA, Karl. *Das Tschuktschische*. (The Chukchi) Published as Part 4 in Beiträge zur Kaukasischen und Sibirischen Sprachwissenschaft, by Deutsche Morgenländische Gesellschaft. Leipzig. 1941.

In this philological study Bouda on p. 35 under entry 20 discusses Chukchi *poŋpoŋ*, *pompoŋ*, meaning mushroom. By comparing it with Koryak *pˀoiunv*, mushroom, and *a-pˀonake*, 'without mushrooms', he arrives at the Chukchi root *poŋ*. He compares these words with

Cheremis:	*poŋgo*, 'mushroom'
Mordvinian:	*paŋgo*, 'mushroom'
Ostyak:	*poŋχ*, *paŋχ*, 'fly-agaric'
Vogul:	*pɔŋk*, *pa:ŋχ* 'fly-agaric'

In a footnote he calls attention to the use of the fly-agaric by the Ob-Ugrian shamans so that, having been entranced by its poison, they may communicate with gods and spirits.

[36] Steinitz

STEINITZ, Wolfgang. Geschichte des Finnisch-ugrischen Vokalisnuis. (History of Finno-Ugrian Vowel Structure) Stockholm. 1944. p. 37.

The author includes in his list of words the Vogul *paŋk*, fly-agaric, which in Mordvinian is *paŋgo*.[338] In the Ostyak of Surgut he supposes that there has been an alternation of the vowel from ★*a* to ★*u* to ★*i*, leading to these three forms: *pɔŋkełłem*, *puŋkłəm*; *pyŋkła*. Only ★*y* in Vogul, with *pə:ŋk*- in one dialect. Changing vowel in Cheremis: *poŋgə*. It is unclear whether Zyrian *pagal*-, *pagyr* comes from this source.

[37] Hajdú

HAJDÚ, P. Von der Klassifikation der samojedischen Schamanen. (On the classification of Samoyed Shamans) Glaubenswelt und Folklore der sibirischen Völker. (Religion and Folklore of the Siberian Peoples) Edited by V. Diószegi. Akadémiai Kiadó, Budapest. 1963. pp. 161-190.

P. 170. T. Lehtisalo is of the opinion that the family of the Nenets (Samoyed) word *sa:mpa:* may be related to the Finnish word *sampa*, fungus, sea-foam.[339] This Finnish word occurs in the names of diseases, as, for example, *sampa*, *sammas*, *sampaat*, a disease of the mucous membrane of the mouth in children; swelling of the submaxillary glands; a disease of horses. The word is also found in compounds such as *maansampa*, puffball; *puunsampa*, white mushroom the size of a pinhead on birches, willows, and alders. According to Lehtisalo, the meaning 'to work magic' originally referred to magic that was performed in the state of ecstasy brought on by fly-agarics. For a semantic confirmation of this, he cites the Khanti verb *paŋχtem*, to work magic while singing after consuming fly-agarics, to heal by magic (<: *paŋχ*, fly-agaric) On phonetic grounds, Lehtisalo distinguishes the Finnish *sampa*-Nenets *sa:mpa:* from the Finnish *sampo* and its derivatives. This is certainly an imaginative explanation, but there are many reasons which compel us to disagree with it. In the first place, this comparison seems doubtful to us because the agreement between the words is found only in the two most widely separated members of the Uralic language family. Another argument against it is that the meaning 'mushroom' has not been found in Samoyed and the meaning 'to work magic in the state of ecstasy brought on by fly-agaric' is unknown in these languages. One could suppose, of course, that the verb 'to work magic' was expressed by a derivative of a word meaning 'mushroom'; however, in Samoyed the form *sa:mpa:* is without a suffix, in so far as we can consider it to be the form corresponding to the Finnish *sampa*.

---

[338] The Mordvinian and Cheremis word means 'mushroom'.

[339] Lehtisalo, T. '*Sampa, sammas*'. *Virittäjä*, Vol. XXXIII, pp. 130-132. [Our ref. **[**24a**]** pp. 310-312 - RGW]

Because of these many problems, I have attempted to find a different explanation for the Samoyed *sa:mpa:*.

[The author then refers the reader to an article that he wrote, 'Etimológiai megjegyzések' ('Etymologische Bemerkungen') ['Etymological Notes'], in *Nyelvtudományi Közlemények*, Vol. LVI, pp. 53-56.]

[38] Balázs

> BALÁZS, J. 'Über die Ekstase des ungarischen Schamenen.' (On the Ecstasy of the Hungarian Shamans) Glaubenswelt und Folklore der Sibirischen Völker. (Religion and Folklore of the Siberian Peoples) Edited by V. Diószegi. pp. 57-83. Akadémiai Kiadó, Budapest. 1963.

[Sections 1 and 2 (pp. 57-59) discuss the Hungarian word *rejt*, 'hide,' the Old Hungarian word variously spelled *rüt*, *rőt*, *röjt*, *réüt*, *rit*, *riüt*, entrance, enrapture,' and the problems whether these two words are related in meaning and whether one or both may be traced back to the shamanism of the Ugric period. - RGW]

Pp. 59-67.
3. We may come closer to a solution of this problem it we investigate the methods by which the shamans worked themselves into a state of ecstasy; in this process we shall make use of the latest linguistic, ethnographic, and archæological results, as well as a critical analysis of earlier data. The semantic explanation of the Hungarian verb *rejt*, 'ecstasize,' is based, to this day, chiefly on Hunfalvy's arguments and on Munkácsi's commentaries on the Russian academician P. S. Pallas's description of his travels.

Concerning the ecstasy of the shamans among the Mansi and the 'northern' shamans in general, Munkácsi writes: 'The visible reality in the magical performances of the northern shaman is that he transports himself into a state of unconsciousness resembling a trance, *i.e.*, into a state of ecstasy. Even when he begins the magical performance, he is in a befogged condition owing to the fly-agaric or brandy he has previously taken. His drunkenness and his agitated nervous state are intensified by the foot-stamping, the loud, excited singing, the wild howling, and the noise of clashing kettles and pots, as well as by the illusion of being in communication, or even in combat, with the spirit.' Here we see that the shaman eats the poisonous fly-agaric or becomes drunk with brandy and in this way achieves a state of trance. In connection with the shamanism of the Ugric peoples, Karjalainen mentions that the shamans of the Irtysh-Khanty often used the fly-agaric as a narcotic. Many travelers describe how the Siberian shamans eat fly-agarics and thus fall into a state of ecstasy.

A systematic compilation of such data has been made by A. Ohlmarks. He states that the fly-agaric (*Amanita muscaria* L. Pers.) is the stupefacient most commonly used by shamans among the Koryak, Kamchadal, Nentsy (Yurak Samoyed), and Selkup (Ostyak Samoyed), and among the Khanty along the Yenisei and the Irtysh. Ohlmarks devotes a separate chapter to alcohol, which is used as a stupefacient by the shamans of many Siberian tribes. He states that the shamans of the Irtysh-Khanty, the Tungus, the Lapps, the Buryats, and other peoples often drink alcoholic beverages until they lose consciousness. Nevertheless alcohol cannot compare with the fly-agaric as an effective narcotic. The designations for the fly-agaric form a very widespread family of words in the Ob-Ugric languages and in a number of Finno-Ugric languages. The corresponding derivations are extraordinarily revealing from a semantic point of view because they indicate the method (quite likely a very old and very widespread method) by which the Finno-Ugrian shamans achieved a state of ecstasy.

Here is a list of the etymologically related words for the fly-agaric in the various Finno-Ugric languages:

Mansi: *paŋχ*, *piŋka*, 'fly-agaric'; Northern dialect: *pa:ŋχ*; Middle Lozva dialect: *peŋk*, 'fly-agaric, *agaricus muscarius*'; Khanti Northern dialect: *poŋχ*, 'mushroom, fly-agaric'; Irtysh dialect: *pa:ŋχ*, *paŋχ*, 'fly-agaric'; Yugan dialect: *paŋga*, *pa:ŋχ*, 'fly-agaric'; Irtysh dialect: *poŋk* (*puŋkəm*), 'the fly-agaric'; Lower-Demyanka dialect: *paŋχ*; Verkh, Kalymsk, Vartokovsk dialect: *paŋk*; Tremyugan dialect: *pəŋk*; Nizyam-Berezovo dialect: *poŋχ*, Kazum dialect: *ponk*, 'fly-agaric'; Mordvinian: *paŋga*, *paŋgo*, 'mushroom'; Cheremis: *paŋgə*, *poŋgo*, *poŋγə*, 'mushroom'.

The importance of the poisonous fly-agaric in the ecstasy of the Mansi shamans is proved by the fact that in the Northern Mansi dialect the word *pa:ŋχ* means 'drunkenness'.

The following words are derivatives by which the concepts of 'drunkenness, ecstasy' are expressed in Mansi: *pa:ŋχli*, *pa:ŋχeta:li*; Lozva Pelym dialect: *pəŋkli*, 'he is drunk, intoxicated.' Likewise, *paŋχtem* in the Northern Khanti dialect and *puŋkłəm* in the Irtysh dialect mean 'to work magic while singing after eating fly-agarics, to heal by enchantment'; in the Upper Demyanka dialect *panɣətta* means 'to shout and make noise after eating fly-agarics'; in the Tremyugan dialect *pɔŋkəłta:ɣə* means 'to become intoxicated with fly-agaric, to sing through the effects of fly-agaric.' The singing of the shaman who is transported into ecstasy by eating fly-agarics is expressed in Khanti by the following words: Tremyugan dialect: *pɔŋk a:rəχ*, *pɔŋkəłsauɣə*, 'fly-agaric song, a song which the shaman sings after eating fly-agarics', Vasyugan dialect: *panləmnəŋ*, 'song which is sung after eating fly-agarics.'

According to T.E. Uotila, the following also belong to this word family: in Komi (Wichm.), Sysola dialect: *pagal-*, to lose consciousness (*i.e.*, through drinking alcohol); (Wied.): *pagal-* (*pagav-*), to lose consciousness, to be overwhelmed (?) [or: to be deluded (?)]; (Sachow [or: Zakhov]): *pagav-*, to poison oneself, to kill oneself; Udorka-Vashka dialect: to be unsteady, to stagger, Sysola dialect. According to Uotila the primary noun root of these words is ★pag-, which we can relate to the above words denoting the fly-agaric. He believes that this word must also have existed in Komi and cites as evidence the following Komi adjectives: (Wichm.) Luza dialect: *pagyr*, sour, sharp (like the taste of beer); (Wied.): *pagyr*, sour, sharp, penetrating; (Wichm.): *pagyra*, penetrating (beer), *pagyra*, sharp-tasting. Uotila assumes that these adjectives are derived from the noun ★*pag*, 'fly-agaric,' by adding the suffix -r and that their original meaning is 'tasting like fly-agaric.' He believes that a special significance must have been attached to the fly-agaric in the Komi language also. Steinitz, on the other hand, doubts that the reference to these Komi words is justified in this connection. They may have acquired their meaning of 'falling into ecstasy, into a trance' through the same semantic development as the above-mentioned Mansi and Khanti verbs with similar meanings.

According to Lehtisalo the following words also belong to this category: Nganasan (Castr.) *faŋkáˀam*, to be drunk, and even Selkup (Castr.), Kamas, Kheya, Kha, Upper-Ob dialect *pöŋer*, drum, Tym dialect *pəŋgər*, a special Samoyed musical instrument, the Russian *domra*; Narym, Lower Vasyugan, Middle-Ket dialect *pəŋgər*, Upper-Ket dialect *py:ŋga:r*, Khaya dialect *p&#601ggər*, the same.

Lehtisalo compares the Nenets verb *sa:mpa:*, to sing the shade of a dead person down into the underworld to the accompaniment of the magic drum, *etc.*, with the Finnish noun *sampa: maansampa*, puff ball, *puunsampa*, a whitish mushroom the size of a pinhead, found on birches, alders, and willows. If the root of this Samoyed verb is a noun meaning 'mushroom', then we have here a semantic relationship similar to that between the following nouns and verbs: Khanti *pa:ŋχ paŋχtəm*, Nenets, Obdorsk dialect *ja:pˀe:*, to be drunk, Nenets (Reg.) *javebš*, fly-agaric, Lyamin dialect *wi:ppi:*, Nyalina dialect *wˀi:ppi:*. Pur dialect *wi:pi:*, fly-agaric, Enets, Khantaika dialect *jeviˀe:rro*, Bayikha dialect *jebiˀedo*, to be drunk.

On this basis, Lehtisalo assumes that the Finnish shamans also used the fly-agaric as a stupefying agent in earlier times and that people probably 'became intoxicated by eating fly-agarics as early as proto-Uralic times.'

In every case the above-mentioned Finno-Ugric words meaning 'ecstasy, intoxication, drunkenness' are similarly traceable to a noun which means 'fungus, fly-agaric' and was used figuratively to denote the intoxicated, ecstatic, or drunken state itself (as in Mansi), whereas the verbal derivatives of this same noun in many Finno-Ugric languages have the meaning 'to fall into a trance.' From the semantic viewpoint this requires no further explanation, since it is obvious that the root-word of derivatives which mean 'to come into a condition' is the same word which is used to denote the substance producing the condition. There is a causal relationship between such root-words and their derivatives. The verbs formed from these nouns mean 'to provide somebody with something' or 'to be provided with something.' Thus we find not only from descriptions given by travelers but also from definite linguistic facts (derivatives of Finno-Ugric words which mean 'fungus' or 'fly-agaric') that the Finno-Ugrian shamans used the fly-agaric as a stupefying agent in ancient times.

4. It might be asked, however, whether all verbs meaning 'to fall into ecstasy' in the Finno-Ugric languages are derived from a noun meaning 'fungus' or 'fly-agaric,' and whether these Finno-Ugric words are not loan-words.

Munkácsi believes that these Finno-Ugric words are of Old Iranian origin. He bases his opinion on the fact that the semantic development of the Old Iranian word *baŋha* is remarkably similar to that of the above-mentioned Mansi word for the fly-agaric. According to Bartholomæ this Old Iranian word has several different meanings: '1. Name of a plant (and its juice) which was also used for producing abortions: 2. Name of a narcotic made from that plant and also a designation of the state of narcosis produced thereby.' Other references in connection with this word are: Old Indian *bhaṇga-*, *bhaṇgā-*, 'hemp; a narcotic prepared from hemp seeds': modern Persian *bang*, 'henbane,' (*bangī*, 'senseless'); Armenian loan-word *bang*, '*Hyoscyamus niger*'; Afghan *bang*, 'hemp.' In Persia, according to W. Geiger, hashish is made from hemp.

Whether Munkácsi is right in making this correlation is a matter for experts in Iranian to decide. As far as the semantic development is concerned, it is rather difficult to imagine that a word which originally meant 'hemp' would be used by the Finno-Ugric peoples to describe the fly-agaric, since these two plants do not resemble each other in the slightest, except for their narcotic effect. (Lehtisalo considers the borrowing of these words unlikely.) Nevertheless, it must be borne in mind that hemp seeds might have played, and perhaps still play, a role in the ecstasy of the shamans. We shall return to this point later.

[39] Pedersen

> PEDERSEN, Holger. 'Przyczynki do gramatyki porównawczej języków słowiańskich'. (Contributions to the comparative grammar of Slavic languages) Materiały i Prace Komisyi Językowej Akademii Umiejętno&sacute;ci w Krakowie. Vol. I, No. 1, pp. 167-176. Kraków. 1901.

There follows an abstract of the original paper in Polish, an abstract prepared by Roman Jakobson as a working paper.

I

Old Bulgarian gąba 'spongia', Polish gąbka. The Old Bulgarian gąba is usually compared with the Lithuanian gum̃bas, 'illness of the uterus, excrescence on a tree', (Mieżinis), 'an excrescence on an organic body or on a stone, colic, cramps of the stomach' (Kurschat), Latvian gumba 'tumor', gumpis, 'colic'. This etymology is improbable.

II

It presents difficulties when one compares the accent of the Lithuanian gum̃bas with the Serbian gȕba, Slovenian góba: the Serbian short falling accent̏ corresponds to the Lithuanian ´, and the Slovenian ' corresponds to the Lithuanian '.

III

Lorentz' law, surmising the change of um̃ to the Slavic ą is erroneous.

IV

To the Slavic gąba there corresponds etymologically the Old High German swamb. Kluge compares swamb with the Greek somphós, 'porous', but it is not plausible. Swamb could represent the Indo-European ★sg̏ hombho-s. The Indo-European g̏ ho gave in Germanic wa, as in the Gothic warms: Latin formus. In Baltic and Slavic languages the consonant s in the initial cluster sg had to disappear; compare Old Bulgarian gasiti and Lithuanian gesýti with Greek sbénnȳmi.

V

Also the German swamb could be easily explained from the original ★sg˘hombho- as well as from ★sg˘hōmbho-. But if the Lithuanian gum̃bas does belong here, one must accept ★sg˘hombho- as the original form and the Lithuanian gumbas represents the reduction ★sg˘hṃbho-. The same reduction occurs in the German sumpf, but English swamp.

VI

Also ★sgwombho- could be admitted as the original form. Then the Slavic gąba either lost the semivowel w during the Baltic-Slavic stage, or it represents an Indo-European variant without w.

VII

In this case it is possible to combine gąba: swamb with Greek sfóngos, Latin fungus. The Greek and Latin expressions spring from the original forms beginning with ★sph-. Here also belong Armenian sunk, sung, 'sponge, pumice', but Armenian s can represent only the Indo-European ★sp and not ★sph. However it is possible to suppose ★sphwongo-. From ★sphwongo there could arise ★sgwompho- and also ★sgwombho-; the alternation ph~bh is not unusual after the nasal consonants.

C. Secondary Sources

[40] Hartwich

> HARTWICH, Carl. Die menschlichen Genussmittel: ihre Herkunft, Verbreitung, Geschichte, Anwendung, Bestandteile und Wirkung. (Human Stimulants: Their Origin, Distribution, History, Use, Components, and Effects) Leipzig. 1911. pp. 255-260.

[Hartwich was a distinguished toxicologist and pharmacologist of his day. He had read widely, he was intelligent, and he expressed himself well and forcibly. What he wrote about the fly-agaric in *Die menschlichen Genussmittel* reflected the best opinion of his day and in pharmacology it exerted wide influence; but on the fly-agaric in major features it was wrong or misleading. As late as 1911 he gave expression to the ancient European superstition that the fly-agaric is dangerously toxic: 'four mushrooms can kill a man'. On the contrary, it is difficult to find case histories of healthy adults who have died from it, which is in striking contrast to the deadly amanitas! He perpetuates the notion that the Tungus and Yakut tribesmen - both speaking Altaic tongues - use the fly-agaric. He quotes 'a Zürich man's letter dated 1799' reporting that the Russian troops occupying Zürich in that year had gathered fly-agarics on the Zürichberg and eaten them, allowing his reader to suppose that it was for their intoxicating effect. In historic times no Russian - whether Great Russian or Little Russian or White Russian - has taken the fly-agaric for its inebriating effect. This statement will not be successfully gainsaid. The Russians have produced numbers of excellent specialists in Slavic folklore and folk practices, and today when the Russian world stands revealed to us, thanks to numbers of persons in the West who have learned the language, it would be impossible for a pharmacologist of standing to say that the Russians eat the *mukhomor*, as they call the fly-agaric, for the inebriation that follows. True, there have been reports that some of the Russian civil servants and Cossacks stationed among the Palæosiberian tribes have taken the habit from the natives, but it is not in this sense that ignorant people lay the charge of fly-agaric eating. A West, where only yesterday there were elements in the educated classes that regarded the Russians as *Untermensch* and not worthy of study, was prepared to believe anything that, according to Western prejudices, was degrading about their neighbors in Eastern Europe. It is not that consuming the fly-agaric would have been disgraceful, any more than consuming alcohol or tobacco. But there were Westerners who believed the Russians ate the fly-agaric, as Hartwich seems to have done. It was not so. Diverse cultures should not be confused: each stands on its own bottom, and to associate the Slavic culture with that of the Koryak is like asking an American tourist whether Iroquois is his native tongue.

[Hartwich of course gives some measure of credence to the belief, common in Scandinavia, that berserk-raging was produced by the fly-agaric. On the use of the fly-agaric in Siberia Hartwich quotes Enderli, who is excellent, and Kennan, who is childish. He ignores Strahlenberg, Maydell, Langsdorf, Georgi, Erman, and Dittmar, who wrote in German; Krasheninnikov who was translated into German; and Bogoraz and Jochelson, whose works had already been published in English in Leiden. Had he done his homework properly, he would have found some answers to the questions that baffled him, such as a possible explanation for the urine drinking of the reindeer folk. He also draws on Ernst von Bibra, a pioneer pharmacologist whose *Die narkotischen Genussmittel und der Mensch* appeared in Nüremberg in 1855, though he was only a secondary source relying on writers whom Hartwich should have read. He quotes Kennan to the effect that the continued use of the fly-agaric has harmful results, adding that Kennan no doubt was right. Kennan had been in the Koryak country, but the man on the spot can be a bad observer and Kennan's text gives no ground for reliance on his word. The fly-agaric may be harmful if its use is continued, but it is the function of a man of science to reduce the area of guessing and not himself reach conclusions that are only guesses. The excessive use of alcohol is harmful, but not the continued moderate use. May this not be true of the fly-agaric? - RGW]

The fly-agaric is one of the most remarkable stimulants. Except for one otherwise unknown poisonous mushroom which was consumed as a delicacy[340] by the ancient Mexicans, it is the only stimulant in the broad subkingdom of cryptogamic plants, and no other stimulant ranges so far north. Only some unusual forms of alcohol production from milk are found in the region of Siberia bordering on the area where fly-agaric is used, and in the extraordinary method of its use it is unparalleled by any other stimulant on earth.

The fly-agaric (*Amanita muscaria* L. Pers.) grows in forests and its distribution is circumpolar in the northern hemisphere; it is found in Europe, Northern Asia, and North America, but it also occurs in South Africa.[341]

It is highly poisonous, and the splendid red colour of its cap, with its sharply contrasting white warts, sometimes entices the inexperienced to eat it. A great many deaths traceable to this cause have been reported. Four mushrooms can kill a man; sheep, on the other hand, appear to be immune to it. The symptoms observed after such poisoning are nausea, vomiting, thirst, colic pains, mucous and bloody stools, flow of saliva, and fainting spells; sometimes there are also intoxication-like states and lethargy, dilation of the pupils with disturbed vision and even temporary blindness, delirium, hallucinations, raving, cyanosis (blue colouration of the skin), difficulty in breathing, loss of consciousness, and cramps. Death has occurred after ten hours, or sometimes after eight. A victim may recover after 5-24 hours.[342] It derives its name from the fact that an extract of this mushroom was used for killing flies, particularly in earlier times, before fly-paper saturated with arsenic, quassia, and the like became widely known. Its use in medicine has always been insignificant. According to Kosteletzky,[343] it has been recommended for use against nervous attacks, swollen glands, ulcers, and - in Kosteletzky's time - for use as a powder or tincture against consumption.

At present it is used as a stimulant only in Siberia, and its range is very extensive. It begins with the Ostyaks, whose territory extends from the Ob to the Yenisei. From here it continues uninterrupted to the easternmost part of Asia. After the Ostyaks come the Samoyeds and Tunguzes, then the Yakuts, the Yukagirs, the Chukchis, the Koryaks, and the Kamchadals. The area of fly-agaric use probably does not extend far south of 6o° north latitude at any point.

According to some reports, the use of the mushroom extended farther west in earlier days and was perhaps forced back by the spread of alcohol. A Zürich man's letter dated 1799,[344] the year in which a Russian army under Korsakoff was in Zürich, mentions with amazement the fact that the Russians gathered fly-agarics on the Zürichberg and ate them. These Russians, of course, must have become acquainted with the mushrooms in their own homeland.

At Polotsk on the Dvina (presumably in 1812) French soldiers ate fly-agarics, and four of them died within a short time.[345] No doubt they had seen the local inhabitants eating the mushrooms. While the Russians in these last two cases were probably not Mongols, as in Siberia, but Slavs, there are conjectures that go even further, and according to some, it may be assumed that even Germanic peoples used the fly-agaric in earlier times. For example, it is sometimes reported[346] that the berserkers - those Germanic warriors who attacked the enemy in a wild frenzy, naked and without adequate defensive weapons, and who in some ways resembled Malays who run amuck - worked themselves into such a state of senseless fury by drinking fly-agaric mixed with an alcoholic drink. These are merely conjectures; nevertheless, the possibility must be considered that the use of fly-agaric was more widespread in earlier times than it is today.

---

[340] Today we know that there are more than a dozen species of these mushrooms, and we have given each of them names. I would take exception to Hartwich's use of the word 'poisonous' unless we are ready to apply it also to alcohol and tobacco. 'Delicacy' is hardly the word to describe the attitude of the Indians toward their holy eucharist. - RGW.

[346] *e.g.*, in E. Krause, *Tuisko-Land* (Tuisko Land), 1891, p. 379. Lewin, *l.c.*

The mushroom is used in a good many different ways in Siberia, but it is certainly not true that it is fermented into a beverage; assertions to this effect are obviously due to a confusion with the production of alcohol through fermentation. According to von Bibra, it is eaten fresh in soups or sauces, but it is reputed to be less effective when used in this way than in the dried state; this is readily understandable in view of the high water content of the fresh mushroom. It is called by the names *muchumor*, *mukamor*, and *mucho-more*.[347] It seems to be a fairly common custom to eat the mushroom in the juice of berries of *Vaccinium uliginosum* L. or in an extract made from the leaves of the narrow-leafed willow herb (*Epilobium angustifolium* L.). (I should point out that these berries are believed by some to have an intoxicating effect, as is suggested by the German names *Rauschbeere* and *Trunkelbeere*.) Even though there are a few reports of cases in which an effect of this kind has been observed, there are many others of cases in which the berries were eaten without any such effect. Ascherson believes that the reports of intoxication are due to a confusion of the berries with those of *Empetrum nigrum* L. (crowberries), which are also called *Rauschbeere* in German. But the fact seems to be that these also can be eaten without ill effects. I remember that in describing his crossing of Greenland, F. Nansen writes that he and his companions ate tremendous amounts of this fruit. (See also Schübeler, *Pflanzenwelt Norwegens* [Flora of Norway], pp. 276 and 324 ...)

The most common practice, however, is simply eating the mushroom in a dried state. It has been observed that the active component passes unchange into the urine, and this remarkable fact has been utilized to obtain a long series of successive effects with a relatively small quantity of mushrooms.

[Hartwich then quotes J. Enderli in full; *vide* our text, [191 - RGW]

The most striking thing in this detailed account is that the active principle of the mushroom evidently is excreted unchanged in the urine, so that the latter retains the effectiveness of the mushroom. There is no doubt whatever that the urine is drunk for purposes of intoxication, and this has also been reported by other observers. According to Kennan,[348] however, it is only the settled and more primitive Koryaks who know this custom. Von Bibra reports that the efficacy is not lost even after repeated consumption, so that four or five people in succession may be intoxicated by the same quantity of mushrooms, first directly and then indirectly.

Apart from the fact that this custom strikes us as highly unappetizing, it seems strange at first glance that the Koryaks could ever have hit upon the idea of drinking urine. Of course, the intoxicating effect of the urine might have been noticed by accident when a man intoxicated with fly-agaric mistakenly drank the urine which he had collected in a container in the close quarters of the yurt. It must also be remembered, however, that urine was not always and everywhere regarded as something repugnant. Among the Chinese it is still used as a medicine, both in its original state and in the form of the residue left after evaporation. Not only among the Chinese, however, but even in our own part of the world, it occasionally has a rôle in folk use, although the rôle is that of a sympathetic agent rather than a recognized medicament. (*Vide*, for example, Kristian Frantz Paulini, *Neu-Vermehrte Heylsame Dreck-Apotheke*, 'On how almost every kind of ... illness, and harm done by sorcery ... is successfully cured by means of excrement and urine - Franckfort am Mayn, 1734.' A new edition of this book was printed about the middle of the last century. I also have before me a new edition of another *Dreck-Apotheke*, which turns out to be an extract of Paulini's book.) If we go back several centuries, we find that science regarded urine not as merely a substance excreted by the body but as something with a special mystery about it. It was ideas of this kind that led Brand in Hamburg in 1670 to seek the philosopher's stone in urine and to discover that it contained phosphorus.

It is also noteworthy that the mushroom-eater discovers the future in his intoxication if he follows certain prescribed formulas. Thus we see that there is a religious factor involved. In this same connection, von Bibra reports that the shamans, the Siberian sorcerer-priests, use the mushroom to transport themselves into a state of ecstasy.[349] (This is not explicitly stated on page 136 of von Bibra's book, but it is unmistakably clear from the context.) His description of the effects differs in some ways from Enderli's: the symptoms described by von Bibra are, in general, not so severe, and the people in his account act in a more lively manner - those with musical talent sing without interruption, while others converse, laugh, and tell their secrets to all the world. They lose their sense of space and leap into the air in order to get over a straw or other small object. Frequently, however, muscular strength is also remarkably increased: one man intoxicated with fly-agaric carried a 120-pound weight for about 10 miles.

---

[347] Why did not Hartwich look up *mukhomor* in a Russian lexicon? - RGW.

[348] George Kennan, *Tent Life in Siberia*, p. 156 of D. Halk's German translation, *Zeltleben in Sibirien*, Leipzig, Reclamsche Bibliothek.

According to Kennan (p. 156 of the German translation) - who says, no doubt quite rightly, that continued use of the fly-agaric has very harmful results - the practice has been prohibited by the Russians in Siberia; as we have seen, this prohibition has had as little effect as the prohibition of other stimulants. An indication of the Koryaks' craving for the mushroom may be found in the high prices they pay for it. Since the mushroom does not grow on the Koryaks' own steppes, it is brought to them by Russian dealers, and Kennan reports that he saw furs worth 25 rubles paid for a single mushroom.

[41] Eliade

> ELIADE, Mircea.
> 1. Yoga: Immortality and Freedom. Pantheon Books. New York. 1958. A translation from: Le Yoga: Immortalité et Liberté. Paris. 1954. pp. 338-9 (French text: p. 335)

[In the following excerpts from this writer's books we have printed in italic certain passages on which we will comment. - RGW]

In the sphere of shamanism, strictly speaking, intoxication by drugs (hemp, mushrooms, tobacco, *etc.*) seems not to have formed part of the original practice. For, on the one hand, shamanic myths and folklore record a decadence among the shamans of the present day, who have become unable to obtain ecstasy in the fashion of the 'great shamans of long ago'; on the other, it has been observed that where shamanism is in decomposition and the trance is simulated, there is also overindulgence in intoxicants and drugs. In the sphere of shamanism itself, however, we must distinguish between *this* (*probably recent*) *phenomenon of intoxication for the purpose of* '*forcing*' *trance*, and the ritual consumption of 'burning' substances for the purpose of increasing 'inner heat'...

> Shamanism: Archaic Techniques of Ecstasy. Pantheon Books. New York. 1964. A translation from: Le Chamanisme et les Techniques archaïques de l'Extase. Paris. 1951.

P. 477. (French text: p. 415) ... But closer study of the problem gives the impression that the use of narcotics is, rather, indicative of the decadence of a technique of ecstasy or of its extension to 'lower' peoples or social groups. In any case, *we have observed that the use of narcotics* (*tobacco*, *etc.*) *is relatively recent* in the shamanism of the far Northeast.

Pp. 400-1. (French text: 360-1). The importance of the intoxication sought from hemp is further confirmed by the extremely wide dissemination of the Iranian term through Central Asia. In a number of Ugrian languages the Iranian word for hemp, *bangha*, has come to designate both the preeminently shamanic mushroom *Agaricus muscarius* (which is used as a means of intoxication before or during the séance) and intoxication;[350] compare, for example, the Vogul *pânkh*, 'mushroom' (*Agaricus muscarius*), Mordvinian *panga*, *pango*, and Cheremis *pongo*, 'mushroom.' In northern Vogul, *pânkh* also means 'intoxication, drunkenness.' The hymns to the divinities refer to ecstasy induced by intoxication by mushrooms.[351] These facts prove that the magico-religious value of intoxication for achieving ecstasy is of Iranian origin. Added to the other Iranian influences on Central Asia, to which we shall return, *bangha* illustrates the high degree of religious prestige attained by Iran. It is possible that, among the Ugrians, the technique of shamanic intoxication is of Iranian origin. But what does this prove concerning the original shamanic experience? Narcotics are only a vulgar substitute for 'pure' trance. *We have already had occasion to note this fact among several Siberian peoples; the use of intoxicants* (*alcohol, tobacco, etc.*) *is a recent innovation* and points to a decadence in shamanic technique. Narcotic intoxication is called on to provide an imitation of a state that the shaman is no longer capable of attaining otherwise. Decadence or (must we add?) vulgarization of a mystical technique - in ancient and modern India, and indeed all through the East, we constantly find this strange mixture of 'difficult ways' and 'easy ways' of realizing mystical ecstasy or some other decisive experience.

---

[349] O. Stoll, *Suggestion und Hypnotismus in der Völkerpsychologie* [Suggestion and Hypnotism in Folk Psychology], second edition, 1904. He discusses the Siberian shamans and their tricks in detail but does not say that they use the fly-agaric in order to achieve a state of ecstasy; instaed, he attributes this state to loud noises, dance movements, and auto-suggestion developed by practice.

[350] Bernhardt Munkási, "'Pilz' und 'Rausch'"; *Keleti szemle*, Budapest, VIII, 1907, pp. 343-344. I owe this reference to the kindness of Stig Wikander. [*Vide* Exhibit 【32】 - RGW]

[351] *Ibid.*, p. 344.

P. 223. (French text: 202-4) Intoxication by mushrooms also produces contact with the spirits, but in a passive and crude way. But, *as we have already said, this shamanic technique appears to be late and derivative*. Intoxication is a mechanical and corrupt method of reproducing 'ecstasy', being 'carried out of oneself'; it tries to imitate a model that is earlier and that belongs to another plane of reference.

Pp. 220-1. (French text: 201-2) Summoned to a house, the shaman [among the Ostyak of the Irtysh - RGW] performs fumigations and dedicates a piece of cloth to Sänke, the celestial Supreme Being.[352] After fasting all day, at nightfall he takes a bath, eats three or seven mushrooms, and goes to sleep. Some hours later he suddenly wakes and, trembling all over, communicates what the spirits, through their 'messenger', have revealed to him: the spirit to which sacrifice must be made, the man who made the hunt fail, and so on. The shaman then relapses into deep sleep and on the following day the specified sacrifices are offered.[353]

Ecstasy through intoxication by mushrooms is known throughout Siberia. In other parts of the world it has its counterpart in ecstasy induced by narcotics or tobacco, and *we shall return to the problem of the mystical powers of toxins*. Meanwhile, we may note anomalies in the rite just described. A piece of cloth is offered to the Supreme Being, but communication is with the spirits and it is to them that sacrifices are offered; shamanic ecstasy proper is obtained by intoxication with mushrooms - a method, by the way, which allows shamanesses, too, to fall into similar trances, with the difference that they address the celestial god Sänke directly. These contradictions show that there is a certain hybridism in the ideology underlying these techniques of ecstasy. *As Karjalainen already observed*,[354] *this type of Ugrian shamanism appears to be comparatively recent and derivative*.

Today Professor Eliade enjoys renown and his word carries weight in certain circles interested in the origin and history of religions, and since he seems to hold the view that the use of divine inebriants is probably a 'recent phenomenon' among shamans, or at least among Siberian shamans, a few words of comment on his treatment of this vital aspect of his subject seems called for. As we have seen on pp. 165 ff, there is valid linguistic evidence that the use of inebriating mushrooms in Siberia goes back to the Uralic period, at a time when the Ob-Ugrian and the Samoyed languages had not yet evolved out of their mother Uralic tongue, more than 6000 years ago. Professor Eliade does not tell us what he means by the term 'recent phenomenon', but presumably he would not carry shamanic inebriation back more than, say, five centuries. The linguistic evidence seems to contradict his conclusions, and there is no evidence supporting them.

1. We have presented the quotations from Professor Eliade's books in their inverse order, the last one first, with deliberate intent, to reveal a trait of his thinking.

The extract that we have quoted from his book on Yoga gives no source or authority for his statements, not even himself. He speaks *ex cathedra*. The reader is not told where one may consult the 'shamanic myths and folklore', nor is it clear how 'myths and folklore' would document a decadence in shamanism, nor do we know whom he quotes when he cites the '"great shamans of long ago"'. We do not know why divine inebriation is a '(probably recent) phenomenon'. That there is decadence in shamanism among the minor nationalities of the world is clear and self-explanatory, as their feeble cultures founder in the mælstrom of the modern world. It is also true that in their disarray these peoples have taken to hard liquor. But this proves nothing as to the antiquity of divine inebriation, and in particular divine inebriation from the indigenous mushrooms of Siberia.

---

[352] The original meaning of *sänke* was 'luminous, shining, light'. (K.F. Karjalainen: *Die Religion der Jugra-Völker*, II, p. 260)

[353] *Ibid*., III, 306. A similar custom is attested among the Tsingala (Ostyak). Sacrifices are offered to Sänke, the shaman eats three mushrooms and falls into a trance. Shamanesses employ similar methods; achieving ecstasy by mushroom intoxication, they visit Sänke and then sing songs in which they reveal what they have learned from the Supreme Being himself (*ibid*., p. 307). Cf. also Jochelson, *The Koryak*, II, 582-583.

[354] *Ibid*., III, 315 ff. [*Vide* Exhibit **[**26**]** - RGW]

On p. 477 of Professor Eliade's book on shamanism he repeats the same thought: the use of 'narcotics (tobacco, etc.) is relatively recent in the shamanism of the far Northeast'. He says 'we have observed' this, by which he probably does not mean that he has observed this in the far Northeast. He probably means that he has discussed the matter and arrived at a conclusion earlier in the volume. He gives no page reference. But, contrary to what he says, in this volume there is no discussion of inebriation in far Northeastern shamanism. There is discussion of Ob-Ugrian shamanism, in the far West of Siberia.

On p. 401 Professor Eliade says: 'We have already had occasion to note this fact among several Siberian peoples; the use of intoxicants (alcohol, tobacco, etc.) is a recent innovation'. We turn back, and on p. 223 he says, '... as we have already said this shamanic technique appears to be late and derivative', referring to intoxication by mushrooms. Again we look back and on p. 220 we find the subject mentioned once more: 'As Karjalainen already observed, this type of Ugrian shamanism appears to be comparatively recent and derivative'. In the same passage he includes this surprising phrase, '... we shall return to the mystical powers of toxins'! And so the reader has found himself shunted back, and back, and back, and again back, only now to be shuttled forward. His statements that the shamanic use of mushrooms is a recent innovation stand unsupported. His reference to Karjalainen gives him no comfort, as the reader will see from **[**26**]** where we quote in full the relevant passage. Karjalainen is discussing the fine points of shamanic technique. It seems that the Ostyak shamans of the Irtysh regions have recently influenced the other comunities in certain particulars. Karjalainen has nothing to say about the span of time during which the shamans have used the fly-agaric to achieve ecstasy.

2. In the excerpt that we have quoted from page 400 of his work on shamanism, Professor Eliade makes a number of flat assertions about the etymon of the word used among certain Finno-Ugric peoples, especially the Ob-Ugrians, for 'mushroom' and 'fly-agaric'. He says that this word is derived from *bangha* meaning 'hemp' (= hashish, marijuana) in Iranian. He quotes as his authority for this derivation the Hungarian philologist Munkácsi, but Munkácsi turns out to have been more cautious than Professor Eliade. Munkácsi said in 1907 that he sees in *bangha* and in *pango* (I cite only one of the Finno-Ugric variants) the same word, and he advances the hypothesis that the Uralic peoples took their words for inebriation from the Aryans. (We quote Munkácsi in full in **[**32**]**.) Munkácsi leaves the question open when the borrowing took place and his wording even permits the reader to ask whether the borrowing may not have taken place before the Aryans emigrated to what has since been called Iran. Other philologists specializing in the Finno-Ugric languages have been inclined to disagree with Munkácsi, but Professor Eliade does not quote them. (*Vide* Lehtisalo **[**24a**]** and Balázs **[**38**]**.) Professor Eliade says, 'These facts prove that the magico-religious value of intoxication for achieving ecstasy is of Iranian origin.' But he has given us no facts, he has asserted as facts what is his own philological speculation, and from these speculative remarks he has gone on to draw religious conclusions that are non-sequiturs.

Apparently the Iranian sources offer no support to Professor Eliade's case. His *Shamanism* appeared in French in 1951. In the same year the Oxford University Press brought out Professor Walter B. Henning's Ratanbai Katrak Lectures delivered in 1949 under the title *Zoroaster: Politician or Witch Doctor?* At the end of his second lecture this eminent Iranian scholar found that the inebriating derivatives of hemp were unknown in Iran before the 11th century at the earliest, that the Persian word *bang* in the sense of 'Indian hemp' is a borrowing from India, that in Iran this Indian word collided with a homonym *bang*, a word used in Iran since Avestan times for a number of Hyoscyamus species (the English 'henbane'), most or all of which are lethal. Persian *bang* in the sense of 'hemp' appears for the first time in medical writings of the 13th century. It is surprising that the English edition of *Shamanism* appeared in 1964 without taking into account the discoveries made since the first edition.

Even without the evidence that Professor Henning adduces, an Ob-Ugrian borrowing of the name for the fly-agaric from Iran in the recent past, as Professor Eliade alleges, is on its face unlikely. Are we to suppose, contrary to all probability, that the tribesmen discovered only late in the day the peculiar inebriating virtue of the familiar fly-agaric, and that having discovered it they crossed rivers and mountains to reach the distant Iranian plateau where it does not grow, and there borrowed the name of another plant that outwardly does not resemble it in the slightest, and brought the name home, and that thereafter everyone called the spectacular mushroom by a new, foreign name?

Professor Eliade suggests that the Ob-Ugrian shamanic practices may have been borrowed from Iran along with the word. But the use of the mushroom is certainly indigenous. A rôle for inebriants in shamanism, including hallucinogenic mushrooms, has sprung up spontaneously in many unrelated parts of the New and the Old Worlds. There is every reason to think that the inebriating mushroom in its religious rôle is millennia old, long outdating the emigration of the Aryans to the Iranian plateau.

Professor Eliade then gives expression to his feelings about the shamanic use of inebriants:

> Narcotics are only a vulgar substitute for 'pure' trance. We have already had occasion to note this fact among several Siberian peoples; the use of intoxicants (alcohol, tobacco, *etc*.) is a recent innovation and points to a decadence in shamanic technique. Narcotic intoxication is called on to provide an *imitation* of a state that the shaman is no longer capable of attaining otherwise.

His preference on moral grounds for other techniques to attain ecstasy has affected his critical faculty when he discusses what is purely an historical question: how old is mushroom inebriation?

3. Professor Eliade lumps all inebriants together. Here is his habitual way of referring to them, as quoted from his books:

> ... intoxication by drugs (hemp, mushrooms, tobacco, *etc*.)
> - (from *Yoga: Immortality and Freedom*)
> ... the use of narcotics (tobacco, *etc*.)
> - (from *Shamanism*, p. 477)
> ... the use of intoxicants (alcohol, tobacco, *etc*.)
> - (from *Shamanism*, p. 401)

For the modern toxicologist this lumping together of diverse psychotropic drugs, obliterating the enormous differences among them, is crude. Let the reader note the catch-all expression, 'etc.'. Professor Eliade does not even take the first step, which is to distinguish between fermented drinks and distilled alcohol. Apparently his translator ignores the difference between the French *alcool*, which is limited to the distillate, and the English 'alcohol', which also embraces fermented beverages such as beer and wine. The discovery of the distillation technique was a sensational development in the social history of the world, never adequately documented and commented on. The technique of distilling potable alcohol seems to have been devised only once, by the school of Salerno, in about A. D. 1100.[355] ('Alcohol' is an Arabic word but in Arabic it meant 'mascara'.) After leading an obscure existence for some centuries in alchemical laboratories and monastic establishments, it leapt into prominence and importance in the 16th century. Schübeler **[**42**]** says that brandy (*i.e.*, 'burnt wine') first became known in Norway in 1531. In England it seems not to have been widely known as late as A. D. 1530 but by 1550 it was cheap. It was everywhere called *aqua vitae*, the water of life. In Russia the sources say that the art of distilling penetrated to Moscow through the Black Sea route, perhaps brought from Italy by Italian merchants, in the early 16th century. Sigismund von Herberstein on a diplomatic mission to Muscovy describing a banquet in the Kremlin[356] in 1526 says:

> ... At length, the servers going out for food ... first brought in *aqua vitae*,
> which they always drink at the commencement of dinner.

---

[355] *Vide* R. J. Forbes: *Short History of the Art of Distillation*. Brill, Leiden. 1948. pp. 32, 88-89.

[356] In the Latin text, *Rerum Moscoviticarum Commentarii*, Bâle, 1551, p. 134, *aqua vitae* appears; and in the Italian translation, *Commentarii della Moscovia* ... Venice, 1550, folio 77 verso, *acqua de vita*. Apparently from Herberstein's words the pre-prandial vodka was already in 1526 established as a custom. We do not know when it came to be called *vodka*, from *voda* an affectionate diminutive of 'water'. (The English and Russian words are cognate.) Already we find *vodka* in Kamieński **[**1**]** in 1658.

Yermak's invasion of Siberia in 1580 marked the beginning of the conquest of that land, and it is probable that hard liquor became known to the tribesmen through the Russians. Has hard liquor ever played a rôle in the religious life of any people? The outlying races of the world may have tried it out in recent centuries sporadically and spasmodically, but Professor Eliade is right in saying that its use in shamanism marks the dying phase in the indigenous religious life of the Siberians.

Tobacco was a gift of the New World to the Old. In the American Indian cultures it was (and still is) a holy plant used in the religious life of the Indians and on other solemn occasions. Among Europeans and their descendants elsewhere it became a habit and an addiction but played no rôle in religion. But after tobacco reached Siberia, probably also in the latter part of the 16th century or at the latest in the 17th century, it is astonishing how quickly the tribesmen adapted it to shamanism, thus recapturing for it the religious meaning that it has always had for the American Indians. This religious connotation was seized upon and quickly integrated into the ways of communities that were in a stage of their cultural evolution similar to the American Indians' when these were first seen by Europeans. Let it be noted that tobacco became adapted to Siberian Shamanism without the influence of the American Indian cultures. Here lies a wholesome object lesson for those who would lightly draw inferences of trans-Pacific contacts merely on the strength of parallel usages.

When Professor Eliade lumps the fly-agaric with hard liquor and tobacco, he is committing an anachronism. He forgets that the fly-agaric is indigenous to the forests of Siberia and that, for the eater, the effects are utterly different from hard liquor. He says that 'narcotics are only a vulgar substitute for "pure" trance.' Would he have said this in 1951 about the Soma that inspired the hymns of the ṚgVeda? We know incomparably more about the world of psychotropic drugs than was known even as late as 1951, when Professor Eliade's work on shamanism was first published. The abuses of these drugs by unbalanced or childish people that are reported in the press do not speak for their use. The West is on the threshold of penetrating their secrets. There is an unexplored world before us, and we should not prejudge it.

All over the world, wherever anthropologists have been making their way, they have been finding the native peoples utilizing as shamanic inebriants natural plant products. With astonishing resourcefulness untutored folk, or rather their herbalists, in ages past discovered these 'drugs', as we call them, and how best to prepare them for medico-religious ends. The plants themselves and the methods of treating them are often secrets of the shaman, not to be had for the asking. Sometimes the inquirer is initiated into the mystery, only to suspect that he has not been told the full story. In this book we present the testimony of many witnesses on the use of the fly-agaric in Siberian shamanism. But Kannisto ⁅33⁆ tells us expressly that mushrooms in addition to the fly-agaric serve the same purpose in the Vogul area, a remarkable fact confirmed for the Chukotka by Ivan Lopatin. In the Vogul case the deficiency in our knowledge is attributable rather to the lack of zeal in the searchers than to concealment by the natives. To this day no one in the Western world can tell us what those other mushrooms are. The inebriants used in food-gathering communities seem to be myriad, their use going back to pre-history. Each presents a problem to our biochemists and pharmacologists, whose abilities are taxed to isolate the active agents, to describe their molecular structure, to synthesize them, and to explore their potentialities.

The thinking of the West is obsessed with alcohol as the sole inebriant: we down-grade and ignore the natural intoxicants that primitive man discovered long ago by himself: we are loath, we seem to be afraid, to discover their possibilities. The distillate of alcohol - what the French call *l'alcool* - is a late comer on the stage of history, but in the perspective of the past of *homo sapiens* even fermented drinks are relatively recent. It is hard to see how the peoples of Siberia could have mastered the art of fermentation before they acquired the technique of making pottery or wineskins. Even today in the tropics there are primitive peoples (such as the Kumá of New Guinea) who did not know fermented drinks until the white man brought them in. It is significant that the Uralic word for 'inebriation' is taken from the name for the fly-agaric: in the sequence of history the food-gatherers must have discovered the natural inebriants long before they learned the art, tricky for those who performed it first, of fermentation.

[42] Brekhman and Sem

BREKHMAN, I. I., and SEM, Y. A. 'Ethno-pharmacological Investigation of some Drugs of Siberian and Far-Eastern Minor Nationalities.' Paper submitted to the Symposium on the Ethnopharmacologic Search for Psycho-active Drugs held at the University of California, San Francisco Medical Center, on January 28-30, 1967.

[This paper by two Soviet scientists based in Vladivostok is of interest for the information that it contains and also because it is, I think, the first utterance out of the U.S.S.R. on the use of the fly-agaric among the Siberian tribesmen. The attitude of the Soviet Union toward this practice finds expression in the concluding paragraphs of the paper. It will be observed that they do not write from personal experience: they rely almost entirely on what Krasheninnikov **[4]** wrote more than two centuries ago - a source superseded by many others today. - RGW]

Various narcotics and stimulants had been used as intoxicating liquors or in popular medicine by the minor nationalities of Siberia and the Far East. Appertaining to them is the use of fly-agaric, tobacco, and its substitutes, alcoholic drinks, root of ginseng, young antlers of the maral, etc.

Fly-agaric (*Amanita muscaria*) had been used mostly by the palæoasiatic peoples of Kamchatka and Chukotka (Itelmen, Koryak, Chukchi, Yukagir). The use of fly-agaric on a vast scale was unknown to all the Tungus world. To it belong Evenki, Eveni, Udegay, Neguidaltsi, Nanai, Ulchi, Oroch, Solon, Manchu, Oroki; and of the palæoasiatic peoples, the Nivkhi [Gilyak] of Amur and Sakhalin.

Fly-agaric had been used with aims of: 1) merry-making, 2) overcoming certain difficulties, 3) instilling one's nerve in the time of inter-tribal clashes and wars, and 4) during a performance of rituals. Stepan Krasheninnikov, one of the first explorers of Kamchatka and its population, thus described the use of fly-agaric by the Itelmen (Kamchadal) and Koryak: 'For good cheer they at times use fly-agaric, too, that is familiar among us; herewith we exterminate flies'. At some other place he remarks that 'Kamchadal and sedentary Koryak eat fly-agaric when they design to kill some one'.[3]

There were known two ways of the use of fly-agaric, in its natural state and in the way of infusion. Fly-agaric was picked in spring, in summer, not often in autumn. For the use of fly-agaric in its natural state the gathered fungi were kept in a dry cool place and were slightly desiccated. 'As need be', wrote S. Krasheninnikov, 'dry mushrooms when rolled are swallowed whole, the which way is in great usage'. For making an infusion the caps of the fungi were soaked in water. After 5-6 days the infusion could be used.[3] More drastic was an infusion of fly-agaric in willow-weed wash. They prepared the latter from willow-weed (*Epilobium angustifolium* L) having boiled it down to a sweet and thick wash. In days of old fly-agaric had been used in Siberia and Kamchatka for a homebrew or added to underproof vodka, which led to intense excitement frequently ending in murder or suicide and now and again in death as a result of poisoning.[1,5]

A twofold use of fly-agaric and its infusion was known to the minor nationalities of North-East of Asia - the so-called 'moderate' and 'immoderate'. The Itelmen [Kamchadal] themselves considered the use of the fungus up to four mushrooms at a time as moderate, which contributed to an increase of organism resistance to fatigue, took off weariness, acted tonically. After such an application, wrote S. P. Krasheninnikov, 'they feel within themselves extraordinary ease, mirth, valour and nerve'.

After an immoderate use, from 5 to 10 fungi at a time, would come a second stage of fly-agaric effect which was accompanied by intoxication and hallucinations. S. P. Krasheninnikov,[3] who observed in person the effect of fly-agaric on Itelmen and Kamchadal, wrote: 'The first and usual sign whereupon ye can apprize of a person being wrought up with the mushroom is a twitch of limbs which would come in an hour or less, thereafter the drunk rave as in a fever; and they dream apparitions, ugly or cheery, as their temper be: from this cause some go a-hopping and some a-dancing, all being in great horror. To some, a slit taketh a view of a big door and a spoon of water of a sea ... But this needs must be thought of those that use it beyond measure'. The use of more than 10 fungi at a time led to a fatal end.

The second stage of intoxication was, probably, accompanied by a temporary partial paralysis and exuberant hallucinations, by involuntary actions. 'All their actions are so harmful that of persons left heedless scarcely any would escape with life.' During S. P. Krasheninnikov's stay in Kamchatka the Cossacks and Russian servants of government also acquired from the Itelmen the habit of fly-agaric use with the aim of intoxication. It served them as a substitute for alcohol. Its effect was known among the inhabitants of Kamchatka as extravagancies', 'visions of infernal regions and fire-spitting abyss', and an inclination to confess one's sins; attempts at suicide, etc.

Everybody addicted to fly-agaric accounted for his actions as if they had been in obedience to the order of Omnipotent Mushroom. In the opinion of the Chukchi 'inebriant mushrooms are a special tribe (*anra-varat*). They are strong and when growing they break through thick roots of trees and dissect them into halves with their sturdy heads. They shoot through stones and crush them to bits. Fly-agaric appears to drunken men in a shape strange and man-like. Thus a certain mushroom appeared in the shape of a single-armed and single-legged man, and another was like a stump. They are not ghosts, they are mushrooms themselves. Their number seen by a man corresponds to the number of fungi eaten by a man. If a man ate one mushroom, he would see one man-mushroom; if he ate two or three, then he would see their respective number. The mushrooms take a man by the hand and lead him to the other world, they show him all that is there, make him do all kinds of unbelievable things. The ways of mushrooms are tortuous. They visit the land where the dead live.'[2]

The effect of the fly-agaric continued until the products were evacuated from the system of a man. Even the urine of this man would have an inebriating effect. 'With sedentary Koryaks the fungus is in so high esteem', wrote S. P. Krasheninnikov, 'that a drunken man is not allowed to pass water on the floor, but they put a vessel before him, and his urine they drink and run mad like those that had eaten the mushroom'.

By the customary law of the minor nationalities of Chukotka and Kamchatka the use of fly-agaric was permitted only to men. Its use by women was prohibited.

Interesting are observations of fly-agaric action on deer, they after eating fungi and the following violent excitement fall into a deep sleep, the meat of such deer, the Koryak vouched, acted on a man inebriatingly.[4]

The northern group of nationalities, especially the Itelmen of Kamchatka, had had another stimulant - wine from 'sweet herb'. The secret of its production passed from them to Russian Cossacks and sedentary Koryaks in the 16th and 17th centuries. For making wine Itelmens used the 'sweet herb' (*Heracleum dulce* Fisch. sem. *Umbelliferæ*). For making grass sugar and wine were used young spring stems, which were usually gathered by women. To avoid the influence of the poisonous juice of the plant they put on gloves. The stored bunches of stems were put in grass bags and kept there until sugar was educed on the stems. Grass sugar was used for making various kinds of Itelmen dainties, beverage, etc.

Sometimes the 'sweet herb' was eaten, like betel, in its fresh natural state. The effect of its chewing was similar to that of alcoholic intoxication. The 'sweet herb' was mostly used for making wine. First was made wine dough. For this aim the 'sweet herb' was put in warm water and leavened with honeysuckle or bog bilberry. The mixture prepared thus was kept in warmth, which contributed to fermentation. As soon as fermentation ceased the wine dough was considered to be ready. Usually, this required about a day. For making wine the 'sweet herb' now in a large quantity was soaked in warm water and leavened with dough, and in a day they began distillation. At first, as S. P. Krasheninnikov notes, comes wine of proof similar to that of vodka, then comes a softer wine. The strength of vodka is such that it is possible to mordant even iron. Itelmens attest that this wine 'presses on the heart very much' and 'decreases sex appeal'.

G. V. Steller, another explorer of Kamchatka, thus described the effect of 'herbal wine': '... whosoever partaketh of it but a few goblets he is harassed by queer phantasies all night and the next day he feels melancholy just as if he had committed some crime'.[3] So the effect of the wine from the 'sweet herb' was similar to that of fly-agaric in some measure.

During a shamanic rite the Nanai, Udegay, Ulchi, and Orochi used to employ some plants that made a specific influence on the psychic state of a person, which, probably, promoted to an arrival of mass hypnosis so needed during a rite. Usually it was the leaves of Ledum, which passed under the name of 'senkura' with the Nanai, 'sengkuro' with the Ulchi, 'sengkia' with the Udegay, 'synkiu' with the Orochi, etc. They used to employ *Ledum palustre* L and *Ledum hypoleucum* Kom. The desiccated leaves stored beforehand were put on the hearth or on a frying pan. A strong active smell in a small dwelling would stupefy those present at the rite. Probably, in some measure it calmed the sick as it was employed at ritual exercises over the sick.

Undoubtedly, the psychoactive drugs employed by the minor nationalities of Siberia and the Far East are not studied yet completely and require further investigations by ethnographers and pharmacologists.

The minor nationalities of Siberia and the Far East now do not use any psychoactive drugs, which have been relinquished because of radical changes in economy, culture, mode of life, and ideology of the population of this part of the Soviet Union. After the October Socialist Revolution and the establish ment of the Soviet Power these not numerous nationalities have embarked on a new way of historical development. Formerly backward nationalities of one of borderlands of Russia, with the help of the Russian people and Soviet Power, passing through intermediate stages, they have soon reached the socialist phase of social development.

2. THE FLY-AGARIC IN SCANDINAVIAN WRITINGS

Preliminary Note

No one who discusses the fly-agaric in Europe can ignore the debate that has been carried on for almost two centuries in Scandinavia on this issue. First Samuel Ödman in 1784 and then Fredrik Christian Schübeler in 1886 propounded the thesis that those Viking warriors known as 'berserks' ate the fly-agaric before they 'went berserk'; in short, that 'berserk-raging' was deliberately caused by the ingestion of our spotted amanita. Apparently the argument went to Ödman and Schübeler by default, because today we find their thesis incorporated in the Scandinavian encyclopædias and the school history books. In fairness to them I here present in full what they said in presenting their views, as well as the utterances of a number of their followers, eminent professors all of them. I wish I could agree with them.

I add also a part of the account of a tragic episode that happened in Hungary at the end of the second World War, in 1945, written by a Swedish woman who was there at the time. There is in it a curious statement about a fungal decoction said to have been used by the Russian troops that occupied briefly the town of Fehérvár.

[43] Ödman

> ÖDMAN, Samuel. 'Försök at utur Naturens Historia förklara de nordiska gamla Kämpars Berserka-gång.' (An attempt to Explain the Berserk-raging of Ancient Nordic Warriors through Natural History) Nya Handlingar, published by the Kungliga Vetenskaps Akademien, Vol. 5. Stockholm. 1784. pp. 240-247.

In the oldest chronicles of our country we not infrequently come across incidents which, for want of a knowledge of natural history, are either explained quite erroneously or risk being relegated, through the injustice of the scholar, to the myths of the dark ages. I am sure that I am not mistaken if I include in this category the accounts, preserved in the old Norse Sagas, concerning the *Berserks* of ancient times, and the celebrated frenzies which, under the name of *Berserka-gång* (Going Berserk), are described in such curious wise.

It is not for me, nor is this the place, to discuss these prodigies of History at length. A brief outline will suffice to pave the way for the present enquiry.

These warriors, according to the military thinking of their times necessary adjuncts for the aims of their warlords, but also often feared by the Prince in whose service they were employed, are depicted more as wild beasts than human beings. As soon as the Berserk-fury came over them, they were seen to rage like ravening wolves, recoiling from neither fire nor iron, braving the direst perils, rushing at the most redoubtable enemy, biting their own shields, *etc.*, or, if no enemy were at hand, venting their fury on inanimate objects, uprooting trees, overturning rocks, and in their exalted state scarcely distinguishing friend from foe. King Halfdan's Berserks are portrayed in Hrolf's Saga in the following interesting manner: 'On these warriors', the account reads, 'there at times fell such a fury that they could not control themselves but slaughtered man and beast, and all that stood in their way and minded not what they did. While this fury lasted they stopped at nothing; but when it left them they were so powerless that they did not have half of their normal strength, and were as weak as if they had just recovered from some sickness, and this fury lasted about one day.' An illuminating example of this is also given in Hervarar Saga, at the battle that took place at Sámsey.

The respect shown towards these heroes was always mingled with a sort of secret hatred, even in heathen times, for which their arrogance no doubt gave good cause. With the peaceful principles that the first Christian preachers tried to instil in the Barbarians of the north, the Berserks soon lost all their prestige, as an alleged connection with the devil caused their skill and their trade to be viewed with even greater horror. To be sure, fighting did not cease altogether, but the difference in attitude made it no longer permissible to use such sinister aids for the purpose. So the science died out with its practitioners; for a long time no further clue to the mystery was sought other than ascribing it to the assistance and co-operation of unclean spirits, so that not only did Prof. Verelius call it a *diabolical art*,[357] but even in this century two dissertations published at Uppsala propounded the same theory,[358] probably because the no doubt exaggerated accounts of these fighters which have been handed down to us, have been taken all too literally.

I am not of the opinion that these transports should be viewed solely as the effect of some special quality of temperament whereby such extraordinary motions can be induced by a mind in a state of violent ferment for, although we are not entirely without examples which could support such an assumption, the persons who suffer from such afflictions, between paroxysms, are not able to maintain the defiant arrogance which made the Berserks so hated even in times of peace. On the other hand, since the Plant-kingdom affords several means of creating such disorder in the mind and inducing the most frenzied attacks of folly, I am inclined to believe that the Berserks knew of some such intoxicating substance which they used when occasion demanded and which they kept as a secret among themselves so that their prestige with the public would not be diminished on account of the simplicity of the means employed.

That *Opium* could produce exactly the same effects is a matter of common knowledge. What we are told on this subject about the inhabitants of the island of Celebes and their opium-induced frenzies when they go to battle matches in every detail the accounts of the Norse Berserks of old. Kempfer's reports of the frenzies which were common practice in his day, in Java, and went by the name of *Hamuk*,[359] so strongly support the possibility that opium could turn people into Berserks, that the testimony of Alpinus can very well be omitted.[360] But since as yet no voyage to the Levant could have taught our ancestors this means; since as yet no Allen or Dillenius had discovered how to prepare opium from the poppy-buds of Europe, and there is still less reason to conclude that such attempts could have been thought of at that time in Sweden, although they subsequently succeeded in the case of Lindestolpe, one cannot reasonably trace Berserk frenzies to this intoxicating resin.

If *Atropa Bella Donna* were indigenous to our northern climes, the example[361] given by Mr. Gmelin the younger would throw considerable light on the question of Berserks. The same applies to several intoxicating substances found in India.[362]

A suitable preparation could also be made from the *Hemp* leaf, which would be sufficient to bring on this periodic bout of frenzy.[363] But since it is not yet certain whether the hemp of our climate corresponds to the southern variety which gives the Persians, Indians and Egyptians their *Bangve*, whose intoxicating properties have already been noted by Galeno, and of which the Turks still use a mixture to strengthen their tobacco, according to Dr. Russel's observations,[364] like the ancient Scythians who, according to Herodotus, were made giddy in the head from the smoke of its seeds, thrown on hot stones, and as it is also certain that this East Indian plant was not known in the North at such an early period, there is no likelihood that it could have been used for this purpose.

Of those native plants of ours which might be considered in this connection, several are known to have some intoxicating properties, although not in sufficient degree to warrant attention, such as *Crambe maritima*, *Lolium tremulentum* and others of which either a large dose is required to obtain such a powerful effect or whose influence is more likely to have rendered the Berserks incapable of committing the excesses ascribed to them in as much as, having a more soporific effect, they bring on drowsiness and apathy. *Datura stramonium* should also merit special consideration as its properties, which are not unknown to our Physicians, have been the subject of new studies by the same Mr. Gmelin.[365]

[364] Nat. Hist. of Aleppo. page 83.

Of all Swedish plants, however, I consider the Fly-Agaric, *Agaricus muscarius*, to be the one which really solves the mystery of the Berserks. Its use is so widespread in Northern Asia that there are hardly any nomadic tribes there that do not use it in order to deprive themselves of their feelings and senses that they may enjoy the animal pleasure of escaping the salutary bonds of reason. The Ostyaks, the Samoyed, the Yukagir and others use it daily, and the *Chukchi* whose rigorous icy climate does not produce this mushroom, obtain it by bartering their reindeer, which are their most valuable possession. The dose of this poisonous substance is from 1 to 4 mushrooms, according to size. The Ostyaks can only tolerate one, or use a decoction of 3.[366] The Kamchadal drink it with a decoction of *Epilobium*.[367] Those who use this mushroom first become merry, so that they sing, shout, *etc.*, then it attacks the functions of the brain and they have the sensation of becoming very big and strong; the frenzy increases and is accompanied by unusual energy and convulsive movements. *The sober persons in their company often have to watch them to see that they do no violence to themselves or others*. The raving lasts 12 hours, more or less. Then lassitude sets in, culminating in complete exhaustion and sleep. Steller[368] reports the curious fact that the urine of persons under the influence of this mushroom possesses the same intoxicating properties. And that the Tungus Shamans, in the ceremonial use of their so-called magic drum, are accustomed to swallow a goodly draught of this urine so as to be able to fall into the epilepsy or ecstatic trance proper to this ceremony has been attested by Mr. Georgi,[366] with several pertinent comments, in his description of the peoples under the Russian Imperial Government. T. II, pages 329, 336.

What seems to me to point particularly to the Fly-Agaric in this case is the fact that its use is a custom from the part of Asia whence Odin, with his Aesir, made his celebrated migration to our North. For although the distiller's art subsequently devised a short cut to this ignominious abuse, and the use of the mushroom accordingly ceased in the region of the Danube, it none the less spread from that point with the northward-migrating Hordes, which still used it. And that the history of the Berserks in our North begins with the arrival of Odin, I find not only accepted by those who have produced all possible evidence from the dark annals of antiquity, but also consistent with the designs of a warlord who with a dozen raving men could make himself so feared and secure among alien tribes. The honour other warriors won for themselves by slaying a Berserk, whom they looked upon as a malefactor, seems to prove that the custom was not a native one. And as this mushroom, like similar substances, prematurely emaciates the human body and makes it insensitive and clumsy, it may have had the effect of inculcating Odin's principle of going to Valhalla in good time, through a voluntary death, over the precipice, so that the honour of the proven hero might not be dimmed, especially as statecraft demanded that a Berserk, as the foremost militia-man, should be regarded as invincible.

[In Ödman's account I have printed in italic the crucial sentence, the source of much misunderstanding. (Mörner **[**45**]** relies on it, quoting it in full.) Here it is:

> The sober persons in their company [*i.e.*, those who have taken the fly-agaric - RGW] often have to watch them to see that they do no injury to themselves or others.

This statement is unjustified. A careful reading of our many Exhibits fails to disclose a single case where a Siberian tribesman under the influence of the fly-agaric threatened either himself or others with injury. On the contrary, the effect is to calm the subject, to put him into a benign mood. Nor is there any reason to believe that this is a question of dosage. Members of the lower orders of the *Russian* community, discovering in the 18th century a surprising new inebriant and jumping to the conclusion that it must be similar to vodka but even more extraordinary, threaten themselves with injury when under its influence (*Vide* **[**4**]**, p. 236; **[**10**]**, p. 249), but the attentive reader will note with a weary smile that, like the tiresome exhibitionists whom we have all known, in every case the inebriated man always takes care to have a friend at hand to arrest his hand. The

one case in the *Russian* community of a suicide **[**4**]** is only hearsay, as Krasheninnikov takes pains to make clear. We may all suspect what that means in the context of the people Krasheninnikov was dealing with. He says the natives take the fly-agaric before going out to kill someone but he gives no support for his statement. He did not know the native language and he relied largely on Russian informants. His own colleague Steller does not repeat this, and the many later observers who knew the country from long experience, some of them professional linguists speaking the local languages, fail to confirm it. Krasheninnikov was an astute observer trying to arrive at the facts through a screen of questionable informants. He should be admired as a worthy period piece, certainly not quoted as an authority on the fly-agaric in 1968. After all, we no longer consult Benjamin Franklin or Lomonosov on physics, great and revered figures though they be. ... As for Ödman, why should anyone cite him today?]

[44] Schübeler

SCHÜHUBELER, Fredrik Christian. Viridarium Norvegicum I. Norway. 1886. pp. 224-226.

[After identifying *Amanita muscaria* by the various vernacular names current in the chief countries of western Europe, our author, the Norwegian botanist, continues: - RGW]

In old Norwegian historical writings there are many references to the fact that in olden times there was a particular type of warrior known as Berserkers, *i.e.*, men who at times were seized by a wild fury which temporarily doubled their strength and made them oblivious to bodily pain, but at the same time numbed all humanity and reason and made them resemble wild beasts. This rage, which was called Berserksgang, occurred not only in the heat of battle but also in the course of strenuous work, so that those who were possessed by it accomplished things that otherwise would appear beyond human strength.[369] This condition is said to have begun with trembling, chattering of the teeth and a sensation of cold, after which the face swelled up and changed colour. Along with this went a fierce passion, growing into a positive fury, during which they howled like wild beasts, bit the edges of their shields, and hewed down everything that came in their way without distinction of friend and foe. When the attack had passed it was followed by an intense apathy and lack of energy, which might last for a day or more.[370]

Even while I was a medical student, and later as a practising doctor, I had a special predilection for toxicology, and particularly the poisons that come from the vegetable world. I have a lively recollection that all that long time ago by comparing all the symptoms that appeared during the so-called Berserksgang, I came to the conclusion that this paroxysm could scarcely be anything else than a kind of intoxication, the symptoms of which closely resembled the effects of *Amanita muscaria*. When one compares with this the descriptions by Krascheninnikov, Steller, and Erman of the symptom seen in the state of intoxication reached by the Kamchadals and other peoples of north-east Asia after partaking of fly amanita, then the correspondence is so unmistakable that my previous hypothesis has all the appearance of fact. Some time after I had reached this stage, I discovered by serendipity that the Swedish Professor Samuel Ödman expressed the same opinion a hundred years ago, though without offering any special evidence for the rightness of the theory.[371]

The reports given by the above-mentioned Russian authors may be summarised thus:[372] since the Kamchadals came into closer contact with the Russians they have begun to drink brandy, and to leave the use of fly amanita to their nomadic neighbours the Koryaks, for whom they now collect the fungi, which can profitably be exchanged for reindeer. - The first symptoms to appear in one who has drunk a 'liqueur' made from fly amanita and the juice of *Epilobium angustifolium* are: a characteristic trembling in every limb; half an hour later he begins to rage, and according to his temperament he then becomes either merry or morose. - The drunkenness has, in fact, a certain resemblance to that caused by wine or brandy, in that the drunken person,

being more or less unconscious, almost invariably grows jolly and only rarely morose. The face becomes red and swollen, as if from extravasated blood, and the drunken men now begin to say and do many involuntary things. - Those who are only mildly affected feel themselves very light of foot and appear inclined to all kinds of bodily activity. The slightest irritation has an unduly strong effect on nerves rendered abnormally sensitive. Some display a muscular strength which in normal conditions would be impossible. Eye-witnesses have reported that a person who ordinarily would have great difficulty in even lifting such a load, has carried a sack of flour weighing 120 pounds a distance of 15 versts (10 miles). - 'The Kamchadals also confirmed what I had already been told in Tigilisk (Ust Tigil) about the intoxicating property of fly amanita, and assured me further that it is not eaten in Sedanka, but only collected for the Koryaks, who in winter will often give a reindeer for a single specimen.'[373] - 'The fly amanita (Muchamor) is very rare in the northern part of Kamchatka, and the Koryaks first learned its properties from the fact that the flesh of a reindeer that had eaten this fungus had just as intoxicating an effect as the plant itself. From the experience thus gained, instinct gradually taught them to enjoy the delights of this precious ware in the most economical way, by keeping the urine of a person intoxicated with fly amanita and later using it as a very effective intoxicant.' - 'As an example of the striking increase in muscular power, a man related that when he had swallowed a portion of fly amanita in the morning he could work without difficulty during the hay-making season from morning to night, and accomplish as much as would otherwise require three men.'

Our celebrated historian P. A. Munch is of the opinion that the Berserksgang was nothing but 'a periodically returning madness'.[374] I cannot share his view, but insist that the berserksgang was induced by some stimulant or other, and specifically by the fly amanita. The probability that this is so is greatly strengthened by the fact that the symptoms described above, both of Berserksgang in Norway and of the effects of fly amanita in Kamchatka, are presented with an accuracy as congruent as if they were written by a keenwitted doctor familiar with all kinds of sickness. Moreover the most peculiar symptoms that accompanied Berserksgang were always repeated in the same form, and the whole thing ceased some time after the introduction of Christianity (about A. D. 1000) had brought a purer ethical standard. It is true that Berserksgang was regarded, both by those who suffered from it and by onlookers, at times at least, as so great an infliction that even the Icelander Thorstein Ingemundsøn made a vow to the Gods in order to free his brother Thorer from this misfortune (Utími).[375] This may, however, also be explained by saying that Thorer in his better moments may have recognised his deplorable condition, but that he found it just as difficult to break free from it as those who now drug themselves with opium or hashish, or even those who have succumbed to an excessive consumption of spirits.

Here may be mentioned also what is related (in the Droplaugar sona-saga p. 3) of the Icelander Thrymketil;[376] but according to what Professor Konrad Maurer of Munich has told me personally, this account is nothing but an addition which an Icelander in the latter half of the last century wove into the Saga.

And if, as appears to me to be established beyond doubt, use was made of some stimulant or other, this cannot have been either beer, mead, wine or brandy, as the effect of all these is very different from what is described here. Moreover, brandy was not known in Norway before 1531, when it was called 'Aqua vitaæ'.[377] And, of course, there can be no question of opium or hashish in this country so long ago. A motive for the constant use of fly amanita as an intoxicant can also be found in the fact that it produces the same phantasms and visions as hashish or opium.[378]

---

[373] George Kennan says that in spite of the fact that the Russian Government has forbidden the sale of fly amanita to the Koryaks, this trade still flourishes. He has, in fact, himself witnessed that a single specimen has been exchanged for furs to a value of 20 dollars. (George Kennan. *Tent Life in Siberia*. London, 1871, p. 139).

[378] Emile Boudier *l.c.*, p. 124 (Husemann's annotation).

Although the old historical records do not say so, it seems reasonable to suppose that the means that was used to induce the state in question must have been kept a secret. The Berserkers were feared by all, and could, in a sense, enforce whatever they wished; it is therefore in the nature of things that they did all they could to retain this extraordinary respect from the common people. So the knowledge of the stimulant was probably passed on as a secret from man to man. Even in our own time, even in our own capital, it is well known that there are certain 'secret' recipes that are bequeathed from parents to children.

The less enlightened part of the population naturally saw the Berserksgang as a supernatural phenomenon, to be ranked with enchantment and suchlike wonders; it may even have been believed that the Berserkers were possessed by demons; but this cannot have been the case with well-informed people. That even as early as the beginning of the 11th century Berserksgang was regarded as a condition for which the sufferers were themselves responsible is clearly indicated by the following: before Erik Jarl left Norway, he called together in 1015 the noblemen and the most powerful peasants to consult them about the laws and government of the kingdom. At this meeting single combat was abolished, and Berserkers and robbers were outlawed.[379] In Thorlak's and Ketil's Icelandic Church Law[380] which was adopted in 1123 as the law of Iceland, there appears the following passage: 'If any man goes Berserk, he is to be punished with three years' banishment (Fjörbaugsgar), and the same applies to those men who are present if they do not bind him, but if they bind him no one shall be punished. Each repetition of the offence will he be punished.' Any comment on this would appear to be superfluous.

[45] Mörner and Hildebrandsson

> MÖRNER, Carl Th. Några erfarenhetsrön om de högre svamparna: Kritisk öfversikt. (Some observations on the higher fungi) Published in Upsala Läkareförenings Förhandlingar, Vol. XXIV, 1-2. Upsala. 1919.

[On November 1, 1918, Carl Mörner read a paper on the higher fungi before the Royal Scientific Society in Upsala. Mörner was a well known professor of physiology and an excellent amateur mycologist. In the discussion that followed the reading of his paper Professor H. Hildebrandsson, who held a chair in meteorology, told of an episode that had happened in 1814 when Sweden and Norway were engaged in a short war with each other. When Mörner published his book on mushrooms in 1919 he inserted a paragraph giving the substance of what Hildebrandsson had said. This is in the second of the two paragraphs that we quote from Mörner's book: - RGW]

Described in popular terms, a mild or medium-severe attack of poisoning resembles a state of alcoholic intoxication in a person who cannot hold his liquor. 'The Kamchadales,'[381] to quote E. Fries, 'make an intoxicating drink [from the fly-agaric], and it has been suggested that the fly-agaric was used in our country in olden times to bring on the so-called berserk furies'. This last-mentioned piece of information is obviously based on S. Ödman's 'Attempt to Explain the Berserk Frenzies of the Old Norse Warriors on the Basis of Natural History' (1784), an interesting work of which a brief outline may be given at this point. After dismissing opium, belladonna, hemp and the like as out of the question for the North, particularly at that time, Ödman expresses the following opinion: 'Of all Swedish plants, however, I consider the Fly-agaric, *Agaricus muscarius*, to be the one which really solves the mystery of the Berserks'. Explaining his reasons for this belief, he gives the following classic description of the notorious amanita intoxication: 'Its use is so widespread in Northern Asia that there are hardly any nomadic tribes there that do not use it in order to deprive themselves of their feelings and senses that they may enjoy the animal pleasure of escaping the salutary bonds of reason. ... The dose of this poisonous substance is from 1 to 4 mushrooms, according to size. ... Those who use this mushroom first become merry, so that they sing, shout, *etc.*, then it attacks the functions of the brain and they have the sensation of becoming very big and strong; the frenzy increases and is accompanied by unusual energy and convulsive movements. *The sober persons in their company often have to watch them to see that they do no violence to themselves or others*. The raving lasts 12 hours, more or less. Then lassitude sets in, culminating in complete exhaustion and sleep'.

---

[379] Grettis Saga. Ch. 19.
[380] Grágás, Finsen's Edition. Ch. 7, pp. 22-23.
[381] Other authors also mention the Koryaks, Ostiaks, Samoyedes, and Chukchi as using fly-agaric for purposes of intoxication.

According to the observations of an officer of the Värmland regiment, fly-agaric was also used at a much later date in order to induce a good fighting spirit. In the course of an advance during the 1814 war, he noticed that some of the men were seized with frenzy and foaming at the mouth. This was traced, on investigation, to the cause just mentioned.[382]

[It is unfortunate that Mörner did not get from Hildebrandsson the source of his account; it would have been easy at the time to do this. Recent efforts by Bo Holmstedt, Professor of Toxicology at the Karolinska Institutet, Stockholm, to find confirmation for the episode have been unavailing: he can discover no local tradition in Värmland relating to it, and he is an extraordinarily resourceful man. Hildebrandsson's reputation as a meteorologist was high; his scholarship above reproach. But in this case he was not in his own field and he was volunteering a remark in a discussion following a lecture. Should not a careful person ask himself how much weight to give to such an utterance, even from a man of Hildebrandsson's standing? - RGW]

[46] Nordhagen

> NORDHAGEN, Rolf. Fluesopp of Berserkergang. (Amanita and Berserk Frenzies) Published in the Norwegian newspaper *Aftenposten*, Jan. 11, 1930.

[Professor Nordhagen held the chair in botany at Oslo University. - RGW]

In an article, Dr. F. Grøn has launched an attack on the late Professor Schübeler's theory that Amanita were the cause of berserk frenzies. Since my own name is also mentioned in the article, on account of a popular piece I wrote for *A-Magasinet*, in which I took a sympathetic view of the theory, I should now like to be allowed to make a few remarks on the subject. For Doctor Grøn's article suffers from one grave defect - several very important elements are passed over in silence, although they are of crucial significance for anyone wishing to adopt a stand on the theory.

It would never have occurred to me to resurrect Professor Schübeler's theory had I not come across a thoroughly modern work on mushroom-poisoning which strongly supports the theory. I am thinking of the book by the eminent Swedish scholar, Professor Carl T. Mörner, entitled: 'On the Higher Mushrooms' (Uppsala, 1919). Since Mörner is a physician and professor of physiological chemistry, considerable importance must be attached to his statements.

In the chapter on Amanita, Mörner deals first with the two varieties which can be considered relevant in this context, that is, *Amanita muscaria* and *Amanita pantherina*. He quotes at length the Swedish professor S. Ödman, who in 1784, that is, long before Schübeler's time, published a famous dissertation entitled 'Attempt to Explain the Berserk Frenzies of the Old Scandinavian Warriors, on the Basis of Natural History', in which he maintains that the berserks know how to use Amanita in order to put themselves in a suitably martial mood. In this connection Mörner produces some extraordinarily interesting information which militates strongly in favour of the theory.

In the first place he mentions a detail which Professor H. Hildebrandsson reported in 1918 after a lecture given by Mörner at the Royal Scientific Society in Stockholm. During the advance of the Värmland regiment in 1814, a Swedish officer noticed that some of the men were 'raving' and foaming at the mouth. *An investigation revealed that these soldiers had eaten Amanita in order to be in proper fighting fettle!*

This piece of information strikes me as being extremely important and I am surprised that Dr. Grøn does not say a single word about either Mörner's book or this particular episode. The soldiers of the Värmland regiment cannot possibly have hit on the notion of eating Amanita by themselves. There must undoubtedly be a popular tradition behind the whole story which may very well have survived from Viking times. In his important articles on Norwegian folk medicine, Reichborn-Kjennerud has demonstrated the antiquity of many of the household remedies which are sometimes applied to both humans and animals even today in our rural areas.

---

[382] This was reported by Professor H. Hildebrandsson in connexion with a lecture given by the author to the Royal Scientific Society on 1 Nov. 1918.

Secondly, Mörner reports a very important case of mushroom-poisoning (no doubt from *Amanita pantherina*) which occurred at Malmö in 1908. A German workman had consumed a plateful of poisonous fungi. After a bare one and a half hours he became light-headed and had to be taken to hospital. Violent fits of mania soon ensued; the patient sang, shouted, laughed and ground his teeth as he jumped about on the bed and hit out with his arms. On account of this he had to be transferred to the psychiatric department and, in the course of this, he put up a furious resistance, manhandling the attendants. The spectacle continued until 4 a. m., when he fell asleep, and the next morning he was 'perfectly fit' again.

Speaking of this case, Mörner says that it may be described as a 'complete berserk frenzy'.

It would take far too long to discuss all the theories put forward on the subject during the past hundred years. But as Mörner is a specialist in toxicology (in his book he mentions no less than 170 different works that are basically toxicological in content!), it will not do to contend, as Dr. Grøn does, that modern toxicological research knocks the bottom out of the Ödman-Schübeler theory.

I also think that he passes rather lightly over all the accounts which exist of the use by primitive Siberian peoples of Amanita as an intoxicant. We cannot escape the fact that the old explorers' descriptions of the course taken by the 'intoxication' tallies very closely with the berserk symptoms. That the intoxication very often takes a far quieter form is established beyond all doubt. But this by no means disproves the theory. Here as in the case of other poisons it depends on the size of the dose. It may be noted that Amanita, like tobacco, are highly prized by Northern Siberian tribes, and that they therefore undoubtedly economize with the precious substance. My colleague Professor H. U. Sverdrup has told me a hair-raising tale about the exorbitant price demanded for a single specimen of Amanita in the region of the Bering Strait. But that is another story, as Kipling says. Experience has obviously taught these people to arrive at the most appropriate dose. Besides, in the last few generations Amanita has steadily been supplanted by hard liquor all over Siberia, so conditions are now not nearly so favourable as they were for the study of Amanita intoxication.

Bergen, January 1930.

[47] Kuylanstierna-Andrassy

KUYLENSTIERNA-ANDRASSY, Stella. Pustan Brinner. Stockholm. 1948. pp. 92-93.

[The author is a Swedish lady married to an Hungarian nobleman, Count Imre Andrassy. The book is autobiographical. The title means, 'Burning Plain'. The chapter from which we quote is entitled, 'Svarta mässan i Fehérvár', or The Black Mass in Fehérvár. It tells of an experience that the author went through at the end of the second World War, in 1945, when the Russian forces occupied the town of Fehérvár momentarily. Her account follows: - RGW]

All private cars are to be instantly present at Apponyitér, the radio announced one day in November.

Imre [her husband] came and collected me in our car and then we drove to the market place where the cars were to assemble. A doctor with dressings was placed in our car. The marching column was formed and the caravan, numbering about 150 cars, snaked its way out of town.

As usual, we drove with secret orders. Only the chief of the column knew where we were headed. We drove southwards. It had been said in the news that the town of Fehérvár had been liberated from the Russians the same day. We guessed that we were on our way there to bring help to the liberated people.

Our guesses came true. The goal was the old Hungarian coronation town, a beautiful country town famous for its cathedral in baroque style. We arrived there in the afternoon. The town was small where before the war there lived only 40,000 people. But the town had great strategic value. Through it runs the auto route down to the Balkans and the main road to Vienna. Through it passed the big oil line from Lispe. The Germans had determined to hold it at any price, but one day when the Panzers became stuck in the bottomless clay the Russians had taken it by surprise. Now it had been recaptured by a counterattack. A Hungarian officer whom we met at the market place in front of the cathedral related to us how this had happened.

'The Russians came stealthily in the November mist immediately before dawn. They came through the maize fields which rustled where the harvest had not been brought in because of lack of people. They succeeded in passing over the Danube without being seen at the big marshes near Baja, where one thought it would be impossible for human beings to advance. The spearhead consisted of 'convict battalions', recruited from among the worst criminals and loose people in the Red Army. In their nostrils they had pieces of cotton soaked with a curious mushroom poison that transforms human beings into beasts. Some of them were captured by us. When the effects of the poison started to wear off, they shouted and cried as though obsessed. They raged and bit like dogs mad with rabies and thereafter fell to the ground in a deep sleep.'

[Under the tensions that must have existed at that horrible moment in Fehérvár, it was not to be expected that the details needed to satisfy scientists in peace-time would be forthcoming. Cotton wads soaked with 'mushroom poison' were in the Russian nostrils. How did they breathe? The inquirer naturally would like to know what kind of mushroom it was. There is no hint, in the Russian writings about war through the ages, of such a practice. The minor nationalities of Siberia, where the fly-agaric is used, certainly did not make up the contingent of Russian troops, since they are far too few in number and the Russian authorities frown on their consumption of the fly-agaric. The reports concerning the Altaïc peoples of Siberia indicate that mushrooms (except for *Fomes fomentarius*, used as tinder for making fire) play almost no rôle in their lives. - RGW]

The Use of Hallucinogenic Mushrooms for Diagnostic Purposes among some Highland Chinantecs

by

Arthur J. Rubel and Jean Gettelfinger-Krejci[1]

Economic Botany 30: 235-248. July-September, 1976. pp. 235-248

Submitted for publication September 22, 1974; accepted for publication November 22, 1974.

original report: https://www.jstor.org/stable/4253740

[1] Department of Anthropology, Michigan State University, East Lansing, Michigan; and University of Notre Dame, Notre Dame, Indiana.

> This article describes the ingestion of hallucinogenic mushrooms - *Psilocybe Hoogshagenii* Heim - as a means to diagnose illness among contemporary Chinantec-speaking Indians of the Sierra de Ixtlán, Oaxaca, Mexico. It is possible that several varieties of hallucinogenic mushrooms are used amongst these highland Chinantecs, the specific variety utilized depending upon "seasonal availability and the precise purpose for which the narcotic is to be taken" (Schultes, 1972: 10). However, the following describes only the observed use of *Psilocybe Hoogshagenii*, and it should not be generalized to the use of other mushrooms which may prove equally available to diagnosticians in the Sierra.

As Wasson, Sclhultes, and Heim have already made abundantly clear, the contemporary usage of narcotic mushrooms in Mexico boasts a long and venerable past. It is now clear that at least some of the hallucinogenic mushrooms utilized in contemporary Mexico were represented by the *teonanacatl* of the pre-hispanic and colonial last. It is unfortunate that, for the most part, those descriptions of *teonanacatl* usage which do come down to us from the early chroniclers, describe its use amongst Nahuatl speakers of the central highlands, leaving only speculation as to the extent to which those descriptions might be applied to non-Nahuatl speakers, located in the more southern regions of México.

However that may be, it is a reasonable assumption that the Spanish missionaries forcefully inveighed against and fearsomely sanctioned continuance of the use of hallucinogenic mushrooms or such other mood modifiers as morning glory seeds or fermented liquors. The confessional used by Padre Nicolás de León (La Barre, 1959) is a case in point, as is the *Doctrina Christiana en Lengua Chinanteca* used by Padre Nicolas de la Barreda. Padre de Leon's concerns are illustratedI in the following translation into English (La Barre: 23):

> Art thou a sooth-sayer? Dost thou foretell events by reading omens, interpreting dreams, or by tracing circles and figures on water? Dost thou suck the blood of others? Dost thou wander about at night, calling upon dreams to help thee? Hast thou drunk peyotl, or given it to others to drink, in order to discover secrets, or to discover where stolen or lost articles were?

Of more immediate interest are the concerns of F. de la Barreda during the early 18th Century, inasmuch as de la Barreda's parish included Santiago Comaltepec, the *municipio* from which this current information derives. Comaltepec, San Juan Yólox, and, probably, San Juan Quiotepec are three localities which were joined together by a civil *congregación* in 1603 to form a single parish served by a priest who resided in the town of Yolox. Incidentally, these three *municipios* are the exclusive components of the sub-group of Chinantecs known as Dza-Hmi (Weitlaner and Cline: 1; Cline's introduction to de la Barreda: 19). Father de la Barreda's major concern for his parishioners is reflected in some questions from his confessional of 1730, which refer to the First Commandment:

> Have you adored, given cult to the devil, or to poles (palos), or to the Sun, as your ancestors did? Have you become a witch or sorcerer? Do you have herbs or other instruments in the house with which you are able to communicate with the devil? Do you have herbs or other instruments in the

> mountains with which you can communicate with the devil? [39, 41]

It is curious that he makes no specific mention of either hallucinogenic mushrooms or *Rivea corymbosa*, although it is a reasonable possibility that implicit reference was made to these substances when questions were asked of the confessor with respect to divination, the use of special plants, herbs, "or other measures for the exercise of witchcraft and sorcery" (Cline: 61 Weitlaner and Cline: 551). As Cline noted with respect to de la Barreda's 18th Century confessional, "In spite of the brevity of the questions and the absence of many details, it is clear enough that in 1730 as well as today, a great part of the ancient rituals and beliefs persisted in Yólox. The plain, unadorned suggestions found in de la Barreda serve only to excite the researcher's appetite without satisfying it."

The paucity of ethnographic references and inferences to be drawn from de la Barreda, and the rarity of materials left us by other chroniclers of the Sierra de Ixtlain prior to the Twentieth Century (Weitlaner & Cline: 530; Gwaltney: 198-205) make it difficult to ascertain the importance of *pulque*, *Rivea corymbosa*, or *Psilocybe Hoogshagenii* during the centuries preceding our own. Today, however, it is very clear that residents of Santiago Comaltepec regularly ferment and drink both *pulque* and *tepache* during the seasons when they are available (and without any indication of public, uncontrolled inebriation about which Father de la Barreda expressed so much concern), but neither the mushrooms or *Rivea corymbosa* are used extensively today except by a very few people. We have record of only a handful of men and women in the entire municipio of more than 1,100 residents who have ingested mushrooms. When they have done so it is only to diagnose, or divine the whereabouts of a lost object or animal, or to establish communication with deceased loved ones. To our knowledge, there is no one in Comaltepec regularly using *Rivea corymbosa*, although residents are aware that it is available in the neighboring municipios of San Juan Quiotepec and San Miguel Maninaltepec in which localities there are persons who take it in the form of a tea to divine on request (cf. Mac Dougall). It should also be noted that although the senior author is well acquainted with several very reputable healers in Comaltepec, none of them to my knowledge make use of either *Rivea corymbosa* or *Psilocybe Hoogshagenii* for purposes of diagnosis, healing or divination. The only person of our acquaintance to regularly use *Psilocybe Hoogshagenii* in Comaltepec is Don Antonio from whom most of the following ethnographic information derives.[2] Don Antonio ingests mushrooms only on the request of patients seeking diagnosis or the whereabouts of lost articles or animals. Compared to other healers, Don Antonio does not boast of high stature in this community.

Don Antonio is a Chinantec-speaking male of approximately 36-40 years of age. He was born in the municipio and attended several grades of elementary school, but is functionally unable to communicate in Spanish. Like other healers of the municipio, Don Antonio learned his techniques during an apprenticeship with another, elder practitioner whom he paid for the training received (cf., Munn: 103, 105, 119).

Several meetings with Don Antonio permitted the collection of information about beliefs related to the collection and use of the hallucinogenic mushrooms preliminary to observations of a night-long session during which he ingested ten of the plants.

These transcriptions of conversations and, later, observation of a session indicate how very much interwoven are the moralistic norms which help govern this peasant society and a deferential involvement with those supernatural beings - "the children" - who so readily reinforce those moralistic norms. Despite the infusion of moralistic admonitions in the talk of "the children", and despite the deference with which they are treated, one is hard-put to describe the observed ingestion of mushrooms as either a ritual or a religious mystery in this municipio. This, of course, is in remarkable contrast to the ritualism and sense of mystery associated with the collection, preparation, and ingestion of hallucinogenic mushrooms among the nearby Mazatec of Huautla de Jiménez as described by Wasson (1972: 195) and Munn, or among other Mexican groups described in the literature. However, this relative paucity of ritual or mystery in Comaltepec is quite consonant with the more general observation that such symbolic elaboration is quite scarce throughout the cultural life of this municipio.

Among the more important beliefs governing the use of hallucinogenic mushrooms in Comaltepec, are the following. For best effect, the mushrooms should be eaten only on the favorable or propitious days of Wednesday, Saturday, and Sunday. The plants may be picked by anyone, male or female, married or unmarried, child or adult. They may be collected at any time of the day, but may be eaten only at night and in a secluded spot isolated from the sounds of other humans. The mushrooms are not processed in any way after picking. They are not ground, nor are they to be soaked or boiled in water. Neither should they be cut with a knife. Because the mushrooms are of a "cold" quality the medium needs sip on *mezcal* liquor throughout the session. (For concepts of "cold" and "hot" in this region, see Adams and Rubel). There is no need to practice sexual continence prior to eating the mushrooms, but one must abstain from the eating of a heavy meal immediately before a session. On the other hand, it is quite alright to eat lightly of soft boiled eggs, coffee, chocolate, bread, although tortillas are considered too heavy. As a matter of fact, the distilled liquor *mezcal* and "holy water" - *agua bendita* - are prescribed accompaniments of eating the hallucinogenic mushrooms in this community, and coffee is considered a necessity. The *mezcal* and coffee provide the medium the strength necessary for the rigors of the experience, and *mezcal* counteracts the "very cold" quality inherent in the mushrooms.

On the other hand, the holy water is kept alongside the medium before and after he eats the hallucinogens in order to protect him from undesirable effects. "The people are also accustomed to drink holy water when they have a bad trip with the mushrooms. You can die, or you can find your mouth tight, so much so that you cannot talk. That is why you require holy water at hand." The most common cause of a bad trip, according to Don Antonio, is the lack of good faith on the part of the client. That is, if the person asking Don Antonio for assistance is either trying to ridicule the latter's diagnostic procedures or really does not believe in the worthiness of "children" (*Los Niños* or *Los Chamaquitos*). Characteristic of a bad trip is that, instead of pretty little children arriving to the sounds of lovely music, such ugly animals as snakes, octopus, tigers, and coyotes march before one's eyes, encircle his face and head, often-times kissing him on the lips and eyes. Don Antonio reports that sipping holy water before lying down, but after eating the mushrooms, serves to prevent such horrendous experiences.

From the reports of Don Antonio, complemented by those of a few others who have accompanied mediums as they partook of the mushrooms, a good trip is a most pleasant and rich experience. If one has eaten only "female" mushrooms there will appear to him only female children, if one has eaten only "boys," then only boys will appear. There is some controversy over the relative value of "boy" and "girl" mushrooms (*machos* and *hembras*) because Don Antonio, on the one hand, avers that "the boys are more powerful and talk more," whereas a woman who has eaten the mushrooms reports that this is not so. Nevertheless, there seems agreement that it is best to take boys and girls together so that boys and girls together will appear to the diagnostician. It should be emphasized that Comaltepec informants universally denied the requirement of eating mushrooms in pairs: a boy and a girl, a boy and a girl, together.

Informants also agree that the boys and girls are approximately one inch in stature or approximately the height of a full-grown *Psilocybe Hoogshagenii*. According to Don Antonio: "The *chamaquitos* look and dress the way that people look here. They wear cotton trousers (*calzones de manta*), they are little boys and girls. (It should be noted that the *calzones de manta* are the traditional indigeneous costume for highland males, but only three or four men in the entire *municipio* were observed to dress so conservatively, and no children were observed in *calzones de manta* during Rubel's year in the commtinity.)

"They are just a very little taller than the mushrooms, and they look like the mushrooms. They seem to be very handsome. They wear stocking-hats (a woolen hat very much affected by the male residents of the highland, cold regions). On the other hand, they are barefoot and wear neither sandals or shoes. Some of them are dark-skinned, others light, just as are the mushrooms, themselves, of different colors. Sometimes they speak Spanish, sometimes they speak in Chinantec. Even when they speak amongst themselves, they speak both languages mixed together. They appear to be poor people as I am for, after all, it is I who am eating the mushrooms."

As has been mentioned earlier, Don Antonio's reports of his involvement with the respected children are very much enfolded within moralistic reinforcement to the norms of behavior in the community. The children speak in support of cooperative and friendly interpersonal relations. They enjoin against fractious and hostile ties. In support of such an orientation, they oppose the fractiousness generated by witchcraft accusations, enjoin against the breaking of promises, or the ridiculing of others. When a client requests assistance in good faith and treats the medium with respect, and the diagnostician has not eaten a large meal immediately prior to eating the mushrooms, then the boys and girls enter in a good humor. "They enter by twos and threes, boys and girls together. They enter dancing, and leaping, and playing. When they come in a good humor, there is very pretty music, it is very pretty. But only when they are in a good mood.

"There are those in our community who want to know the truth. They ask me to find out which person is doing them harm. They want the names of those people, that is the custom of our people. But, I have not been able to tell them the names of their enemies because the mushrooms, themselves, do not permit it. The boys and girls who appear before me say 'No'. They will not seek out the names, they won't give me the names! They will only say that the patient should ask God-*Dios* - for help, or that the patient should make a vow to God. That is all that they permit. They *do* tell me that someone is doing harm to the patient, but they refuse to identify who it is. If they were to do so, it would cause me difficulty, and cause my patient difficulties. That is why they do not wish to identify the person causing my patient's illness.

"The mushrooms advise me that the reason why they will not tell me the identity of the witches (*dañadores*) is to protect me, that is what they advise me. At times, the people would become drunk and they would strike me because I have identified them, and then I would suffer.

"There are many kinds of sickness, but many times the people don't carry out the cures that I advise. They only desire to ask me their questions in order to ridicule me, as shown by the fact that they do not comply with my recommendations. That is why I do not like to agree to eat the mushrooms for the people because I lose time and, besides, I suffer (from a consequent bad trip). There are those who ask me what they should do and I find out for them, I make recommendations to them, but they do not follow my instructions. Instead, they blame a witch (*braujo*) for the persistence of their condition. I get tired of those who do not obey what I recommend to them. It is tiresome. For example, there is the case of a woman who once came to ask me questions. I told her what she must do, I told her that she was suffering from *susto* [for description of the *susto* illness, see Rubel, 1964]. I gave her the cure which the mushrooms had given to me for her. She never complied [with my advice]. Then she returned to ask me to eat the mushrooms a second time for her. I took them again, but this time the mushrooms scolded me [*me regañaron*]. They said to me: 'Why do you do whatever the people ask you to? If the people don't do what you tell them to, if they only make fun of you, then you should not comply with their whimsies'. The mushrooms recommend that the people make a vow, or request a mass for the dead, or they recommend remedies which the patient should take, and they counsel that the patients have faith in God. That is what the mushrooms say!"

In this vein, the mushrooms also admonish Don Antonio to look out for his own welfare as well as that of his clients. "The mushrooms tell me: 'You comply with what we have advised, and if the others do not, the fault is not yours. You collect [your fee] from the people', that is what they tell me to do!" "There was a woman who came to see me and to request my assistance. I ate the mushrooms and advised her that she was to dig a hole to cure her *susto*. She was to dig the hole at the place where her *susto* occurred. Then she was to bring the earth she had excavated from that place back to her house where it was to be used to blow [*soplar*] upon her. She never did it! She returned to insist that I take the mushrooms another time which I did because of her need and her insistence. The second time the mushrooms scolded me. They asked me: 'Why do you comply with their wishes if they do not follow your advice? Why should you suffer from eating little [abstaining from the large meal of the day] when they do not pay you attention? Don't pay any attention to the capricious requests of the people!', that is what the mushrooms counseled me."

There now follows a description of observations made during a session in which Don Antonio ingested *Psilocybe Hoogshageni* Heim. The reader will readily note the infusion of moralistic injunctions incorporated in the communication of messages between "the children", the medium, and the client. In this instance, the client was the senior author who requested a diagnosis and prognosis for his own mother who was critically ill in New York City.

Despite our having been informed previously by Don Antonio that Thursday was not a propitious day for diagnosis, other pressing matters related to our research on the *susto* phenomenon prevented our joining Don Antonio on a Wednesday, Saturday, or Sunday, and it was considered better to take a chance on an unpropitious Thursday than risk the later disappearance of the mushrooms, as the season waned in late August. Don Antonio accepted the logic of this argument and agreed to a session on an unfavorable day. However, the reader will note several references in the forthcoming text in which Don Antonio comments on the unpropitiousness of the day.

Our arrangement was to pick up the diagnostician at a place alongside the highway, drive in the jeep to another location, and proceed on foot to an isolated, depopulated hamlet, four hours walk from the highway. Unfortunately, a flat tire, and delays caused by highway construction caused Rubel and his interpreter to arrive several hours late.[3] The delays made it impossible to walk to the hamlet before sunset, and neither Don Antonio or the interpreter relished walking the mountain paths in the cloud forest after dark. Consequently, it was decided to go to another, populated, hamlet alongside the highway. This alternative proved less propitious than the original plan because youngsters peered through the windows of the schoolhouse in which we prepared for the event. Moreover, instead of permitting the medium to collect the mushrooms in the security and privacy of the cloud forest surrounding the abandoned hamlet, he was subjected to the ridicule of the children who accompanied him as he picked the plants in our alternative site.

On arrival in the hamlet, Don Antonio immediately set about to locate the mushrooms which grew in profusion in the immediate neighborhood of the homes. He and the children quickly collected enough to meet his needs. It is worthwhile observing that he was aided by both boys and girls, and that as far as could be observed, neither he nor they made any special preparations for the task. No one washed their hands or other parts of their bodies, changed clothes, said prayers, crossed themselves, or in any other way prepared themselves for the collection of the plants. When the mushrooms were in hand, there seemed no special way of handling them while carrying them to the schoollhouse. However, Don Antonio showed care not to discard, or allow to be discarded, any of the mushrooms which were picked.

When Don Antonio decided that he had enough mushrooms, we retired with him to the empty schoolhouse where he awaited the dark of the night and the quiet that came with it. During our wait, the medium piled the ten mushrooms one on top of another, reminding me of a game of "pick up stix." When asked the significance of the number ten, he responded that he had picked only six mushrooms, but that the mischievous children had picked the other four. He commented that *he* had taken the other four from the children so that they - the four mushrooms in excess - would not feel mistreated.

Although, clearly, the act of collecting the mushrooms and the respect which surrounds the act of eating them in this hamlet show this occasion to be different from other, more mundane events, they could not be described as mysterious, a usage implying a religious experience.

The use of the term 'mystery' very aptly (Wasson, in Furst: 195) describes the preparation and ingestion of mushrooms among the neighboring Mazatec of Huatla de Jiménez (*Ibid*.; fig. 1 in Weitlaner & Cline; Weitlaner & Hoppe). There are several other differences in the collection, preparation, and use of mushrooms in Comaltepec compared with their treatment elsewhere in Mexico. Those differences will be discussed in concluding sections. However, it should be well noted that the problem of comparing the cultural usage of hallucinogenic mushrooms in Chinantec-speaking Comaltepec with that characteristic of linguistically different peoples in Mexico is compounded by the fact that only one person regularly practices the eating of mushrooms in Comaltepec, making it difficult to distinguish between what may prove to be cultural behavior and that which possibly represents idiosyncratic behavior.

After dark, Don Antonio began to eat the mushrooms one by one without any perceived preparation other than an "Our Father" and a "Hail Mary" in Spanish which preceded the actual eating of the mushrooms by between 40 minutes to an hour. Rubel was startled by the matter-of-factness with which he set about eating the ten mushrooms, one by one, button end first, followed by the entire stem. Nothing was left, nothing set to one side. I say that I was startled because of reports which describe somber preparatory rites among contemporary Mazatec (Wasson, 1972), Mixtec (Ravicz: 80), Zapotec (Ravicz: 84), and Lacandon (Robertson, 1973).

Unlike all other reports of contemporary use of hallucinogenic mushrooms in Oaxaca (see Schultes, in Furst), these observations in Comaltepec are notable for the absence or rarity of ritual, magical connotations, or religious "mystery", but this is quite consonant with a general paucity of ritual in this municipio.

After ingesting the mushrooms, Don Antonio sipped at the *mezcal*, following which he became more friendly to me and inquired of me whether my body was *contento* (comfortable). I advise him that it was and inquired whether his body was also *contento*? He responded that it was. He requested Us not to provide him with large amounts of *mezcal* when he requests a drink because he was not supposed to drink large quantities but, rather, to sip the *mezcal* from the shot-glass provided.

Because, during the collecting of the mushrooms, he had distinguished males (*machos*) from females (*hembras*) based on his understanding that the larger mushrooms were male, I enquired of him whether those he had eaten represented both male and female plants. He answered that he had eaten only males. I suggested that there had been some small mushrooms among them and asked were they not *hembras*? He responded again by affirming that they had been all males.

He then asked me to describe my mother's condition to him. I described her as very ill, very weak, and so sad that, at times, she begins to cry. Her abdominal area has become quite enlarged although she does not eat much. He responded by asking whether her condition is not very frail? I answered that it was, but that at the present time she is not in the hospital, although she goes in and out of the hospital as her condition changes. I also informed him that she had been very ill for approximately three years. Don Antonio responded: "I do not know what to do, and neither do you. Let's see what these people [*gente* that is, the mushrooms] will say. Because that is what he wishes to know."

Then Don Antonio began to pray in Chinantec: "I do not attempt to mistreat you. I do this only in response to the problems which people have at home. I obliged myself to help this man, and he made an agreement with me, and here he is. I came to fulfill my part of the agreement. It is not that I wish to eat, you know. You are aware of what is happening. You know that others laugh and make fun of what I do, but also you can tell whether what they say about me is true. Well, that is the way it is! Yes, they try to ridicule us. They cannot! Well, let us see how many of the mushrooms I am able to eat?"

Then he informed us that the six mushrooms were equivalent to "six pesos. If it was someone other than him who came with me, they would be worth six pesos. I collected ten of them, but I feel able [*aguanto*] to eat only six. Only six will I eat, because these are fresh. Those that are left over I will keep, in order that they do not complain about me. If one were to throw them away they would complain. One digs them up because they are useful. One cannot simply throw them away. You dug them up for a reason, to meet a necessity, and cannot throw them away. However, if he wishes to take them away with him, he may do so for it is as if he had bought them now. I am going to keep them because I dug them up, and to throw them away would mean that they would suffer, and then they complain". He then requested the interpreter to extend the straw mat (*petate*) on the floor because he was now ready to lie down.

Before he lay down, Don Antonio advised the interpreter that he had spoken to the mushrooms to advise them as to the reason for digging them up. He advised them that the reason was to answer my question about the health of my mother. I asked whether piling the mushrooms on top of one another before eating them had any significance. He answered that it had simply been to gather them together, but had no other significance. We then asked Don Antonio whether it was not true that one was supposed to take both males and females together [*revueltas*]? He answered in an interesting fashion: "It is not essential. They can be eaten - all males - when they are found like this [that is, when only males have been discovered]. In fact, the words of the males are of greater value. The men have greater value because they talk more and they appear in a more pretty form [porque platican más y se ven más bonitos]. If you eat them mixed together - men and women - then they arrive together [revueltas vienen]."

The interpreter then requested Don Antonio to advise us when he was hungry because we had brought much food for him to eat. The diagnostician answered: "That's what I like. People attend me well when they have a problem [Así me gusta. La gente sí atiende bien cuando hay necesidad!]." He then said that he would not eat until after the children [*los niños*] have bade him farewell, until after the matter was closed.

Don Antonio then asked us to request some hot coffee from the storekeeper. The interpreter suggested the possibility that hot coffee at this time might not be good for him. He responded: "I will drink it immediately while I am still hot because the mushrooms are cold, are they not?" When the interpreter responded that he, himself, had no idea whether they were cold or not, Don Antonio advised us that: "These mushrooms are cool [*frescos*] and will soon have an effect. If they had been dry, it would be more difficult". Don Antonio then sighed audibly, which led me to ask whether he was feeling sad. He said: "This act is difficult because when one commits himself to it, he must comply. It is difficult; I always worry when I commit myself to taking the mushrooms. I always worry because when I take the mushrooms, they always have an effect, and one is always frightened. That is because one always sees frightening, ugly things. It startles one. When you have taken many times, as I have, then you know that you will be frightened, and so I worry because the moment is arriving in which I will be frightened. It is always like this when the effects begin. One becomes sad. He is not content because he is unable to sleep well."

He then asked whether I had advised my mother that I was going to make an inquiry about her condition? I told him that I had not because she is far away in New York City. He then asked whether I have visited my mother, and I told him that I had paid her a visit in June and during last Christmas. Don Antonio then asked whether the tape recorder would make a record of the fact that he was not eating the mushrooms out of sheer whimsy but, rather, to the contrary, he does so to respond to my need to be informed about my mother's health. He repeated his anxious comments: "No es por mi gusto que tomo, pero por cierto necesidad!" He began to yawn very deeply and often, again expressing his fears of the effects to come: "Está difícil, éste!" The interpreter asked whether there was still time for him to go out for the purchase of hot coffee before the diagnostician was affected by the mushrooms. The latter reassured him about the time and stated that he would not go to sleep without hot coffee. As a matter of fact, he adds that he would like some hot coffee and that, at the present time, he is going to request a piece of the bread we have brought for him, "... so that I can eat it when the coffee arrives. In this way I will be strong [be courageous?] when the effects begin". [Amongst these Chinantec it is generally customary to drink hot coffee before retiring at night.]

We then left for coffee and on our return found him yawning deeply and sighing. He advised that he was now ready to retire. At our request he repeated a prayer he says he pronounced during our absence. It proved to be an "Our Father" followed by a "Hail Mary," both in Spanish.

In response to several repetitions of a question by the interpreter as to whether that was the complete prayer, or whether there might be more. he continued with a Hail Mary.

He then began to eat the mushrooms. In the midst of eating them, he requested a bit more of the mescal. Then: "We will wait awhile until the smell [*olor*] of the mushrooms passes. Mientras tanto, se ponga silencio!" [In the meantime, be quiet!] He began to eat the mushrooms again after a brief respite during which he asked for a little more mescal. He announced: "I am going to eat all ten of the mushrooms in order that none be left over. Once and for all, I will eat them all, in order that none of them be lost! I usually eat only six, but I will eat all ten, then it would be like throwing the remainder away. They - mushrooms - could say to me: 'Why did you throw away our *compañeros*? It is as if they were *we* and you had thrown us away! ' "

Don Antonio then asked of the interpreter whether there was mescal in the other bottle we had brought him. When told that it contained mescal, he answered: "Well, you are well prepared. Tomorrow you can give me the meat, if he has brought meat? Don't say anything to my brother. If he so wishes, he can leave the meat with my mother telling her it is for Antonio to eat." He then asked whether I have, indeed, brought him meat. I answered that I have eggs, and tortillas, and bread for him. He began to laugh when the interpreter advised that Antonio had already eaten the meat we had brought him in sandwiches while we drove along the highway.

He continued to talk, but became more and more disconnected and rambling. He suggested I give him some payment now so that when we go to the store on the highway tomorrow, we need not speak of payment in front of onlookers. In answer to his request for more mescal, the interpreter advised him not to get drunk, but he responded that he wanted more mescal because lie felt like vomiting from the food he had just eaten. His conversation became more and more rambling as he became more and more loquacious in both Chinantec and Spanish.

He then asked: Is your mother's illness the only thing that you wish to find out? Perhaps there is no cure for her, for you say that she has been ill for three years." Following this, he either began to speak to himself or was whispering so low that we are unable to recover what he said from the tape. Then, again, he became more audible, speaking to the anthropologist. "I am pleased with the help that you have given to the *municipio*. I am very grateful! There are people here who have threatened me because I do not assist with the communal labor, something I am unable to do. There are those who have mistreated me because I have been unable to help. Perhaps sometime when you and I are together and these people mistreat me, you will tell them to desist because I am your friend. I feel very content because you are helping us. That is why I am making the effort to help you, if only a bit. Even though the people say to me that I have soiled myself for telling you what one is able to do [to speak with "the children" by means of hallucinogenic mushrooms]. I don't know what to do because this man already knows well what it is that I do! This man does favors for the people, too. By not charging for a ride in his automobile, lie saves one a lot of money that it would cost for the fare. The people say that I am soiling the community because I tell you that I take the mushrooms. But you are someone who helps the people and assists the community and so I do what I am able to help you. I believe that we are now going to lie down. Let's see what lie [Rubel] has to say about it. But first I will smoke a cigarette."

He lay down on his mat in a dark corner of the room, I tried to sleep in my hammock, an(h the interpreter tried to sleep on one of the benches. Several hours later, but long before (lawn, Don Antonio was heard to be restless and began to speak, apparently to himself. I asked him whether "the children" had appeared to him. He answered in the affirmative. He then continued: "They said to me that although it is not yet the proper time, it doesn't matter because you made an agreement with him [anthropologist] and he arrived here fulfilling his part of the agreement. You, too, complied with your word. That is the only proper way to do things.

"Los niños said: 'You have fulfilled your agreement with him.'" "I have met my obligation to him on that matter", said Don Antonio to me. "With reference to your mother, it is certain that she will not recover. But she will live a while longer. She is not going to die very soon, but neither is she going to recover to the condition she was in prior to becoming ill, because she is now elderly. That is the way it is!"

In response to a question from the interpreter as to whether there was not some other message in addition to that which he passed on to me, the response was: "One part ended with that. Then they said that he had best be careful wherever he went. Take care on the highway. Taking account of the condition of the roads where he goes, they are not very safe. Inasmuch as he relates well with the people, nothing will happen to him, because he is a nice person. Well, that is what 'the children' said! I only wish that you two could speak with them. If only you could hear their words. He [anthropologist] appreciates the people, so nothing will happen to him on the road."

I then inquired whether "the children" had told him what I was to do. He answered: "You must request a mass. For example, during this fiesta of ours which is approaching. That is, if you are present at that fiesta? If he really desires that this should come to pass then it will be necessary for him to request a mass. He should request a mass before the Virgen de los Remedios, that is, if he really wants with all his heart that which he is asking."

"They told me that 'We will meet this man afterwards', that is all that they said. They said to me, When a person wishes to speak with you, you also must be prepared to ask questions. That is why we are desirous of speaking, because this man wanted to come this far with you'. They said to me, 'If this man arrived willingly with you because of his need to ask you a question, you should be willing, also'."

The interpreter asked whether that was all, to which Don Antonio responded that there was nothing else. He then added: "They told me more. They said: 'It is not important that we meet only once in a while, we and you remain the same towards one another'." Then, addressing himself to the interpreter, he began to importune: "They said that it is good that you are working with him. For example, when I am in need of help and that man is not here, then you will do me the favor of seeking help for me from him. In case he is not present, you will serve in his stead. You will favor me with something, according to my need. That is good that you have a friendship with this man and that the mushrooms are not opposed to you. Let us work together, you and I, with this man."

The interpreter asked whether there was more to the message? "Yes. They said that if he takes the trouble to ask for the mass, perhaps his mother will recover. Perhaps she will recover half of her former health. Because when the Virgin of the Remedios arrived, there was the flower known as 'flor de los remedios'. Because she blessed the whole world in order for that flower to exist."

Don Antonio then asked me whether his performance was good or bad. He asked whether I felt happy. I told him that I did not feel happy because he had not provided a remedy for my mother. "But that is why you are to request the mass. Your mother will recover because if you request the mass up there, the blessing will arrive in your country where your mother is. She sends her blessing with much ease. As your mother is of a very advanced age, it has been a long time that she has had this sickness. But she will recover by half." Then, to the interpreter: "Tell him, in order that he (hoes not feel sad!" "Tell him that if he requests the mass he is not to tell people that he does so on Antonio's advice. He can tell them that he does so of his own free will. That is what he can do. That is all that I can tell you. Let us see if he does this?"

In response, then, to a question from me as to whether the children had presented themselves to him in good humor or in bad humor, he answered that they had been in a good humor because: "They told me that this man is of good will, he really wishes to find out the answer to his question. 'It does not matter,' they said to me, 'that it is not the appropriate day. It is essential to comply with your arrangement when a person arrives truly desiring to know the answer to a question. When a person acts in good faith, even though it is not one of the proper days, one must respond to the inquiry. Whatever else, as he has met his agreements with the people and inasmuch as he has fulfilled his part of the bargain, you, also, have met your obligation. In that way, everything resulted well. It did not result badly! For, if you had not met your word, it would be bad'."

Inasmuch as Don Antonio had advised in an earlier conversation that he sometimes saw animals, sometimes children (*los niños*) after eating the hallucinogenic mushrooms, the interpreter asked Don Antonio whether animals presented themselves this time. "Yes, the snake presented himself. The snake always appears. He always appears together with the octopus. These animals presented themselves after the children had appeared. The children say that these animals are for those people who do not marry, who do not become formally married, for those who only live together, but do not marry. Moreover, these animals are for those who do marry, but later become divorced. Like Martin, it is not good!

"They said to me that when persons call upon you, you must attend them. When you are in need, and it is critical, and you have nothing for your expenses, you should request aid of those who have. Ask them to help you when you are in need. Remember that time when this man called upon me to assist him? That is why I went, to be of assistance to him. It is not good when one has been offered a gift and immediately afterwards returns to that same person to request of him another gift. That is not right! Isn't that right, isn't it? It is not good to wander about, shamefully asking aid of people. The people remember to whom they have previously provided assistance. It isn't correct to return again and again to the same,people for aid. Do you recall that time when I arrived at this man's house and he gave me some money to help) me? He helped me plenty that time. I am very grateful for it.

"I have still not slept; I am now going to sleep for a while. I have not lied. I now am going to sleep peacefully. I have not slept a wink. I have done a favor for him, and he did a favor for me. That is the way that I like it! I like it when we help one another in the face of need!"

Some comparisons

Although the preceding interviews and observations related to the ingestion of *Psilocybe Hoogshagenii* among highland Chinantec of Santiago Comaltepec suggest some degree of variance from what seems more general practice among other groups of Mexico, we shall dwell on the similarities demonstrated. The way in which Don Antonio and others of Comaltepec relate to the narcotic mushrooms is far more secular and matter-of-fact than is reported from other groups, and particularly from the Mazatec of Huautla de Jiménez from where there are good ethnographic reports (Heim and Wasson, Chapt. II: Munn). On reflection, the difference appears one of degree, rather than of kind. Indeed, as earlier suggested, the matter-of-factness with which the mushrooms are treated in Comaltepec is quite compatible with the general absence of rich symbolism in this *municipio*.

Data obtained in Comaltepec by means of participant observation and interviews indicate that there are many features which these mountain people share with others who are linguistically and geographically distant from them (Merrifield). But, as Miller (1966: 326) has properly emphasized, comparative ethnographic data is so thin and scattered with respect to the contemporary use of narcotic mushrooms that one attempts generalizations only with great caution. Miller warned that rather than suggest the existence of a single cult devoted to the use of hallucinogenic mushrooms all over Middle America, it should be borne in min(d that even among villages of the relatively isolated Mixe, "... rites related to the use of mushrooms vary from one locale to another" (*Ibid*; cf., Ravicz: 90). Thus, keeping in mind the need for caution, we will emphasize only those traits from Comaltepec which appear to be of greatest significance and which are generally shared with other groups from which the use of these hallucinogens has been reported.

First, and perhaps of over-riding significance, mushrooms with narcotic properties are distinguished from others which do not have such an effect. The narcotic mushrooms are gathered only in order to respond to an individual's need to know the answer to questions of critical personal import: "What is the cause of my illness?" "What must I do to recover good health?" As is true elsewhere, but not universally, the mushrooms are collected in Comaltepec by *either* the diagnostician or the client for whom he will query the "little people" - *los niños*. However, in Comaltepec only the diagnostician eats the hallucinogens, and *only* he hears how "*los niños*" respond to his questions.

As is universally true in this region of the Sierra, in Comaltepec the mushrooms are ascribed special religious characteristics and treated with reverence. Unlike other localities, such as Mixe-speaking Camotlán in which the mushrooms are referred to as "Our Lords, the Earth's mushrooms" (Miller, 1966: 319), or as among the Nahuatl of San Pedro Nexapa who call the narcotic plants "The Noble Princes of the waters" (Wasson, 1963: 184), in Comaltepec, the personified mushrooms receive deference but not *such* great awe.

It is generally true in this area that the same techniques of prayer are used to solicit aid of the mushrooms as of other supernatural beings. Moreover, people do not arbitrarily discriminate between those supernatural figures which are post-conquest, and those which probably derive from pre-Christian periods. Although all reports indicate that narcotic mushrooms are revered in and of themselves, the ex tent to which they are independent of the will or control of other, perhaps more powerful, deities seems to vary. Don Antonio appealed directly to the mushrooms for counsel, whereas, in other communities mediating supernatural figures are invoked to ensure that the mushrooms will present themselves. (Wasson and Heim: 88; Ravicz: 80, 82; Munn: 90, 91). Mrs. Merle Robertson reports that among some Lacandon, the practitioners bypass Christian deities in order to go directly to pre-conquest deities: "They (*Psilocybe cubensis* and *Panaeolus venenosus*) are placed in the ritual bowls on small stone altars in ancient Maya *oratorios* (places of worship). The purpose of their use, according to the Lacandons, is to contact their gods." (Personal communication.)

Surely one of the more interesting results of comparative research which Wasson, Heim and Weitlaner have done so much to inspire, is the discovery that hallucinogenic mushrooms have such similar effects across linguistic and cultural boundaries within Mexico. With remarkably little variation, that which is revealed to the taker of the mushrooms assumes the form of graphic, colored, and auditory experiences. The human forms which appear are approximately the stature of grown mushrooms, and these revealed "little people" speak in both the indigenous tongue of the medium, and in Spanish. To the contrary, in reports by European researchers - Heim, Cailleux, Hofman, and Brack - in which they describe the effects on themselves of relatively "controlled" dosages of the mushrooms, or of psilocybin extract, not a single researcher reports significant encounters with persons or animals, much less bilingual boys and girls or elderly people of small stature (Wasson and Heim: 273-4, 280, 282, 283, 284) (luring experimentation. Doubtless, what one experiences during such an occasion is a function of chemical *and* cultural influences in interaction as Miller (1966: 326, 327) and Munn (114, 122) appear to suggest. One also ventures to suggest, that individual personalities must play some part in the variations in response to the narcotic properties of the mushrooms, a premise which makes all the more interesting the similarity of responses reported from so many Indian individuals, living in so many different cultural milieux.

In Chinantec-speaking Comaltepec, and in at least four other Chinantec-speaking communities (Heim and Wasson: 99), the major function of the mushrooms rites is to diagnose and prognose illness. The important role of the mushrooms in healing have also been attested to among the Mazatec (Heim and Wasson: Chapter II; Munn), among some of the Mixteca (Ravicz: 77-8), Mixe (Miller, 1956, 1966; Hoogshagen: 313-4), Chatino (Wasson, 1966: 343, fn.), and Nahuatl (op. cit., 346). The second most often reported function of the narcotic mushrooms in this region is for purposes of divining the whereabouts of an object or animal which has been lost or, perhaps, stolen. Utilization of the mushrooms to communicate with the dead seems restricted to Comaltepec (cf. Miller's commentary on séances, p. 326).

Finally, as Wasson has emphasized (1966: 166-70), despite widespread use, narcotic mushrooms are nowhere in the region taken whimsically or without serious consideration, preparation, and reverence. Its most general use is to acquire counsel from divine beings for diagnosis an(I prognosis of illness. However, by no means do *all* diagnosticians have recourse to, or even know how to exploit, the powers of the mushrooms. Whether or not those practitioners whose diagnoses depend upon the hallucinogenic mushrooms differ from other healers of the same community, along dimensions of personality, social status, or the manner in which they have been recruited to their healing responsibilities remain tantalizing questions to be answered only by empirical field research. Because of the rapid changes affecting the communities where these traditional practices of diagnosis and divination still survive, the time which remains for such badly needed research is distressingly brief.

The religious uses of hallucinogenic mushrooms in northern Eurasian and Mesoamerican cultures are compared. In northern Eurasia, some shamanistic cultures have used the Fly Agaric (*Amanita muscaria* (L.) Pers.); Mesoamericans, mainly mushrooms of the genus *Psilocybe* (Fr.) Kummer. The hallucinogenic potency of the former is due to isoxazole compounds and of the latter, psilocybine-type compounds. Despite similarities between ihe uses in these two cultural areas, there are also marked differences: the Fly Agaric did not seem to have been an object of religious, ritual veneration in northern Eurasia, whereas this was true for the *Psilocybe* mushrooms in Mesoamerica. This is suggested to be a result of the difference between these two mushroom groups in their pharmacological and clinical effects on man and also a result of vast cultural differences between the areas in question. The cultural and religious differences between northern Eurasian and Mesoamerican use of hallucinogenic fungi and the significance of these differences are discussed.

Keywords: *Amanita muscaria*, hallucinogenic fungi, Mesoamerican cultures, *Psilocybe*, shamanism, Siberian cultures

Introduction

Religious use of hallucinogenic fungi has been repeatedly documented among shamanistic cultures in different parts of the world. In this paper, the use of these fungi by Siberian shamanistic cultures and by certain Mesoamerican Indian cultures are compared. There is an extensive documentation of the use of the Red Fly Agaric (*Amanita muscaria* (L.) Pers.) in Siberia, although the ethnologists have obviously been more interested in the shamanistic rites and their aims and performances, as well as in the mythology of the peoples studied. The use of the Fly Agaric by shamans or ordinary people in Siberia and its consequences have often been overlooked and usually described more or less briefly (e.g. Bogoras 1904-1909, Jochelson 1908, Lehtisalo 1924, Karjalainen 1927, Ohlmarks 1939, Siikala 1978). Studies on the Siberian use of the Fly Agaric have diminished during the recent years, with the notable exception of Saar (1991), who also presents some new data on the subject. However, the possible religious veneration of the Fly Agaric by the Siberian peoples is a question which is largely neglected.

For some Mesoamerican ethnic groups, the use of hallucinogenic fungi was an essential part of the culture during the Spanish conquest, when it was for the first time observed by Europeans. It is obvious that this use of fungi had a long history behind it already at that time Fray Bernardino de Sahagún (1499-1590) mentioned the Aztec use of hallucinogenic fungi (Aztec *teonanácatl*) in his famous work "Historia General de las Cosas de Nueva España", also known as *The Florentine Codex* (de Sahagún, English transl. 1950-1963; hallucinogenic mushrooms are cited in Book 9: pp. 38-39; Book 10: pp. 12, 20, 37, 49, 55, 88, 173; Book 11: pp. 120, 129, 130, Fig. 516). The Florentine Codex is bilingual (Spanish and Aztec) and is regarded also as the most important document on Classical Nahuatl (Aztec) language. As regards cultural anthropology, de Sahagún's research methods were far ahead of his time and even today his work is much more reliable than other Mexican documents from the same period (Ortiz de Montellano 1990).

This use of hallucinogenic fungi, especially species of the genus *Psilocybe*, was still practiced, but already about to vanish in the 1950s, when it received the attention of the scientific world, mainly as a result of the field studies of R.G. Wasson and R. Heim in Mexico (see, for instance, Wasson 1957, Heim and Wasson 1958, Guzmán 1959, Wasson 1959, 1961). These discoveries, along with the growing interest in psychoactive drugs, led to a veritable stream of books and articles in which plants containing psychoactive or hallucinogenic compounds were described again and again. It is certainly no coincidence that all this happened when the 'hippie' movement was emerging; it created a supply and demand of many pseudo-scientific writings. Some scientists also pondered the value of hallucinogenic substances as tools for research of religious experiences (for example, Staal 1975), or even encouraged their use. However, this trend, along with the recreational use of mushrooms, declined in the 1980s and, after all, recreational use has little to do with religion and thus falls outside the scope of this paper. However, the recreational use of psychoactive substances offers an interesting field for psychological and sociological studies.

Mushroom cult in Mesoamerica is evident from numerous so-called 'mushroom stones' dating from the Middle Preclassic Mayan period (1000-400 B.C.) to the Classic Mayan period (500-1000 A.D.) in southern Mexico and in Guatemala (de Borhegyi 1961, 1963, Lowy 1971, 1972, Morley *et al*. 1983). Also pottery mushrooms have been found in the Maya area (Mexico, Guatemala, El Salvador) dating from approximately the above-mentioned periods (de Borhegyi 1961, 1963). A well-known early (Mayan Preclassic) 'collection' of mushroom stones has been found from the Kaminaljuyú tombs near Guatemala City (de Borhegyi 1961, Morley *et al*. 1983). Stone engravings and frescoes representing or symbolizing mushrooms (according to the interpretation of Wasson 1980) occur also in the murals of Teotihuacán and other Aztec temples; however, engravings and paintings representing flowers of hallucinogenic plants seem to be much more common in the temples. Several XVI century Mexican codices have illustrations representing mushrooms (Heim & Wasson 1958, Wasson 1980).

In this paper, I imply that although the religious use of mushrooms was found in both the Old and the New World, the ways of their uses and the rites, myths and ways of thought associated with them were essentially different. In comparing Siberian and Mesoamerican cultures I omit discussion of the well-known theory that the Indian and Iranian *soma/haoma* was identical with the Fly Agaric (Wasson 1968); this very controversial question deserves a treatment of its own (Nyberg 1991a). The possible use of the Fly Agaric by ancient Norsemen (to explain the berserk rage) I have treated elsewhere (Nyberg 1991b). In comparative religion, the subject of the use of hallucinogenic fungi falls in the area of phenomenology, psychology and mysticism.

The effects of hallucinogenic fungi are caused by their chemical constituents whose occurrence, structure and toxicology can be studied by means of chemical and physiological methods. This is an interesting field of ethnopharmacology, other relevant fields being mycology (both the taxonomy and physiology of fungi), clinical toxicology and plant chemistry. The material for this study was provided by the extensive literature on the subject and the author's experience in plant chemistry.

Pharmacological properties of the Red Fly Agaric, Amanita muscaria

The Red Fly Agaric (*Amanita muscaria*) is a mushroom with wide distribution in the northern hemisphere. It is mycorrhizal with birch, pine and occasionally other coniferous and deciduous trees, of boreal and temperate climate, and is found in more southern latitudes only in montane forests. The genus comprises c. 100 species, of which at least the death-angel (*Amanita phalloides* (Fr.) Link.) and its white relatives (*A. virosa* (Fr.) Bert., *A. verna* (Bull.: Fr.) Roques) are deadly poisonous to man. The Fly Agaric is not fatal, because its poisons are isoxazole compounds, not related to the cyclopeptides of the deadly *Amanita* species. The Fly Agaric is an easily recognized, red-capped (some forms yellow-capped), large species, usually with white patches on the cap. Formerly it was used as a fly poison, a practice which is reflected in its vernacular name in many languages. The first toxic compound isolated from it, muscarine, was long held to be the main source of its poisonous properties, until the mushroom was found to contain far too small amounts of muscarine (0.0003%) for it to be pharmacologically active (Bresinsky & Besl 1985). Later other isoxazoles were found in larger amounts: ibotenic acid, muscazone and muscimol. Some strains contain c. 0.1% of ibotenic acid, but in other strains this is mostly replaced by muscazone (Wagner 1985).

Although *Amanita muscaria* is a well-known species indigenous to both Eurasia and America, it comprises numerous subspecies or geographical races, which differ in their isoxazole composition; moreover, variation occurs down to different clones of the mushroom. This explains the very varied responses in man observed in modern studies towards Fly Agaric consumption. The chemical, clinical and pharmacological properties of the Fly Agaric have been described by Singer (1978) and Bresinsky & Besl (1985). Although the taxonomy of *A. muscaria* is still not fully known, a satisfactory review can be found in Singer (1978). The poisonous compounds are water-soluble, but not very rapidly extractable from the mushrooms, e.g. by boiling. In contrast, when the mushrooms are eaten or a broth made of them, the poisons dissolve and are absorbed rapidly from the stomach and the intestines into blood, and their effects are manifested after 30 minutes to 3 hours. The isoxazoles, especially muscimol (Schultes & Hofmann 1980), pass through the human renal system almost intact, and thus it is possible to ingest them by drinking urine, human or reindeer, which also seem to eat the fungus (Furst 1976): this custom has been reported several times from northern Siberia (Bogoras 1904-1909, Jochelson 1908, Ohlmarks 1939, Saar 1991). Urine-drinking has probably been practiced because of the rarity of the Fly Agaric: this mycorrhizal mushroom is not likely to occur in treeless northern Siberia. It has thus also had certain commercial value in these parts.

Largest amounts of poisons occur in the mushroom cap, especially in the yellowish layer under the red pileipellis. Only small amounts can be found in the stipe. The main symptoms of *Amanita muscaria* poisoning (the *Amanita pantherina*-syndrome: Bresinsky & Besl1985) are lack of muscular coordination, moods fluctuating from bliss to rage, a sense of unreality, and emotional and also visual hallucinations (Singer 1978, Bresinsky & Besl 1985). The symptoms often begin with a short period of sleep (Wasson 1968, Siikala 1978). A capacity to exceed one's normal physical powers has also been reported, for example, people are able to walk long distances in deep snow without getting tired, but when the mushroom effects end, exhaustion follows (Bogoras 1904-1909). In some users the Fly Agaric apparently causes a hang-over, and abstinence symptoms after long usage (Bogoras 1904-1909, Jochelson 1909), but this seems to depend on the individual. The nature of the hallucinations caused by the mushroom also seems to depend on the culture, and on psychological and physical characteristics of the user. In northern Siberia, the mushroom seems to have been used mainly by males. I will return later to the role of the Fly Agaric in shamanism.

Pharmacological properties of Psilocybe mushrooms

Most of the hallucinogenic mushrooms used in Mesoamerican cultures belong to the genus *Psilocybe*. This is a cosmopolitan genus with 144 species, of which 81 have been reported to contain hallucinogenic compounds (Bresinsky & Besl1985). Their taxonomy has been well monographed by Guzmán (1983). The seem to have been in use already in pre-Columbian (mainly in Mayan and Aztec) cultures in what are now Mexico, Guatemala and El Salvador. As early as in the 16th century de Sahagún (1950-1963) mentioned the use of *teonanácatl*, which Nahuatl word is often translated as 'divine flesh', 'flesh of the gods', (e.g. by Furst 1976), but a better translation is 'divine mushroom', 'dangerous mushroom' (Cooke 1977, Wasson 1980). This, however, was often confused by earlier scientists with the peyote cactus (Nahuatl *peyotl*, *Lophophora williamsii* (Lem.) Coulter; Ott 1978, Schultes & Hofmann 1980). In the 1950s, thanks to the work of several eminent investigators (Schultes 1939, Reko 1949, Heim & Wasson 1958, Ott 1978, Singer 1978, Schultes & Hofmann 1980) it finally turned out that *teonanácatl* meant hallucinogenic mushrooms. The attitude of the Catholic church was from the beginning very unfavourable toward the use of the mushrooms, seen as a diabolic mimicry of the Holy Communion, and the church succeeded to suppress the use so that it survived only in remote mountainous areas. The traditional religious practice has been documented in the divinatory and magic rites of the Mazatec, Chinantec, Chatino, Zapotec, Mixe and Mixtec of Oaxaca, the Nahua of Mexico, and possibly the Otomí of Puebla and the Tarascana of Michoacán (Schultes & Hofmann 1980). Possible modern use has also been reported among the Chol and Lacandón Maya (Furst 1976). Linguistic evidence reveals much wider use in the whole area of ancient Aztec and Mayan cultures.

The most important species of *Psilocybe* in religious use have been *P. aztecorum* Heim, *P. caerulescens* Murr., *P. hoogshagenii* Heim, *P. mexicana* Heim, *P. yungensis* Singer & Smith, *P. zapotecorum* Heim and *P. (Stropharia) cubensis* (Earle) Singer (Schultes & Hofmann 1980). Complete lists were published by Schultes & Hofmann (1980) and Guzmán (1983).

These mushrooms seem to prefer sites with high nitrogen content, and some of them are growing on cattle and deer dung. They are very variable in size, but usually small with a stipe of at most 10-15 cm and a more or less cone-shaped cap (hence the name 'liberty cap'). *P. cubensis* differs in habit from most other species; it is tall, robust and flat-topped. Their hallucinogenic compounds are psilocybine (the most important), psilocine and baeocystine. Some other related compounds are also found, but usually in small amounts (Schultes & Hofmann 1980; Bresinsky & Besl 1985). The psilocybine compounds are water-soluble indole derivatives, and have close relationships with tryptophane metabolism and auxin-type plant hormones. As tryptamines they bear a resemblance to the active compounds of several hallucinogenic plants, for instance, ayahuasca (*Banisteriopsis caapi* (Spruce ex Griseb.) Morton), Syrian rue (*Peganum harmala* L.) and peyote (*Lophophora williamsii*). Close chemical relatives are also the ergot alkaloids of the ergot fungus (*Claviceps purpurea* (Fr.) Tulasne) and the synthetic, not naturally occurring LSD (lysergic acid diethylamide).

The symptoms caused by these fungi (mainly by psilocybine) have been called 'the *Psilocybe* syndrome' (Bresinsky & Besl 1985). Psilocybine is a powerful compound causing hallucinations in man with doses as low as 4-8 mg or about two grams of dried fungi (Schultes & Hofmann 1980). The effects are psychologically dramatic but do not affect man physiologically very greatly: symptoms pass in 6-10 hours without apparent aftereffects. The psychical symptoms vary according to the mental disposition and balance of the individual: feelings of euphoria or panic and consciousness of time, space and self change in a way which is very difficult afterwards to put into words; colours, sounds, smells and touch reach unusual intensities. Erotic feelings are often strong, and the person may experience imaginative traveling to distant places or times of the past or future. Luminous visual hallucinations are vivid especially in the dark: they may have geometric, organic or ornamental pattern shapes. It has been suggested that the human sacrificial victims of the Aztecs were willing to die because they were drugged with psilocybine (Bresinsky & Besl 1985). However, the Aztecs thought that the continued existence of the world was guaranteed by sacrifice of human blood and hearts to the sun, and the souls of the sacrifice victims fared better in the afterlife than those of ordinary people (Ortiz de Montellano 1990). Thus it seems that no drugging was necessary, especially as the Aztec philosophical ideas were thoroughly permeated with the importance of fulfilling one's duty.

The *curanderos* who have consumed these mushrooms for decades have showed no abstinence symptoms between the seasons of use, and usually belonged to the oldestliving and mentally best-balanced individuals of their societies. No evidence exists of addiction or permanent psychic changes from psilocybine. In this, psilocybine resembles mescaline, as both seem to be lacking any element causing permanent damage to man.

Use of the Fly Agaric in Eurasian shamanism

Many documents on the use of *Amanita muscaria* in northern Siberia date back to the 17th century (Furst 1976). Use seems to have been both religious and recreational, and *A. muscaria* seems also to have been the only inebriant in the area before the availability of alcohol (Bogoras 1904-1909). When using *A. muscaria*, the psychological aim of the shaman is to reach an altered state of consciousness (ASC). Siikala (1978) defined several of these states and classified them; the religious use of *A. muscaria* is mainly connected with 'sacral institutional ASC'. However, the attaining of the ASC in Siberian shamanistic practices do not seem to depend on the use of the mushroom. The necessary prerequisites for a shaman to enter the ASC are a careful preparation of the séance (fasting, abstaining from sexual relations for a time, solitude, ritual donning of the shaman dress, and singing of hymns). The trance (ASC) is then usually attained with the help of rhythmic beating of the shaman's drum with increasing intensity. Mainly the rhythmic flow of impulses seems to influence the central nervous system of the shaman (Eliade 1964, Siikala 1978). But what is the attitude of shamans and their peoples towards *A. muscaria* and the reasons for its use?

Saar (1991) separates two regions of customary *A. muscaria* use. The first is West Siberia and the Taimyr Peninsula, where mushroom use has been reported among the K.hanty (Ostyaks), Selkup (Southern Samoyeds), Nganasan (Taimyr Samoyeds) and Ket ('Yenisey Ostyaks'), with episodic use even now. The second area is the easternmost Siberia, including the Chukchi and Kamtchatka Peninsulas. The use of mushrooms has been reported among all peoples of the region: the Chukchi, Koryak, Itelmen ('Kamchadal'), Inuit, Yukagir, Even (Tungus) and even the Russian descendants of the earliest settlers in the area. Here the custom of *A. muscaria* consumption is still alive (Saar 1991). In some cultures, e.g. the Khanty, also women could be shamans and use the mushroom (Karjalainen 1927).

Bogoras (1904-1909) describes how *A. muscaria* leads to the appearance of the spirits of the Fly Agaric. The spirits bear the shape of actual mushrooms, and the user feels impelled to imitate them. The spirits are mischievous and play practical jokes on the user. They also ask for obeisance, which must be given, otherwise the person's life would be in danger. The spirits can take him to various worlds and show him visions. The Koryak call these spirits *wapaq*, a name used also to denote the mushroom itself (Furst 1976). Saar (1991) states that the mushroom spirits of the Khanty are half as tall as men and usually ask why the person has eaten the mushroom: this question must be answered. The person explains and then tells his desires and the spirits give the answer, in the form of a song or a narrative. The Forest Nenets believed that only those who were acquainted with the 'inner nature' of *A. muscaria*, could eat them "with luck", otherwise the spirits are not clearly visible, and they lead the shaman into darkness (Lehtisalo 1924). The Nenets shaman had to eat, in addition to the 'suitable' amount of mushroom caps, one halved mushroom cap, as this produced a spirit less powerful than the others and he will be able to follow them as they run swiftly in the same direction as the sun. The 'half-spirit' falls behind the others and makes it easier to follow the spirits.

Saar (1991) lists the reasons for the consumption of *A. muscaria* in Northern Eurasia as follows: 1) for communication with the souls of the dead or with spirits; 2) for treatment of diseases; 3) for naming a new-born child; 4) for making clear the cause of a dangerous situation and finding ways to overcome it; 5) for interpretation of dreams, prediction and fortunetelling, and seeing past events; 6) for visiting different worlds and flight over the earth (shamanistic journeys); 7) for creation of assistant spirits using *A. muscaria* as a mediator; 8) for increasing the shaman's courage; 9) for inspiration to recite songs or epics; 10) to increase bodily resistance to physical strain and 11) to call forth spirits of high status. According to the shamans, it is necessary to take into account the phase of development of the fruit body and the personality of the person consuming it. Also the dose and the form in which *A. muscaria* is consumed are important, but must be adjusted according to the user's purpose and to the 'nature' of the individual. Recreational use of *A. muscaria* has also at all times existed in Northern Eurasia (Bogoras 1904-1909, Jochelson 1909, Saar 1991). In the 19. century some ethnic groups preferred the use of the Red Fly Agaric as an inebriant instead of alcohol (Wasson 1968).

These descriptions suggest that the Fly Agaric itself was not an object of religious veneration, and no real mushroom cult existed in Siberia. The mushroom spirits are merely considered potentially dangerous helpers in the shaman's journey, with no evidence of any mushroom cult similar to that of the Mesoamerican cultures. Saar (1991) states that some Siberian peoples held the mushrooms to be supernatural beings, but it would perhaps be more correct to regard them as secondary tools. In fact, those shamans who did not need to utilize the mushroom as an ally were considered more powerful (Saar 1991). The eating of mushrooms does not seem to involve any specific rituals, and Eliade (1964) and Siikala (1978) share the view that only a weak shaman, i.e. a person whose psychical disposition to shamanism is not very suitable, had to use a chemical 'tool' to attain the necessary ASC. Eliade (1964) sees the use of mushrooms as a late development and even a 'degeneration' of shamanism; the high status of the shaman in society has caused many "less gifted" individuals to resort to mushrooms, which have the capacity to produce the necessary ASC, but in a crude and passive way (Eliade 1964).

The Fly Agaric in North and Central America

Amanita muscaria occurs through the vast area of North and Central America in all suitable habitats, though in the south only in mountainous areas. In the United States it fruits from early spring through late autumn, in Mexico from summer to autumn in the pine-oak forest belt (Ott 1976). In Mesoamerica the Fly Agaric is usually regarded as a poisonous and dangerous species (Lowy 1974). However, as the taxonomy of *A. muscaria* is incompletely known, it is not certain whether all clones belong to the same species in this area. Very little is known of its possible religious use outside the Old World: Wasson (1986a) reports its religious role among the Ojibwa Indians and its use by the Maya for divinatory purposes. Among the Quiché, Cakchiquel and Tzeltal Maya it seems to be associated with thunder and lightningbolts (Lowy 1974, Wasson 1986b). It seems that the association of certain mushrooms with thunder is widespread in different parts of the world, but little evidence is available to indicate that the Mesoamerican cultures were ever aware of the hallucinogenic properties of *A. muscaria*. However, certain mushroom stones of ancient Mesoamerica bear closer resemblance to *A. muscaria* than to *Psilocybe*: one striking example has been found in Patzcuaro (Michoacán, Mexico: Guzmán 1990). Also a ceramic bottle representing a human head with a patched mushroom emerging from the side of the forehead has been found; the mushroom bears a close resemblance to *Amanita muscaria* and the bottle is typical for the Mochica culture in Peru dating back to 200-500 A.D. (Niemela 1984). Mushroom figures with patches on the cap occur also in Maya codices (Lowy 1972). It has been suggested that *A. muscaria*, which occurs throughout Guatemalan and Mexican pine forests, was once used by several tribes in Mesoamerica for religious purposes (Guzmán 1990).

Religious use of Psilocybe fungi in Mesoamerica

In contrast to the Eurasian cultures, a genuine mushroom cult in Mesoamerican cultures seems to have existed, and its beginnings can be traced to remote antiquity. The remarkable 'mushroom stones' (of stone or pottery) of the ancient Mayas and mural frescoes found in central Mexico are striking archeological evidence, the earliest 'mushroom stones' dating from the period 1000-300 B.C. (Mayan Early and Middle Preclassic: de Borhegyi 1961, 1963, Lowy 1971, Schultes 1972). Mushroom stones are found in all parts of Highland Guatemala and in the Petén province in northern Guatemala. They occur also in the Mexican states of Oaxaca, Tabasco, Veracruz and Chi a pas, and in El Salvador (de Borhegyi 1961, 1963). They represent many different types, but the "stipe" is usually decorated with human or animal figures; their description and analysis are outside the scope of this article, but they seem to imply the existence of important mushroom cults among the ancient Maya.

Scripts from the early Conquest period (late 16th century) contain several descriptions of the importance of hallucinogenic mushrooms to Mexican religion and life. By far the most important contribution to the early knowledge of Mesoamerican mushroom cults is the huge work of de Sahagún (manuscript (*The Florentine Codex*) from 1578-80, English tr. by Anderson & Dibble 1950-1963). Three types of hallucinogenic fungi are mentioned also by the famous Spanish physician, F. Hernández, sent to Mexico by the King of Spain (Hernández 1942-1946, orig. 1577: mushrooms mentioned in book 2/fX, Ch. 95). However, few later references to the use of hallucinogenic mushrooms in Mexico are to be found, until modern scientific interest 'discovered' the phenomenon anew, first in the 1930s, largely through the work of R.J. Weitlaner, B.P. Reko, J.B. Johnson and R.E. Schultes (Johnson 1939, Schultes 1939, 1940, 1978, V.A. Reko 1949, Heim & Wasson 1958). In the 1950s the task was taken up by R.G. Wasson, R. Heim, R. Singer and G. Guzmán; their results and the discovery of an extant mushroom cult in Mexico have been published many times, for instance by Wasson (1957), Heim & Wasson (1958), Singer (1958), Schultes (1972) and Wasson (1980). The earliest Mexican and

Spanish sources are well presented by Heim & Wasson (1958).

It is evident that specialists in the mushroom cult existed from the earliest times, and the use of hallucinogenic mushrooms in Mesoamerica was strictly ritualistic and under the control of 'professionals'. These people were in modern times called, in Spanish, *curandero*s (masc.) or *curanderas* (fern.), which reveals their main function: curing of illnesses. They had, however, other tasks also, such as finding lost or stolen property and predicting the future. Another name for the curers is *sabio* (masc.) or *sabia* (fern.), 'wise man, wise woman'. Quite often they were women. These are in literature also called 'shamans', but to me it seems that the latter name leads one astray, as the Mesoamerican 'wise person' does not in every respect resemble the Eurasian shaman. The Mazatec Indians, who have been most completely studied in this matter, divided the curers into three further categories (Estrada 1981): 1) on the lowest level is the sorcerer (Sp. *brujo*, Mazatec *tji ʔe*) who can be evil and turn himself into an animal (*nagual*, Nahuatl *nahualli*) at night; 2) on the intermediate level is the curer (Mazatec *cho ta xi vʔe'nta*), who uses massage, potions and a sacred language of his own; 3) in Huautla de Jiménez (Oaxaca, Mexico), the third and superior category was the 'Wise One and Doctor' (Mazatec *cho ta chji ne*), who does not use potions and does no evil. His power is in his ability to ingest and communicate with the mushrooms, euphemistically called 'saint children' (Mazatec *ʔnti xti santo*), 'little one who springs forth' (Mazatec *ʔnti xi tjo*), 'little saints' (Mazatec *ʔnti*' *sa nto*) and 'little things' (Mazatec *ʔnti*'*tso jmi*). Other edible or poisonous mushrooms are never called by these names (Estrada 1981).

The most comprehensively documented mushroom cult was found in the 1950s in the state of Oaxaca, southern Mexico. The Indian inhabitants of some mountain villages, especially the Zapotecs of San Agustín Loxicha, the Mixe of SanJuan Mazatlán and the Mazatecs of Huautla de Jiménez, still actively practised the nocturnal mushroom séances (Sp. *velada*); the *curandera* of Huautla, María Sabina (born 1894), has especially attained worldwide fame (Heim & Wasson 1958, Wasson 1958, Furst 1976). First she was introduced by Wasson (1957) under a pseudonym to protect the person and village against public interest. Her life and sacred chants have been published by Estrada (1981), himself a native Mazatec; and H. Munn, an American who married a Mazatec woman from Huautla, has contributed to our knowledge of María Sabina both by translating Estrada (1981) into English and studying the sacred language used in the mushroom cult (Munn 1973). The *velada* of María Sabina has also been recorded and the words and tunes published (Wasson *et al*. 1974).

The Mixe Indians in the eastern part of the state of Oaxaca, Mexico, have also used hallucinogenic *Psilocybe* mushrooms for divinatory and medicinal purposes up to the present time (Lipp 1990). In Mixe, these mushrooms are called *na.shwiñ. mush* and are further recognized under the following names: 1) *pi.'tpa* 'spindle whorl' or '*ene.ti.ic* 'thunder's teeth' (*Psilocybe mexicana*, *P. cordispora* Heim), 2) *atka:t* 'judge' (*P. hoogshagenii*) and *ko:ng* 'lord, governor' (*P. caerulescens*). The Mixe consider these mushrooms to be all-knowing soothsayers, equated with the blood of Christ. According to the Mixe, illnesses originate in man's bones, and the mushrooms are the only 'medicine' able to penetrate the bones. They are said to grow only in sacred soil. According to the description of Lipp (1990), when they are found, they are first revered with kneeling and the lighting of candles, then plucked very carefully and taken to a house for treatment with copal (from *Bursera bipinnata* (DC) Engl. or some other woody plant yielding resins; author's comment) incense or to a church, and then they are used after three days. The partakers must abstain from sexual intercourse, from fowl or pig meat, mescal, eggs or vegetables during this period. After the mushrooms are eaten, on the next day chili peppers are eaten, but meat and alcohol are proscribed for one month. The mushrooms are always consumed in pairs, and the dosage varies according to the age and sex of the person. They are eaten in a lonely hut to prevent anyone from overhearing the conversation with the mushrooms; the mushrooms are also held to be sensitive to noise, and they stop 'speaking' when it occurs. Other hallucinogenic fungi found in divinatory use in this area are reported to be some species of the family *Lycoperdaceae*, and *Scleroderma verrucosum* Pers. (Ott *et al*. 1975). It is also interesting to note that in Chignahuapán (State of Puebla, Mexico), a church has been discovered to have been dedicated to a mushroom; this mushroom, carefully preserved in the church, was identified as *Ganoderma lobatum* (Schw.) Atk. (Guzmán *et al*. 1975, Guzmán 1990). This polypore has no hallucinogenic properties, but it is closely related to *Ganoderma lucidum* (Curt.: Fr.) Karst. which is considered especially in China and Japan to have medicinal properties (Stamets 1990). However, it is probable that the Indians of Chignahuapán had, at least formerly, practised a cult of sacred mushrooms (Guzmán 1990).

Mushroom rituals of the Mazatecs in Huautla de Jiménez

Munn (1973) describes the Mazatec mushroom *velada* as follows:

> *The Mazatec Indians eat the mushrooms only at night at absolute darkness. It is their belief that if you eat them in the daylight you will go mad… Usually several members of a family eat the mushrooms together: it is not uncommon for a father, mother, children, uncles and aunts to all participate in these transformations of the mind that elevate consciousness onto a higher plane. The mushrooms themselves are eaten in pairs, a couple representing man and woman that symbolizes the dual principle of procreation and creation. Then they sit together in their inner light, dream and realize and converse with each other, presences seated there together, their bodies immaterialized by the blackness, voices from without their communality… For everyone present the purpose of the session is a therapeutic catharsis… The psychedelic experience of the Mazatecs is inseparably connected with the curing of an illness; not only physical illness but spiritual and ethical problems. The mushrooms are eaten when something is wrong.*

Both María Sabina herself (Estrada 1981) and Munn (1973) stress the importance of language in the mushroom cult. María Sabina describes the beginning phases of her call as follows (Estrada 1981):

> *I remember that I had a vision: some people appeared who inspired me with respect. I knew they were the Principal Ones of whom my ancestors spoke. They were seated behind a table on which there were many written papers. I knew that they were important papers. There were a number of Principal Ones, six or eight of them… Right away I heard a voice. A voice that was sweet but authoritarian at the same time. Like the voice of a father who loves his children but raises them strictly. A wise voice that said: "These are the Principal Ones". I understood that the mushrooms were speaking to me. I felt an infinite happiness. On the Principal Ones' table a book appeared, an open book that went on growing until it was the size of a person. In its pages there were letters. It was a white book, so white it was resplendent.*
>
> *One of the Principal Ones spoke to me and said: "María Sabina, this is the Book of Wisdom. It is the Book of Language. Everything that is written in it is for you. The Book is yours, take it so you can work". I exclaimed with emotion: "That is for me. I receive it"… I limited myself to contemplating it and, at that moment, I began to speak. Then I realized that I was reading the Sacred Book of Language. My Book. The Book of the Principal Ones.*
>
> *I had attained perfection. I was no longer a simple apprentice. For that, as a prize, as a nomination, the Book had been granted me. When one takes the saint children, one can see the Principal Ones. Otherwise not. And it's because the mushrooms are saints: they give wisdom. Wisdom is Language. Language is in the Book. The Book is granted by the Principal Ones. The Principal Ones appear through the great power of the children. I learned the wisdom of the Book. Afterwards, in my later visions, the Book no longer appeared because I already had its contents in my memory.*

The curing ceremony that María Sabina used to cure her sister is described as follows:

> *The vigil… I conducted as the ancient Mazatecs did. I used candles of pure wax; flowers, white lilies and gladiolas (all kinds of flowers can be used as long as they have scent and color); copal and San Pedro (ground-up tobacco (Nicotiana rustica L.) mixed with lime and sometime also with garlic; author's comment) as well.*
>
> *In a brazier I burned the copal and with the smoke incensed the saint children that I held in my hands. Before eating them, I spoke to them. I asked them for favor. That they bless us, that they teach us the way, the truth, the cure. That they give the power to follow the tracks of evil in order to be done with it. I said to the mushrooms: "I will take your blood. I will take your heart. Because my conscience is pure, it is clean like yours. Give me truth. May Saint Peter and Saint Paul be with me". When I felt dizzy, I blew out the candles. The darkness serves as a background for what is seen.*

The person who gathers or uses *Psilocybe* mushrooms in the way decribed above must abstain from sexual relations and avoid any connection with corpses, dead animals or any decomposing matter.

The *language* (the sacred chants) of María Sabina is interestingly full of symbolism which is not easily understood. Moreover, the *language* is not the same in all cases (Estrada 1981). An example of the chants runs as follows (the original Mazatec translated into English by Estrada 1981):

> *I am a woman who shouts, says*
> *I am a woman who whistles, says*
> *I am a woman who thunders, says*
> *I am a woman who plays music, says*
> *I am a spirit woman, says*
> *I am a woman who shouts, says*
> *Ah, our Jesus Christ, says*
> *Ah, our Jesus, says*
> *Our Saint Peter woman, says*
> *Our Saint Peter woman, says*
> *Our Ustandi woman, says*
> *Our shooting star woman, says*
> *Our shooting star woman, says*
> *Our whirling woman of colors, says*

The Mazatec used in the chants is much richer in vocabulary than the usual conversational language, and much of it is incomprehensible to ordinary people; this, of course, is a common trait to shamanistic sacred languages everywhere (Eliade 1964). The word 'says' repeated after each strophe refers to the mushrooms; it is the sacred mushroom who 'says' everything. In the chants, Christian holy persons and native Mazatec characters (for instance, the Lord of the Mountains, Mazatec *Chicon Ninto*) appear together. The syncretistic features of the cult are manifest, although the Indian concepts are the prevailing ones, being woven together with Christianity only in comparatively modern times.

Conclusions

It seems that, to our present knowledge, religious use of hallucinogenic fungi has occurred in two large areas in the world: northern Eurasia and Mesoamerica. Outside these areas, the evidence is inconclusive, although Wasson (1968, 1986a), especially, sought to prove fungi's former use also among the early Indo-Aryans and Greeks. I also disagree with the theory enthusiastically put forward by Wasson (Wasson 1961, 1986a), and favoured by some other scholars, such as La Barre (1972, 1990), that hallucinogens were once indeed the source of all religion and of the evolution of human culture in general. One should take seriously the warnings ofWeil (1978), concerning psychedelic mycophagy, and Naranjo (1990), who comments on Wasson's ideas on the origins of religion. However, it is true that the shamanistic world-view seems to be a very old way for man to arrange his relationship both to the visible and the supernatural world (Furst 1976). On the other hand, it is significant that Furst himself does not openly commit himself to 'the Wasson theory' even in his published reminiscences of Wasson (Furst 1990).

It is evident that the use of hallucinogenic or if we prefer to use the word coined by Ruck and Wasson (Wasson 1978, Wasson 1986a), *entheogenic*- mushrooms has many common characteristics both in northern Eurasia and Mesoamerica: both cultural areas have used them for similar purposes. But there are also profound differences: in northern Eurasia the mushrooms themselves have not been objects of veneration, while in Mesoamerican cultures this has been the rule. In my opinion, this contrast is mainly a result of the difference in the mind-altering properties between *Amanita muscaria* and the *Psilocybe* mushrooms, which, in turn, derives from the fact that these two groups contain totally different hallucinogenic compounds.

We also have to take into account the profound cultural differences between Mesoamerican and Siberian cultures. In Mesoamerica, the religious use of hallucinogenic fungi evolved among culturally advanced agriculturalist peoples with a centralized government, which emphasized the role of the rulers, gods, shrines and a priestly class. The use of hallucinogenic fungi in modern times can be considered a remnant of an official religious system, which disintegrated after the Spanish conquest. In contrast, the Siberian cultures were culturally at a lower level with more diffuse and variable religious ideas and with a subsistence economy based on hunting, fishing and reindeer-breeding. This formed the basis of the development of shamanism in its 'genuine' form (i.e. in the sense described by Eliade 1964). Moreover, the Siberian peoples were mostly nomadic or seminomadic, and this explains the wide distribution of the use of *Amanita muscaria* in northern Eurasia and the cultural similarities of the peoples concerned, from the Lapps in the west to the Chukchi and Koryak in the east. The use of *Psilocybe* fungi in Mesoamerica seems, in contrast, to have been confined to relatively small areas. However, the difference in the active hallucinogenic compounds of *Amanita muscaria* and *Psilocybe* must also have been an important factor in explaining the differences between the religious use of fungi in Mesoamerica and Siberia.

Table 1. Comparison between the religious use of hallucinogenic fungi in Siberia and Mesoamerica

mushrooms: mainly *Psilocybe*, also others	mushrooms: *Amanita muscaria* only
use strictly ritual and obligatory	use not ritual or obligatory
use limited to professional shamans	use not limited to professionals
no recreational use	recreational use common
mushrooms regarded as divine or a manifestation of divinity	mushrooms regarded as a tool or as as an ally
mushrooms sacred	mushrooms not sacred
mushrooms not subject to trade	mushrooms have commercial value
use not revealed to outsiders	no special secrecy in use
the mushrooms themselves speak to the shaman	the mushroom calls forth spirits; the shaman speaks with the spirits

Acknowledgements. I am grateful to Dr. Tuomo Niemelä (Department of Botany, University of Helsinki) for critical reading of the manuscript and many useful comments and suggestions. I also wish to thank Ms. Sirkka Sällinen and to Ms. Marjatta Rautiala (Botanical Library, Department of Botany, University of Helsinki) for their patience in helping me to find the often not so easily available sources for my work.

This introduction to the special issue reviews research that supports the hypothesis that psychedelics, particularly psilocybin, were central features in the development of religion. The greater response of the human serotonergic system to psychedelics than is the case for chimpanzees' serotonergic receptors indicates that these substances were environmental factors that affected hominin evolution. These substances also contributed to the evolution of ritual capacities, shamanism, and the associated alterations of consciousness. The role of psilocybin mushrooms in the ancient evolution of human religions is attested to fungiform petroglyphs, rock artifacts, and mythologies from all major regions of the world. This prehistoric mycolatry persisted into the historic era in the major religious traditions of the world, which often left evidence of these practices in sculpture, art, and scriptures. This continuation of entheogenic practices in the historical world is addressed in the articles here. But even through new entheogenic combinations were introduced, complex societies generally removed entheogens from widespread consumption, restricted them in private and exclusive spiritual practices of the leaders, and often carried out repressive punishment of those who engaged in entheogenic practices.

Keywords: mushrooms, religion, shamanism, origins of religion, psychedelics, entheogens

Introduction: Psychedelic Use In Human Antiquity

When human ancestors first intentionally ingested psychedelics will forever remain unknown, but what is certain is that millions of years ago hominins encountered psilocybin-containing mushroom species across the temperate regions of the world and undoubtedly consumed them. Just when our ancestors began to deliberately use these conscious-altering substances in rituals will never be known with certainty. However, we can be reasonably certain that more than a million years ago, our *Homo habilis* and *Homo erectus* ancestors and their mimetic capacity expressed in group song and dancing expanded beyond the nighttime displays characteristic of hominids (Donald, 1991; Dunbar, 2014; Winkelman, 2009, 2010a, 2010c, 2015) as they were extended by the effects of psychedelic mushrooms. This expanded visionary ritual capacity set the foundations for the emergence of shamanism and the deliberate use of psychoactive plants to enhance ritual activities and visionary experiences.

The evidence for the ancient ritual consumption of psychedelic plants and their influence on human evolution is partially substantiated by the converging evidence reviewed here:

1. Psilocybin-containing species are found virtually in all regions of the world and stretching back millions of years, as evidenced in psilocybin-containing species unique to each of the major regions of the world;
2. the enhanced binding of the human serotonin receptors with psychedelics;
3. shamanic traditions of ritual use of sacred mushrooms and other psychedelic substances that have great antiquity, as attested to language, art, petroglyphs, and stone sculptures of fungiform figures that often closely resemble the observable features of local psilocybin-containing mushroom species; and
4. ancient psychedelic mushroom use attested to in artifacts from religious traditions in all of the major regions of the world.

Worldwide psilocybin mushroom species

The human engagement with psychedelics was inevitable in the form of psilocybin-containing mushrooms. The widespread presence of species containing psilocybin across most ecozones (Guzmán, 2005, 2009; Guzmán, Allen, & Gartz, 1998; Stamets, 1996) indicates that they were widely present as environmental influences affecting hominin adaptations across the major inhabitable regions of the earth for millions of years. There is a worldwide distribution of psychedelic fungi, especially the psilocybin-containing species, as well as other fungi that are used as entheogens. Psychoactive fungi are found across most ecozones. In the Americas, they have been noted as far north as Alaska and as far south as Chile; other Southern Hemisphere extremities include Australia and New Zealand. The presence of psilocybin-containing species across the tropics and extending far into northern latitudes assured that our various ancestor species commonly encountered and ingested psilocybin-containing mushrooms.

The premodern worldwide distribution of psychedelic mushrooms is illustrated by regionally specific species. In addition to species unique to Thailand (*Psilocybe samuiensis*), New Zealand (*Psilocybe aucklandii*), Australia (*Psilocybe australiana* and *Psilocybe subaeruginosa*), Japan (*Psilocybe argentipes* and *Psilocybe subcaerulipes*), and Africa (*Panaeolus africanus* and *Psilocybe natalensis*), there are psychoactive fungi that are distributed across major regions of the earth such as the Northern Hemisphere, Eurasia, tropical and subtropical zones, and the Arctic and Alpine areas (Guzmán *et al.*, 1998). This distribution, especially the numerous region-specific species that attest to their ancient presence, shows the inevitability of worldwide premodern exposure of hominins to psychedelic species.

Psychedelic influences in hominin evolution

The evidence for psychedelic influences in hominin antiquity is indirect, but undeniable with the weight of diverse forms of evidence. Humans have a long-term evolutionary relationship with psychotropic plant substances, a relationship that resulted from their selective effects on human evolution (Sullivan & Hagen, 2002). There were a variety of ancient exposures to plant substances that effected human evolution, with our ancestors acquiring fitness benefits as a consequence of the use of psychoactive substances (Sullivan, Hagen, & Hammerstein, 2008).

The use of psychedelics exemplifies these enhancements of neurotransmitter functions as a consequence of their ingestion in plant sources. Evidence for the influences of psychedelics on human evolution is found in the greater sensitivity of the binding of psychedelics with the human serotonergic system than is the case for chimpanzees (Pregenzer, Alberts, Bock, Slightom, & Im, 1997). These differences reflect the survival advantages that resulted from their use and the consequent selection for those ancestors with an enhanced capacity to utilize these exogenous analogues of the serotonergic neurotransmitters, influencing a major neuromodulatory system. The human-chimpanzees differences in the sensitivity of response of the serotonergic system establish that there were ancient hominin adaptations involving selection for those ancestors in the hominin line that had a capacity for enhanced binding with psychedelics.

Hominin adaptations to the secondary metabolites of fungi, particularly distinguishing among toxic species, food sources, and consciousness-altering psychedelic species, were significant for human survival. Consequently, human ancestors underwent a multimillion year process of acquiring biological and eventually cultural adaptations to distinguish among mushroom species and their appropriate use. These experiences could have functioned as selective factors in the evolution of specific characteristics of the human brain, our neurotransmitter systems, and our innate psychology that could best exploit these serotonin- and dopamine-enhancing effects.

These psychoactive effects were inevitably incorporated into the central dynamics of shamanic rituals, attested to in the diverse species used as sacraments or entheogens in cultures around the world (see Rätsch, 2005; Schultes, Hofmann, & Rätsch, 1992). Shamanism was central to premodern ritual practices, attested to in the worldwide presence of shamanism in foraging societies (Winkelman, 1992). This ritual activity was central to many aspects of human adaptation and evolution, including subsistence, social organization, healing, cosmology, and symbolic cognition (Winkelman, 2010a).

Entheogens in shamanic origins

Shamanism was central to premodern ritual practices worldwide, attested to the presence of remarkably similar shamanistic practices and beliefs in foraging societies cross-culturally (Winkelman, 1992, 2010a, 2010b). The entheogenic contributions to the origins and evolution of shamanic practices are indicated by the substantial parallels between the basic principles of shamanism and the experiences induced by psilocybin mushrooms and other psychedelics. Ethnographic accounts reveal repetitive features associated with the ritual use of psychedelics in cultures around the world (Dobkin de Rios, 1984; Winkelman, 2007). These include the belief that they are:

- entheogenic, inducing an internal sense of spiritual presence;
- provide access to a spiritual world, the supernatural, bringing the world of mythic beliefs into experience;

- produce an experience of one's soul or spirit and its separation from the body and travel to the supernatural world;
- cause experiences of the activation of powers within and outside of the person;
- induce experiences of relationships with animals and at times the sense of transformation into an animal;
- provoke experiences of ego death followed by transformation or rebirth;
- provide information through visions;
- engage healing, especially through the dramatic ritual evocation of emotional experiences; and
- provide processes for group integration and enhanced social cohesion.

Guerra-Doce (2006, 2015) similarly notes that the predominant model of entheogenic consumption in foraging societies is associated with shamanic practices, where the shaman consumes the sacrament to enhance the healer's spiritual force and divinatory capacity for purposes of healing. These entheogenic practices generally occur in a communal ritual context with the attendance of the entire local group, who are often subjected to the conditions of ritual-fasting, as well as the experiences from drumming, singing, and clapping and overnight vigil. These ritual practices enhance the effects of the entheogen in producing experiences of communication with divinities for a range of objectives. These include: diagnoses of disease and guiding treatment; establishing contact with the ancestors to obtain advice; seeking advice from the spirits regarding plans for the future; acquiring information regarding hunting and about missing family members; and seeking to influence spiritual forces to enhance well-being.

The institutionalization of the effects of psilocybin within communal ritual practices was inevitable foundational influences in the evolution of human religiosity, as well as significant aspects of our evolved psychology (Winkelman, 2010a, 2013). Psychoactive substances were inevitably incorporated into the central dynamics of shamanic and religious rituals, attested to in the diverse species used as sacraments or entheogens in cultures around the world (see Dobkin de Rios, 1984; Rätsch, 2005; Schultes *et al*., 1992). Shamanism provided the cosmological and ritual context within which the experiences induced by psychedelics were incorporated into human culture, and through their selective effects, into humans' innate psychology (Winkelman, 2010a, 2013, 2014a, 2014b). These influences also contributed to the development of ritual healing practices, exploiting principles that were part of the formation of our evolved sociality and psychology (Winkelman, 2015). These shamanic activities played a key role in the evolution of hominins (Winkelman, 2010c) and the evolution of modern human cultural during the Middle/Upper Paleolithic some 50,000 years ago (Winkelman, 2002).

Rossano (2007, 2009, 2011) points out that the interaction of shamanic ritual context with the evolution of the human brain contributed to selection for susceptibility to hypnotic and placebo effects. The well-known "suggestibility" and contextual effects (set and setting) produced by psychedelics indicate that their use would have also contributed to these tendencies to be influenced by the expectations of others. This selection occurred because of the health benefits provided by the mental states that enhanced susceptibility to ritual healing and the ability to use alternate identities, supernatural beliefs, and internalization of the expectations of others to produce beneficial internal states. This ritual context also selected for greater propensities for a variety of personal, interpersonal, and cognitive responses that enhanced ritual healing processes.

Psychedelics enhanced the survival and reproduction of those who could best exploit and benefit from their effects; consequently, psychedelics operated as environmental factors that selected for those who had greater degrees of those innate qualities that were elicited by the neurobehavioral effects of psychedelic and exploited by ritual processes. The selective effects of psychedelics exercised their influences in the context of enhanced capacities for participation in ritual and healing activities. These involved the enhanced cognitive states that were produced by the effects of psychedelics (enhanced serotonin and its effects of brain function; see Winkelman, 2014b, 2017b).

Humans have sought out not only psychedelic mushrooms for their consciousness altering properties, but a wide variety of plant substances as well. While a principal conceptualization of psychedelics is that they involve the ethnobotanical (and chemical) substances with action on the serotonin 5HT2 receptors (such as psilocybin, ergots, ayahuasca, and bufotenine), the visionary and entheogenic substances are not limited to this class of action. Visionary and entheogenic experiences are produced by diverse classes of plants and their respective neurochemicals and their effects on diverse neurotransmitter systems, not only serotonin, but also dopamine, endocannabinoids, GABA, muscarine, and others (see Winkelman, 2017a, 2017b for review). The human potential for entheogenic experiences and visionary encounters appears to reflect innate properties of our nervous system, a potential elicited by many different drug and non-drug mechanisms (also see Winkelman, 2011). This human search for drug-induced spiritual encounters has an intimate relationship with our evolved psychology (Winkelman, 2013, 2014a, 2014b) and has led humans to discover many different plant substances for altering consciousness.

The antiquity of *Homo sapiens*' relationships with psychoactive plants

In his paper here on "*The oldest archaeological data evidencing the relationship of Homo sapiens with psychoactive plants*," Giorgio Samorini provides a worldwide overview of what we know about the prehistory of entheogenic practices. As modern instruments become increasingly sophisticated and sensitive, they are capable of detecting the presence of miniscule quantities of psychoactive plant sources in various archeological materials. These varied approaches (also see Fitzpatrick, 2018) are providing hard evidence of the antiquity of humanity's use of botanical agents known for their ability to induce alterations of consciousness. Samorini's review of the archeological literature on the presence of psychoactive plant sources shows evidence of *H. sapiens*' relationship with psychoactive plant sources going back nearly 10,000 years. This synthesis regarding the earliest knowledge of the main psychoactive plant sources of the world indicates the antiquity of use of diverse plants sources, but not always providing certain knowledge regarding their mode of use (i.e., intoxicant, food, or material).

A more pressing question for Samorini's findings is whether the use of these plant substances was for entheogenic purposes or for other reasons. In some sense, these questions might always remain ambiguous, but from the perspective of the entheogenic paradigm, the meaning of the facts is less ambiguous. If our distant ancestors deliberately left psychoactive substances in graves and other deposits, is there a fundamental ambiguity regarding what the message is here? The limited grave goods attest to the substantial significance that people placed in these objects, and more so, their implications for concepts of the spiritual and afterlife. Burials are intrinsically entheogenic in their intentions, an unequivocal statement that people perceived these substances as central to relationships with the spiritual and the afterlife. The presence of mushroom representations is particularly powerful evidence in this regard, attesting to a central concern with entheogenic experiences. There is no reason to presume that the fungiform representations were depictions of culinary activities or incidental environmental features. The inclusion of mushroom effigies in burial goods and ritual artifacts attests directly to their significance in the production of entheogenic experiences. Proposals of non-entheogenic purposes to ancient mushroom representations face the burden of proof and ought to be backed by evidence, not just offered as speculations.

The diversity of psychoactive plant substances used in the past as indicated in Samorini's review here makes an important point. The widespread use of diverse plant substances and psychoactive ingredients to evoke common themes of entheogenic experience and shamanism reveals that what is important about these agents is not many different and specific forms of psychophysiological action, but rather the common shift in consciousness that is produced by many different psychoactive agents and mechanisms (Winkelman, 2011, 2017a). It is the general principle of the alteration of consciousness, which is relevant to understanding entheogenic experiences. While the specific substances used may not conform to the "classic psychedelic" - those acting at the 5HT-2 serotonin receptors - the real issue is their visionary and entheogenic capacities, induced through a variety of pathways or mechanisms, but resulting in a common physiological condition of organismic operation (an integrative mode of consciousness; Winkelman, 2011).

As Fitzpatrick and Merlin (2018) point out, while humans' use of psychoactive substances falls into many different pharmaceutical categories (i.e., inebriants, stimulants, opiates, narcotics, hallucinogens, etc.), ethnographic analogies suggest that their use in the past generally shares a common entheogenic function of divine communication, even if the substances involved are not generally considered to be hallucinogenic or psychedelic (acting at 5HT2 serotonin receptors). The classification of the use of these diverse psychoactive substances as entheogenic in purpose is appropriate, given the typical perspectives of most cultures toward the use of varied classes of psychoactive substances that are employed to enhance experiences of contact with deities and supernatural forces. An entheogenic perspective may be valid even in the cases of substances with recognized alcohol content because of the widespread practice of mixing other psychoactive substances in the fermentation process to enhance the effects.

The integrative mode of consciousness emerges with the elevation of ancient brain functions by diverse process that promotes psychodynamic growth and cognitive, social, and psychological integration. Diverse ritual activities induce this integrative mode of consciousness, stimulating the autonomic nervous system through extensive ergotropic (sympathetic) activation until collapse into a trophotropic (parasympathetic) dominant state with a slowing of the brain waves into a more synchronized and coherent pattern (see Winkelman, 2011 for review). This extreme parasympathetic state is a recuperative state of the body, a state of extreme relaxation culminating in sleep and unconsciousness that restores homeostatic balance and evokes endogenous healing responses, especially through reduction of stress responses. This shift to parasympathetic dominance is also accompanied by a shift from left-hemisphere- to right-hemisphere-dominated brain processes and from frontal brain activity to predominant brain wave patterns emanating from lower brain structures. Winkelman (2017a, 2018) has reviewed evidence indicating that these diverse entheogenic substances result in the stimulation of innate modular structures and intelligences that provide the central features of spirit encounters.

The human search for chemically enhanced consciousness as a better conduit to experience divinity is a virtual universal of human cultures. And as will be illustrated in a number of articles below, this development likely began with the most easily available sources - psychedelic mushrooms - which were later supplanted by more complex combinations of plants. This primordial use of mushrooms as entheogens is illustrated by findings of fungiform artifacts from all of the major areas of the world, as seen in the following section of this introduction. While far from exhaustive, it establishes that there existed ancient spiritual practices in all of the major regions of the world that were entheomycological, finding entheogenic inspiration in locally available psychedelic fungi.

Mushroom And Entheogenic Cults Of The Past

By their nature, mushrooms are hard to detect in the archeological record, as their fleshy substance largely composed of water quickly deteriorates and leaves little if any physical trace. Consequently, the evidence regarding the roles of psychedelic mushrooms in cultural activities of the past involves fungiform representations in petroglyphs, rock art, sculptures, and metal artifacts found in cultures around the world. Samorini (2012) reviewed a wide range of mushroom forms found in cultures around the world, showing that mycolatry is a widespread ancient practice. Psychedelic mushrooms were encountered in most of the habitable regions of the world and displayed in ways that indicate that they were central features of early ritual systems. Their significance led their practitioners to capture the source of their experiences and their significance by producing images on stone.

Asia

A deep prehistory of mycolatry in Asia is well attested to in the presence of practices and mythology regarding *Amanita muscaria* and *Psilocybe* species (Figures 1 and 2) among diverse cultures of the region. Furthermore, there is reason to expect that encounters with *A. muscaria* stretch back as long as hominins occupied the temperate forest regions of the Northern Hemisphere where these mushrooms grow in symbiosis with *Betula* spp. (birch) and *Pinus* spp. (pine trees).

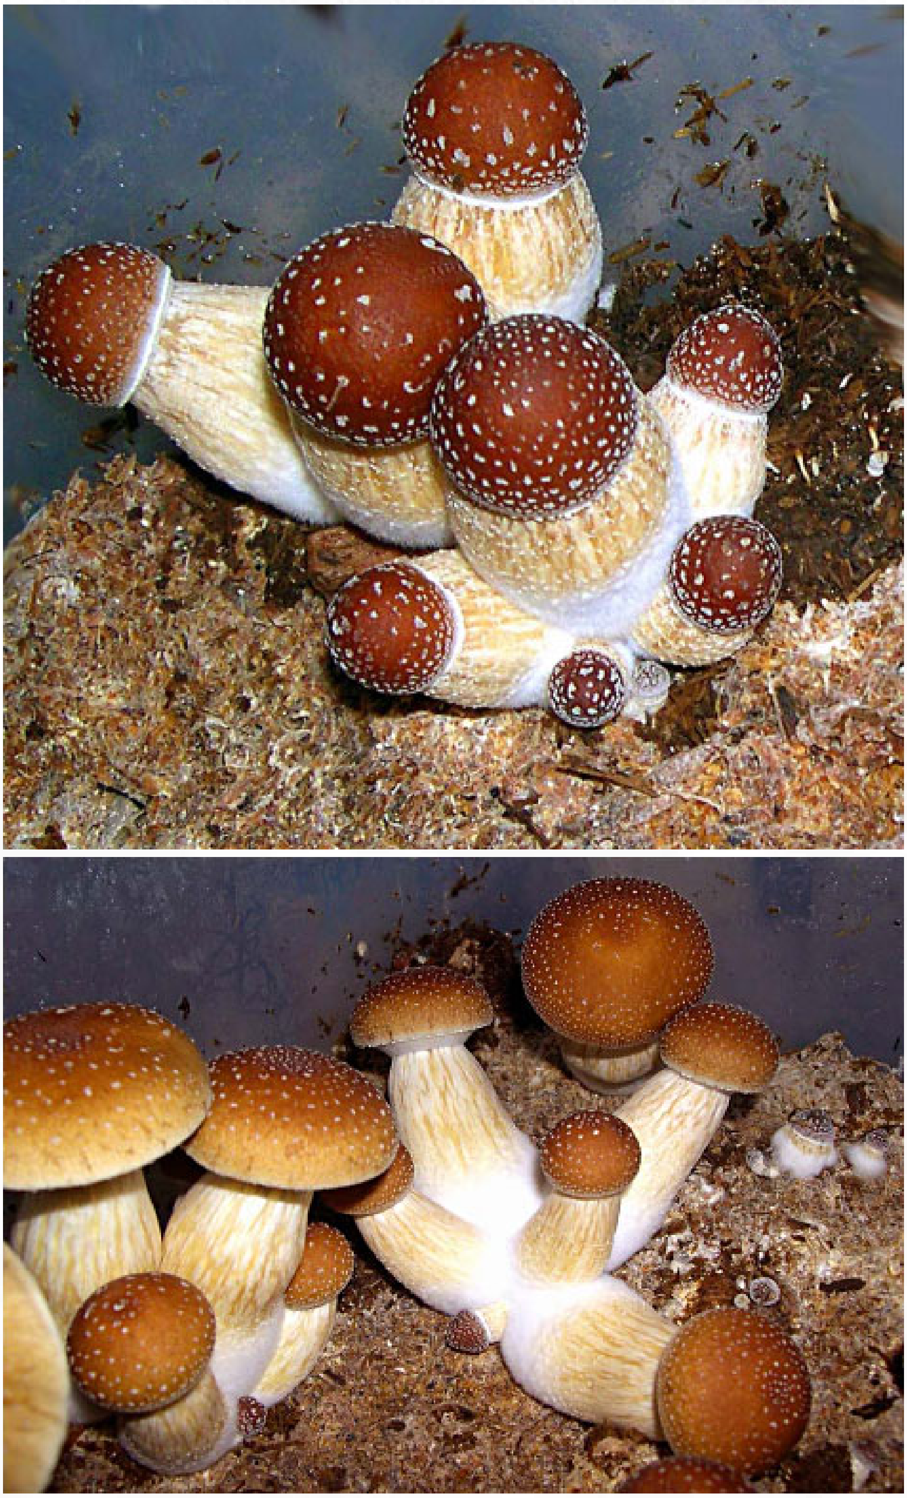

Figure 2. (a, b) *Psilocybe cubensis* grown from spores obtained in India (photo credit: John Allen; used with permission)

Prehistoric evidence

The direct evidence for prehistoric mycolatry is found in a variety of mushroom and mushroom-human depictions found in the northern regions of Eurasia (see Hoppál, 2013; Rozwadowski & Kosko, 2002). Panels in the Pegtymel River region of Siberia are exhibited on large rock formations. Figure 3 presents sketches of rock art images in the Sayan Canyon of the Yenisei from Devlet and Devlet (2002); they proposed that these portray human figures with mushroom-like heads and are reflections of ancient cults involving *A. muscaria*. The identification of *A. muscaria*, as opposed to other psychedelic mushroom species, is based on features exhibited on the headgear of the anthropomorphic being. Some of these mushroomshaped caps have shallow areas that appear to represent the white spots that are found on the caps of *A. muscaria*.

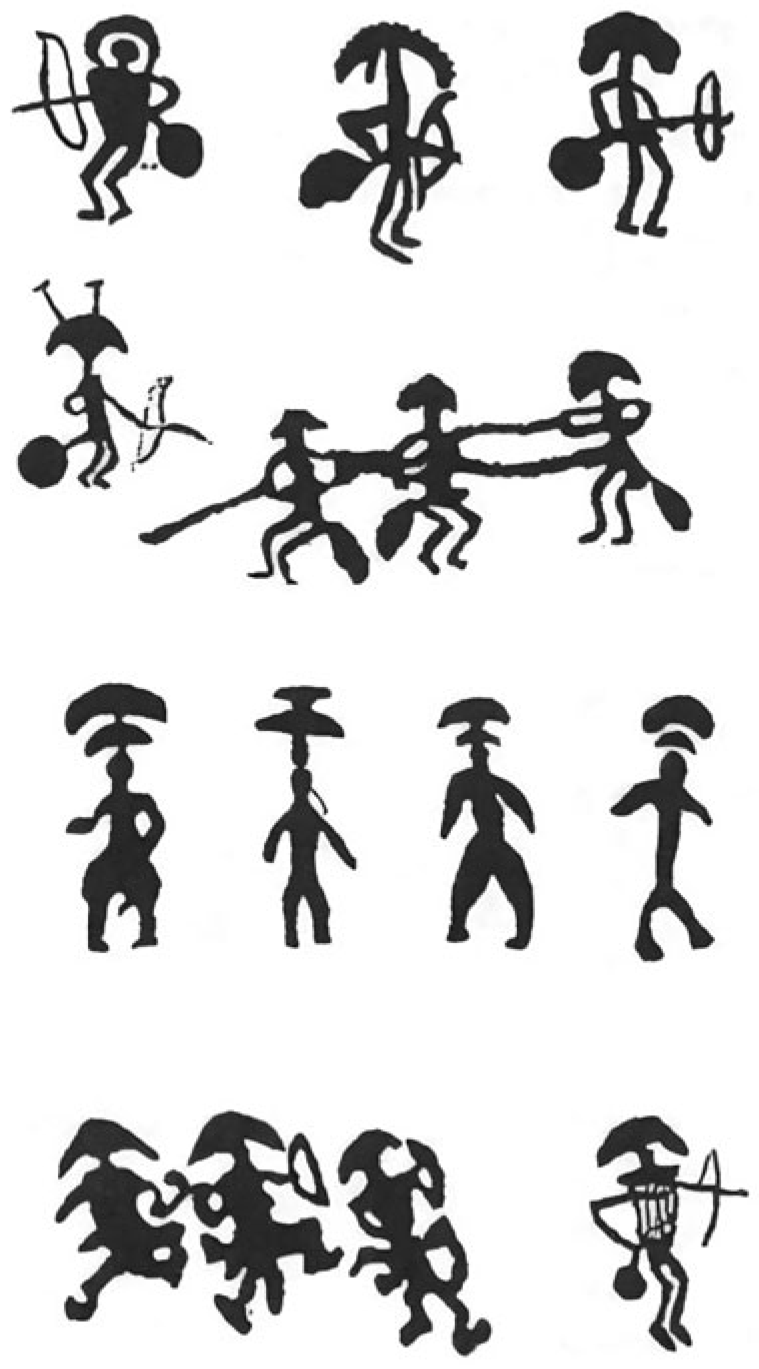

Figure 3. Representations of petroglyphs that Devlet and Devlet (2002) call "fly-agaric creatures" (in reference to *A. muscaria*) and discuss as shamanistic figures. Images found in Upper Yensi Basin, Khara-Chulun Mongolia, and the Pegtymel rock art site. Images used with permission of Andrzej Rozwadowski from Rozwadowski and Kosko (2002)

Guzmán (2016) has noted that some of these depictions may more closely represent *Boletus* species, which are used for their psychedelic effects in Papúa New Guinea (Reay, 1960) and China (Stijve, 1997). These petroglyph images of humans covered with giant mushroom shapes were likely made by the ancestors of the local cultures because the Chukchi mythology refers to human-like mushrooms and had practices of using *A. muscaria* that continued until the current era (Saar, 1991; Schurr, 1995).

Ethnohistorical studies show that the ingestion of A. muscaria was involved in shamanic practices, although there are more modern cases of non-ritual individual use. Bogoraz (1909) reported that the shamans among such diverse groups as the Yukagir, Kamchadal, Inuit, and Koryak and Chukchi ate the mushrooms and even *drank* the urine of reindeer intoxicated on the fungi, receiving an even more potent dose of the psychoactive ingredients once the more toxic substances were processed by the body (see Feeney, 2010; Schurr, 1995). This shamanic context of *A. muscaria* use was part of other ritual practices to produce alterations of consciousness experienced as a travel to and entry within the spirit world. The widespread association of the *A. muscaria* with reindeer reflects the animals' practice of consuming the mushrooms, as well as drinking the enhanced psychoactive substances in the drugged deer's urine. These behaviors may reflect the origins of human knowledge regarding the mushroom's intoxicating properties still present in the urine.

The Soma controversy

In their article "*The 'Kamasutra' Temples of India - a Case for the Encoding of Psychedelically-induced Spirituality*," Meena Maillart-Garg and Michael Winkelman address one of the most famous entheogenic controversies, the identity of Soma of Hindu traditions, proposed to be the mushroom *A. muscaria* by Wasson (1972). The presence of mushroom representations in the sculptures of sanctuaries of the Khajuraho Temples provides evidence that entheogenic mushrooms are the identity of soma. They analyze the features of these fungiforms and Vedic traditions to propose that these are designed to depict both the *A. muscaria*, as well as *Psilocybe cubensis* species (see Figures 1 and 2a,b). They further propose that some of the so-called "broken" sculptures of Khajuraho are not actually damaged, but rather deliberately constructed to appear vandalized to encode information related to entheogens in the "figure 8" form of the early stage of *A. muscaria*. The central placement of mushroom pedestals as necessary steps into the sanctum of the temples attests to a profound entheogenic message. This physical and symbolic data has considerable implications for a reevaluation of the ancient roots of Hinduism, indicating that entheogenic mushrooms were the most important sacraments of early Hinduism and persisted for millennia.

Entheogenic mushroom use in complex Asian societies

Wasson's (1972) proposal of the existence of a widespread entheogenic *A. muscaria* mushroom tradition across Eurasia has various forms of support from findings reported for complex societies as well. The continuation of mushroom cults in complex societies of Asia was illustrated by Crowley (2015), Dannaway (2009) and Hajicek-Dobberstein (1995), who review evidence of religious mushroom cults. Psychedelic mushroom use is reported for Taoist cult practices documented in Tibet and China by Crowley (2015) and Hajicek-Dobberstein (1995), as well as across the ancient Indo-Aryan world from India to Greece (Ruck, Staples, & Heinrich, 2001). Chinese traditions recorded the use of hallucinogenic plants, including mushrooms, in herbal manuscripts almost 2,000 years ago. Dannaway (2009) points to evidence the use of botanicals substances as tools for obtaining siddhis or mystical powers in: the yogic tradition of Patanjali; ancient Buddhists texts, especially in the Buddhist Tantric traditions; and Taoist literature, the later making references to what is translated as "magic mushrooms" and "divine mushrooms."

Hajicek-Dobberstein (1995) reviews biographical accounts of some legendary Buddhist adepts from the first millennium (200-900 AD) that provides clues to a psychedelic practice represented in symbols that suggest that they consumed *A. muscaria* as a tool for achieving enlightenment. The identity as *A. muscaria* is revealed in common symbols representing Soma in the Rg Veda, Buddhist traditions, and ancient shamanic practices found across Northern Eurasia. Hajicek-Dobberstein (1995) presents evidence that "*The congruity of the set of symbols in the legend of Arydeva and the sets of symbols in the mythology of A. muscaria from Siberian and Vedic traditions is too strong to be a coincidence*" (p. 109). For instance, the Sanskrit term "madhu," meaning "honey, sweetness, delicious," is a common description of Soma in the Rg Veda; such descriptions parallel the characterizations of the Buddhist Amrta as a "nectar of the gods," a delicious food and drink. The exalted and sacred status attributed to the birch tree in Siberian and Altaic cosmology and its central roles in shamanic rites reflects the trees' role as the habitat *A. muscaria*, constituting the preferred mycorrhizal symbiont of the species. Hajicek-Dobberstein (1995) proposes this is the reason for the significance of the birch as a "great drug" in India pharmacopeia in spite of its rather innocuous medicinal properties, a reflection of its status derived from its role as the symbiont of *A. muscaria*. Paralleling the Siberian mythologies of one-eyed demons, Vedic texts describe beings with a single eye associated with Soma that Wasson interpreted as derived from the characteristics of the early stage of development *A. muscaria* when it appears similar to a bloody human eye-ball.

Hajicek-Dobberstein (1995) reviews materials from *The Stories of the Eighty-Four Siddhas*, representing later codifications of oral biographical legends that described experiences of notable Buddhist adepts using psychedelic mushrooms. These stories indirectly convey such experiences in words and symbols that embed a deeper level of meaning in sandhabhasa, an "enigmatic language" that simultaneously reveals a secret message to the initiates while openly obscuring the true facts for the uninitiated. But as is the case in other traditions, the Buddhists texts provide the identity of *A. muscaria* for this elixir of enlightenment in its features as a magically potent urine, the one-eyed and one-legged beings, and the references to its symbiont birch tree.

Crowley (2015) explores further psychedelic associations with a class of Buddhist deities with the name Uṣṇ&imacr;ṣa, referring to the crown of the head, specifically a "crownbump" (umbo) or cranial protrusion that characterized them, as well as the depictions of many Buddhas. Crowley presents evidence that these crown bumps represented a tantric Buddhist sacrament derived from earlier traditions of psychedelic mushroom use. Based on analysis of liturgical data in the Sadhanamala and the traditions associated with the sacramental amrita, Crowley contends that these bumps are representations of *Psilocybe* species.

Crowley notes that the lack of an explicit Sanskrit term for mushroom led to the use of terms such as "umbrella" and "parasol" (along with other terms such as silindhraka, meaning "maggoty thing") to refer to mushrooms. Silindhraka also has the meaning of "growing on cow dung," a reference to the proclivity of *P. cubensis* and other psilocybin-containing species to grow up through bovine dung. Various references to the blue neck and staff of the parasol reflect the dark ring hanging on the mushroom's stem that is characteristic of *P. cubensis*; and the tendency of the flesh to bruise blue that is characteristic of psilocincontaining species. Crowley extends his analyses to Japanese Buddhist traditions where representations of various deities include depictions of mushrooms that resemble various entheogenic species of the *Psilocybe* genus characteristic of the region (*P. liniformans* and *P. argentipes*). Further analyses of the meanings of the names of the various Uṣṇ&imacr;ṣas provide confirmation of his interpretation of entheogenic mushrooms in features that reflect the physical features of the mushrooms (sprouting, specific colors, wheel-like, etc.), their growing seasons (rainy), and effects (quick acting and vomiting).

Soma as ayahuasca analogue

In the article on "*Soma* and *Haoma*: Ayahuasca analogues from the Late Bronze Age," Matthew Clark continues the examination of the various identities of the entheogenic soma, noting the common elements in the myths and religious practices of both Indian and the Zoroastrianism practices of Persia. Clark notes that the sacred texts have references to several different kinds of *soma/haoma* and examines the consistency in the evidence for various botanical candidates proposed for Soma. He proposes that this "nectar of immortality" was eventually derived from complex plant formulas that included more than a dozen plants. These included DMT sources and monoamine oxidase inhibitors, as well as other psychedelic substances that provided a synergistic formula similar to the famous ayahuasca from South America. He proposes that knowledge of psychoactive properties of the constituent plants was widely diffused from their origins in Central Asia to India and then Persia.

Many plant identities proposed for soma suggest that there were likely more than a single soma. The widespread Eurasian shamanistic use of *A. muscaria* indicates that it must be considered as a primordial entheogen of the region. During cultural development, a variety of factors made *A. muscaria* less available (i.e., deforestation of the symbiotic trees) and the entheogen was replaced by other substances then more readily available (coprophilous or fimicolous *Psilocybe* species), and eventually more complex botanical and chemical combinations that served the same purpose in altering consciousness.

Africa and the Middle East

There is limited ethnomycological data for the ancient use of psychedelic mushrooms of Africa. There are, however, widespread contemporary traditions of hallucinogen use (see De Smet, 1996; Sobiecki, 2017). Some of the most significant entheomycological data is the evidence from the well-known petroglyphs in the Tassili caves in the south of Algeria (Lajoux, 1964; Lhote, 1968; Mori, 1974, cited in Samorini, 1992). Mycological traditions are also suggested for Ancient Egypt, where fungiform representations in Egyptian crowns provide iconic symbols of entheogenic traditions (Berlant, 2005).

Samorini (1989, 1990, 1992) characterized the Tassili petroglyphs and rock paintings as possibly the most ancient of the physical evidence for ethno-mycological practices, hypothesized to date 7000-9000 years BP. Echoing previous analyses, he proposed that these works of art reflect the states of consciousness produced by psychedelic mushrooms and the associated ritual dances that are clearly reflected in the postures of some of the figures. Based on their features, Guzmán (2012) proposed these mushroom figures represent *Psilocybe mairei*, but they also resemble other African psychedelic species, including *P. cubensis* and other species known in the region (*Psilocybe aquamarina* and *P. natalensis*; Guzmán, 2016).

The shamanic nature of the associated ceremonies was noted by the discoverer of this Tassili art, Henri Lhote (1968, 1973), who pointed out that these remote painted cave walls served as secret sanctuaries, consistent with specialized ritual activities. In one panel there are several figures shown in active postures implying dancing, with each holding a mushroom-shaped object (see Figure 4). Samorini (1992, p. 6) notes: "*two parallel lines come out of this object to reach the central part of the head of the dancer, the area of the roots of the two horns. This double line could signify an indirect association or nonmaterial fluid passing from the object held in the right hand and the mind. This interpretation would coincide with the mushroom interpretation if we bear in mind the universal mental value induced by hallucinogenic mushrooms - the lines an ideogram which represents something non-material in ancient art - represent the effect that the mushroom has on the human mind.*" Shamanic figures with mushroom features are repeated in other petroglyphs of the region; see Figures 5 and 6), with a typical gait of a dancing figure with legs bent inward and with the depiction of mushroom figures in the hand as well as on the forearms and thighs and distributed in the area around the body.

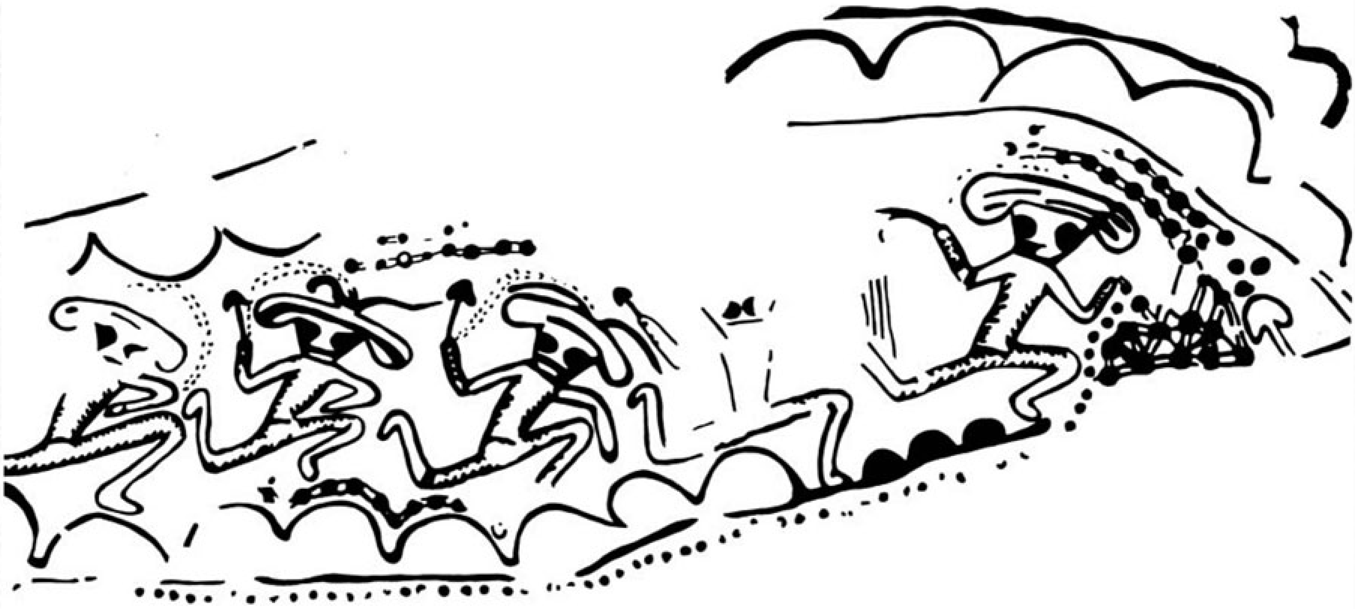

Figure 4. Relief of a painting in a rockshelter of Tin Tazarift, Tassili, Algeria that Samorini interprets as dancing figures with a mushroom as a head and a mushroom-like object in the right hand with lines coming out of this object and extending to the head of the dancer, representing some energy passing from the object to the mind (photo credit: Giorgio Samorini; used with permission)

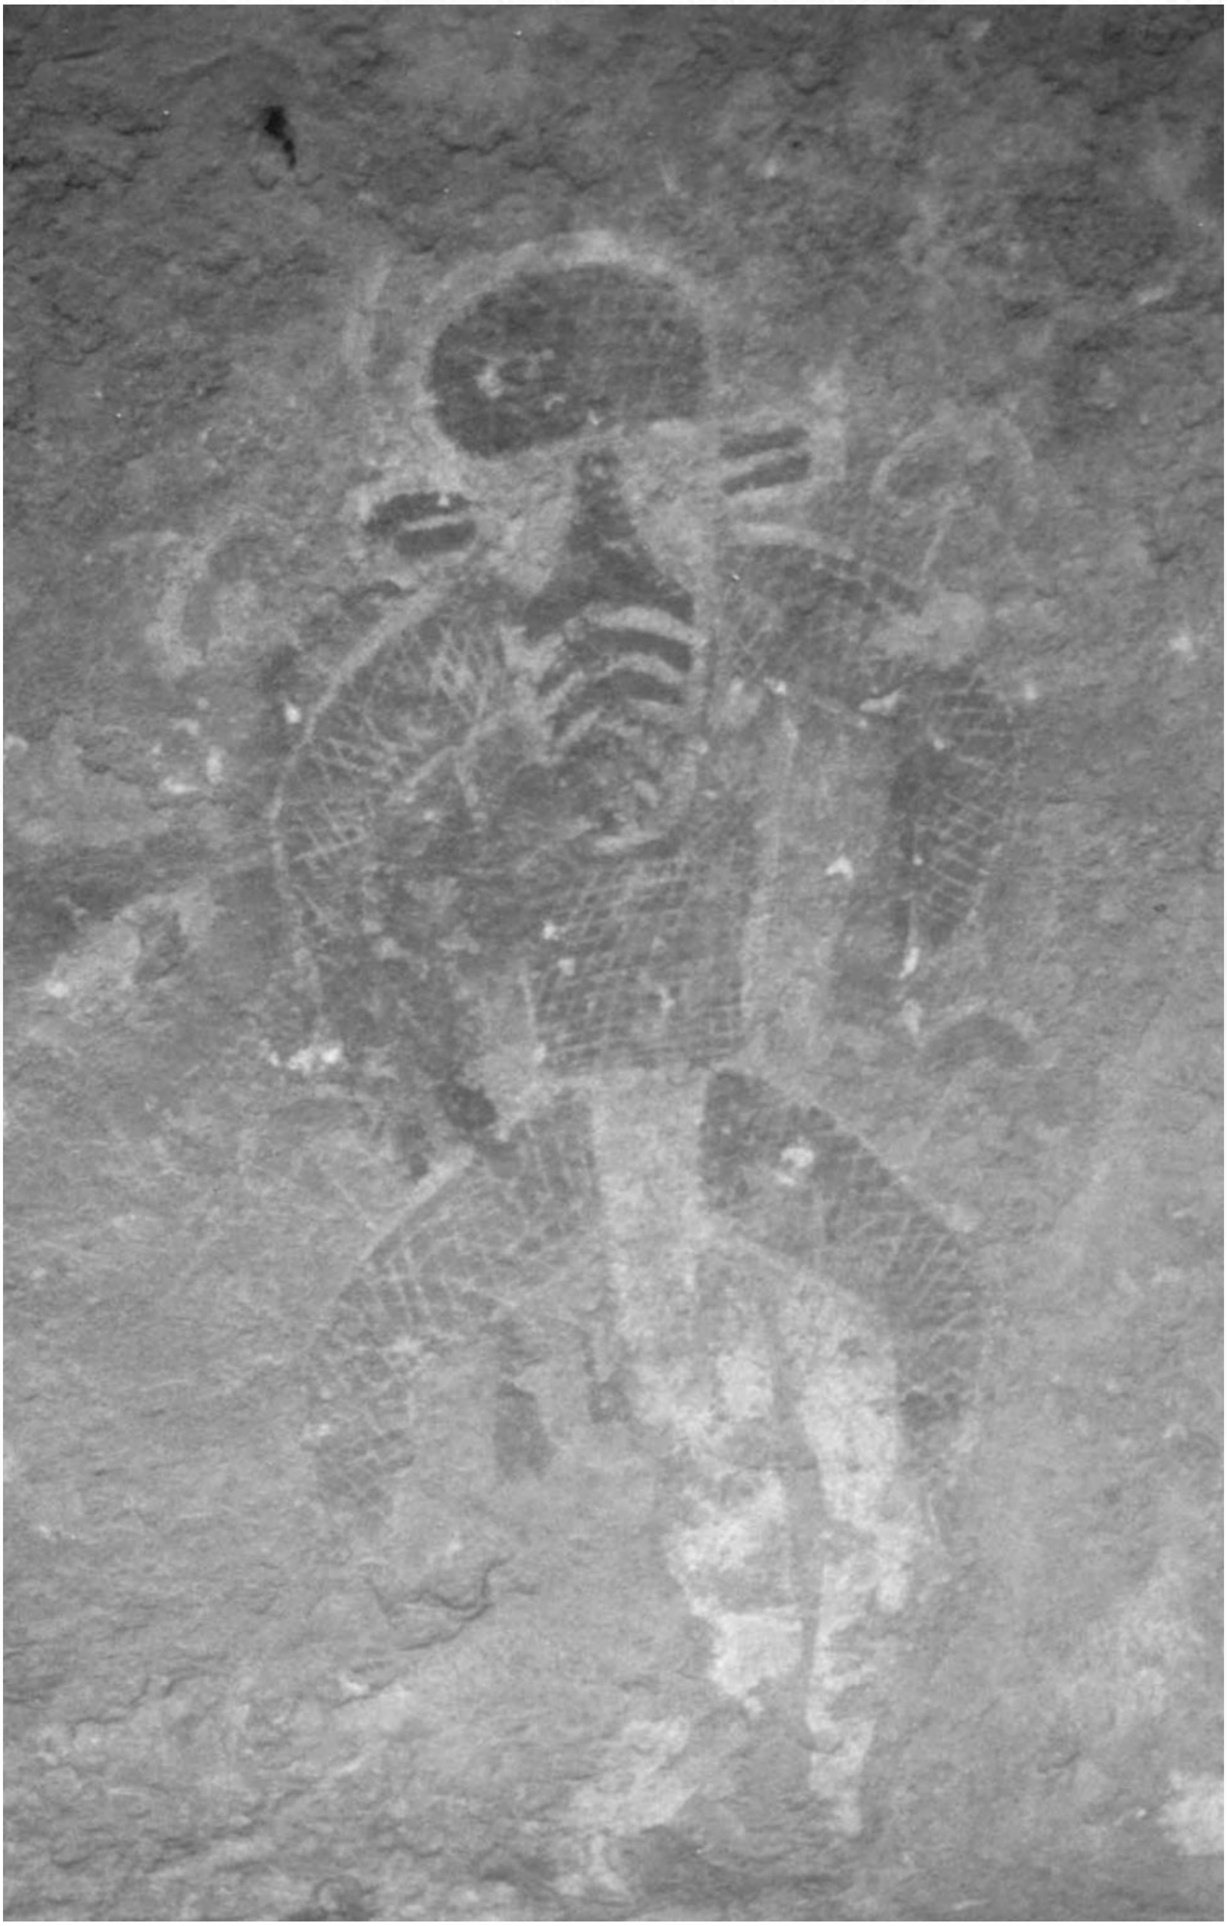

Figure 5. Photograph of a petroglyph that Samorini calls a "Mushroom Divinity" located at In-Aouanrhat, Tassili (Algeria) (photo credit: Giorgio Samorini; used with permission)

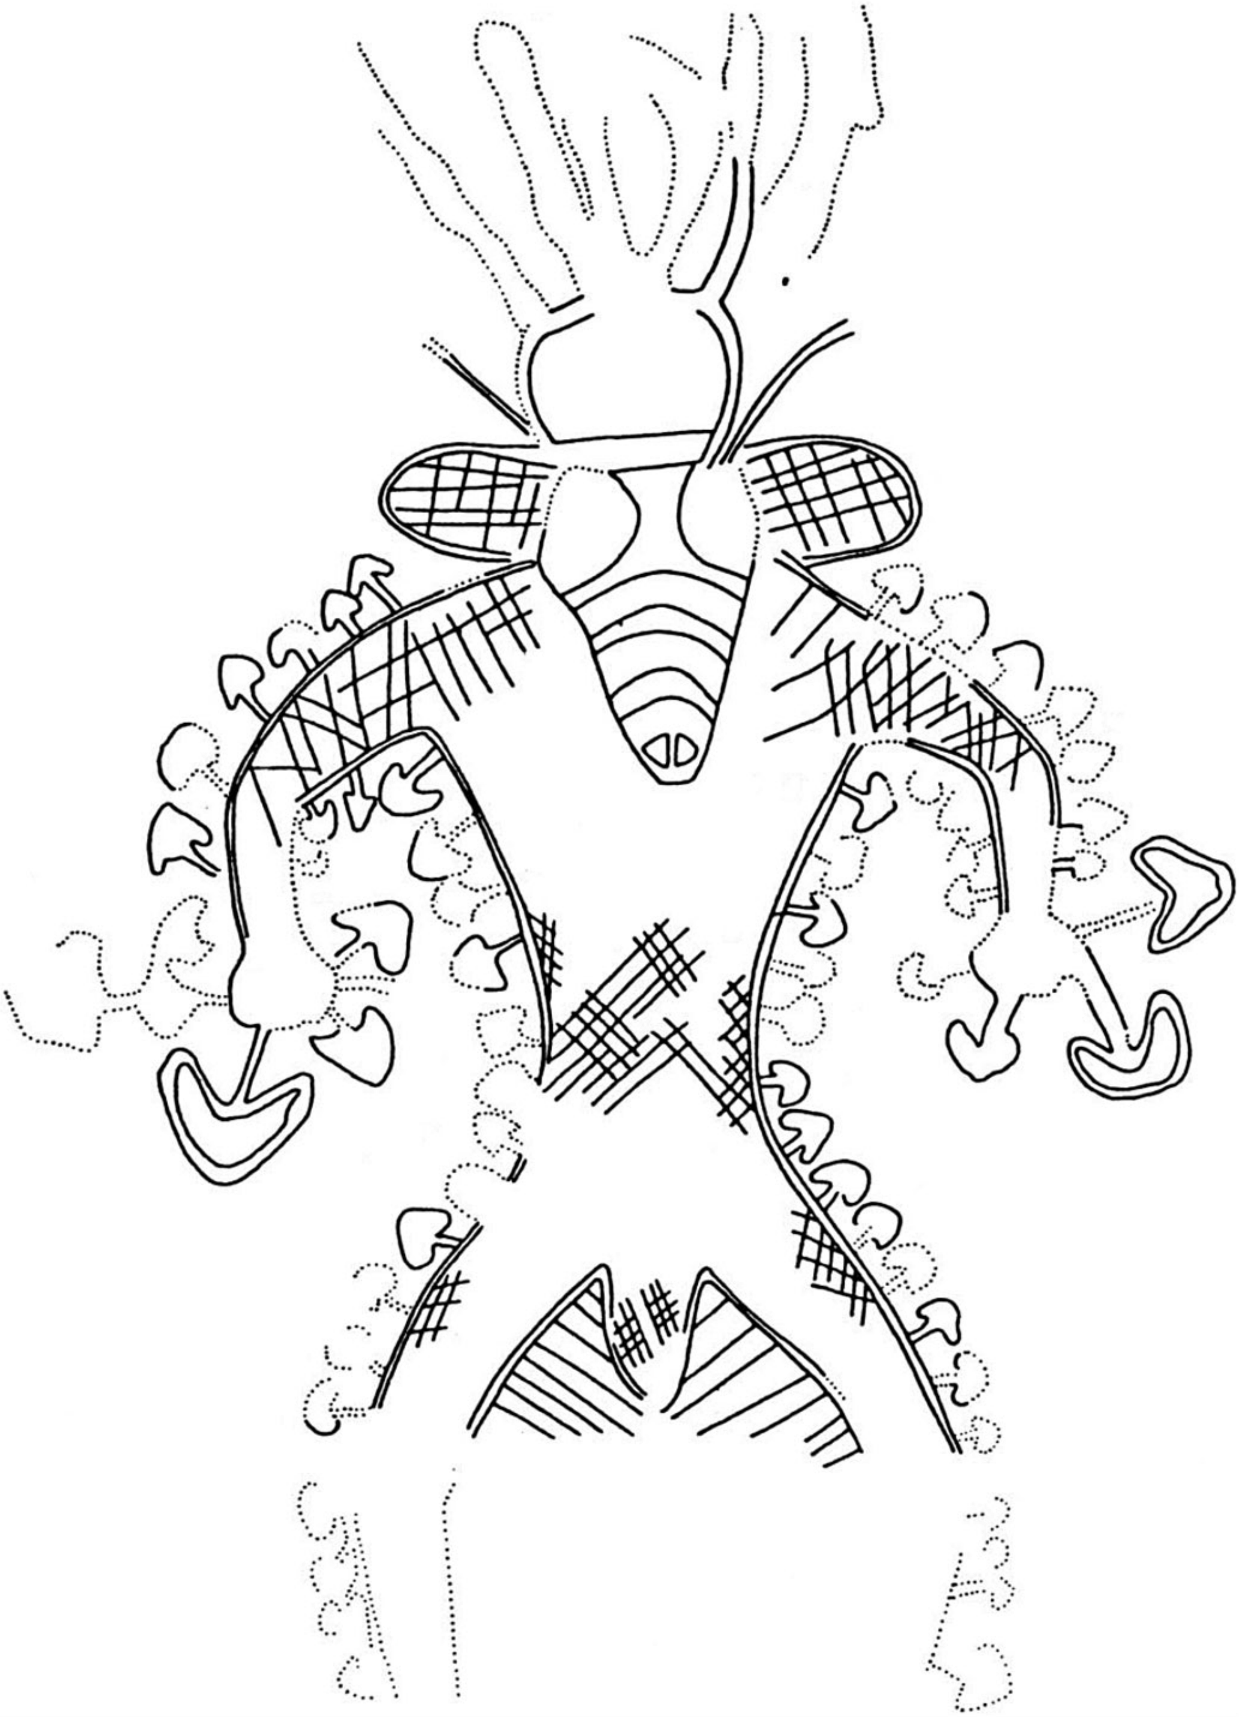

Figure 6. A sketch of the petroglyph at Ti-n-Tarin, Tassili (Algeria) that Samorini calls a "Mushroom Divinity" (photo credit: Giorgio Samorini; used with permission)

These are not the only mushroom depictions in African cultures. Mushroom-head figures adorn the front cover of the 1993 *South Africa Archaeological Bulletin* (vol. 68 #57; also see Hollmann, 1993), depicting scenes from the Bella Vista site in Ladybrand District of the Orange Free State. These images portray a group of men dancing in the style of the shamanic medicine dance of the San people. These figures are mostly characterized by various mushroom shapes on their heads, and in a few cases, with inverted mushroom caps with birds (a classic symbol of shamanic flight), which are shown within the mushroom cup on top of the body (in place of a head). The association of the mushrooms with the medicine dance reinforces the shamanic interpretation and functions of the mushroom caps, a primordial iconic symbol of the locus of effects of the entheogens.

Old Testament evidence for entheogens

The article "*Getting High with the Most High: Entheogens in the Old Testament*" by Danny Nemu presents evidence of the use of entheogenic substances in ancient Judaic traditions. Nemu compiles evidence from scripture, historical sources, and archeology to identify the plants likely found in the Old Testament Manna, Showbread, the Holy Ointment, and the Tabernacle Incense. The psychoactive significance of the ointment and the incense is in their proclaimed role enabling the priestly caste to have a direct experience of their God. The sacramental way they are consumed and the taboos around them are highly suggestive of their use as psychoactive agents. Furthermore, the psychoactive components found in these preparations include GABA receptor agonists and modulators and opioid receptor agonists, as well as enzyme inhibitors that permit them to be orally active. The combinations in these preparations show that the ancient Israelites understood the plant synergisms involved in producing entheogenic experiences and deliberately employed them.

Ruck *et al*. (2001) provide further evidence for *A. muscaria* practices in Judaic traditions, characterizing Moses as an entheogenic shaman, especially in his encounters with the "burning bush" on the "Mountain of God." This bush, with a flaming center that did not burn or consume the bush, also spoke to Moses, giving him instructions. Ruck *et al*. (2001, p. 164) point to the features of *A. muscaria* in burning coal and white ash appearance of the tree, as well as in the signs given by Yahweh to Moses to convince the followers - his hand showing "leprous patches white as snow" (resembling the *A. muscaria* veil remnants on the cap) and the ability to take his hand from his cloak and "to draw water and have it turn red" - (the liquid pressed out of the mushroom). Other circumstantial evidence they present includes the coincidence of the season for obtaining these mushrooms and grazing sheep in the mountains - after the rains. Signs of *A. muscaria* effects are also found in Moses' symptoms of violent illness and his subsequent "superhuman courage and confidence."

Islamic entheogenic roots

In his article "Bur&amacr;q depicted as *A. muscaria* in a Fifteenth Century Timurid Illuminated Manuscript?," Alan Piper present evidence of enthogenic roots within Islamic traditions derived from Turkey and Afghanistan. These influences are expressed in the Herat manuscript, which provides descriptions of the formative experiences of the Prophet Mohammed. These include the *mi'raj* - the miraculous ascent of the Prophet Mohammed through the seven heavens to receive God's instructions - and the proceeding *isra* - the "Night Journey" - during which Mohammed traveled overnight from Mecca to Jerusalem by means of a fabulous beast called *Bur&amacr;q*. Piper analyzes the illustrations of this manuscript, reflecting Islamic traditions formed in an admixture of Turco-Mongolian shamanism, which records Mohammed's *mi'raj*. Piper shows that descriptions in the Herat manuscript that depict the fabulous creature through which Mohammed makes this ascent share distinctive features of the *A. muscaria*, depicting the *Bur&amacr;q* with the distinctive red and white spotted skin of the mushroom. Piper makes an argument for shamanic and entheogenic interpretations based on several elements, including the similarity between the *mi'raj* and shamanic journeying. *Mi'raj* refers to a "ladder" that reaches from earth to heaven for the ascent and descent of the Angels of God, corresponding to the notched tent pole that Siberian shamans use as the axis mundi for their celestial ascents to the spirit powers. Features of Siberian shamanic spirit journeys and *A. muscaria* experiences are found in key elements of the *mi'raj* story. Piper uses ethnographic analogy for interpretation of this depiction of the *Bur&amacr;q* through an interdisciplinary approach that shows how these representations of the Bur&amacr;q depicted in the Herat manuscript are related to Islamic traditions influenced by Buddhism, Hinduism, and other regional cultures. An Islamic spiritual leader called Baraq Baba who is involved in a situation of consumption of vomit has analogies in the consumption of *A. muscaria* in Siberian cultures, a connection that may explain other parallels between the *Bur&amacr;q* and *A. muscaria*.

Europe

Shamanistic practices using *A. muscaria* existed across ancient Europe (Rätsch, 2005), but these entheogenic rituals were generally lost, repressed, or hidden in esoteric cults long before the emergence of Christianity and the formation of modern Europe, making the evidence of their importance easy to overlook. Nonetheless, evidence for ritual practices using mushrooms are attested to numerous artifacts, especially in folklore, mythology, and early mystery religions of the region. These involved both *Amanita* and *Psilocybe* species, as well as other plant combinations.

Fungiform representations of ancient Europe

The oldest reported mushroom petroglyphs of Europe yet discovered are those found in the Selva Pascuala mural of rock art at Villar del Humo, a post-Paleolithic rock art site in Cuenca, Spain. Akers, Ruiz, Piper, and Ruck (2011) present evidence that these figures reflect the ritual use of *Psilocybe* in Europe as long as 8000 BP. The representations present fungiform figures that depict both the key features of *Psilocybe hispanica* - specific aspects of variation within the species, such as the straight to sinuous stalks, and convex to bluntly subconical caps that characterize the typical morphological variation observed in this species.

The shamanic interpretation of these fungal representations is substantiated by several additional facts. One is their depiction on a panel with a bull, a highly significant association given the proclivity for many *Psilocybe* species to grow in the dung of bovines. The shamanic interpretation of these depictions at Selva Pascuala is also supported by the austere location of this rock art, which was not a habitation site, but because of its isolation, suggests that it served a special ritual purpose.

Although these *Psilocybe* traditions, like those of *A. muscaria*, were largely lost in European antiquity, they are attested to the artifacts, mythology, and folklore of the cultures of region. The fungiform heads on petroglyphs in the western regions of Europe (Molodin & Cheremisin, 1999) indicate such activities were still carried out during the Bronze Age, when such practices were apparently still widespread. Kaplan (1975) analyzed Bronze Age metallurgy and petroglyphs of Scandinavia to argue that the fungiform metal works are in fact representation of mushrooms used for ritual purposes. These mushrooms constituted symbols of a religious tradition of ancient ritual consumption of psychedelic mushrooms. However, many of these representations are highly stylized and leave unanswered questions regarding the ritual context of their use.

Greek entheogenic roots

There was a continuation of many earlier cults of *A. muscaria* within Greek culture, including Dionysus (Ruck, 2014). Their origins lie further in the past, derived from ancient Egyptian religions that were conveyed throughout Western Eurasia and northern Africa by a Hellenic inspired diffusion of the mysteries of Isis and Osiris throughout the Roman European empire (Ruck *et al*., 2001). Wasson, Hoffman, and Ruck (1978) identified *A. muscaria* as the sacramental offering to Apollo, an ancient entheogen of Greek culture that was later substituted with other psychoactive substances. Although *A. muscaria* was also associated with the Goddesses Demeter and Persephone of the Eleusinian mysteries, the identity of this ancient sacrament of the Greek mystery schools proposed by Wasson *et al*. (1978) in *The Road to Eleusis* was the LSD-like fungus ergot that grows on rye. The use of *A. muscaria* within the rituals of Dionysius and Apollo was secret and they were publicly portrayed as dangerous or ancient pagan practices to facilitate their cover-up. Even the manifestations in the ancient Greek-Roman world were subjected to official condemnation, imprisonment, and even death to those who practiced these entheogenic rites (Ruck, 2014).

A Classical Greek marble fragment (5th century BC; see Figure 7) is called "The Exaltation of the Flower," based on a mis-identification of the fungiform that is the central element between the heads of two females identified as the Demeter and Kore, also known as Persephone (Ruck, 2006; Samorini, 1998). The stella was found beneath the ruins of a Catholic monastery in Thessaly, Greece, which had been built on top of the shrine to Demeter. While various identities (i.e., opium poppy and flower) have been proposed for the fungiforms on the stella, the mushroom is the most direct resemblance, and certainly the obvious candidate given the nature of the location - a sacred site.

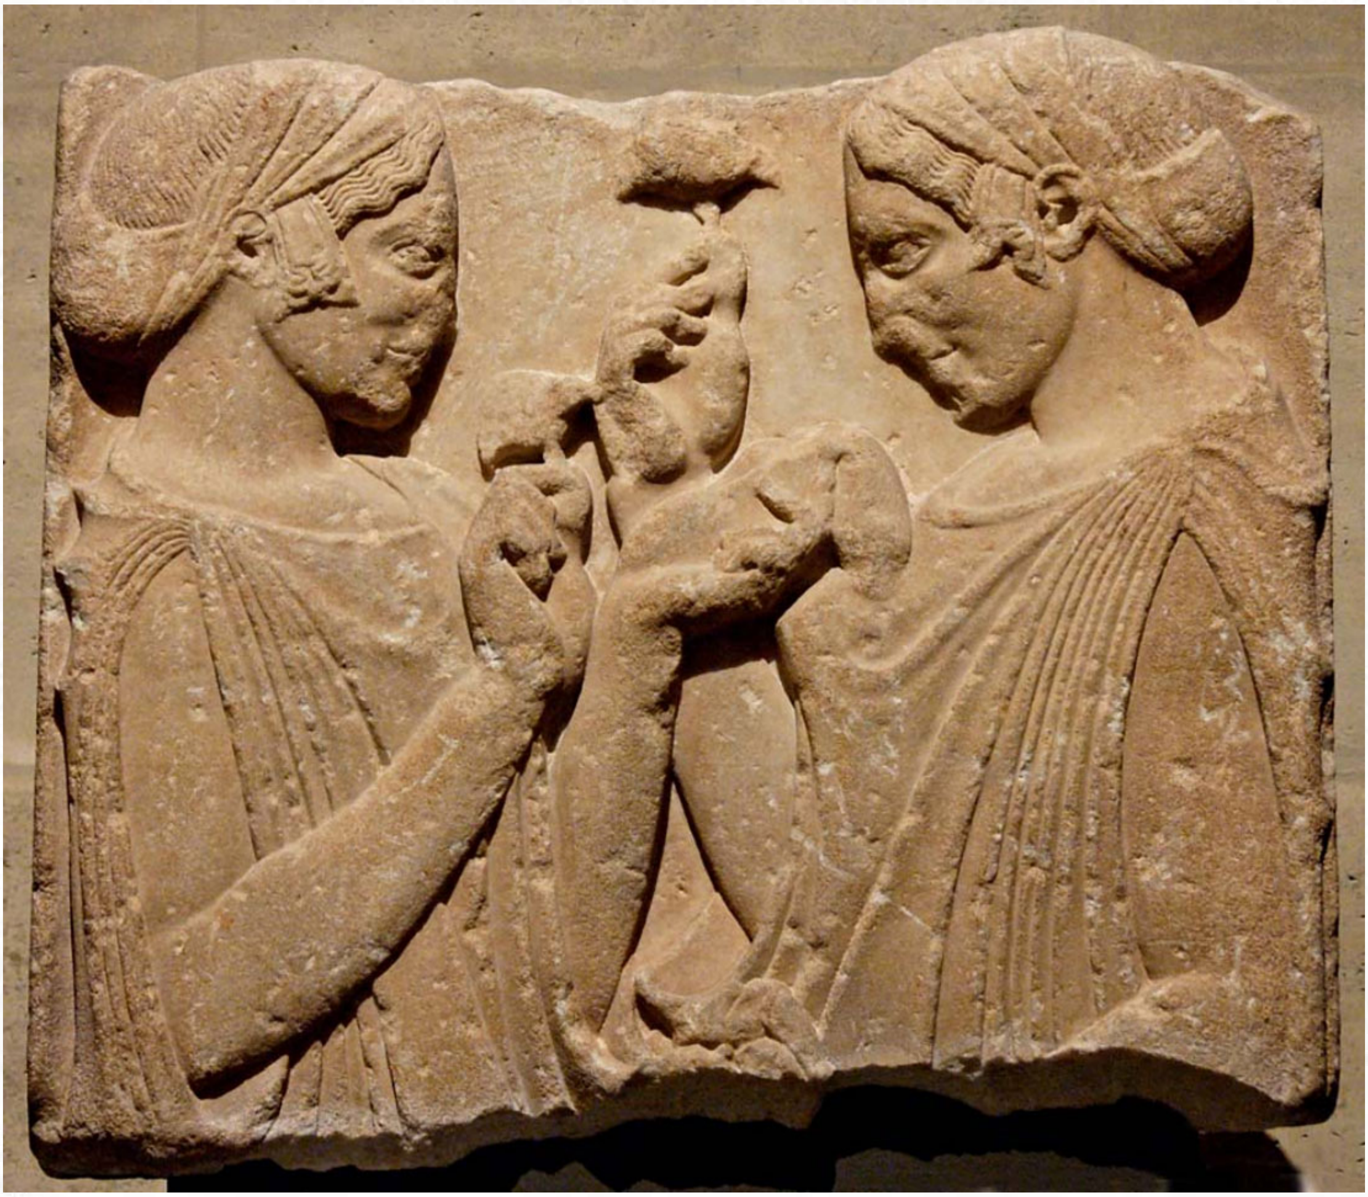

Figure 7. Exaltation of the flower (photo by Lan Nguyen placed in the public domain)

Ruck *et al*. (2001) illustrate the Greek entheogenic past as revealed in the many entheogenic features of the Greek hero Perseus, known as the "mushroom picker," as well as associated mythological figures who have central features that provide symbolic representations of the physical features of *A. muscaria*. Physical characteristics and ecological and mythological aspects of *A. muscaria* use are suggested by the characterizations of deities and sacraments that have central features of the fungi, including: the reddish-orange and white color patterns; the associations with thunderbolts, rain, and bulls; the trees with which the mushroom grows in symbiosis; and the golden-red liquid extracted; as well as the subsequent use of the urine as the sacrament, among others.

Perseus is linked to another figure of Greek mythology, Jason, known for his exploits of acquiring the Golden Fleece and the Golden Apples, which have features directly associated with the characteristics of *Amanita* species. These include Jason's shamanic training, his identity as single-footed, and the meaning of his name (Iason), which (Ruck *et al*., 2001) propose as "drug man." The association of the origins of Perseus (also known as Iamos) with a period of transition from matrilineal Greek culture to the patrilineal Olympian traditions speaks to a key social transition involving the use - and eventual abandonment - of the psychedelic mushrooms, which were seen as a challenge to the Olympian order.

Women's roles in entheogenic traditions

There are deep roots to European female entheogenic traditions, tied to the ancient regime of matriarchy and Aphrodite (Ruck, 2014; Ruck *et al*., 2001). These traditions of priestess and sorceresses involved knowledge of plant use that was also found among the traditions of the European midwives and female herbalists, who used a variety of methods to alter consciousness and heal. The activities of Greco-Roman priestesses of the various mystery religions provide ample evidence of the use of sophisticated pharmacological combinations that permitted the induction of a variety of ecstatic alterations of consciousness (Hillman, 2014; Ruck, 2014). The association of aphrodisiacs with these entheogenic combinations attest to a period in which women themselves, rather than a male hierarchy, controlled their bodies and sexuality. These traditions were the context of the healing practices of Jesus, who famously exorcised the seven demons of Mary Magdalene, whose knowledge of herbal practices identifies her as a priestess of these ancient mystery cults.

These female-based entheogenic practices contributed to the formation of European and Christian practices through the traditions of Mithraism from the Zoroastrian practices of Persia (Hoffman, Ruck, & Staples, 2002). They propose that the Mithraic practices involved the further evolution of these earlier mushroom cults from an ancient Indo-European culture that preceded the separate Hindu and Iranian developments, and constituting the original pan-Eurasian religion. The few descriptions of the Mithraic sacrament allude not only to its mushroom-like qualities (thrusting out of the earth, single-footed), as well as specific *A. muscaria* features (red caps, white jewels, associations with mountains, and the symbiotic tree species).

Ruck *et al*. (2001; Ruck, Hoffman, & González-Celdrán, 2014) propose the Mithraic links as evidence of *A. muscaria* as the Christian Eucharist, arguing for a foundational role of *A. muscaria* in Christians' sacramental body and blood of Christ that are to be eaten and drunk, constituting a real rather than merely symbolic representation of that sacramental flesh and blood. The *A. muscaria* is a "flesh that contains blood" - a reference to the red liquid squeezed from the mushroom flesh when rehydrated. The stem is also a flesh, which with drying, turns a color similar to bread. Other parallels with the Eucharist include its production of a sense of vitality to life and a sense of unity with deity. Ruck *et al*. (2001) extend this analysis to the chalice of the Holy Grail, pointing out that the fully form *A. muscaria* presents as a chalice with its upturned edges forming a cup around the blood red cap.

The incorporation of the entheogenic practices of Mithras into the foundations of Christianity was facilitated by the widespread diffusion of the practices through the Roman Empire, where Mithraic rites were important mechanisms for the foundation of bonds of brotherhood among the soldiers of the Roman army and its political apparatus (Hoffman *et al*., 2002). While the later ascendant Catholic Church viciously persecuted the Mithraic religion, their entheogenic rituals persisted in pagan practices, as well as sects functioning secretly within the Church.

The entheogenic traditions of Europe retreated from public life and the male dominated priesthoods, which had antipathy for the shamanic alterations of consciousness. The last thing that the bishop wants to hear is that there is a new saint in the parish. This patriarchal rejection of the entheogenic traditions left them in the hands of women and their spiritual healing traditions. These ancient mushroom practices also persisted in the popular culture as attested to the survival of this information in diverse areas, such as its widespread association with toads and elves (Morgan, 1995). *A. muscaria* survivals include its highly probable role in historical and contemporary Christmas designs. Parallels with Siberian practices and beliefs suggest that symbolic remnants of these ancient *A. muscaria* traditions are still present in contemporary culture, reflected in representations of the red and white of Santa Claus, his flying reindeer, the associated birch and pine trees, and their hanging colorful gifts derived from practices of hanging the mushrooms to dry on these symbiont trees.

Religious use of A. muscaria in Christianity

There is a growing body of literary material recently reinterpreted in light of the entheogenic perspectives that present evidence for widespread entheogenic mushrooms cults across Europe, and even in the formation of Christianity. Evidence for the continuation of shamanistic *A. muscaria* practices in ancient Europe is found in a wide range of mythological and religious phenomena and artifacts (Rätsch, 2005).

The possibility of a broader European role of *A. muscaria* practices beyond its shamanic roots was boldly proposed by Allegro (1970), who in his book, *The Sacred Mushroom and the Cross*, attributed the origins of Christianity to an *A. muscaria* cult. The sacramental body of Christ is the mushroom, with the extracted red juice the blood that is also the sacrament. Allegro presented linguistic evidence that suggested not only Christianity, but also Judaism and Islam had ancient roots involving ritual worship of *A. muscaria*.

Although Allegro had fame as an expert on the Dead Sea Scrolls, his hypothesis received little serious attention, but rather was summarily dismissed in what has been alleged to have been a deceitful and repressive cover-up by Gordon Wasson (see Irvin, 2008; also see Brown & Brown, 2016 and their article below). Wasson's rejection of *The Sacred Mushroom & the Cross* was not on the basis of an objective evaluation of the evidence. Rather than engaging Allegro's information and arguments on the origins of Christianity in mushroom cults, Wasson summarily dismissed Allegro's ideas and subjected Allegro's work to ridicule through intellectually questionable behavior (Irvin, 2008). By reference to private correspondence, Irvin reveals that Wasson's dismissal of Allegro's work was not because he read it - Wasson apparently confided to others that he did not even read Allegro's book. Instead Wasson took the opinions of a rabbi and a priest and dissuaded further research in this area.

But as we will see below, there is strong evidence for entheogenic cults using psychedelic mushrooms within Christianity. Evidence supporting Allegro's hypothesis of the ancient entheogenic roots of Christianity is found in the repeated appearance of mushroom representations in later Christian art, some with the typical characteristics of *A. muscaria*, and other depictions resembling local psychedelic species of the *Psilocybe* and *Stropharia* genera (see Brown & Brown, 2016; Hoffman *et al*., 2002; Ruck, 2017, 2011; Ruck *et al*., 2001). Allegro (2008) received post-humus support in a rerelease of his book with additional evidence provided by Carl Ruck (also see Brown and Brown's article here).

Psychedelic mushrooms in Catholic art and architecture

Although many aspects of entheogenic knowledge disappeared from European cultures, this ritual knowledge and messages regarding entheogenic mushrooms remained blatantly displayed - for the initiate - in Christian artifacts, from architectural features such as fungiform door frames to elaborate commissioned art works with mushrooms conspicuously displayed in key areas - such as above the hand of saints. Evidence that such practices persisted through direct transmission is found in the Anthonite healing order and esoteric Christian groups such as the Albigensians and Cathars, and many paintings of Saint Hildegard of Bingen (see Keizer, 2012).

The involvement of *A. muscaria* in the secret rituals of Catholics is indicated by it being well-represented in works of Hildegard of Bingen (1098-1179), a Catholic saint who was also a German Benedictine abbess and an accomplished philosopher, writer, and mystic (Keizer, 2012). The Isenhein altarpiece produced by Matthias Grünewald contains representations of mushrooms, one significantly in the background of outstretched hands of Saint Anthony. The location of the painting within the Abbott of the Anthonites, the followers of St. Anthony (patron of mushroom hunters) who founded a Christian healing order, reflects their secret knowledge and use of *A. muscaria*. Ruck *et al*. (2001) note the repetitive allusions to the *A. muscaria* in many significant aspects of the artistic composition. Mushroom caps and stipes subtly surround angels and an *A. muscaria* mushroom is depicted in the background as if floating in St. Anthony's outstretched hand and pointed finger. Depictions of a raven with the "raven's bread" (*A. muscaria*) and the stag (the urine of which provides an enhanced psychoactive preparation) present a scene rich with symbolic references to these ancient entheogenic traditions of Eurasia, as well as the hidden traditions of Christianity.

The psychedelic gospels: The secret history of hallucinogens in Christianity

In the article "*Entheogens in Christian Art: Wasson, Allegro and the Psychedelic Gospels*," Jerry Brown and Julie Brown provide an in-depth analysis of the presence of entheogenic mushroom images in early and medieval Christian art. They begin with a review of the controversy between avocational ethnomycologist R. Gordon Wasson and philologist John Marco Allegro regarding the presence of psychoactive mushrooms in Christianity particularly the identification of a figure in the 12th century Chapel of Plaincourault in France as a representation of an *A. muscaria* mushroom. This seminal debate about the role of entheogens in Christianity was then decided in Wasson's favor, who discounted the Amanita interpretation by reference to an opinion of an art historian, who characterized it as a stylized pine tree in private correspondence with Wasson. However, Browns show that in other correspondence, which Wasson did not share, the same authority questioned such identification.

The Browns present a summary of central findings of their book "*The psychedelic gospels: The secret history of hallucinogens in Christianity*," which presents widespread evidence of entheogens in Christian art found in abbeys, churches, chapels, and cathedrals across Europe and the Middle East. This includes a detailed examination of the evidence for the identification of the Chapel of Plaincourault figure as an *A. muscaria* mushroom, as well as other features of the fresco that identify entheogenic themes. Their fieldwork across Europe and the Middle East provides abundant iconographic evidence of other entheogenic species represented in Christian art, in particular *Psilocybe* species. They show that time and again, the representations of biblical events have clear depictions of mushrooms that resemble psilocybin-containing species, and that the oversized and central placement of these objects indicate that they are central to the messages of these representations. Their paper provides a review and critique of the various positions taken in the debate regarding the presence of entheogenic mushrooms in Christian art, and asks why Wasson, arguably the leading world figure of the epoch advocating for entheogenic interpretations of the religious past, rejected, until the end of his life, such interpretations of Christian artifacts. The silence of the Catholic Church and art authorities remains a puzzle, unless one endorses a theory of a conspiracy of silence to suppress the entheogenic past of Christianity. Browns call for the establishment of an Interdisciplinary Committee on the Psychedelic Gospels, housed by an academic institution, to examine the evidence for entheogenic mushrooms in Christian art and provide a more satisfactory resolution to what may be the most important knowledge about the origins of this religion.

Brown and Brown's assessment of The Plaincouralt Fresco and its undeniable representation of *A. muscaria* places it as a representation of the Tree of Good and Evil of the Garden of Eden. This situates the *A. muscaria* sacrament as complex phenomena, simultaneously the forbidden fruit, as well as the means by which humans acquired morality in the knowledge of the difference between good and evil. An entheogen that provides forbidden knowledge also gave the consciousness necessary for morality, as well as Adam and Eve's self-consciousness of their own nakedness.

Whether or not the secret sacrament of early Christianity was originally *A. muscaria*, ergot wheat drinks, or other entheogenic admixtures, the certainty is that *A. muscaria* practices persisted among esoteric cults, mystery schools, and the Gnostic sects hidden within members of the Catholic Church. *A. muscaria* traditions also persisted within esoteric societies such as Freemasonry, which incorporated earlier influences of the Knights Templar and other groups (Hoffman *et al.*, 2002). The presence of *A. muscaria* practices was obscured by the official Church's efforts to stamp them out and by many cult's efforts to hide evidence of use to protect the secrecy of the continuing ritual practices. This leaves questions regarding whether Wasson's opposition to Allegro's ideas was a continuation of the historical repression of entheogenic traditions within Christianity.

The witches' flying ointments

The survivals of these actual entheogenic-inspired ritual practices also continued well into the second millennium in Europe, occasionally revealed in the practices of those accused of witchcraft, pagan rituals, and various secret societies. Their associations with females are well-noted in the history of the European witchcraft trials, where these female traditions are alleged to use a wide range of powerful psychoactive substances.

In an article "*Those Goddamn Ointments: Four Histories*," Tom Hatsis documents and analyzes these aspects of entheogenic history of Western Europe that survived into the Renaissance and early modern eras in beliefs regarding "flying ointments." In contrast to the postmodern academic skepticism regarding the actual reality of such ointments, which may attribute such beliefs to the fabrications of fearful religious minds, Hatsis shows us that there is more probably a factual basis for them, albeit in dramatically altered form. While it is true that both theologians' misconstruals and popular fears have fueled many beliefs, such as murdered children and cannibalistic spirit familiars, these constitute an early modern radical reconceptualization of what were prior practices and beliefs. Hatsis similarly contends that the 1970s popularization of the concept of "flying ointments" by anthropologist Michael Harner (1973) is also a fabrication of that era. Nonetheless, these mistaken construals and fabrications have a likely historical basis in the medieval beliefs regarding what he calls transvection ointments, referring to their alleged ability to make the person fly in some form, or to travel in spirit. Hatsis reviews the evidence that something like this historically documented ointment derived from medieval folk traditions was the basis from which a variety of otherwise inaccurate modern and post-modern beliefs derived. Although the exact composition of such ointments will likely forever remain a mystery, Hatsis concludes "there is every reason to believe that the ointments contained psychoactives," including the various mandrake species of the genus *Mandragora*, which share the hallucinogen and hypnotic properties derived from their tropane alkaloids. Hatsis proposes that other hallucinogens likely included in these transvection ointments are henbane (*Hyoscyamus niger*) and belladonna (*Atropa belladonna*), both with worldwide fame as magical potions. The inclusion of such powerful consciousness-altering agents in these classic ointments speaks to a shamanic past of these practices, where powerful botanically induced alterations of consciousness were part of ritual healing practices.

Although the exact composition of the witches' brews may remain forever unknown, Rätsch (2005) proposes that there is good evidence that a variety of psychotropic plants were used, including *Valeriana officinalis*, *Mandragora officinarum*, *Hyoscyamus niger*, *Papaver* spp., *Atropa belladonna*, *Datura* spp., and many others. The use of these powerful psychoactive plants to induce stupor, paralysis, and death-like states was the basis of the extraordinary experiences reported of flying and strange worlds found in many traditions of Europe.

Sacred mushrooms in the Americas

Ironically, as the Renaissance and Enlightenment finished off the last vestiges of entheogenic spirituality in Europe, it began to bring the same perspectives back into European society through colonial encounters with the foreign other that brought knowledge of shamanism, *A. muscaria* use, and entheogenic practices into Europe from Siberia and the Americas. The *A. muscaria* traditions of Eurasia were likely already part of the shamanic cultures of the populations that migrated to the Americas 15,000 years ago or more. Although reports of *A. muscaria* traditions are rare in Native American traditions recorded from early contact and ethnographic periods in North America, there is clear evidence of mycolatry in the ethnographic record and mythology. There are also clear representations in the archeological record of Mesoamerica and South America of artifacts representing *A. muscaria*. Representations of various *Psilocybe* species are also found widely across Mesoamerica and South America. Borhegyi (2010) shows numerous examples of mushrooms in art and artifacts from across central Mexico and Peru, establishing both the antiquity and widespread distribution of an ancient pre-Columbian mushroom cult.

North America

Evidence for indigenous North American use of *A. muscaria* is reported by several sources (Navet, 1988; Peschel, 1978; Wasson, 1979). Wasson sought and found evidence of contemporary North American *A. muscaria* ritual among the Ojibway in the writings of Peschel Keewaydinoquay, a woman who was a custodian of her culture's indigenous spiritual traditions. Navet (1988) provides a summary of ethnohistorical sources of information regarding the use of *A. muscaria* and its role in the origin myth of the Ojibway, where a red and white mushroom buzzes with strange sounds and songs. When Little Brother consumes the biggest of the mushrooms, he is transformed into a mushroom himself. The Big Brother uses drumming, tobacco, and eagle feathers in a ritual that the shamans had recommended. This enabled Big Brother to escape with the little Brother mushroom and transform him back into a human. But something had changed: "*Little Brother woke up smiling every morning, the heart happy and a song on his lips*" (Navet, 1988, p. 169). Curiously, he cures and resolves misfortunes with the waters that flowed out of his penis, a clear parallel to the Siberian practices of consuming the even more potent urine from one who consumes *A. muscaria*. Little Brother begins to perform healing rituals based on the powers acquired from the supernatural experience in the land of the mushrooms, providing a mythological verification of a general entheogenic hypothesis of the origin of shamanic-healing practices in the experiences produced by psychedelic mushrooms.

Mesoamerica and Central America

The prominent mushroom depictions in stone sculptures and ceramics provides clear evidence that psychedelic rituals were central features of ancient Pre-Hispanic American cultures from Mesoamerica down into South America (Torres, 1996, 2006; Torres & Repke, 2006; Velandia, Galindo, & Mateus, 2008). The most ancient evidence of sacred mushroom rituals in the Americas may be the representations of *A. muscaria* among the Mayas and Náhuatl in México, represented in ceramics from Mesoamerica and Peru and in stone objects found in Nayarit, Mexico. The Aztec's entheogenic mushroom ceremonies involving the consumption of the sacrament teonanácatl or "God's flesh" were documented by the Spanish chroniclers. *Psilocybe* species are the predominant candidates and likely involved several species. Guzmán (2008, 2016) reviews archeological and botanical evidence that various species of these psilocybin-containing mushrooms were used in sacred rituals in prehistoric México, Mesoamérica, and South America. Borhegyi and Borhegyi-Forrest (2015) analyzed the visual data in Justin Kerr's compilation photographs of ancient Mesoamerican art that illustrate realistic, conventional, and abstract depictions of *A. muscaria*, as well as species with characteristics representative of several *Psilocybe* species (and possibly *Panaeolus* species).

The ritual use of entheogenic mushrooms was especially widespread in Mesoamerica and continued into the modern era with more than two dozen psilocybin-containing species used for religious ceremonies in Mexico (Guzmán, 2016; Wasson, 1980). Among the most well-known archeological evidence of fungiforms are the "mushroom stones" discovered during archeological excavations in sites in Guatemala, which Borhegyi examined in the collections of the Guatemalan National Museum. Borhegyi (1961, 1962) proposed that these stones were evidence of an ancient cult of mycolatry. The stone effigies carved in the shape of mushrooms that were found in Guatemala establish a high level of organized religious mycolatry in Mesoamerica as early as 600 BCE. But while both Borhegyi and Wasson proposed that the identity of the mushroom stones was *A. muscaria*, Guzmán (2012) proposed the identity of these "mushroom stones" as *Psilocybe zapotecorum*, based on their robust form and the common appearance of the species in the region.

María Sabina: An ethnographic analogy for ancient Mesoamerican mycolatry

The Western encounters with the indigenous use of psilocybin mushrooms by Mesoamerican cultures was reported from the cultural distance of the Spanish invaders, whose accounts related by Catholic priests were severely distorted by their ideological views of these practices as involving witchcraft. The violent oppression of these practices led to their virtual extinction in most of Mexico. The surviving practices came to the attention of Western scholars in the early 20th century when anthropologists and ethnobotanists reported their ritual use in Oaxaca Mexico. These investigations among the Mazatec and subsequent publications by Gordon Wasson (Wasson, 1980; Wasson, Cowan, & Rhodes, 1974) brought international attention to María Sabina, a Mazatec *sabia*, meaning wise woman. This Mazatec healer and her ritual use of psychedelic mushrooms (*Psilocybe caerulescens* Murrill and *Psilocybe mexicana* Heim) and others provides an ethnographic analogy for understanding these ancient traditions (see Estrada, 1977; Munn, 1973). In addition to the mushrooms, María Sabina and other Mazatec healers use other psychoactive plants including *Salvia divinorum* and local tobacco (*Nicotiana rustica* L., *Solanaceae*). These practices (summarized from Schultes & Winkelman, 1995) provide an ethnographic analogy for understanding the nature of the prehistoric practices.

While María Sabina's practices had obvious Christian influences in her invocations of Jesus, Mary, and Christian saints, her healing activities manifest indigenous traits that are a window to the ancient pre-Columbian Mesoamerican use of psychedelic mushrooms in healing rites. María Sabina's training and healing practices reflect the classic features of shamanism found cross-culturally (Winkelman, 1990, 1992). Features of her life and practices involving shamanistic elements are the processes of selection for the vocation, the interactions with mushroom beings or spirits, the experiences of training, the ritual therapeutic activities, and the cosmologies regarding the causes of illness.

María Sabina's grandparents were also "wise ones," her paternal and maternal grandparents practicing as healers. María Sabina began her formation as a shaman at an early age of 6 years, when she ingested mushrooms out of hunger while with her sister attending the cows in the mountains. The experiences that followed gave María Sabina her calling to use mushrooms for healing. These sacraments that she called "saintly children" nourished her during periods of hunger in the forest and gave both sustenance and spiritual inspiration. As expressed in traditions around the world, she experienced the mushrooms speaking to her, manifesting in visions and voices that encouraged her, offered her advice on how to address problems, and eventually gave her the gifts to heal.

This entheogenic origin of her powers, personal development, and healing practices, experienced as direct interaction with the spirit within the mushrooms, is a feature of shamanic experiences that is reported worldwide. The ingestion of the mushrooms provides the spiritual contact and experiences of the training for use of the sacred mushrooms, engaging them as agents that provide wisdom and healing powers. This animistic quality of the experience is exemplified in her personifications of the mushrooms as "saintly children," "little women," "little nuns," "children that sprout," and Christian personages, especially the Virgin Mary and Jesus Christ (Allen, 1997; Estrada, 1977; Wasson *et al*., 1974).

María Sabina felt that she was born to be a healer, a preordained potential that unfolded as the mushrooms gave her the wisdom necessary for performing the rituals to heal and other powers. These plants were experienced as sentient beings that communicated with her internally in extensive engagements experienced as "language of the mushrooms." These communications from the mushrooms taught the traditions of the wise ones, guiding her professional practice and providing the information needed to diagnose illness and heal. The techniques for using the mushroom are not something the healers learn beforehand, but rather acquire this knowledge directly from the mushrooms when their force acts through the healer's body. The mushrooms speak directly to and through the person, stating the origins of illness and the ritual processes necessary for healing. The healing process is advised by the healer's and patients' visions that reveal the origin of the problem.

The formation of a mushroom healer engages process of self-initiation as the neophyte directly experiences the spirits of the mushrooms in visionary experiences as higher sources of spiritual authority. These entities provided María Sabina access to a Book of Wisdom, spiritual texts that were used to heal with the power derived from the "language of the mushrooms." This power is expressed in the healer's songs that emerge when the mushrooms are consumed and then act through the body of the shaman during the ritual, chanting, singing, speaking, and the directing the healing processes.

The ritual healing is an overnight vigil held in the darkness, generally far from others in a remote house. The ill person is accompanied by their family and other members of the community, and generally remain together overnight. The participants must comply with a number of restrictions, avoiding sexual behavior and alcohol consumption for 4 days before and after the ceremony and fasting from breakfast on the day of the ritual.

The use of mushrooms is necessary for the healer, and may also be ingested by the patients if the healer decides it is necessary. The mushrooms are normally eaten raw, often accompanied by a cup of cacao. The power of the healing ceremony is also produced by the healer's singing and chanting, combined with whistling, humming, and ventriloquistic effects. The healer dances and chants during much of the night, often breaking into words that convey the healing powers of the mushrooms. Munn (1973) characterized the sacred language of the mushrooms as a "poetic art" of words and sounds that are used as tools to elicit emotions and catharsis. María Sabina's diverse use of sounds, not only in singing and chanting, but other monotone rhythmic utterances, also functions as procedures for altering consciousness. The healing done with the mushrooms involves such traditional shamanistic practices as addressing the loss of the soul or spirit of the person, resolving spirit afflictions, providing exorcisms, and removing hexes by sorcerers and witches. The *veladas* were also used for a physical illness and to resolve disputes. The healer may address the actions of evil spirits, block hexes, or the consequence being enchanted by evil spirits or sorcerers. The healing *veladas* are normally held to seek a remedy to a persistent health problem, but may be used for acquiring solutions to other problems. The *velada* is typically focused on the cure illness or to determine the possibility of recovery from some disease and the treatments necessary. The mushrooms are also used in divination to locate lost animals and discover the situation of distant family members.

Costa Rica's entheogenic prehistory

In their article "*Ritual consumption of psychedelic fungi and plants in ancestral Costa Rica*," José Manuel Rodríguez Arce and Marco Antonio Arce Cerdas examine artifacts that document the use of psychedelics in pre-Columbian societies that inhabited the current Costa Rican territory. They examine the cultural and social significance of this activity through integration of historical, ethnographic, archeological, and paleobotanical findings. Psychoactive plants of the region included tobacco (*Nicotiana* spp.), cacao (*Theobroma cacao*), morning glory (*Turbina corymbosa*, *Ipomoea tricolor*, and *I. carnata*), fly agaric (*A. muscaria*), cohoba (*Anadenanthera peregrina*), and various psilocybin mushroom species (e.g., *Psilocybe aztecorum* and *P. caerulescens*). The 46 artifacts from the Museums of the Central Bank of Costa Rica and the National Museum of Costa Rica reveal the centrality of supernatural ritual practice linked to psychedelics. These aspects of the archeological record together with other data permit a nuanced examination of their use of psychoactive substances. Ethnographic analogies suggest these substances were instruments to attain esoteric knowledge that was central to healing practices and a source of social power. Archeological evidence that psychedelic drug use was most frequent in the record during the period from 300 BCE to 300 CE suggest that psychedelics and their effects were instrumental in the emergence of sociopolitical formations in ancient Costa Rica. This significance is attested to by the placement of a mushroom-shaped ceramic statue in an elite burial along with sumptuary symbolic objects (carved jade effigies), along with snuff inhalers (rather than pipes). These inhalers appear to have been employed as insignia of political and ceremonial rank, as attested by the presence of worn down orifices for suspending them as pendants. Access to entheogenic ritual knowledge was part of the source of power of high-ranking leaders and may have played a role decision-making and coordination of tasks during a period of sociopolitical complexification.

South America

Evidence of ancient sacred mushroom practices in Peru is found in iconographic depictions that document the ritual use of sacred mushrooms on stones, ceramic vessels, and in metal work. Trutmann (2012) presents photographs from diverse sources that show these mushrooms representations in Moche ceramic artifacts (dated between 100 BCE and 800 AD) that have realistic representations of *Psilocybe* species and *A. muscaria*. Trutmann (2012) reviews archeological evidence of sacred mushroom use in prehistoric Peru in the Cupisnique, Paracas, Moche, Chimú and Pukará cultures, as well as the mushroom stones of Chucuito (see Figures 8 and 9 for photographs). Trutmann presents these various stone mushrooms as evidence of their ancient ritual use among a number of areas in coastal and highland Peru dating from as early as 1200 BCE. These mycolatry practices continued until the European conquest, as evidenced in documents from the end of the 17th century. Schultes (1966) summarized evidence that the Yurimagua culture of the Peruvian Amazon employed an inebriating beverage based on a tree fungus that was likely *Psilocybe yungensis*, which was also used ritually in Bolivia and southern Mexico.

These mushroom representations provide evidence of not only the use of various *Psilocybe* species, but also the famous *A. muscaria* mushroom, easily recognized because of its red and white coloration. This later species, represented in ancient ceramics but not documented in contemporary ethnobotany of Peru, suggests that long distance trade in these sacred items and the ancient Peruvian practice of borrowing of sacred plants from other cultural traditions. Analyses of artistic representations by Velandia *et al*. (2008) illustrate some of the frequent motifs of South America iconography in relationship to fungiforms and conventional representations of mushrooms, making the argument that abstract mushroom representations are far more widespread than apparent.

In his article "*The Use of Psychoactive Plants and Fungi by Ancient Indigenous Populations of the North Andes*," Manuel Torres presents evidence of the widespread ceremonial use of entheogenic plants in the ancient cultures of South America. He reviews evidence that the use of entheogenic plants permeated these cultures as a core feature of shamanic religious practices. The importance of these entheogenic substances was expressed in a complex iconographic systems revealed in a variety of media, most of which survived in stone sculptures and gold work. These include the San Pedro cactus.

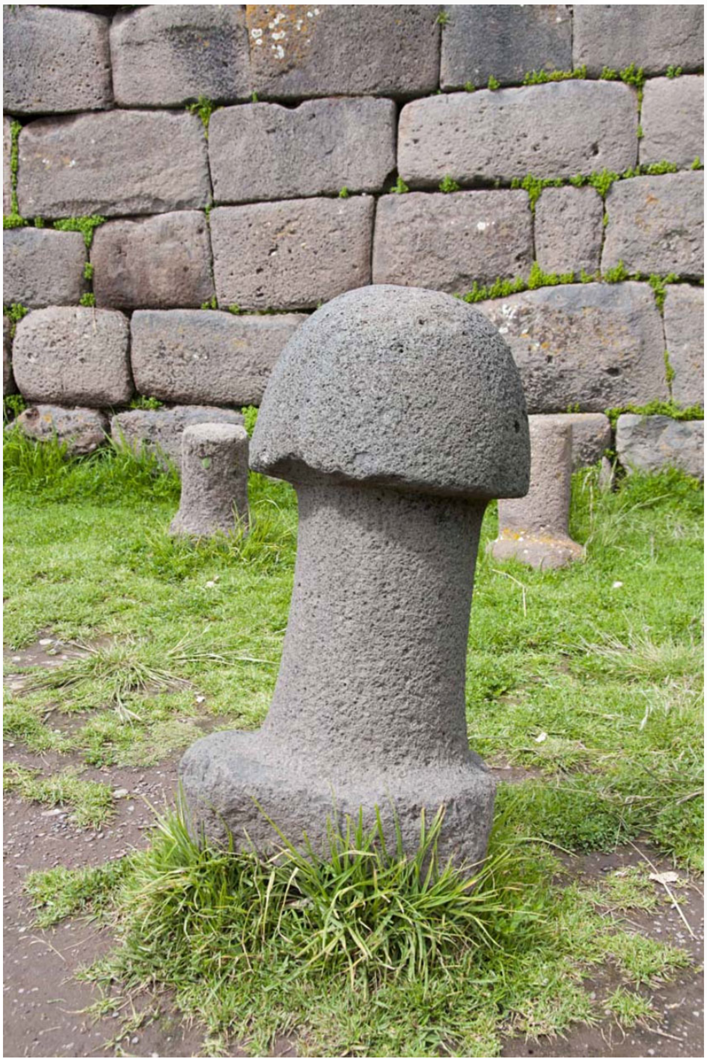

Figure 9. A mushroom-shaped stone from Chucuito, Peru (photo credit: Peter Trutmann; used with permission)

Echinopsis sp. (synonym: *Trichocereus* sp.) and psychoactive snuffs from *Anadenanthera colubrinai* practices are still attested to in South American cultures today. The fungiform representations in the Darién pendants have been identified as psychedelic mushrooms by several authorities, consistent with the entheogenic themes found in burial artifacts. Torres provides iconographic analyses of ceremonial paraphernalia to show how they reveal the central role of entheogens in the religious practices of the ancient cultures of this region.

However, with rare exceptions outside of Mesoamerica, these entheogenic mushroom rituals were not reported in the historical or near-contemporary ethnographic documents produced by the Western world. The exact nature of these ancient entheogenic practices was lost due a variety of factors, perhaps the most important of these being the extremely destructive influences of the prohibition of consumption and teaching about these substances issued by Catholic Inquisition. This repression upon threat of punishment with death by torture that persisted well into the colonial period in the Americas assured the loss of the knowledge regarding these practices during the subsequent formation of mestizo cultures through acculturation. Furthermore, this repression contributed to the production of mycophobic attitudes in the mestizo cultures, further contributing to extinction of knowledge regarding entheogenic ritual practices. Even today "Christian" people of indigenous cultures may set out to kill their more "primitive" neighbors who harbor and engage in these ancient shamanic practices.

Conclusions: The Modern Loss And Eternal Return Of Entheogenic Spirituality

Interdisciplinary evidence regarding the entheogenic use of mushrooms provides perspectives for interpreting findings from investigations by archeologists and ethnobotanists. What this entheomycological research has revealed is that religious activities focused on the entheogenic use of psychedelic mushrooms were present in all of the major geographical regions of the world. These widespread practices indicate that use of entheogenic mushrooms is a universal religious heritage of humanity. This simple fact should lead to unequivocal support for an entheogenic paradigm, specifically mycolatry, when iconographic evidence of fungiforms is found in the archeological record. Arguments for culinary or other ethnobotanical representations should be required to provide extraordinarily robust evidence to counter what is arguably a virtual universal of human cultures - evidence of beliefs and practices related to the entheogenic use of psychoactive mushrooms.

The continuity of these entheogenic mushroom traditions from prehistoric shamanic traditions into historical cultures is attested to the articles in this special issue. The entheogenic encounters that inspired the evolution of shamanism continued in the practices of historical and contemporary religions - Hinduism, Buddhism, Jainism, Judaism, Islam, Christianity, and others. While the coverage provided in this introduction and the following articles is not a comprehensive review of this evidence, it points to the widespread evidence of psychedelic mushrooms and other entheogens in the early formation of the major world religions. The shamanic impulse that gave rise to worldwide entheogenic practices was, however, more hidden in these traditions of complex societies, where the knowledge regarding use of these substances was now an exclusive practice of a priestly class. This hiding of secret knowledge regarding entheogenic use contributed to the general loss of knowledge about mushroom-induced transformations of consciousness that give rise to religious traditions.

Entheogens, especially mushrooms of the *Amanita* and *Psilocybe* genera, have inspired countless spiritual encounters and traditions in the past. But are entheogenic-inspired religions just a phenomena of the remote past, a relic of a previous era and human mentality when humans were more susceptible to the chemically inspired entheogenic encounters? Or are these entheogenic potentials still part of the modern ecopsychology of humanity. Our final article here gives an emphatic "Yes!"

A modern entheogenic-origin religion: Mormonism

In the article "*The Entheogenic Origins of Mormonism*," Robert Beckstead and his co-authors Bryce Blankenagel, Cody Noconi, and Michael Winkelman present evidence regarding the entheogenic origins of the Church of Latter Day Saints, known as Mormonism. This modern worldwide religion has its roots in the early 19th century American Midwest with Joseph Smith Jr., the founder who rapidly gathered thousands of recruits to Mormonism with the compelling power of visionary experiences. The authors argue that this was due to the convincing power of entheogenic-induced experiences. The family of Smith shows evidence of a history of entheogenic knowledge that produced his revelatory experiences and that entheogens were incorporated into the early Mormon Church in sacraments, anointing, and temple rituals. The 19th century historical data related to the rise of Mormonism and events in Joseph Smith's life and the experiences of early Mormon converts suggest the ritual use of entheogenic material was explored, systematized, and modified by Joseph Smith Jr. in the founding period of Mormonism. The unusual features of visionary and spiritual experiences reported during early periods of Mormonism mimic the anti-cholinergic syndrome produced by *Datura stramonium*. The neurophysiological and phenomenological effects of various entheogenic plants explain the unusual symptomatology reported in newspapers of the time, as well as ego dissolution, visionary experiences, and mood-enhancing sequelae experienced by Mormons. Mormonism is a very important example of entheogen-inspired religions, showing that they are not just a thing of our ancient past, but also part of recent history. Mormonism shows the power of a few early entheogenic experiences to inspire the formation of a religious organization that can persist long after its founders and their entheogenic stimuli have faded from the scene.

Entheogens as a universal religious heritage

Our various contributions here on the entheogenic elements of religions of the past - and their descendants in the present - provide ample data for assertions about a common worldwide basis of religious experiences in psychedelics and their influences in the formation of humanity's religions. The roots of entheogenic religions in shamanistic practices are not just a relic of the past, but also a part of the present, as exemplified in the many contemporary ayahuasca practices and churches. Perhaps, entheogenic religion is here to stay. It is after all part of our evolution and nature. One can hope that this nascent stage of reemergence will move beyond this into an entheogenic revival, a global movement of spiritual acceptance across traditions that is worthy of the sacred mushrooms' long history.

Shortly before his death, Wasson recanted on his rejection of the Allegro's hypothesis regarding the entheogenic origins of Christianity, proclaiming in his final book, *Persephone*'s *Quest* (Wasson, Kramrisch, Ott, & Ruck, 1986): "*I once said there was no mushroom in the Bible. I was wrong. It plays a hidden role (that is, hidden from us until now) and a major one, in what is the best-known episode of the Old Testament, the Garden of Eden story and what happened to Adam and Eve.... I hold that the fruit of the Tree of Knowledge of Good and Evil was Soma... was the Amanita muscaria.*"

As proclaimed in the subtitle of the book - *Entheogens and the Origins of Religion* - the primordial origins of religious thought and experience are found in the neurophenomenology of psychedelic mushrooms and other entheogenic plants. Unfortunately, Wasson did not support Allegro's hypothesis in that crucial time when he could have changed the course of entheogenic and Christian studies.

"*Jesus said to them: Amen, amen I say unto you: Except you eat the flesh of the Son of man, and drink his blood, you shall not have life in you.*"

If this refers to *A. muscaria* and psilocybin-containing mushroom species, the real Christian Pentecost may still await humanity. Spiritual experiences of many religious traditions apparently originated in the effects of *A. muscaria* and *Psilocybe* species. Our religions - Judaism, Buddhism, Hinduism, Christianity, Islam, and others, including Mormonism - have ancient roots in entheogenic experiences produced by these fungi, as well as numerous sacred plants. Humanity can recover their true spiritual roots through the ritual engagement with these sacraments. And if we do so we will become better people from the experiences. That is another paper, but the evidence is there that these substances make us more egoless, other-oriented, altruistic, compassionate, open, tolerant, friendly, and less fearful, anxious, depressed, etc. - effects that undoubtedly benefited us in the past and can do so in the future.

Mushroom-Trees in Christian Art

by

Giorgio Samorini

Eleusis, n.s., 1:87-108, 1998

Summary: In this article, various examples of the so-called "mushroom-trees" to be found in early and medieval Christian art works from a number oj churches in Tunisia, central France and other regions of Europe are presented and discussed. The author makes it clear that the works of art presented here are considered from the point of view of the possible esoteric intention of the artists in their inclusion of the mushroom motif This paper, based on the most recent research, reaches two main conclusions. Firstly, the typological differentiation among the "mushroom-trees" of these works would appear due to a natural variation among psychoactive mushrooms. Secondly, on the basis of analysis of the works in question, a call is made for a serious and unprejudiced ethnomycological study of early Christian culture.

In an article published in the previous issue of this magazine, I presented a discussion of the mushroom-tree in the famous frescos of the Romanesque chapel of Plaincourault in the province of Indre in central France (SAMORINI 1997).

During a visit in May 1997, I was able to examine the frescos of the chapel (and also note their state of deterioration). Here, we find the scene of the Temptation with its mushroom-tree - painted by the Knights of the Order of Malta on their return from the Crusades.

By way of summary of my earlier article, I observed that the Plaincourault mushroom-tree is to be found in the scene of the Temptation from the book of Genesis. It appears between Adam and Eve, with a serpent coiled around it - in its mouth the fruit it offers to Eve.

According to the historian of Christian art, Erwin Panofsky (cf. WASSON 1969: 179-180) this type of tree - which resembles a mushroom and which, for this reason, is termed *Pilzbaum* ("mushroom-tree") in German - is widespread (above all, in Romanesque and early Gothic) Christian art. It has been considered the schematic representation of a conifer (the "umbrella pine") and there are hundreds of examples illustrating the gradual transformation from the naturalistic forms of the pine to the more schematic "umbrella-tree", hence to the various forms of mushroom-tree.

Toward the beginning of this century, a French mycologist put forward the hypothesis that the Plaincourault mushroom-tree was a representation of *Amanita muscaria*, the well-known psychoactive mushroom with its white-spotted red cap. If this is the case, the esoteric content of the Temptation would appear evident - i.e. identification between the Tree of Knowledge of Good and Evil and a mushroom capable of producing visionary states and "illumination".

After a hurried visit to the chapel in Plaincourault and, above all, after consulting the art historian Panofsky, R. G. Wasson categorically denied the validity of the interpretation offered by the French mycologist and supported and propagated by his followers. In his essay on Soma (1968: 179-180), Wasson, the father of modern ethnomycology, after citing Panofsky's comment, stated " it would have been better if the mycologists had consulted the art historians".

Closer examination of the facts reveals that, in a footnote in his *Mushrooms, Russia and History*, Wasson had already stated even more forcefully that "The Plaincourault fresco does not represent a mushroom and has no place in a discussion of ethno-mycology. It is a typical stylized Palestinian tree, of the type familiar to students of Byzantine and Romanesque art" (WASSON & WASSON 1957, 1:87).

As I have already noted on a previous occasion (SAMORINI 1997) and as the evidence I present here would suggest, Wasson's conclusion may be considered premature. However, it must be remembered that, according to J. OTT (1997), Wasson was unable to advance research into the Plaincourault "case" on account of his fundamental research and discoveries in Mexico and concerning the Vedic *soma*. Nevertheless, I feel this hardly justifies his hasty dismissal of this idea.

I might add that Wasson's probable "oversight" does not in any way diminish the credibility or stature of the father of modern etnomycology. I stress this point because the direction I have taken in my studies has as its starting point the trail blazed for mycologists by Wasson's critical works.

With the premise that the problem of interpretation of the evidence consists in establishing the intention of these artists to represent the mushroom symbol as part of the esoteric content of their work, we may now consider a detailed description of the evidence.

In the Plaincourault mushroom-tree form (fig. 1), we may note the following details: 1) the semispherical foliage or fronds is similar to the cap of a mushroom and is studded with spots (in this case, whitish on an ochre background); 2) two of lateral ramifications join the frond-cap from below and symmetrically in relation to the main trunk of the tree. These two ramifications may be intended as a means of representing the three dimensions of the tree with a serpent coiled around its trunk. From the mycological angle, however, these ramifications might represent the membranes enveloping mushrooms of the family of the Amanitaceae at the early stages of development. This membrane then breaks when the cap broadens out and separates from the stalk; 3) the roundish fruit of the tree is, here, held in the mouth of the serpent as it offers it to Eve; 4) along and around the base of the main trunk we have ramifications which are also very similar to mushrooms in form surmounted by "caps" upon which once more we may note whitish spots. I have also studied a number of other mushroom-trees characterized by the same four iconographic features found at Plaincourault.

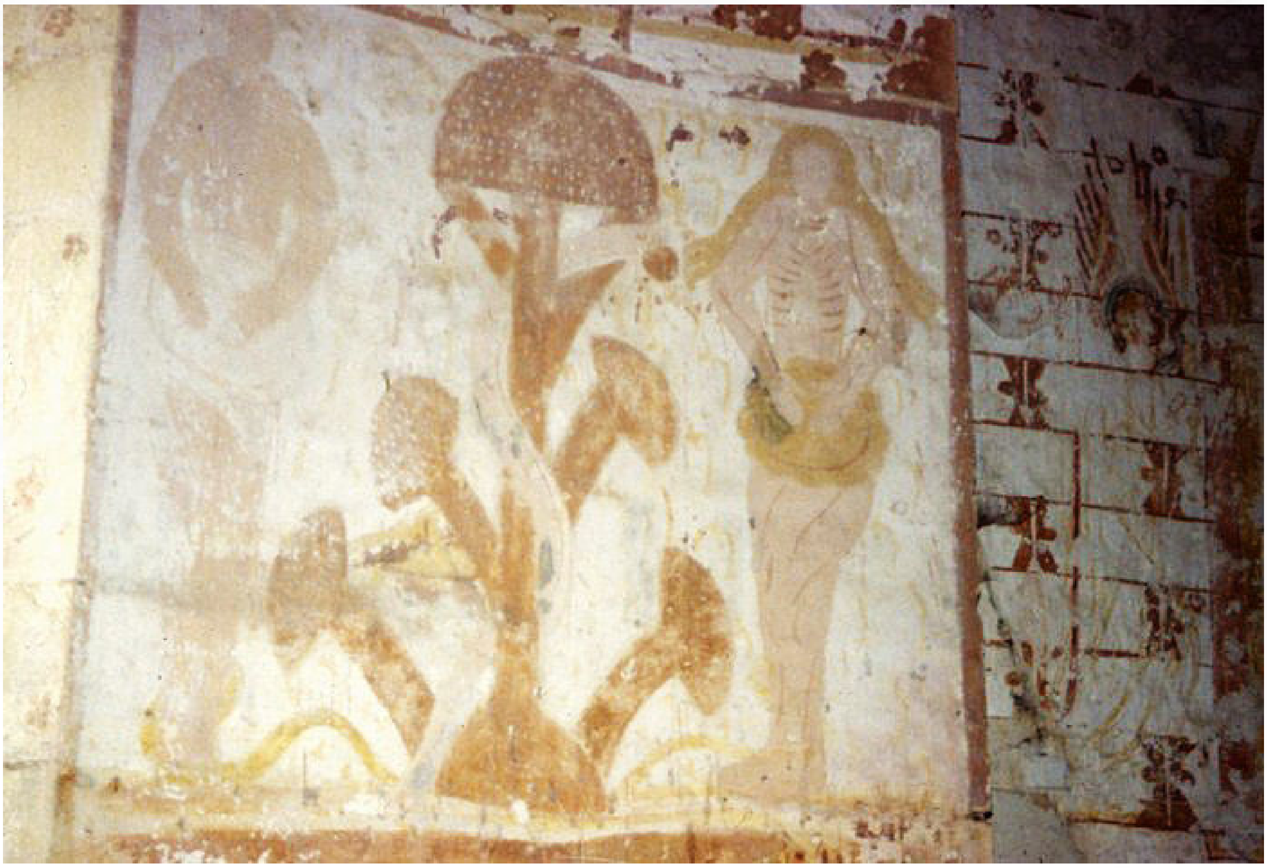

Fig. 1 - Plaincourault Chapel, Indre, central France. Fresco of the Temptation. End of the 12th century AD.

Two examples are to be found in 4th and 5th century B.C. Tunisian mosaics. In Tunisia during the centuries of Roman domination (I st-4th centuries B.C.) there was a flourishing tradition of well-crafted mosaic work of considerable artistic value. This tradition was continued in the mosaic floors of the first Christian churches (FANTAR 1995).

The mosaic in fig. 2 decorates the baptistry of the *henchir* Messaouda in the Tunisian region of Sfax. lt probably dates back to the 5th century a.c., and here we have an iconographic scheme which was fairly widespread and of very ancient origin: two animals symmetrically placed beside the Tree of Life.

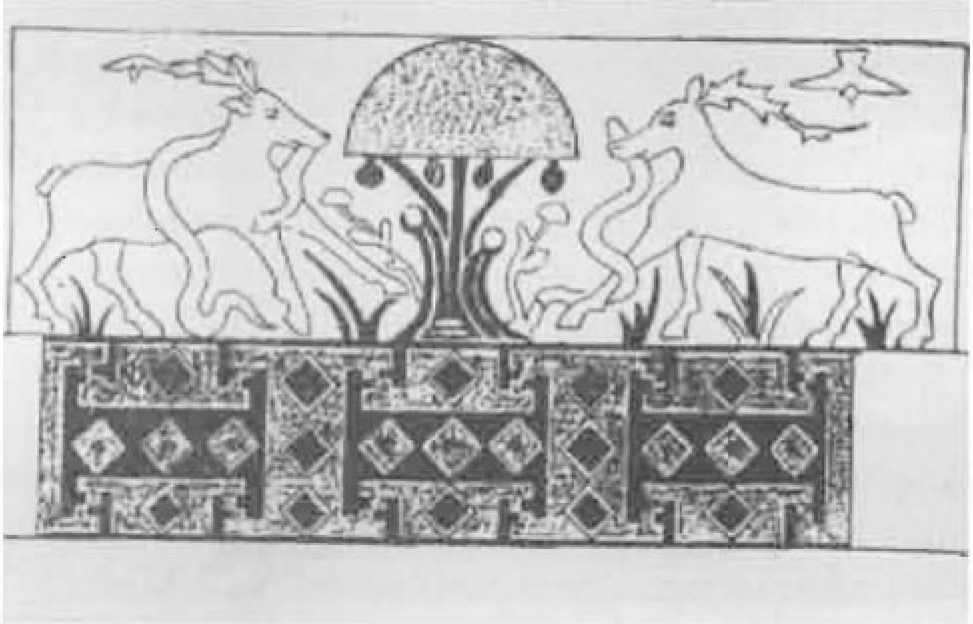

Fig. 2 - *Henchir* Messaouda, Sfax, Tunisia. Baptistry mosaico V century a.C (From PUECH 1949)

The first representations of this arrangement date back to Sumerian art of the 3rd millenium B.C. The two animals are generally of the same species; they are horned wild animals or quadrupeds (above all, Cervidae) or birds. The object placed between them is the Tree of Life. A typical example is the two wild animals beside the sacred tree Horn (Haoma) of Persian art. Simi/ar representations exist, such as a Plant of Life, a recipient containing the Water of Life, a Tree of Life from the foot of which rivers of the Water of Life spring forth (usually, four rivers are represented), or even a column (as in the famous "Door of Lions" at Mycene surmounted by two lions rampant upon a column). Sometimes the two animals feed on the Tree of Life or drink from the Chalice or the springs of the Water of Life. This variant is probably c1osest to the original iconographic scheme. This artistic scheme originates in the Middle East and spread to much of the Old World including North Africa as it underwent local stylistic modifications. According to FANTAR (1995: 107), the Phoenicians brought it to Africa, where it passed into the hands of the Romans.

The Tree of Life is the element most subject to stylistic variation, from the most realistic to the most imaginative. The palm-tree is one of the most widespread types. It may be more or less realistic, or represented by a single palm leaf the size of a tree. A further common type in the Mediterranean basin is the conifer-tree, sometimes represented quite simply by a pine cone. The mushroom-tree, which appears to derive from the conifer tree, seems to be less widespread than the other two types mentioned here.

Christianity was one of the last and most important means by which the artistic scheme of the two animals and the Tree of Life spread. The two most frequently adopted animals were two lambs or two fishes. The *Cantharos* (chalice) of the Water of Life or the Cross gradually took the place of Tree of Life. The esoteric meaning of the scene also changed, as CHARBONNEAU-LASSAY (1997: 54) has pointed out: "When, in the iconography of the first centuries of Christianity, two fish or animals surround an emblem, this always directly represents Jesus Christ; and the animals which accompany Christ are the symbolic representation of the Christian faithful". With the transformation of the Tree of Life into a Cross we therefore have an identification between the Tree and Christ. The Water of Life, placed in the *Cantharos*, and which flows from the Tree of Life becomes more and more closely identified with Christ's blood.

On further examination of the Messaouda mosaic, we may note that the two animals are deer, both of which are savaging a serpent. The deer savaging a serpent is also an iconographic scheme of pre-Christian origin. This motif is associated with the belief, record ed by writers in antiquity, that deer were fierce foes and persecutors of serpents (cf. CHARBONNEAU-LASSAY 1994; see "Deer", l:XXX; PUECH 1944). The tree placed between the two animals is a mushroom-tree of the same kind as that found at Plaincourault and it is endowed with the same four characteristics mentioned above, namely, 1) the cap-shaped fronds, with many spots; 2) the two lateral ramifications of the main trunk joining the frond; 3) the round fruits (here, hanging from the frond) and; 4) the fungoid protruberances at the foot of the tree. In the upper right corner of this scene we may note a dove, a widespread feature of Christian art with a great variety of meanings.

The same artistic scheme is featured in another 4th century A.D. Tunisian mosaic (fig. 3; cf. FANTAR 1955: 107) from Carthage, now in the *Bardo Museum* in Tunis. This mosaic was discovered in a Roman house and not in a Christian church. Not only do we find the main pair of animals, two lions, but also other pairs, hares and birds (probably doves) in the upper half of the scene, these two symmetrically arranged around the tree. The tree is rendered fairly realistically and, indeed, it might be considered a conifer-tree, despite the presence of the four characteristics of the Plaincourault and Messaouda mushroom-trees which ascribe it to this type of representation. The Carthaginian mosaic tree would appear to be midway between conifer-tree and Pl a incourault-type mushroom-tree. If this is the case, it might be considered a (pre-Christian) prototype of this mushroom-tree.

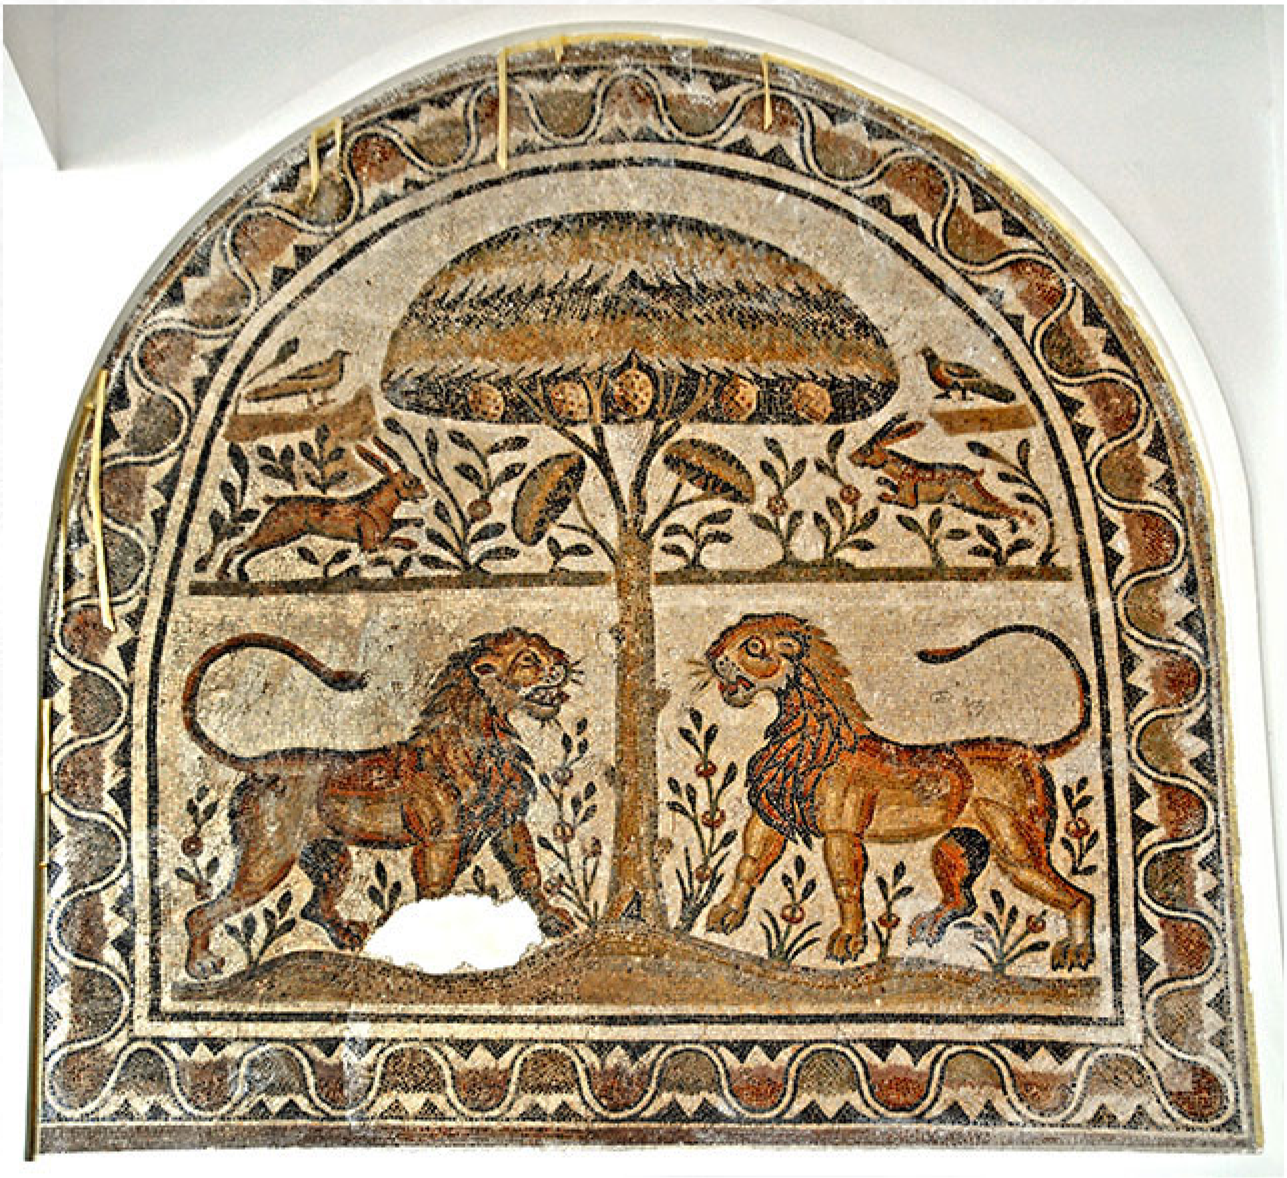

Fig. 3 - Mosaic from a Roman house. Carthage, Tunisia. 4th C AD

The fruits of the Carthage mosaic tree are represented with the characteristics of a cone, and this is the main detail which provides the identity of conifer. Art historians, including Panofsky (cf. WASSON 1968: 179), believe this conifer-tree form corresponds to *Pinus pinea*, the "umbrella pine", a common Mediterranean pine (cf. fig. 4). This conclusion is probably correct for the Carthaginian mosaic and any number of other examples of conifer-tree, but less appropriate for the Plaincourault and Messaouda mushroom-trees and others which I shall mention shortly. We should also bear it in mind that the mycological interpretation does not rule out the dendrological (pine) interpretation, or vice versa, given the ecological association between conifers and certain species of mushrooms, notably *Amanita muscaria*.

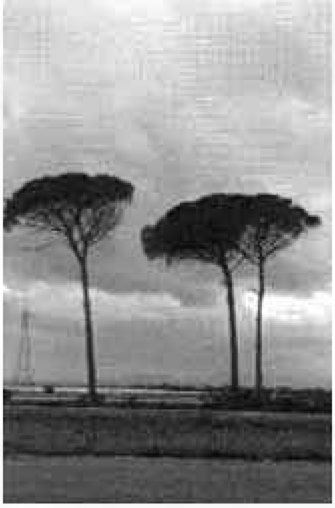

Fig. 4 - "Umbrella pine" (*Pinus pinea*)

We also find another kind of mu shroom-tree in Tunisia. This is from the *henchir* Ounaïssia (6th-7th century), at the moment housed in the Museum of Sbeitla (fig. 5, cf. FANTAR 1995:229). We might consider this scene a transition stage in an iconographic scheme which is only slightly different from that of the two animals symmetrically placed beside the Tree of Life; it might be considered a variant of a scheme which also originates in the Middle East and dates back to remotest antiquity. Here we have the two animals and *three* Trees or Plants of Life which are usually the same as each other, one between the two animals and the other two behind them. A fine example comes from the Mycenean gold ring in fig. 6, in which three trees or plants are combined with two quadrupeds, apparently steinboks. During the last stage of absorption of this artistic scheme in Christian art (i.e. its full transformation into a "truly" Christian symbol) we may note the recurring image of the two animals combined with one or more crosses. As we have already indicated, the Trees of Life become the symbol of the Cross, once Christianized, and the three parts constituting many examples of a certain type of Tree of Life (e.g. in the Mycenean ring) become the three upper components of the Cross, the various stages of the "crucifixion" of the Tree of Life become evident in paleo-Christian art.

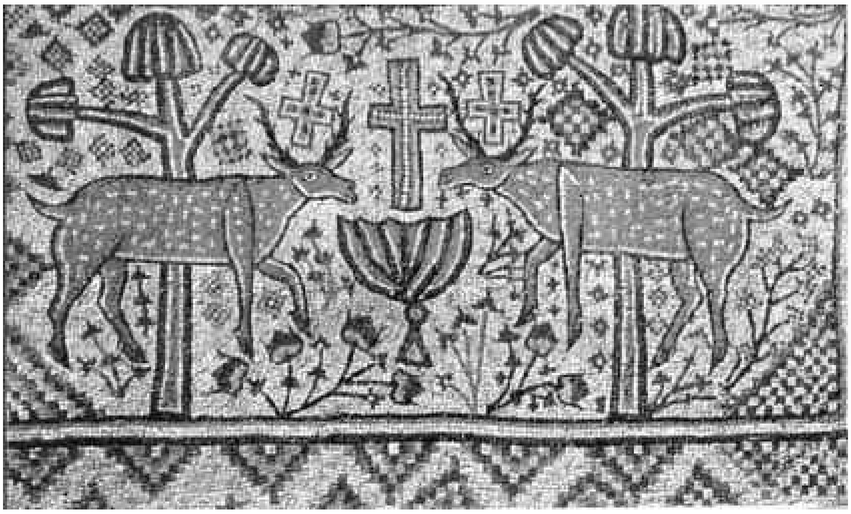

Fig. 5 - Mosaic from the henchir Ounaïssia. Tunisia. 6th-7th C AD

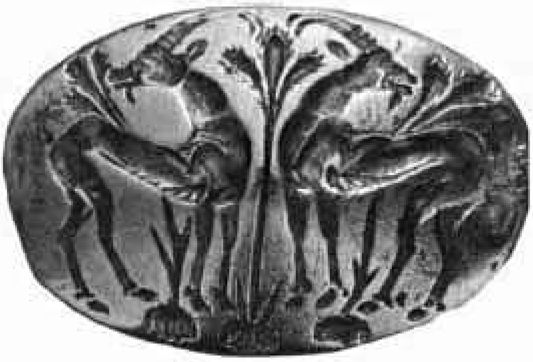

Fig. 6 - Mycenean gold ring

The Ounaïssia mosaic represents a stage in the transition of this iconographic scheme: the two animals are symmetrical1y placed and are once more two (ochre-coloured and white-spotted) Cervidae; the tree placed between the animals has already completed its transformation into a "cross", and, below it, there is a *Cantharos* containing the Water of Life (at this stage, perhaps already considered the blood of Christ). We may also note that the other two Trees of Life, placed behind the animals, have not yet been fully 'crucified'. These two trees are mushroom-trees of a different kind than the Plaincourault one. Both feature the three cap-like fronds and, upon these, vertical lines have been traced which we may consider "striations".

In another 5th-6th century mosaic from the Béja region in Tunisia, housed in the *Bardo Museum* in Tunis (fig. 7, cf. FANTAR 1995:92-3), we find a mushroom-tree similar to the Ounaïssia example. This mosaic represents a Greek mythological scene in which Achilles receives instruction from Chiron, the wisest of the Centaurs, on deer-hunting. A Chimera is presented in the lower left corner. Achilles and Chiron are surrounded by four plants of the same shape, and on careful observation we may consider them mushroom-trees. Probably for reasons of space, three of these are composed of two mushrooms but the fourth has three. Each of the frond-caps presents lines in various colours which remind us of the "striations" encountered in the Ounaïssia mushroom-trees. Some of these lines overlap the lower edge of the frond-cap. This kind of mushroom-tree has been called "tree with medusa-shaped frond" (RIOU 1992). Mycologically speaking, these overlapping lines recall the filaments which adorn the edges of the caps of various species of psychoactive and non-psychoactive *Panaeolus*-type mushrooms.

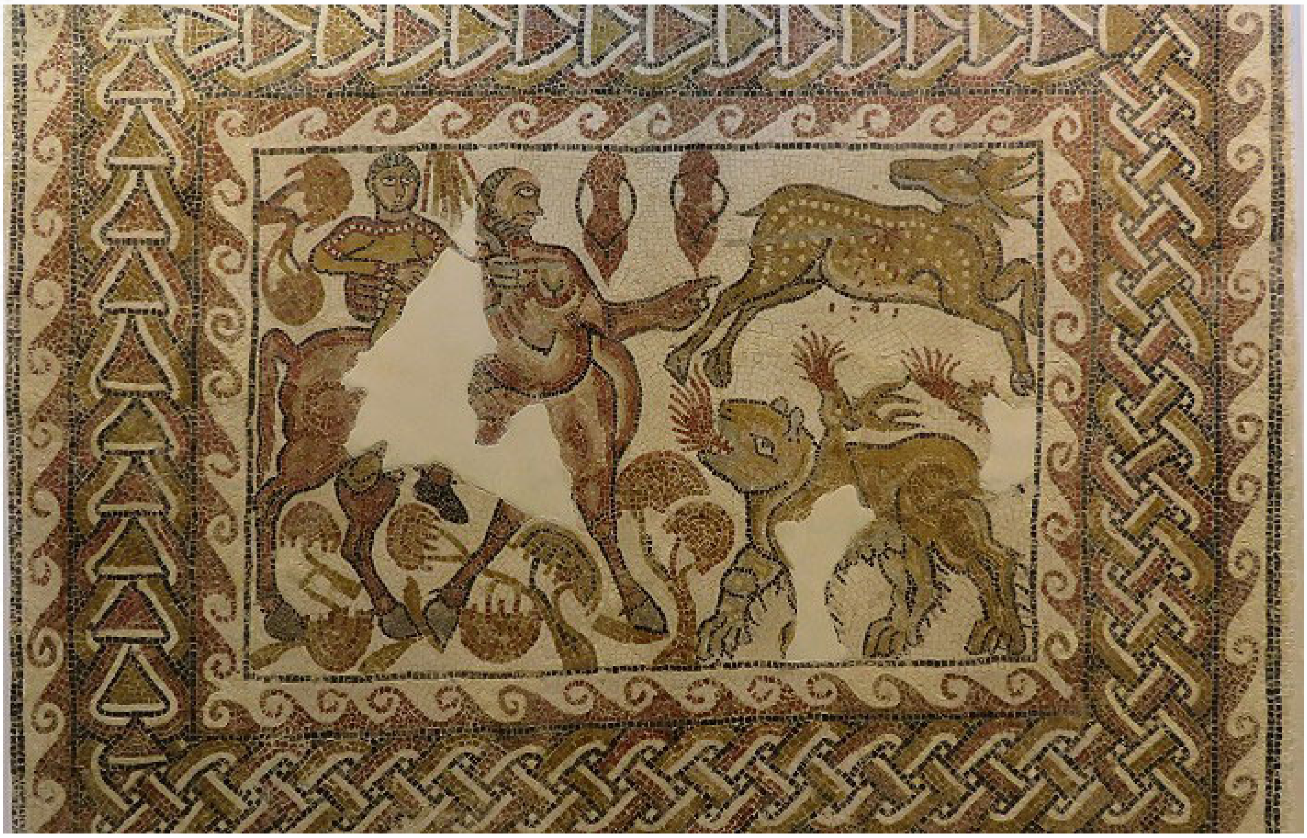

Fig. 7 - Roman mosaic, Béja, Tunisia. 5th-6th C AD

In fact, ROBERT GRAVES associated the mythological figure of the Centaur with psychoactive mushrooms in his essay *Food for Centaurs* (1960, cf. 1994). However, the arguments he used were unthorough and perhaps a bit fanciful. FANTAR (1995: 92) comments on the Béja mosaic, the work of Christian artists who revived pagan symbols and mythologies, and stresses the point that it dates back to a period of heresy and fratricide due to struggles among various groups of Christians.

We find mushroom-trees which are similar to the Ounaïssia examples in a fresco dating back more or less to the same period as the Plaincourault mushroom trees, and from the same area (central France). This fresco is in the Abbey of Saint-Savin-sur-Gartempe (fig. 8) in the province of Vienne, about 40 kilometers from Poitiers and only 9 kilometers from Plaincourault. The Abbey's frescos are among the most highly admired works of French Romanesque art. They are dated *circa* 1100, about 80 years before the Plaincourault frescos and, like these, are of the Haute-Poitou Romanesque Style (OURSEL, 1994).

Fig. 8 - Abbey of Saint-Savin-sur-Gartempe, Vienne, central France

On the ceiling above the central nave of the church at a height of about 16 metres, there are some scenes from the Old Testament. Figure 9 presents the scene of the fourth day of Creation with God placing the Sun in the firmament in the presence of two trees which could hardly be considered mere ornament. One of these is a mushroom-tree. The moon and sun are anthropomorphically depicted, each featuring a head within a medallion.

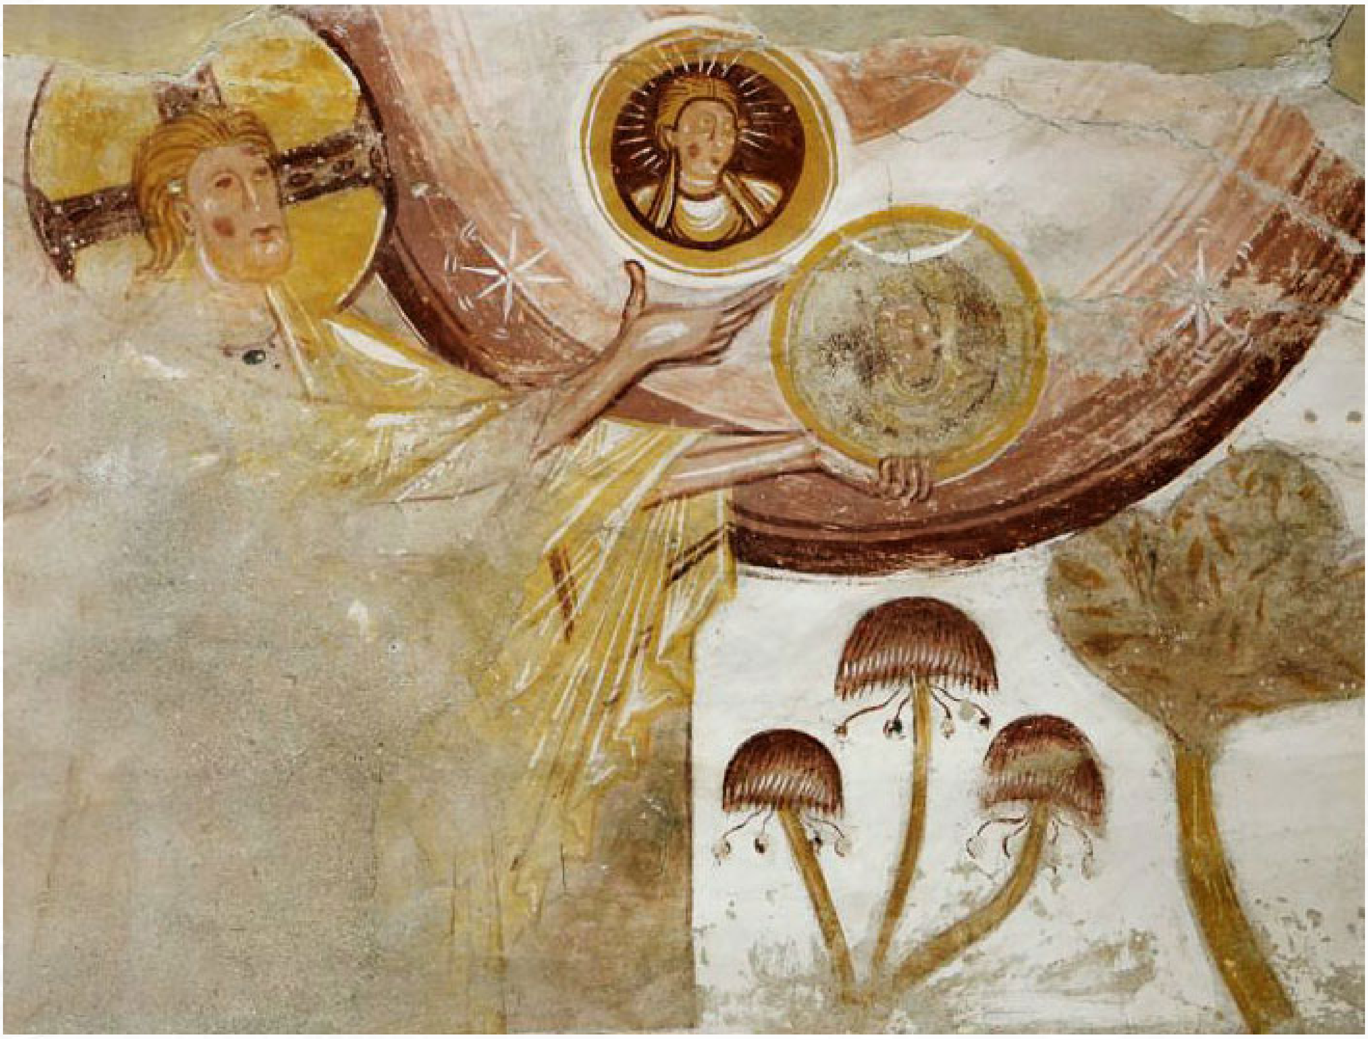

Fig. 9 - Fresco from Saint-Savin-sur-Gartempe, *circa* 1100 AD

In the same fig. 9 we see part of the preceding scene (which has somewhat deteriorated) depicting the third day of Creation - the day of the creation of vegetation. Here, we see two trees of two types (one, a mushroom tree) which are also like the ones on the right. A third tree of the same kind is depicted elsewhere among the nave frescos next to the scene of Moses in the presence of the Pharaoh (RIOU 1992:35). We should also bear in mind that the Saint-Savin-sur-Gartempe frescos include many other trees which also have a fairly tall trunk which is often above a sort of ring. The trunk spreads out to form a number of branches, generally three, and some branches terminate with a compact trilobate frond. A number of these trees spring from a small conical base or mound which might represent a mountain (RIOU 1992). H has been suggested that the pictorial cycle of Saint-Savin-sur-Gartempe contains stylistic influences of the Byzantine art of northern Italy (cf. LABANDE-MAILFERT 1974). The mushroom-trees are all the same. They have a large trunk encroaching downwards upon the lower scenes of the same wall, as we may note in the detail provided (fig. 10). These trees are also similar to the Ounaïssia mushroom-trees. Here too, they present three mushrooms with striated "caps".

Scholars have termed this kind of vegetation "mushroom-tree", or even " tree with medusa-shaped frond" (RIOU 1992). Alternatively, it has been defined "mushroom-shaped flowers" (THOUMIEU 1997: 134). ELEMIRE ZOLLA (1979) seems to have no hesistation at alias to the inspiration of the Saint-Savin-sur-Gartempe mushroom-trees: they are hallucinogenic mushrooms, "symbols of the divine, and of exceptional powers".

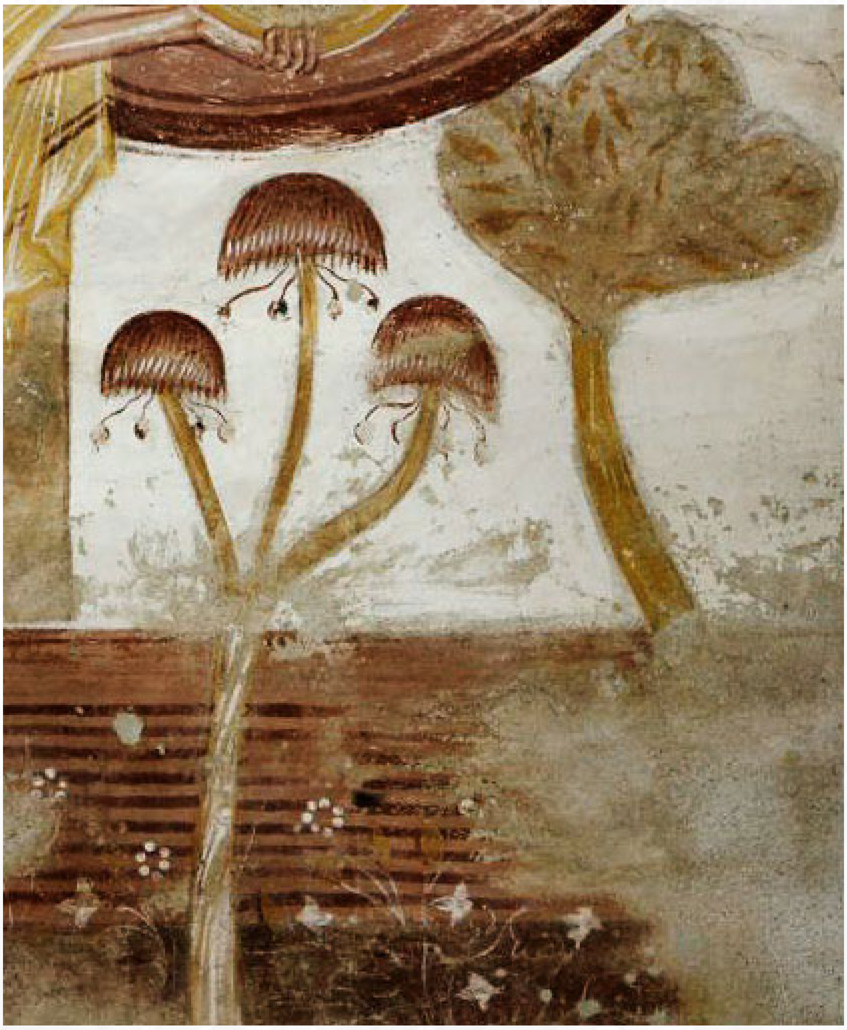

Fig. 10 - Fresco from Saint-Savin-sur-Gartempe (detail)

As stated above, in reference to the mushroom-tree from the Béja mosaic (fig. 7), the striations hanging over the "frond" are very similar to the fringes on the caps of various species of *Panaeolus*. These striations are more a feature of mushrooms than trees; very many mushrooms present these striations, some of which are psychoactive. In fact, the mushroom striations are caused by the juncture between the gills and the cap (see fig. 11). The four cirrous adornments under each cap terminate with a small round object which might symbolize the fruit of the mushroom-tree.

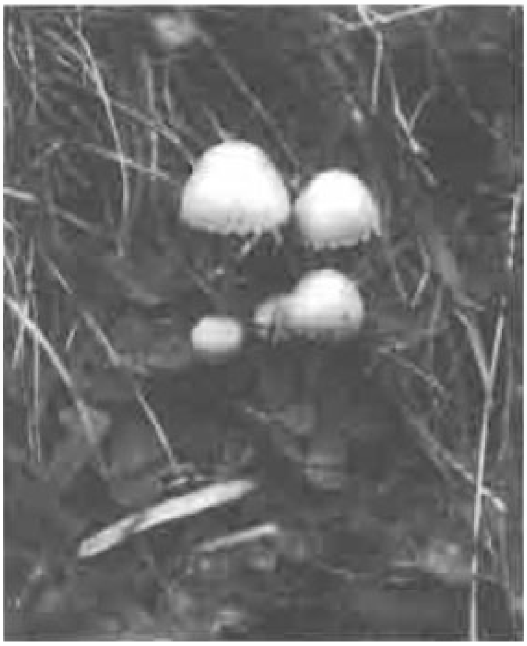

Fig. 11 - *Panaeolus* sp.

In fig. 12, we see the frontispiece of a German edition of the *Carmina Burana*. This edition is dated to the early 12th century and is housed in the Munich *Staatsbibliolek*. Various types of tree are depicted; they are quite bizarre, although they do have a common source: the large group of artistic forms which developed in the Mediterranean from the Greek period on (GRABAR & NORDENFALK 1958). One of these trees, which is very small, in the middle of the top half and upon which a bird perches, is a mushroom-tree of the Saint-Savin type, made up of three mushrooms with striated caps.

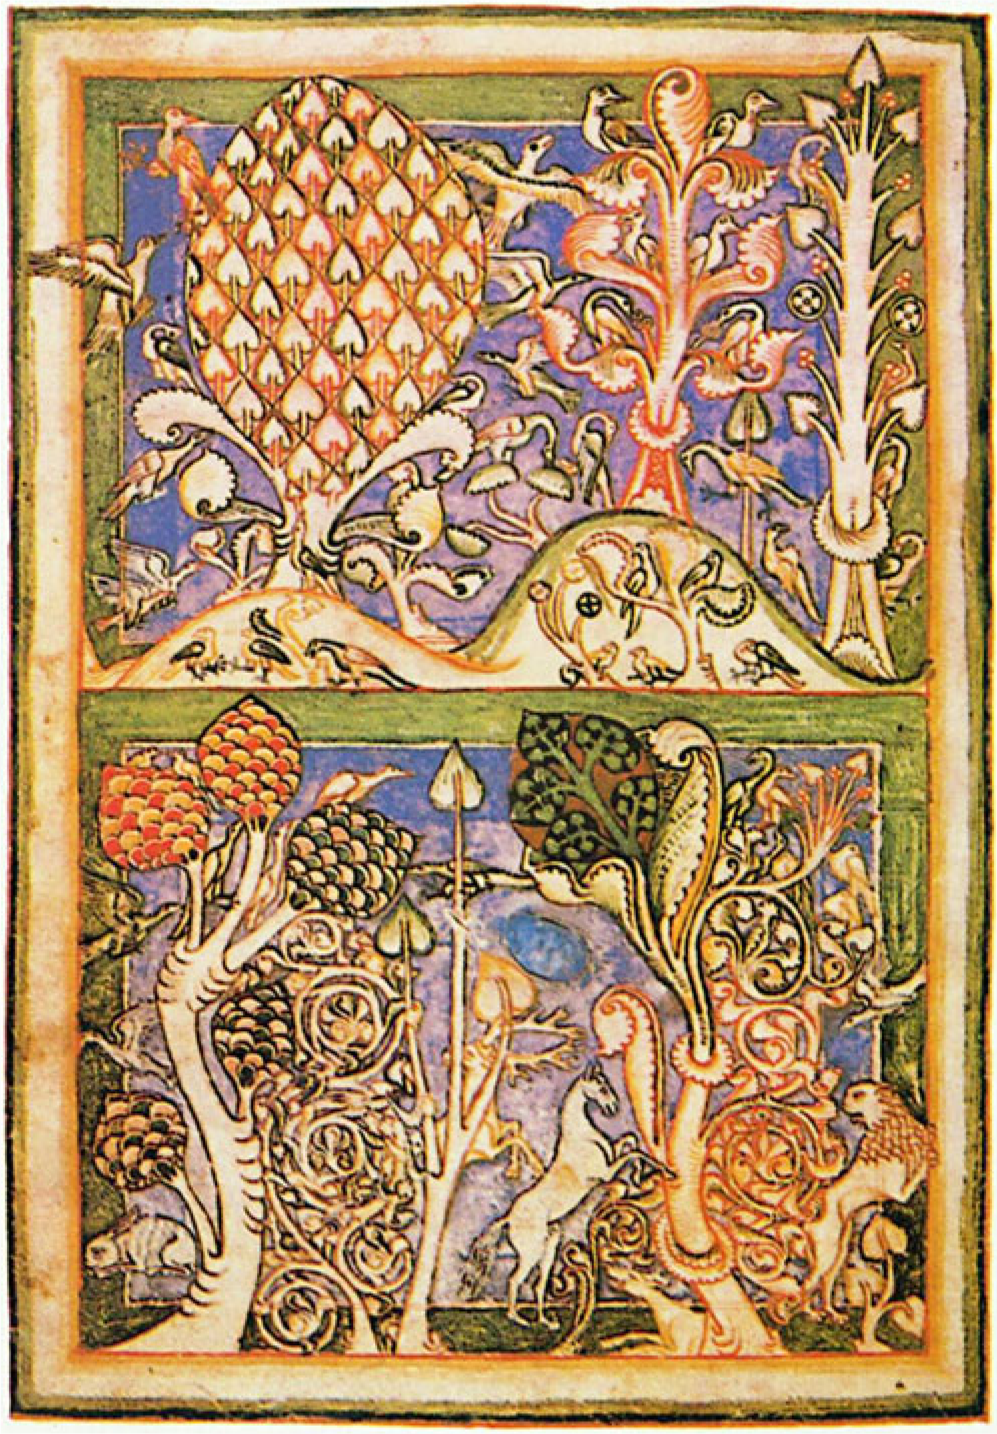

Fig. 12 - Frontespiece of a German edition of the *Carmina Burana*. 13th C AD (from GRABAR & NORDENFALK 1958)

As Panofsky notes (in WASSON 1968: 179), there are many mushroom-trees in Romanesque art (more than I present here). Apart from the types described above, there are others the styles of which are derived from local variants and individual imagination. One example is the mushroom-tree in the magnificent frescos in the small church in Vic (fi g. 13), once more in central France in the Berry region some 80 kilometers from Plaincourault (fig. 13). These 12th century frescos are the work of an anonymous artist, as are most of the works I present here. They therefore follow the Saint-Savin works, which are themselves only slightly earlier than the Plaincourault frescos. Although these frescos do not represent the Haut-Poitou Romanesque Style they are nevertheless considered part of the same artistic tradition (GRABAR & NORDENFALK 1958).

Fig. 13 - Church of Vic, Berry, central France.

As Manuel and Dona Torres pointed out to me, the scene of Jesus entering Jerusalem is presented in the upper part of the right wall of the choir (fig. 14). Christ is riding a donkey. Some people welcome Christ by laying their cloaks on the ground while others pluck flowers and leaves from the trees and offer them to him. The trees are stylized as palms in the manner of a familiar and fairly widespread typology. However, the upper part of one of the trees is quite unusual (see detail, fig. 15). It terminates with five umbrellas and may be defined a mushroom-tree. The mushroom-like appearance is further confirmed by the concave "caps", as depicted. Here, we might say, we have a "mushroom-palm".

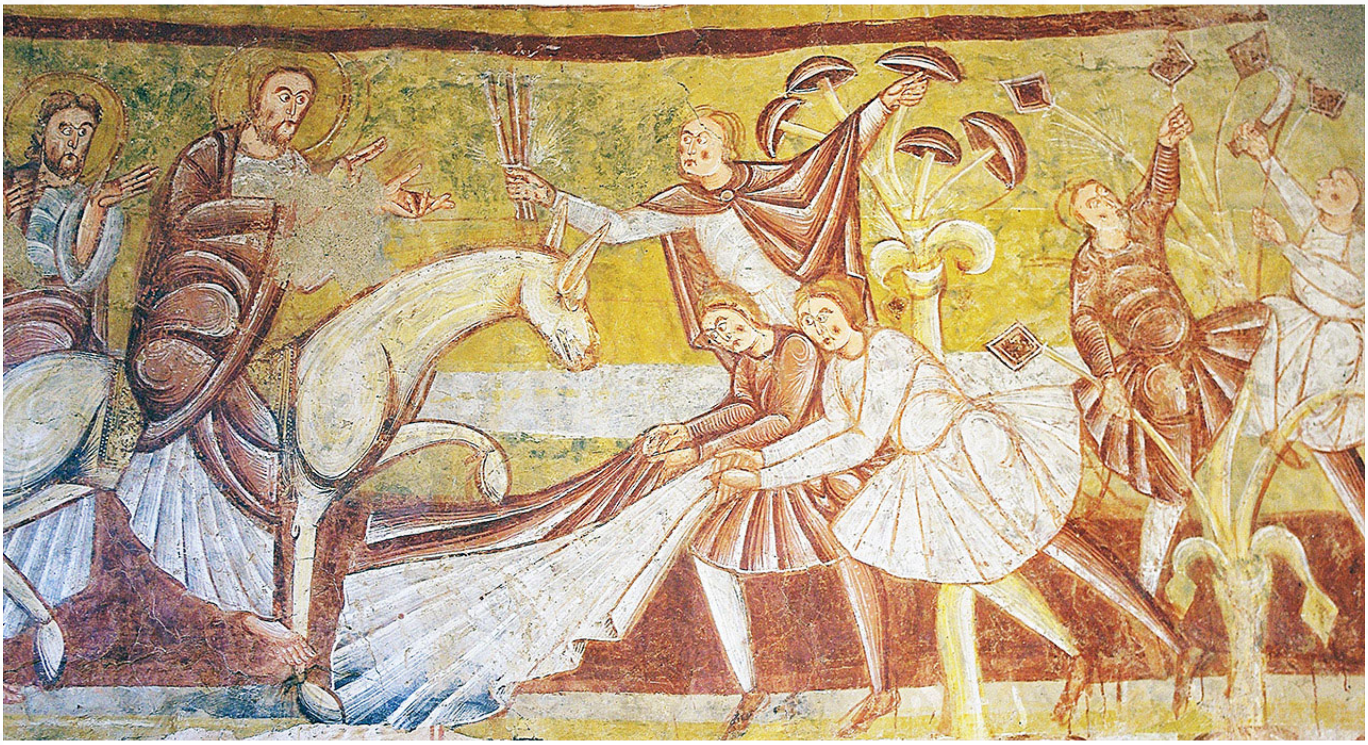

Fig. 14 - Fresco from the church of Vic. 12th C AD

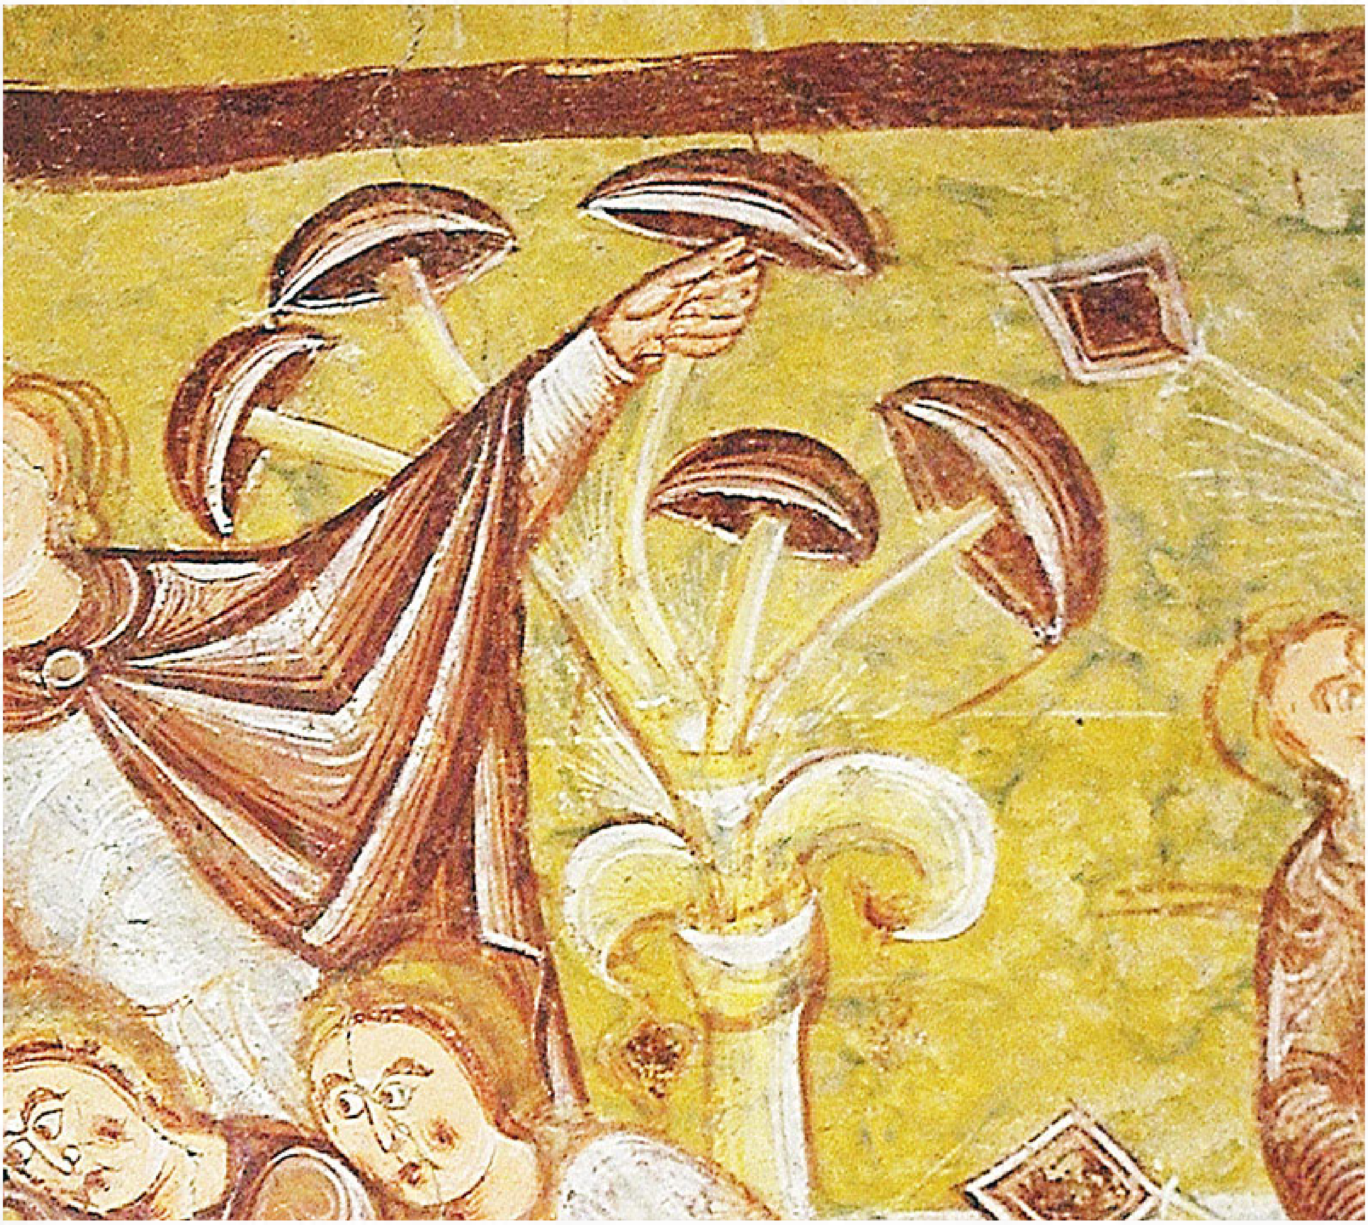

Fig. 15 - Fresco from the church of Vic (detail)

Mushroom-trees can also be found in twentieth century folk religious art which - iconographically speaking are the outcome of developments taking place in the Middle Ages or in even remoter epochs.

See, for example the Rumenian painting reproduced in fig. 16, which my Bolognese colleague Dr Guido Baldelli kindly brought to my attention. Many folk crucifixions are to be found in the houses of Rumenian farmers. During the various periods of the Middle Ages the mythological image of the Tree of Life rising out of the Cross of the Passion of Christ and extending its branches was commonly encountered, as was the belief that the Cross itself had been made out of the wood of the Tree of Life (cf., for example, COOK 1987). We note the presence of the mushroom-tree, or rather of groups of mushroom-trees springing up all over the Cross in Rumenian paintings of the kind presented here in fig. 16. The "caps" are red with white spots, like the fly-agaric. Another interesting detail is the inclusion of smaller striated caps. It would appear that this kind of painting, after centuries of reproduction, combines two different kinds of mushroom-trees which, despite all, may each be identified separately even today.

Rather than transmitting esoteric messages indicating some knowledge of psychoactive mushrooms, it is more likely that the folk artists of today are quite simply reproducing stereotyped images in pictures such as these, and are quite unaware of any mycological interpretation of their work.

However, if it is recognized that during the Middle Ages knowledge of the psychoactive properties of mushrooms stili existed, it is more likely that this was the intention in older representations. Here, the indications are few and far between, and it must also be noted that research of this kind has been very scarce indeed.

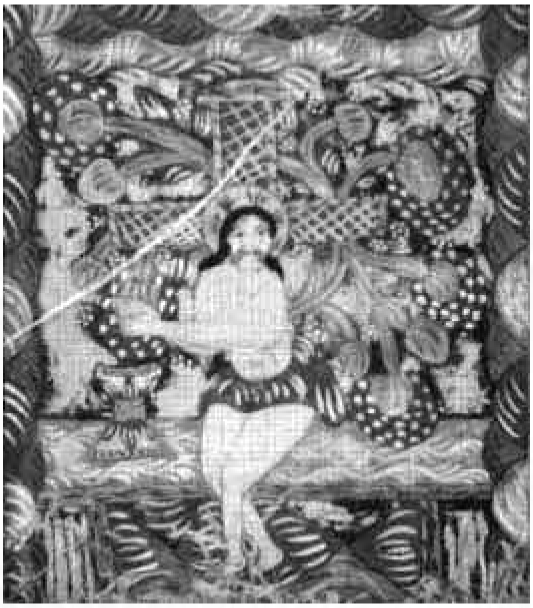

Fig. 16 - Rumenian painting. 20th C AD (photo Dr. GUIDO BALDELLI)

There are quite a few psychoactive mushrooms in Europe. Not only do we have the two species, *Amanita muscaria* and *A. pantherina* - which require conifer or birch woods in their habitat (forests which were much more common and extensive than they are today) -, we also find a few dozen species of psilocybian mushrooms including the genera *Psilocybe*, *Inocybe*, *Pluteus* and *Panaelous* (to be found both in fields and forests, on the plains and in mountainous regions) (FESTI 1985; GARTZ 1996; GUZMÁN 1983; STAMETS 1996).

While there are few ethnomycological *data* concerning the relations between these mushrooms and European peoples, the most interesting findings concern the Iberian peninsula.

JOSEP FERICGLA (1993) found traces of the use of fly-agaric in the 20th century on the southern side of the Pyrenees in Catalonia. His research shows that until the first decades of this century, *A. muscaria* was consumed (by shepherds, charcoal burners, and isolated peasants) in the remoter rural areas - and today there are those who consume it "just to get high" and no longer for reasons concerning religious life or magic.

In any case, there is a colloquial Catalán expression, *estar tocat de bolet* ("to be touched by the mushroom") referred to one acting or saying completely crazy things. This would appear to reflect once widespread knowledge of the inebriating power of certain mushrooms, above all the *oriol fol* (*falsa oronja*) or *matamosca* (*A. muscaria*) (FERICGLA 1994: 177-184). Nowadays, the Catalán expression is used without thinking about whence it came or how it derived, just as mushroom gatherers in northern Italy refer to inedible mushrooms as *funghi matti* ("crazy mushrooms"), unaware of the fact that this expression has broadened its meaning over time and once referred to certain mushrooms which "drive you mad" or which are, rather, inebriating.

Psilocybe semilanceata may be found close by in the Basque country. Although it is a mushroom with which people are familar, they are apparently unaware of its psychoactive properties; its vernacular name is *sorgin zorrotz* (BECKER 1989:243), a term which refers to the figure of the witch. 1. M. FERICGLA (1998) translates this Basque term with the Castilian term *bruja picuda*, as in *bruja que tiene pico*, literally "witch with a point", that is: witch carrying a pointed object. This brings to mind the traditional image of the witch with her pointed hat. This piece of etymological information might confirm the hypothesis that the witch's pointed hat was a representation of a psychoactive mushroom such as witches may well have consumed. Likewise, the hypothesis put forward by a number of researchers (cf., for example, CALVETTI 1986) that Little Red Riding Hood's headgear originally represented the cap of the fly agaric, as might the hoods of other woodland folk from European folk and fairy tales. In any case, the Basque term, *sorgin zorrotz* is one of the few instances recorded up to the present in which psilocybian mushrooms have perhaps not been forgotten but are stili referred to by traditional names (names of some consistency, given the allusions to which they might have).

In Aragón, bordering Catalonia, 19th century bronze medallions have been discovered, showing the devil beside what might be "hallucinogenic" mushrooms (GARI 1996).

It may be appropriate at this stage to bring up Robert Grave's recollections of a visit to Portugal: "Some years ago, I learned that a number of Portuguese witches made magic use of some varieties of mushroom and I arranged that the most famous mycologist in Europe, my friend Dr. Roger Heim, receive a sample [of these mushrooms]. If I remember correctly, they were *Panaeolus papilionaceus*. The document is in Wasson's possession" (GRAVES 1984: 132-3; cf., also, *id*. 1992: 52). Although Graves is not considered entirely trustworthy since, as we noted above, some of his interpretations are perhaps a bit fanciful, this episode bears investigation.

In Italy I recently discovered a 1880 use of *A. muscaria* apparently for pleasure in the province of Milan, in an area in which, according to folk tradition, this kind of mushroom *fa cantare* ("makes you sing") (GRASSI 1880; cf. SAMORINI 1996).

In 1990, in the journal *Nature*, Daniele Piomelli advanced the unlikely hypothesis that St. Catherine of Genoa entered a state of ecstasy after (perhaps unwittingly) consuming *A. muscaria*. PIOMELLI's evidence (1991) is a passage from the biography of this saint - who lived between the years 1447 and 1510 - in which reference is made to "Aloe epatico" (hepatic aloe) and "agarico pestato" (pounded or crushed agaric) which the biographer understands to be unpleasant-tasting preparations used as condiments by the saint in order to deny herself any pleasure in alimentation. However, as Tjakko Stijve points out, "there is no reason to believe this 'agaric' was *A. muscaria*. Fly agaric is not bitter tasting and the term 'agaric' in the 15th century was widely used to indicate *Agaricum officinale* (Vill. ex Fr.) Donk which, in its dry form, was a commodity considered beneficial. Furthermore, *A. officinale* is very bitter, but it does not act on the central nervous system" (STIJVE 1994). By way of confirmation of Stijve's conclusion, it is worth noting that even as far back as Dioscorides and Pliny, the term *agaricum* was associated with this polyporaceous mushroom (LAZZARI 1973).

JONATHAN OTT (1998: 131-2, n. 70) refers to an illustration appearing in a work on Gnosticism by RANDOLPH KURT (1987) in which, in a fragment of a Manichaean miniature, probably of French origin, the "Feast of Bema" is depicted with Mani beside the " table of God" on which there is a basket containing bread and red "sacred fruits " with white spots, like the cap of fly-agaric. WASSON also (1968: 71-6) had already stated that there may be a link between this mushroom and Manichaeism.

Turning to central and eastern Europe, we may consider Jochen Gartz's observations: "Clusius (1525-1609), the great physician and botanist, discovered the *bolond gomba* in Hungary. This mushroom was known under the German name *Narrenschwamm* ("fool's mushrooms"). It was used in rural areas, where it was processed into love potions by wise men or *javas asszony*. At about the same time, this " fool's mushroom" was documented in Slovakja as well. In addition, the mushroom found its way into the verses of Polish poet Vaclav Potocki (1625--1699), who refers to its potential for "causing foolishness much like opium does". Similarly, in England, John Parkinson's *Theatricum Botanicum* (1640) includes details about a "foolish mushroom". The Austrian colloquial expression "he ate those madness-inducing mushrooms" (*er hat verrückte Schwammerln gegessen*) refers to states of mental confusion. Historic source materials such as these are scarce and widely-scattered. Undoubtedly, they refer to psychotropic mushrooms" (GARTZ 1996:11-12).

I remember the old Croatian myth preserved in folk tales, according to which the fly-agaric springs up on Christmas night (H. Kleijn 1962; *cit. in* MORGAN 1995: 116--7).

With regard once more to mushroom-tree re presentations, we cannot be sure that the artists wished to represent psychoactive mushrooms; indeed, it is unlikely that this was the case. However, in the two examples I present below we have good reason to suspect that the artists wished to supplement the depicted scenes with an esoteric message associated with psychoactive mushrooms.

CHRIS BENNETT and LYNN and JUOY OSBURN (1995) wrote an essay on the history of Cannabis, one page of which is dedicated to *A. muscaria*. Here they present the surprising image (fig. 17) taken fro m a 14th century manuscript on alchemy from the Bodleian Library in Oxford (England). Bennet and Osburn comment as follows: "... the alchemical painting show a man intoxicated on *Amanita muscaria* mushrooms. He clutches one mushroom in his [left] hand as he dances about holding his other hand to his forehead as if the reve1ation is too intense. Behind him a tree grows with a spotted mushroom for a top" (BENNET *et al.*, 1995: 240).

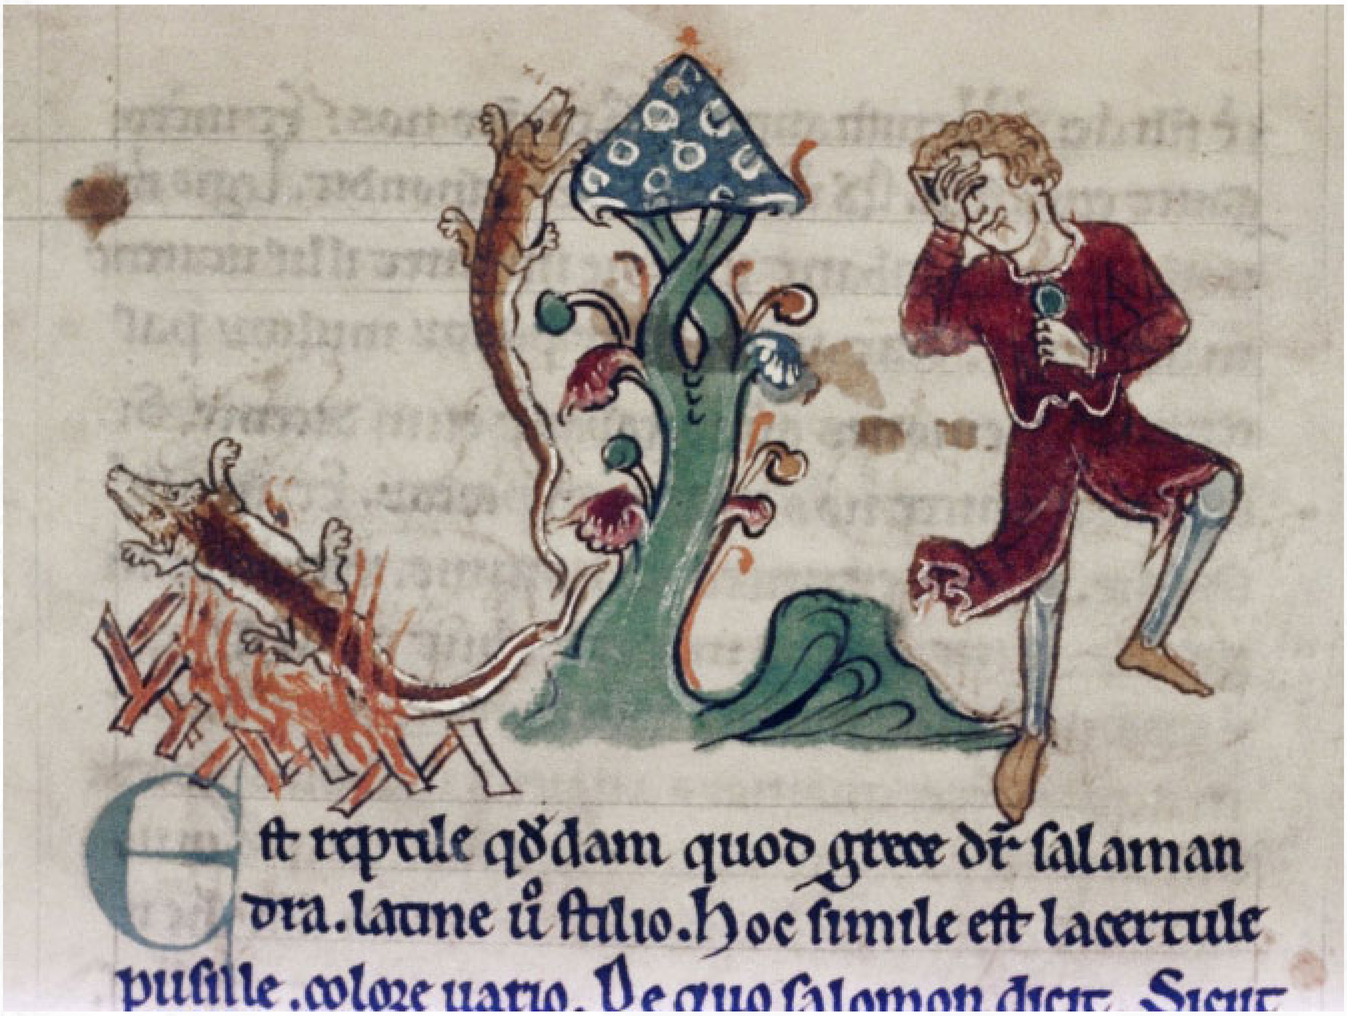

Fig. 17 - Painting from a 14th C AD alchemical manuscript (from BENNETT *et al.*, 1995:241)

The tree in question is a mushroom-tree of the Plaincourault variety. It presents the four particularities described above. The impression is that the man may be dancing; however, he may be swaying as a result of the overpowering effect of the mushroom. This latter impression is confirmed by the fact that his hand is on his forehead in the typical manner of a person in a state of mental confusion, inebriation or dizziness. These signs are characteristic of the onset of the effects of fly-agaric. If we follow this line of interpretation, and accept Bennett's and the Osburns' hypothesis that the object in the man's left hand is also a mushroom, we are justified in thinking that the author of this manuscript intended to draw the tree with the semblance of a mushroom, and not just any mushroom; it is *A. muscaria*. This very picture, which we might consider an alchemical puzzle, parts of which we are trying to uncover, includes other interesting symbols. Beside the Amanita-tree we see one salamander, and another one above a fire. Here we find the first confirmation of something I personally have suspected for some time now, and that is that the salamander in certain circles engaged in alchemical studies during the Middle Ages may have been a secret symbol for fly-agaric (due perhaps partly to the fact that the cap of the mushroom and the skin of the salamander are both maculate). The alchemical salamander, which Pliny called *animal stellatum*, is the *Salamandra salamandra* L., and is popularly known in Italy as the *salamandra pezzata* (pied salamander). According to Duccio Canestrini, "in all likelihood, on seeing salamanders coming out of damp tree trunks - their favoured habitat - to escape fire, the legend came about that these animals were incombustible" (CANESTRINI 1985:27). In ancient times it was believed that salamanders could survive in the midst of fire and would not be consumed by flames, and as time went by they became gradually more closely associated with fire.

If the hypothesis be correct that in certain alchemical circles the salamander symbolizes fly-agaric (and fig. 17 would seem. to corroborate this), the familiar symbol of the salamander above a fire might, in these circles, represent the drying of the cap of the fly-agaric. It is well known that fly-agaric must be dried before it is consumed to obtain the full effects (cf. FESTI 1990: 171).

In the mediaeval alchemical and heraldic repertory, the iconographic scheme of the salamander in the midst of flames is generally unaccompanied by other elements. However, the scene presented in fig. 18 (taken from the *Musaeum Hermeticum* of 1678) is more complex. The man appears to be moving the salamander toward the fire with his trident as though he wished to toast it. This is not the widespread allegory of the salamander which can brave the flames without getting burnt; this is instead an operation of the *Opra* depicted in the manner of an alchemical allegory (the salamander is immersed in flames due to the action of man; man is cooking it, or drying it, as one does with fly-agaric before consuming it for its inebriating effects).

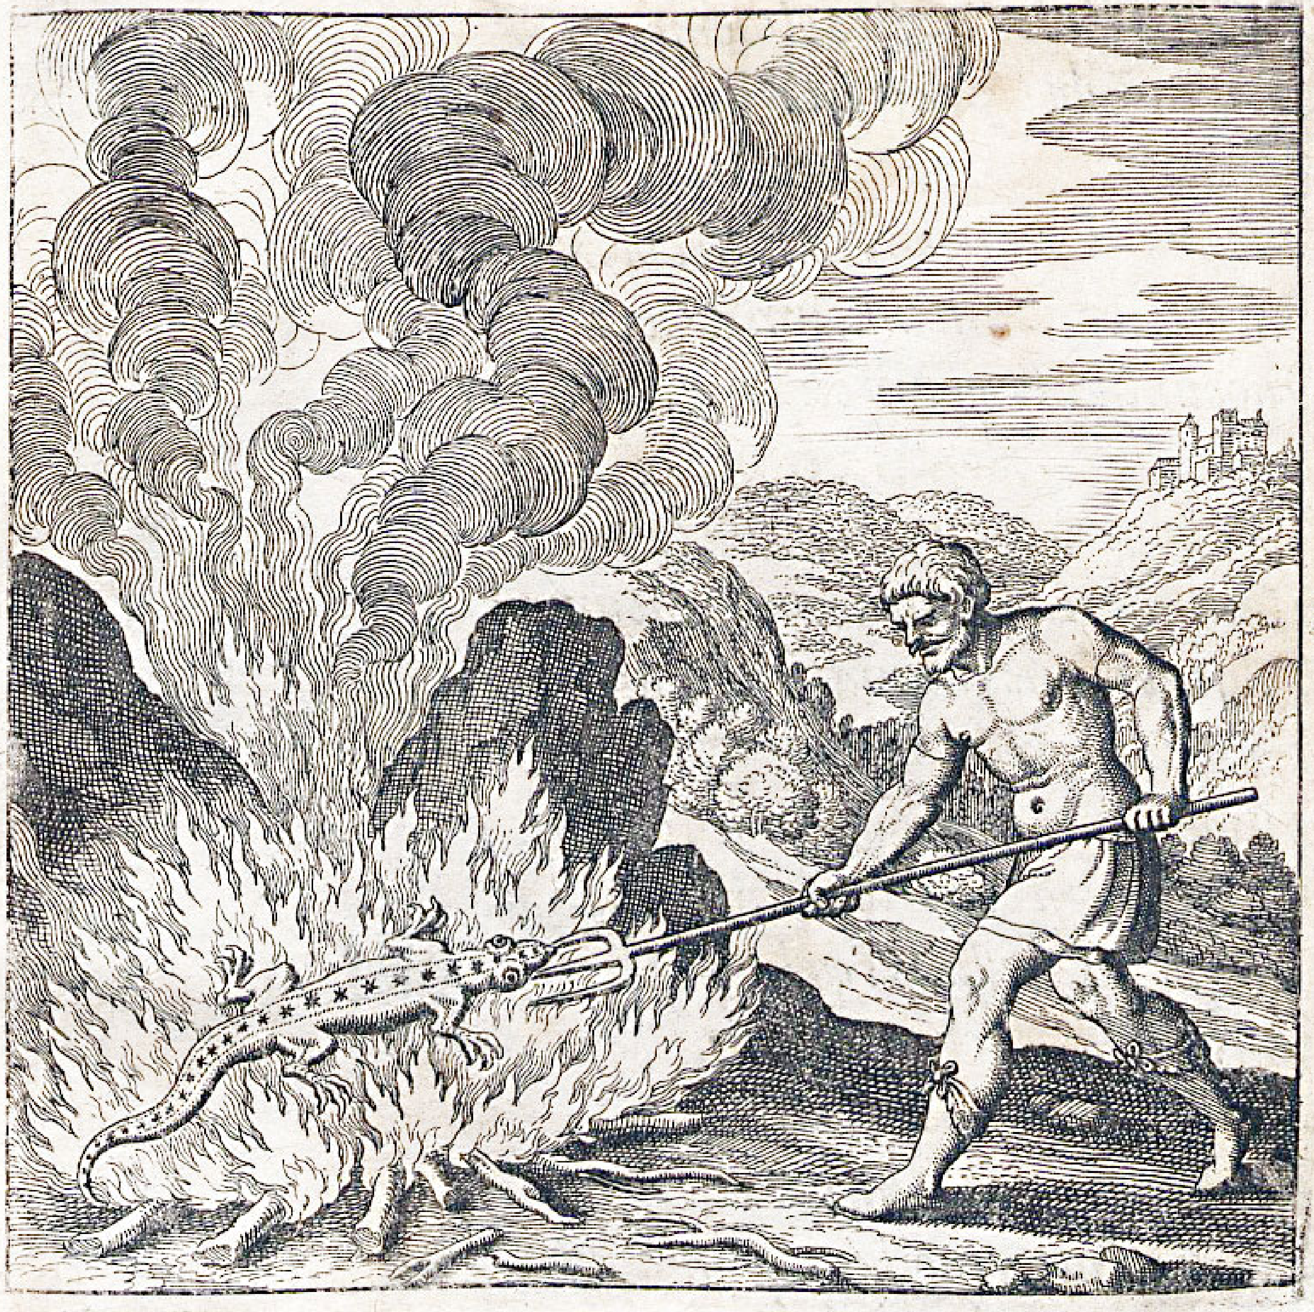

Fig. 18 - Illustration from the *Musaeum hermeticum*. 1678 AD

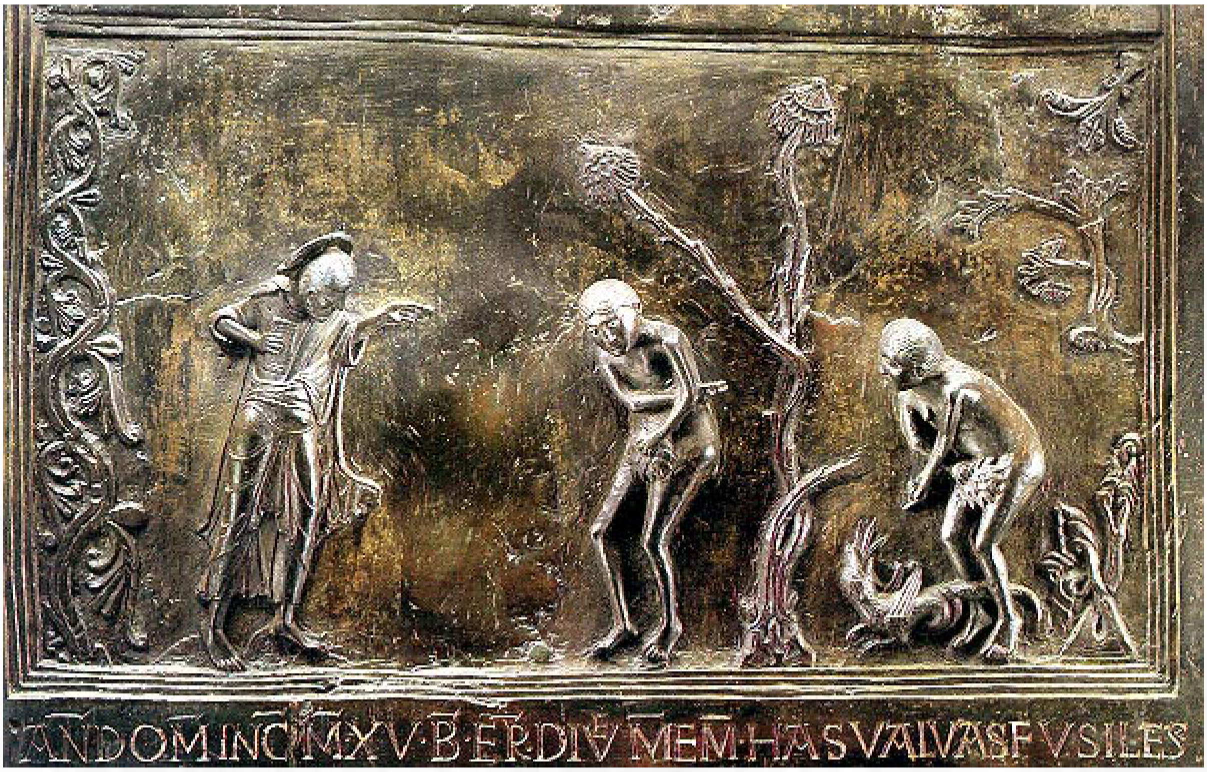
Actually, I well remember the extraordinary page from the well-known alchemical treatise by Salomon Trismosin, *Splendor solis* (first edition 1582), presented and discussed by CLARK HEINRICH (1994: 167-9 and table 41). In it, the winged Divine Hermaphrodite with its two heads is represented as if it were standing on only one leg. It holds two objects in its hands. These objects, given their form and color, fairly closely resemble the lower part of the cap and the ovule from which the fly-agaric grows. Furthermore, the hermaphrodite is placed in a birch forest (this is one of the few species of tree with which the fly-agaric can enter into a symbiotic relationship). According to interpretations of alchemical symbolism, certain correspondences seem to emerge surprising clearly: the relationship between the sun and moon represented by the two heads and the two different coloured wings (red and white), which the mushroom precisely represents.

The next item we shall consider was located by the German chemist JOCHEN GARTZ (1996). It is a bas-relief from the bronze doors of the cathedral in Hildesheim close to Hannover (northern Germany) by an artist named Bernward, dating back to *circa* 1020 (fig. 19).



AN DOM INC MXV B ERDIV MEM HAS VALVAS FVSILES

Fig. 19 - Bas-relief of the bronze doors of the cathedral in Hildesheim, northern Germany.
Circa 1020 AD (with kind permission of JOCHEN GARTZ)

The scene following the Temptation, fairly realistically rendered, shows Adam and Eve who have already eaten the forbidden fruit. They discover their nudity, and, covering their sex with an object, perhaps leaves, they speak with God. God is asking Adam who ate the fruit, and appears to be pointing at him with His right hand. Adam covers his sex with his right hand and with the left points to Eve. She covers her sex with her right hand and with the left points at the horrendous creature writhing on the ground at her feet, the incarnation of the Tempter. There is a mushroom-tree between Adam and Eve upon which we may note two mushrooms with pointed striated caps. T'his is the "Saint-Savin" type of mushroom (three striated mushrooms). Here, the third mushroom has been consumed by Adam and Eve, as revealed by the broken branch springing from the lower part of the tree trunk. The esoteric meaning would appear to be quite clear. T'he mushroom-tree is realistically rendered with a precision not far short of anatomic accuracy and can be identified as one of the most common Germanic and European psilocybian mushroom, *P. semilanceata* (Fr.) Quél. This mushroom is endowed with a characteristic "papilla" or "papillate umbon" surmounting the cap; this seems to indicate quite clearly that the artist intended to represent precise ly this species of mushroom in his basrelief.

By way of summary, we may note that with the alchemical illustration (fig. 17) we have at least one example of the "Plaincourault" type mushroom-tree with its four characteristics as defined and, here, we are justified in our strong suspicion that the artist wished to represent a psychoactive mushroom, the mushroom in question being *A. muscaria* (or the mushroom of the same genus, *A. pantherina*). With the German bas-relief of fig. 19 we have also found at least one "Saint-Savin" type mushroom, with its three typically striated caps, and here too we are justified in strongly suspecting that the artist intended to represent a psychoactive mushroom (the mushroom in question is a psilocybian). Thus, we have discovered a precise typological differentiation among mushroom-trees in Christian art which corresponds with the variation in naturally occurring psychoactive mushrooms (cf. fig. 20).

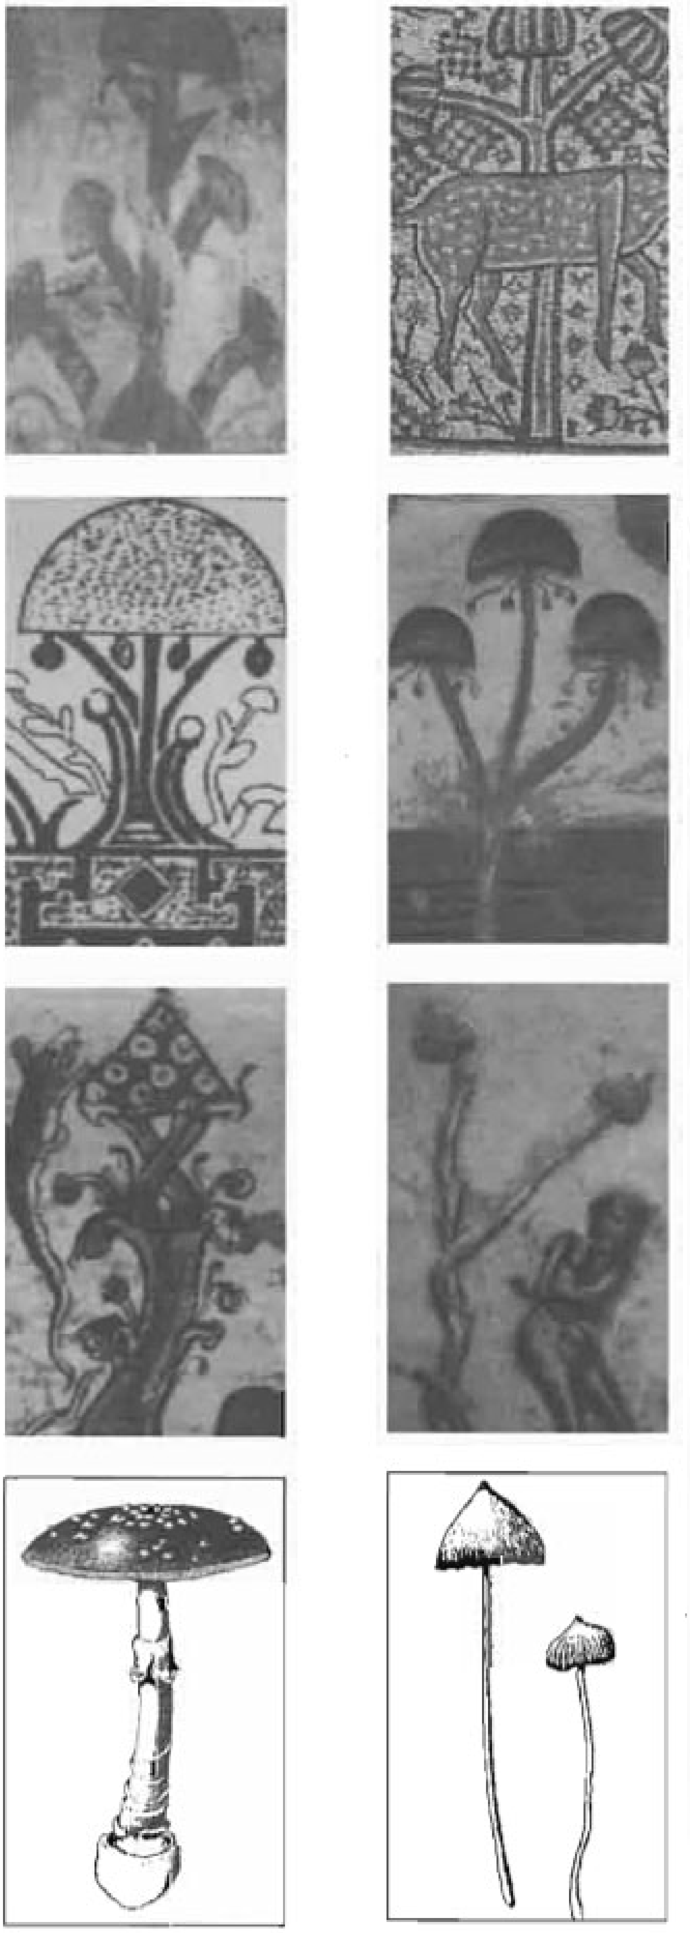


Fig. 20

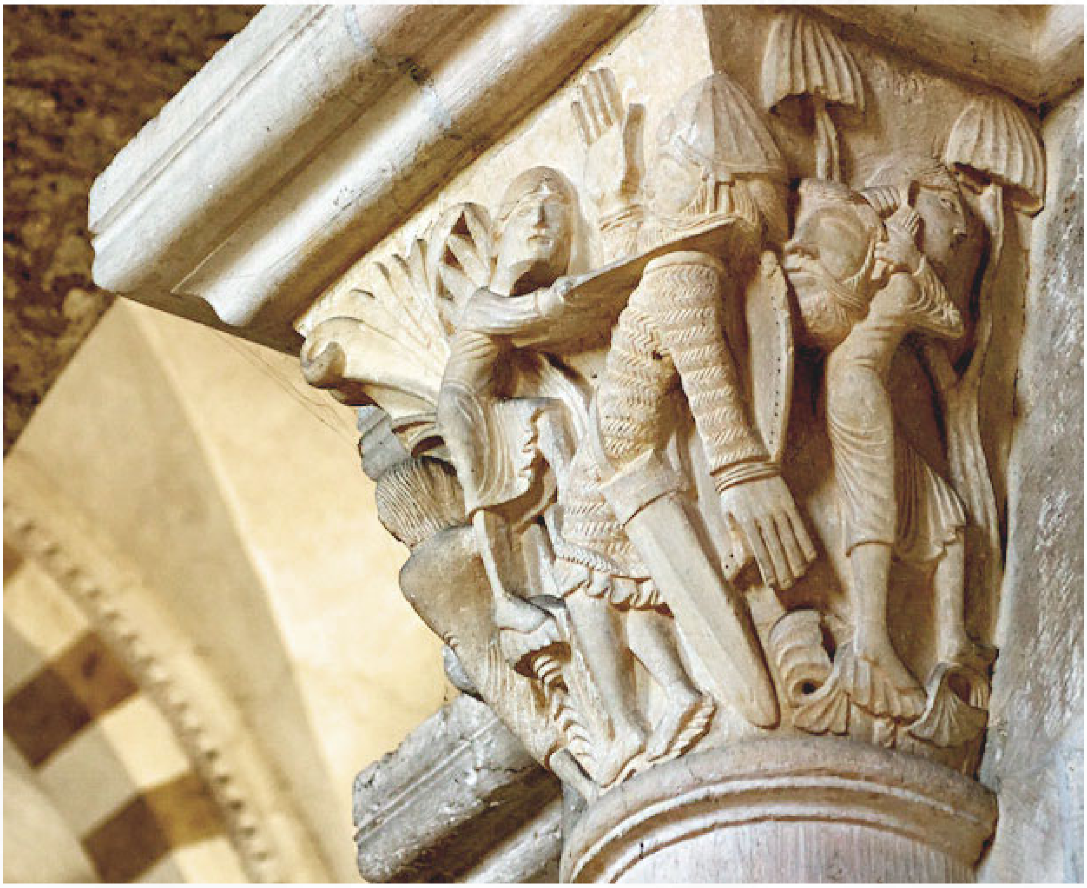
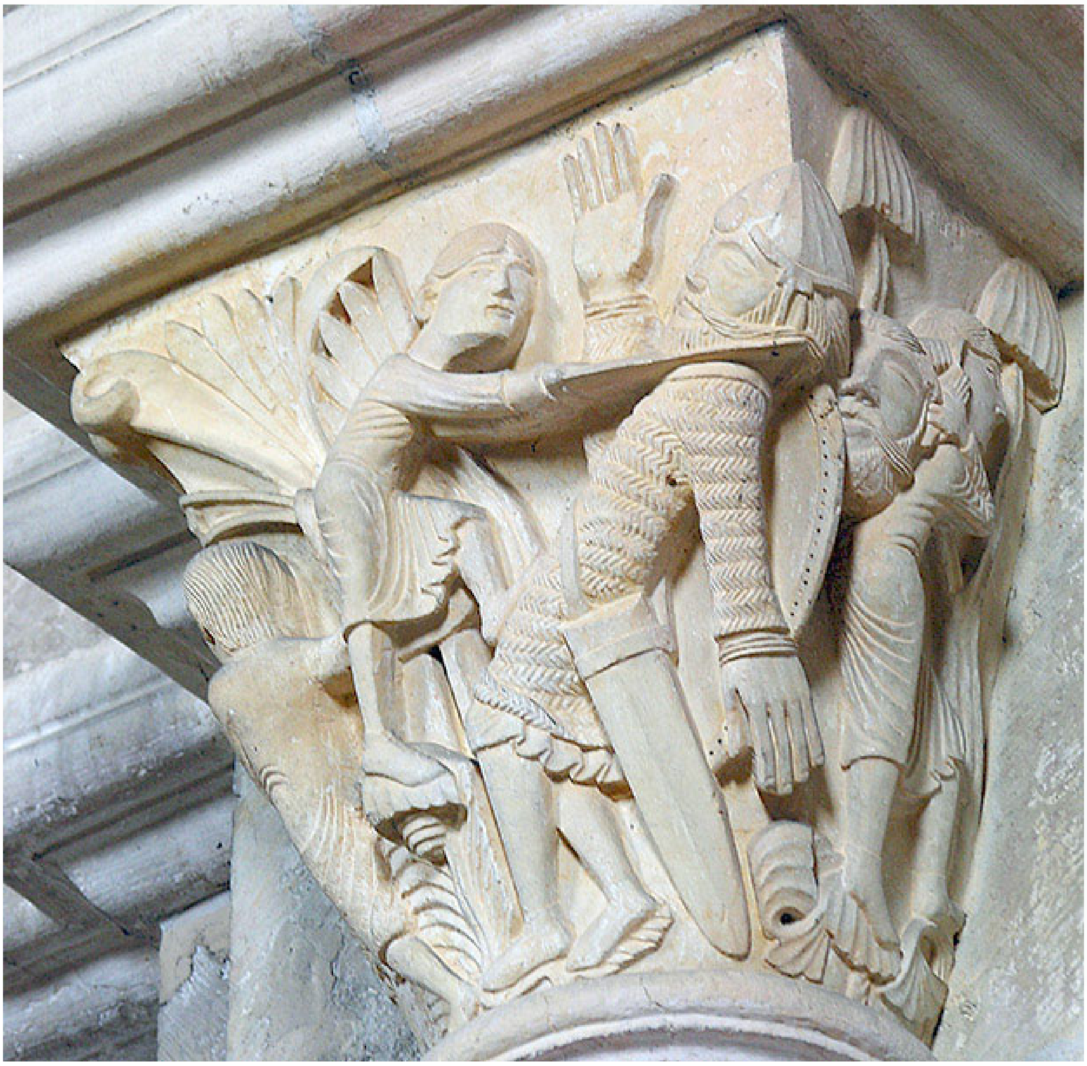
I have recently identified another mushroom-tree on a capital in the famous Romanesque basilica at Vézélay (fig. 21), this too in central France. This basilica's hundred capitals dating back to *circa* 1135 are well-known and are probably the work of one sculptor.

Fig. 21 - Basilica of Vézélay, central France

In figs 22 and 23, we see capital no. 50 with scenes from the biblical account of the struggle between David and Goliath (*I Samuel*, 17). The anterior face shows David decapitating the Philistine giant with his sword; on the right side, instead, we have the next scene in which David carries the head of the giant on his shoulders as a trophy he will display to King Saul in Jerusalem. The artist sculpted a mushroom-tree by David's side in this scene and, if we look carefully, we may note that David, carrying Goliath's head, is walking on some leaves, one of which. belongs to the mushroom-tree. This mushroom-tree might be considered of the "Saint-Savin" type, given the evident striations on the caps of the mushrooms, but here we have only two. If we go back to the Hildesheim mushroom-tree (fig. 19), we will remember that, although there were two mushrooms there too, we have an explanation for the absence of a third one (which in any case existed). Here too, we are tempted to search for the third mushroom. Consider Goliath's helmet in the preceding scene. The shape and striations (grooves, or fluting) of the helmet are quite similar to those of the two mushroom caps of the mushroom-trees. If we examine one side of the capital (fig. 23) and bear in mind that it is located well above the viewer, the "illusion" created if we may cali it that - is of a mushroom-tree with three caps. Far reasons of space, artists often had to eliminate details from scenes and would not hesitate to superimpose motifs and sequences otherwise represented in chronological order and therefore separately. In the Tunisian mosaic at Béja (fig. 7), far example, we have Achilles and the centaur, Chiron. Here, three of the four mushroom-trees are without the third mushroom, probably due to lack of space.





Figg. 22 & 23 - Capital n. 50 from the basilica of Vézélay. *Circa* 1135 AD

Considering this Vézélay capital, one might also be tempted to interpret the object which can only just be seen under David's foot on the anterior face as the "third mushroom". THOUNIEU (1997:149) comments: "David is so small compared to the giant that he has to climb up a sort of plant in order to decapitate him". This plant might be taken for one of the many decorative leaf motifs which are a feature of the Vézélay stonework. But it has a stalk and can hardly be thought of as a branch or petiole, and therefore might be a mushroom. If this is the case, the esoteric message is unfolded before our eyes: to gain enough strength to decapitate Goliath (allegory of the struggle between good and evil), David must "ascend" by means of something which will "imbue" him with courage and strength. Mushrooms, the form of which is the same as that of the mushroom-tree in capital no. 50, appear in the foliage of other capitals in the same basilica. See, for example, the anterior face of capital 26 (fig. 24) representing the 4th century Bishop of Tours, St. Martin, as he preaches (he is known for his incessant efforts to convert pagans). In the middle of this scene, we find a palm tree which VIVIANE HUYS-CLAVEL (1996: 123) interprets as the "tree of the pagans" which St. Martin hurls insults at, the veneration of which St: Martin openly condemns. On the top of the palm tree we see a mushroom. Is it mere chance that a tree believed to be "pagan" should also feature a mushroom? There is something odd about this tree. Stylistically speaking, the mushroom poking out of the palm frond makes little sense; indeed, quite the opposite: it is an anomaly which seems to have been included to set this tree apart from the others and provide it with a separate meaning, as though the mushroom itself was an indication of the tree's "pagan" nature. The Vézélay master was meticulous at his job and the impression is that nothing was left to chance in these capitals. The wealth of allegorical and esoteric material in each scene is evident and, indeed, has been fully acknowledged by all scholars active in this field.

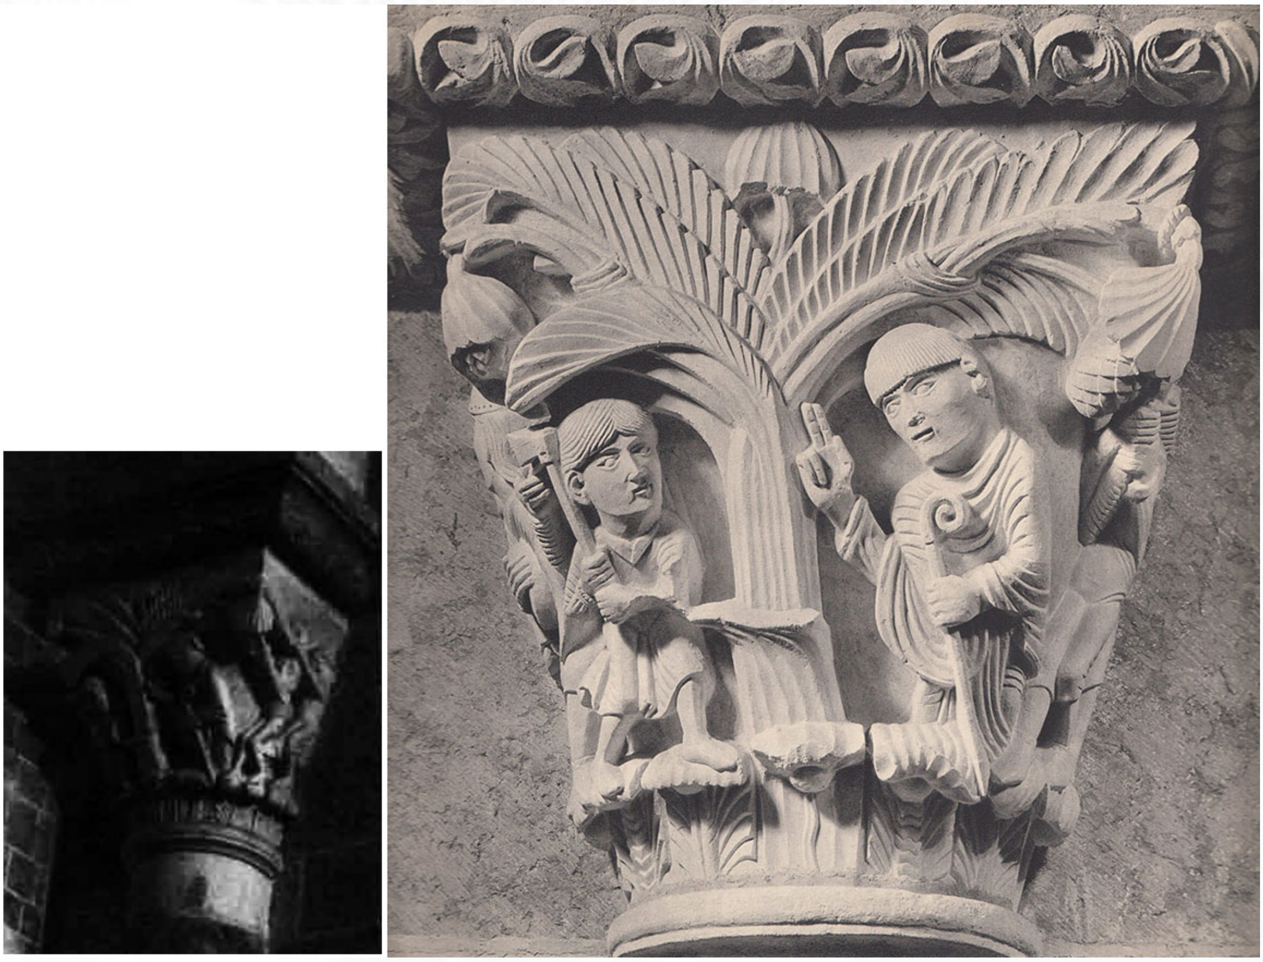


Fig. 24 - Capital n. 26 from the basilica of Vézélay. *Circa* 1135 AD

Lastly, I wish to refer to the observations made by FRANCO FABBRO (1996) on one of the mosaics of the paleo-Christian basilica of Aquileia (Fig. 25) in northern Italy (the Friuli-Venezia Guilia region). The mosaic forms part of the oldest paleo-Christian part of the basilica, known as the "*Cripta degli Scavi*", dated 314 A.D. (cf. MARINI 1994). Among the various subjects - animals, crosses, geometrie symbols - we may note a basket containing mushrooms (Fig. 26). Here, we have no mushroom-tree but mushrooms themselves, represented as such by the artist. Perhaps this is the only existing example known to us to date of the evident representation of mushrooms in an early Christian church.

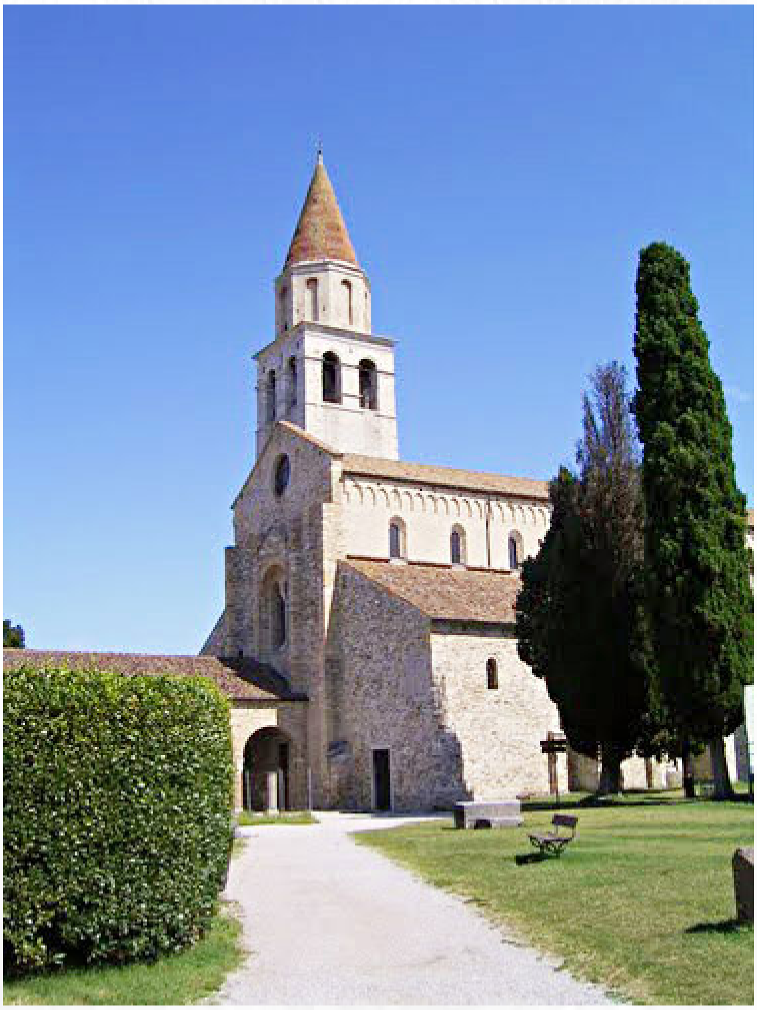

Fig. 25 - Basilica of Aquileia, Friuli-Venezia Giulia, northern Italy

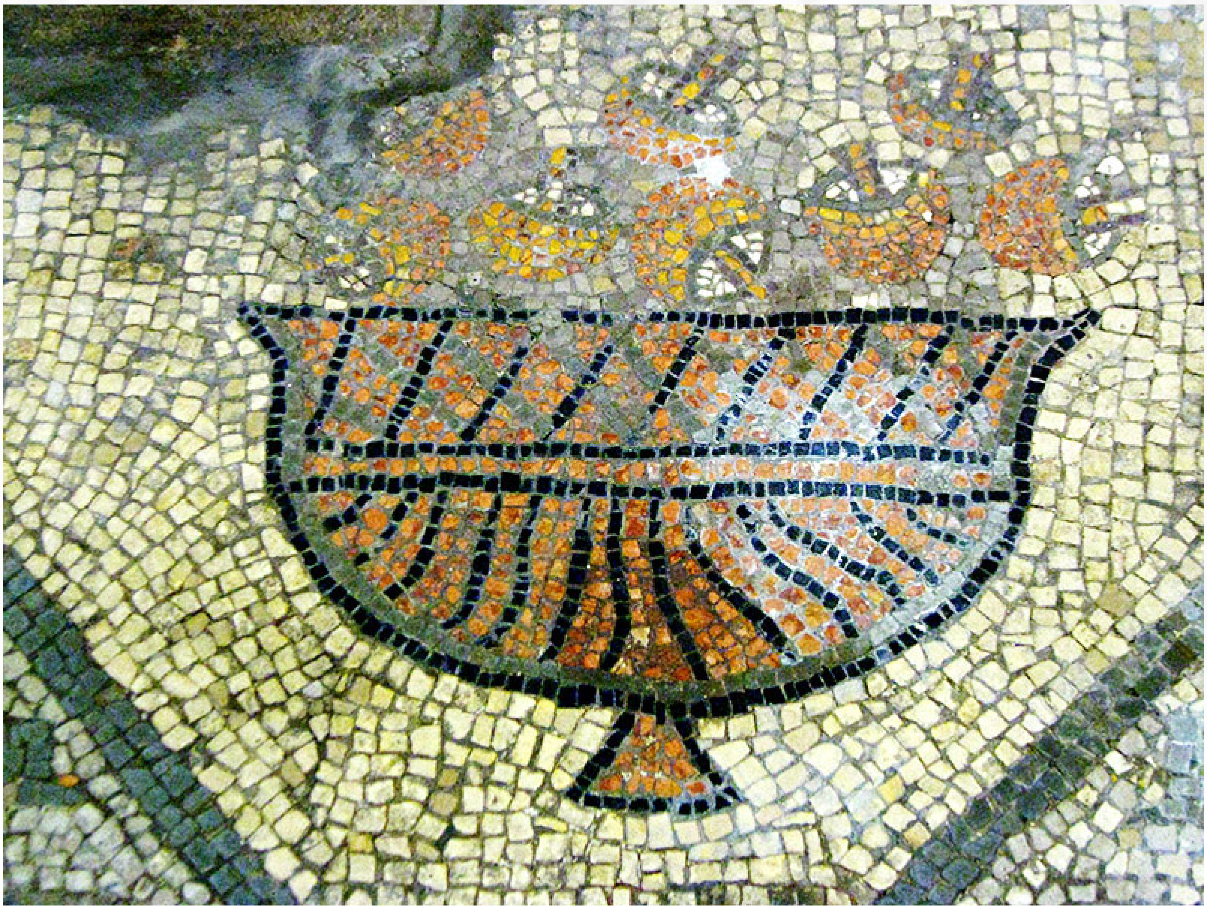

Fig. 26 - Mosaic of the "Cripta degli Scavi" from the Basilica of Aquileia (detail), 314 AD

Fabbro appears to have no doubts as to the species of mushroom presented: fly-agaric. Indeed, he is perhaps too self-assured and hasty in his conclusion that this Aquileia "find" provides corroborative evidence that the early Christians used fly-agaric. As Francesco Festi of the *Museo Civico* in Rovereto and I concluded (FESTI & SAMORINI 1997), the mushrooms represented in the Aquileia mosaic were probably *Amanita caesarea*, also known as "*ovulo buono*" (royal-agaric), an edible mushroom considered a delicacy by the ancient Romans and often included in the figurative works of the Roman imperial period. We based our view on the fact that the mushroom stalks are yellow and not white, this being one of the distinguishing marks between these two species. However, after paying a visit to the basilica I did note that the part of the mosaic corresponding to the inside of the caps, the gills, is white, as are the gills of the fly-agaric, and not yellow (as in the royal-agaric). Furthermore, while the gills of the royal-agaric are always yellow, in some cases the gills and stalk of fly-agaric present gradations of yellow (ARIETII & TOMASI 1975: 106). It was also noted that the artist had circumscribed the various areas of the mosaic to be filled in with different colours with dark-coloured fragments, which means that the wrong colour of fragment would not be able to make its way into another circumscribed zone of another colour. Therefore we may conclude that the artist wished to portray these mushrooms specifically with white gills, and that there is good reason to doubt that these mushrooms are in fact *A. caesarea*. Another feature of this mosaic is that two of the eight mushrooms have stalks which are not entirely yellow but also white.

The Aquileia mushrooms would therefore appear not to be explicitly represented as belonging either to the fly or the royal agaric species. Representation of the royal agaric would not call for subterfuge, but fly agaric would. However, this may be yet another species of mushroom or quite simply a generic "mushroom". It has been hypothesized that the mosaic represents the food (including mushrooms) the faithful consumed during agapes (mysterious ritual feasts held by early Christians) (Brusin & Zovatto 1957, *cit. in* FABBRO 1996).

I fully appreciate just how complex an investigation of this kind is, how many pitfalls await the researcher, and how easily he may be "led up the garden path". I therefore prefer not to offer my own interpretations of the various works of art presented here.

In any case, we may confidently conclude from what has emerged that justifications do exist for serious and unprejuduced ethnomycological study of early Christian culture, and it is our hope that such studies will take place.

Abstract

The author presents his research on ethnology of psychoactive mushrooms developed during the last 20 years. in the core of the Sahara Desert, on a group of rock paintings, dating back to 9000-7000 B.C., mushroom effigies are represented repeated ly. The polychromic scenes of harvest. adoration, and the offering of mushrooms lead to suppose we are dealing with an ancient hallucinogenic mushroom cult. Another significant documentation refers to an old mushroom religious cult located in the Kerala State, India. It belongs to a megalithic, pre-Indoeuropean culture dating back to the 1st millennium B.C. The so-called *kuda-kallu* ("umbrella stone") may resemble a large mushroom. In Europe, an effigy of a mushroom, very likely fly agaric, inserted in a scene with shamanistic connotations, is calved on a rock engraving of Mount Bego, France, dating back to 1800 B.C. Further important archaeo-ethnomycological documentation is to be found in the Greek culture. in particular, in a 5th century B.C. bas relief from Pharsalus, the two goddesses of the Eleusinian Mysteries, Demeter and Persephone, are represented, showing each other objects, two of which have a mushroom like shape. This bas relief takes us to the very heart of the controversial issue of the Eleusinian ethnobotany. Finally, various examples of the so-called "mushroom trees" to be found in early and medieval Christian artwork from a number of churches are discussed. These works of art are considered from the point of view of the possible esoteric intention of the artists in their inclusion off the mushroom motif. The typological differentiation among the "mushroom trees" would appear due to a natura l variation among psychoactive mushrooms.

Key Words: Ethnomycology, archaeology, psychoactive or hallucinogenic mushrooms.

My contribution is focused on the research carried out on psychoactive mushrooms over the past 20 years following the pioneering work of Robert Gordon Wasson, who is considered the father of modern ethnomycology (Wasson and Wasson, 1957; Wasson 1968, 1980). The new information can be found in the Old World, Africa and Europe in particular, because these geographic areas have been looked into in any depth only since the 1980s.

The information presented in this article refers primarily to the use of psychoactive mushrooms in the past, that is, information from research carried out in the field of archaeo-ethnomycology.

The most up-to-date maps of the distribution of psychoactive mushrooms show the presence of these mycetes - psilocybians in particular - roughly throughout the world, and numbering more than 200 species.

African ethnomycology

The African continent, where the use of psychoactive mushrooms was previously unknown, reveals now what appears to be the oldest proof of the knowledge and use of this kind of vegetable; the findings are located primarily in the Sahara desert, an area where mushrooms are currently extremely rare.

Before turning into a desert, the Sahara region was cut across by rivers and lakes and was covered by a lush plant life and populated by human tribes. These peoples left behind a rich variety of rock paintings that have been preserved by the desertification and consequential dehydration of the area.

The ethnomycological documentation I have identified, also following two research trips during the 1980s, belongs to the characteristic "Round Head" period (Samorini, 1989, 1992). The absolute chronology of this pictorial epoch is still uncertain, although it is generally estimated to have been between 9000 and 8000 and 7500 and 6500 years ago. The highest concentration of rock paintings is found in Tassili (Algeria); these skillful findings can also be found in Tadrart Acacus (Libya), Ennedi (Chad), and more sporadically in Djebel Ouenat (Egypt) (Sansoni, 1994).

One of the most significant and comprehensive scenes is in a shelter in Tin Tazarift (South Tassili); it portrays a series of masked individuals lined up and in hieratic/dancing position, encircled by long and waving geometrical design festoons of various kinds, which quite likely have a very specific meaning now lost to us (Fig. 1). Each dancer is holding a mushroom-shaped object in his right hand: surprisingly, two dotted parallel lines are depicted stal1ing from the point of contact between the hand and the mushroom-like object that reach the central point above the head. Two horns then originate from this point. The double line could denote an indirect connection or an immaterial fluid passing between the object held in the hand (or the act of holding it in one's hand) and the human mind. This association fits in well with a mycological interpretation if one keeps in mind the universal mental value (often mystical-spiritual in nature) of experiences involving psychotropic mushrooms.

In a shelter in Tin-Abouteka, again in Tassili, a pattern appears at least twice connecting mushrooms with fish, a unique symbolic association among the ethnomycological type cults (Fig. 2). Two mushrooms are portrayed across from each other, and perpendicular to the fish drawings, at about the height of the caudal region. Further up, other fish can be seen, with similar features and size as the others, but without the two mushrooms at the sides.

This ethnomycological-type cult shows a certain richness in the repetition of the figures so as to suggest a definite associated conceptual structure. Two southern Tassili characters (from the Aouanrhat and Matalem-Amazar areas; Figs. 3 and 4 are such examples, both about 80 cm in height with the mask and stance typical of the period (bent legs and arms folded downwards). Another common characteristic that largely helps la identify them consists of the presence of lance-type objects that come out of the forearms and thighs, while others are grasped in the hands. In the Matalem-Amazar figure, these objects are dotted all around the outline of the body.

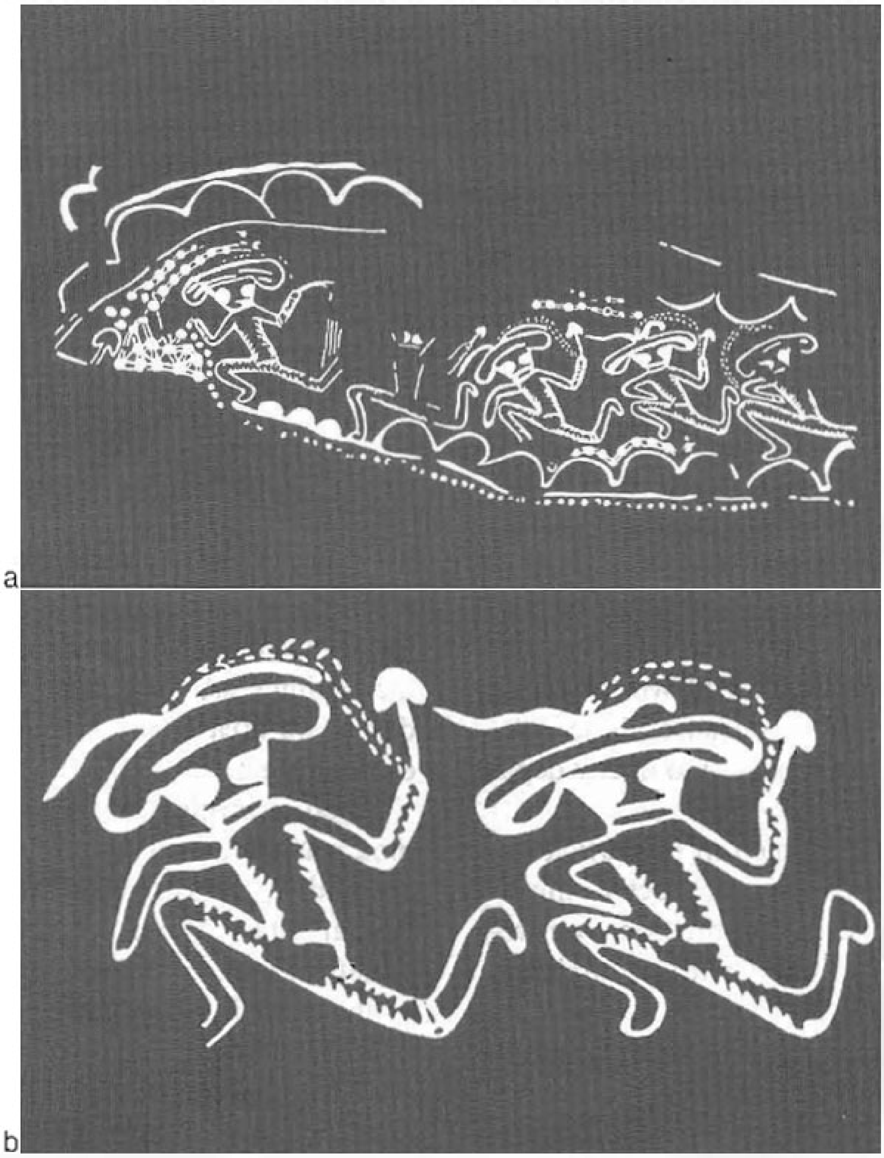

Figure 1. (**a**) Design from a prehistoric rock painting, Tin Tazarift, Tassili, Algeria; (**b**) delail.

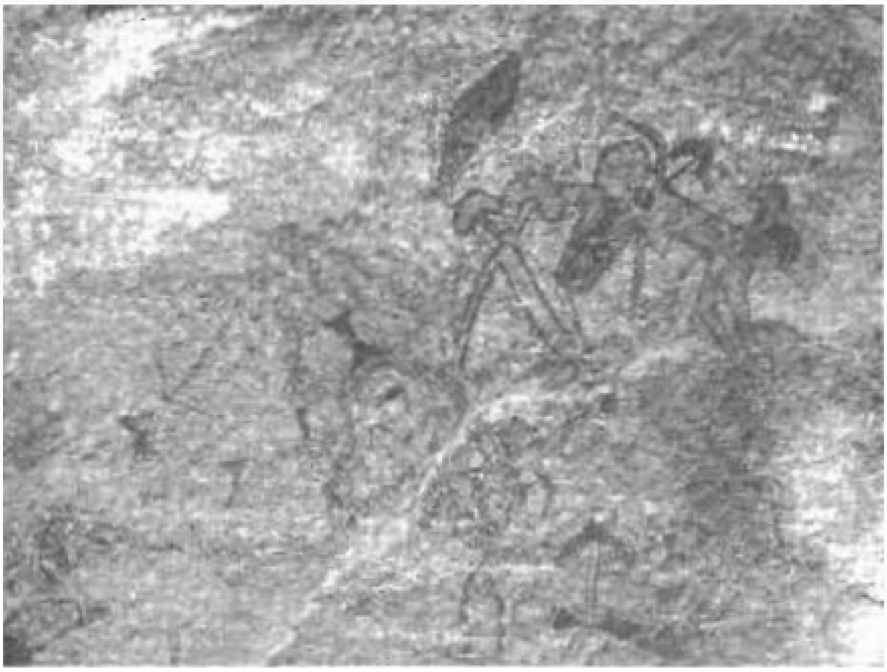

Figure 2. Rock painting from Tin Abouteka, Tassili, Algeria.

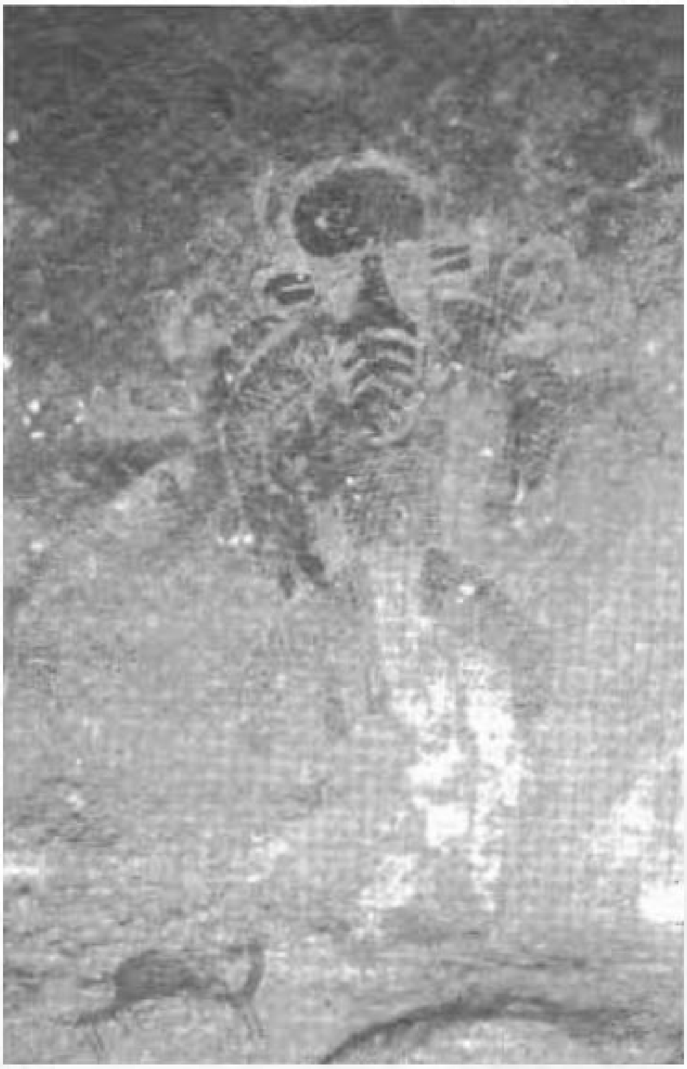

Figure 3. Rock painting from Aouanrhat, Tassili, Algeria.

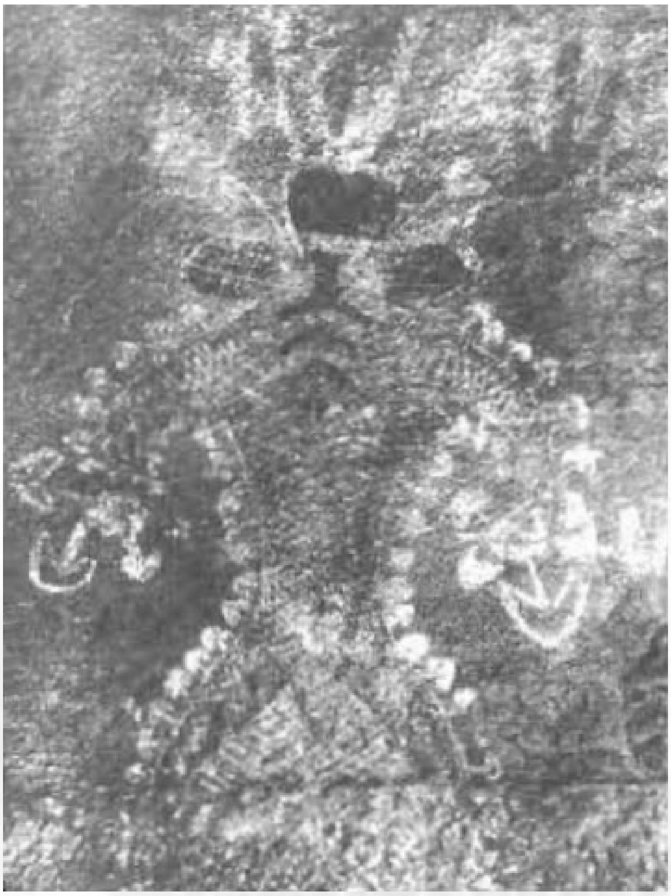

Figure 4. Rock painting from Matalem-Amazar, Tassili, Algeria.

In these cases, too, the lance-like elements represent the same symbol as was found in various scenes from the Round Head period, and are interpreted here as mushrooms. Said elements have been read by many authors as the tips of arrows, rowing boats (Mori, 1975), vegetables, even flowers (Lhote, 1973, pp. 210 and 251), or as unidentifiable enigmatic symbols. The shape that more closely matches that of the cult object in question is the mushroom, mare than likely of the psychotropic kind, whose socio-sacred use is marked in the scenes showing its harvest and offering, as well as in the expressive dance rituals, in the phosphene geometric work and also in the visionary productions from Tassili.

The fungiform symbolism seems to be represented in two different ways: as a realistic object held in the hands of the figures (usually masked or with special headdresses), or as an element "coming out" of the body. There are even cases where the figure's head is in the shape of a large mushroom.

The Round Head artwork is strewn with figures, of various degrees of anthropomorphism, with a fungiform head. Some have a pointed "cap head" or with a papilla, others hold a leaf or branch in their hand. In many cases, archaeologists themselves labeled the figures as having "fungiform heads" (*tête-champignon*), without actually attaching any ethnomycological symbolic value to it, that is, without making a direct reference to mushrooms. This is the case, for example, of the paintings found in the Algerian region of Immidir, north of the Hoggar mountain range. These paintings may very well belong to the Round Head period (Muzzolini *et al.*, 1991).

Several data suggest the existence of an ancient psychoactive cult, with a complex variety of botanical species, accompanied by associated mythological representations. It is not easy to devise a hypothesis about the mushroom species that are portrayed - their biochemical characteristics are partly at the root of the kind of mental experience they provide - as they belong to a flora that is no longer present in today's barren Sahara basin. The paintings let one infer the presence of at least two species, one of small size, often with papilla on the very top and with similar characteristics to most of the currently known *Psilocybe* hallucinogens, while the other is of larger size (such as *Boletus* or *Amanita*).

The polinimetric analyses carried out on Tassili highlighted the kind of mountain vegetation that would have been found there during the Round Head period, consisting of various conifers and oak (AA.VV., 1986: 97); it can be assumed that the depicted mushrooms were part of this belt of forest and that, at least the larger sized ones, relied heavily on some of these tree species (symbiotic mushrooms).

In the less than specific debate on this Saharian documentation mentioned in popular psychedelic literature, these paintings are wrongly considered to belong to a Neolithic civilization, that is, a civilization of breeders. They belong in fact to a Palaeolithic, or epi-Palaeolithic civilization, existing toward the end of the Stone Age. Herein lies the most important consequence of this Saharan age: for the first time we come across evidence of the use of psychoactive mushrooms in the Stone Age. Thus the hypothesis by Wasson *et al*. (1986) that the knowledge of sacred mushrooms originated in the Stone Age appears to have been confirmed.

In equatorial Africa, other ethnomycological details are being uncovered. One of the most interesting findings refers to an ethnic group from the Ivory Coast.

The following narration is taken from a recent French book, written by herbal therapist Yves Soubrillard (1992). The author met Souleymane, a traditional healer belonging to the Mao ethnic group from the Ivory Coast, at an African congress. Souleymane sold the herbal therapist, at a very high price, some of his secrets about magic plants. He invited the therapist to spend some time in his village and there he revealed to him his knowledge concerning various mind-altering plants, among which were two psychoactive mushrooms. Soubrillard had a chance to tryout the effects of both mushrooms.

The first of these is called *tamu*, which means "knowledge mushroom;" it was identified by the herbal therapist as belonging to a *Conocybe* species (fam. Bolbitiaceae). The second is called "action mushroom," and is identified with a *Stropharia* species (fam. Strophariaceae).

It is more than likely that there was some truth behind the account (which may have been rendered intentionally confused and contradictory) made by Soubrillard of his experience, and it does deserve more serious and competent investigation.

By observing other cases of intentional use of psychoactive mushrooms in Africa, I remember that Frantz Thille (1990), who spent some time with the Babinga Pigmies from the Central African Republic, learned that this nomadic tribe is aware of the hallucinogenic nature of certain forest mushrooms; the fungi, however, were reserved only for use by the witch doctors (the *n'gagna*) for their trances. Robert Graves (1994 [1957]: 91) also reported about psychoactive mushrooms based on information provided to him by a Dr. Sinclair Loutit. Dr. Loutit lived for many years in western Africa and, according to him, the Ibo people of Nigeria also reserved mushrooms exclusively for the witch doctors' rituals, in which human flesh was also eaten. In Madagascar there are mushrooms that bring about a kind of merry intoxication; among them is the Tanala's *tsigegy*, which grows on the rotting trunks of fallen trees. It is not, however, known what species it belongs to (Heim, 1978: 37).

In 1983, Adrian Morgan (1995: 169) told the story of a friend who went to Zimbabwe to teach English in the Harare region. One day two students offered to take him to the forest to look for, and eat, mushrooms and roots that would lead to him becoming intoxicated. The professor didn't accept the offer.

If all these African ethnographic details were confirmed (for a full review cf. Samorini, 2001), we would find ourselves facing the most extensive and differentiated "complex" concerning the use of psychoactive mushrooms in the world. This would portray Africa as the continent where the uses, beliefs, and mythologies about hallucinogenic mushrooms, probably from very ancient times, are best preserved.

The 'Umbrella Stones' from Kerala

Let us move on to Asia now, and notably to south India and to the state of Kerala. A rather mysterious megalithic prehistoric culture characterizes this land, particularly regarding its origins. This civilization from the south Indian Iron Age shows dolmen, menhir, and other stone monuments, remarkably similar to the megalithic monuments from northern Europe, although very distant both geographically and chronologically.

Typical megalithic monuments from Kerala are the *kuda-kallu* (Fig. 5), which means "umbrella stones" in the Malayalam language; archaeologists have classified them as dating from between 1000 B.C. and 100 A.D. The most important concentration of these monuments is found in the interior of the Trichur and Palghat regions north of Cochin, in central Kerala (Krishna, 1967).

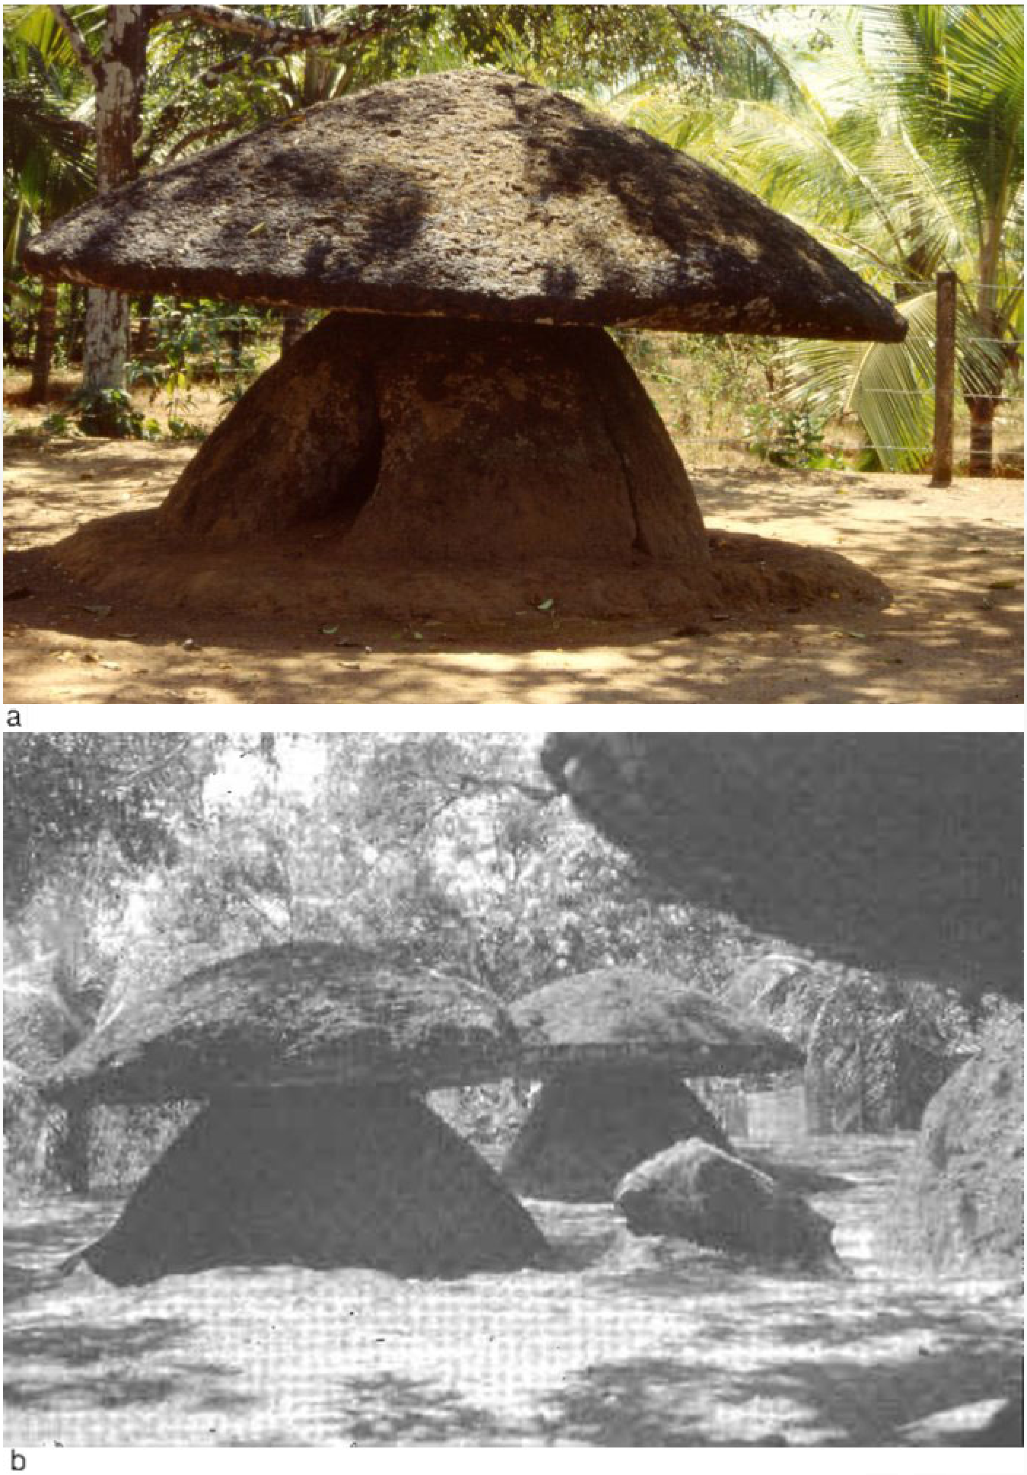

Figure 5. (**a,b**) Megalithic "umbrella stones" (*kuda-kallu*) from Arryannor, Kerala, Southern India (1 st millennium B.C.).

On average, the *kuda-kallu* measure 1.5-2 m in height and 1.5-2 m in width. They are made up of four stones cut into half segments, joining at the bottom and holding up a fifth stone that is flat on the side on which it is resting and convex and even in shape on the other side. The entire complex would seem to resemble an umbrella, or, even better, a huge mushroom. These monuments are not graves. It was suggested that they were archaic prototypes of the Buddhist stupa (Longhurst, 1979). Culturally, the *kuda-kallu* is strongly associated with the umbrella, an archaic symbol of power and authority and sacredness that was widespread in ancient Egypt among the Assyrian and the eastern civilizations.

Although the connection between these stone monuments and the umbrella is plausible, I have put forward the hypothesis whereby they were supposed to portray mushrooms, as they are very similar in shape (Samorini, 1995b).

The name *kuda-kallu* was clearly given at a later time, no doubt after the time when the monument was erected. There is no re liable evidence that it has the same meaning as the name given to it by those who built it. Besides, as Longhurst confirms, it is more than likely that during the Asoka period, some centuries after the erection of the *kuda-kallu*, the royal umbrella was associated with the stupa, for which the *kuda-kallu* are seen as the forerunners, both from an architectural and a symbolic point of view.

In his book *Soma*, Wasson (1968: 66) makes a brief reference to the Kerala "mushroom stone," although he did not actually see them. I believe that if he had had the opportunity to go to the Arryannor sites and had found himself before the seven *kuda-kallu*, he would have been very impressed.

Near the *kuda-kallu* are other megalithic monuments: menhir, dolmen, stone circles, and "hood stones." These "hood stones" are very interesting because of something I noticed On some of them. They are made up of a single stone that covers over an underground grave. I saw numerous round cavities on some of them, dispersed over the entire upper surface of the stone (Fig. 6). The point of these cavities is incontestable: they served a clear decorative purpose and also highlighted a distinctive characteristic of the object that the "hood stones" were meant to represent (Fig. 7). One must take into consideration that the most practical way of representing the fly agaric or the panther-cap's white spots on stone was by scooping out round boles in the surface. At this point, the hypothesis that the " hood stones" and the *kuda-kallu* were meant to specifically represent either one or both of these mushroom species becomes much more convincing.

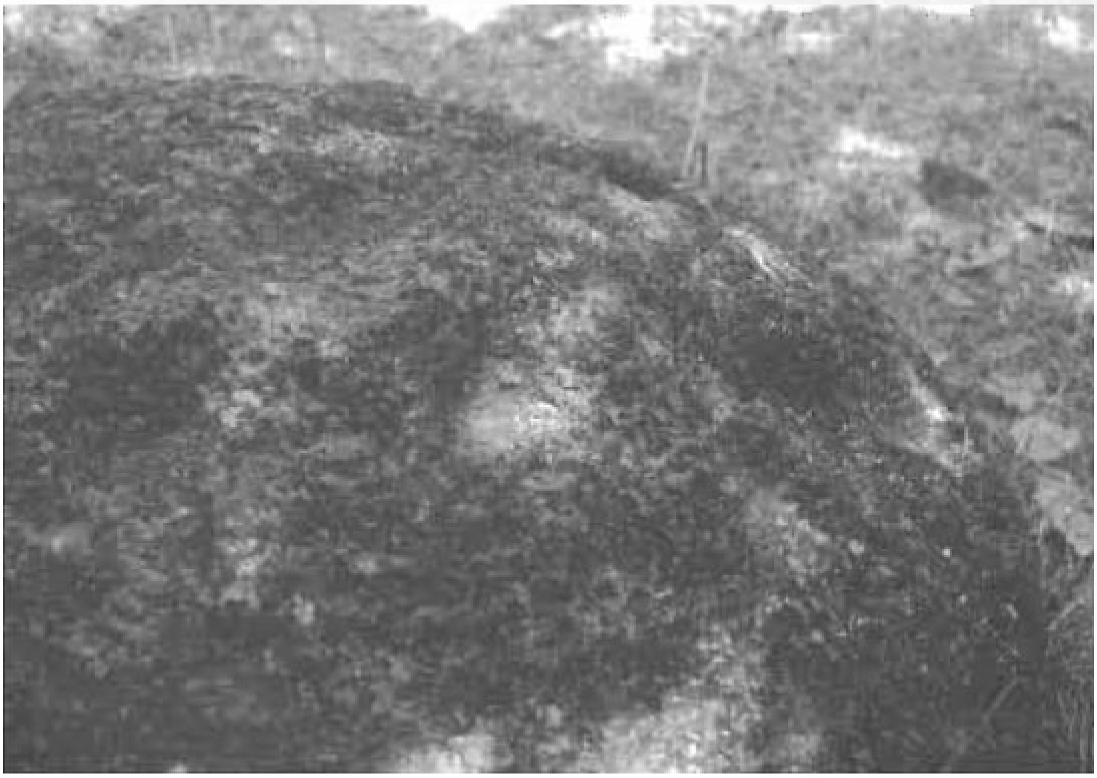

Figure 6. "Hood stone" (*topikal*) from the megalithic site of Cheramangad, Kerala, Southern India.

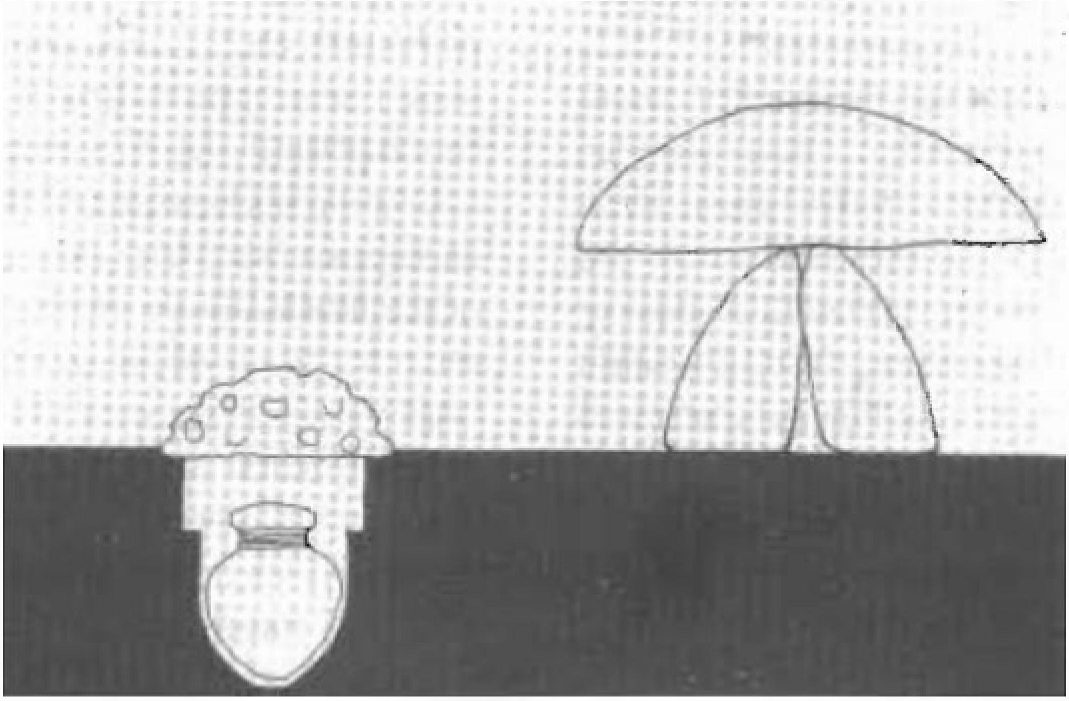

Figure 7. Design of a *topikal* and a *kuda-kallu*.

Amanita muscaria and *A. pantherina* are present in south India, in the coniferous forests of the Kodaikanal region (in Tamil Nadu), about 80 km from the megalithic sites. In this same region, different species of psilocybian mushrooms Can be found: *Psilocybe cubensis*, *P. zapotecorum* var. *aztecorum* and var. *bonetii*, *Copelandia cyanescens*, and so forth (Natarjan and Raman, 1983). The Kodaikanal region is a place noted for the so-called "psychedelic tourism," in which the psilocybian mushrooms are particularly involved today.

If the *kuda-kallu* really represented mushrooms, they therefore represented psycho active mushrooms, that is, mushrooms that allowed visions of the "other side," of life after death; as such, they were far more suitable than others (than edible mushrooms, for instance) to being associated with funeral cults.

The hypothesis by Wasson (1968) that identified the sacred drink and the divinity *soma* in the *ṚgVeda* - the most ancient Indian holy text with the fly agaric is well known. If the *kuda-kallu* were trying to portray psycho active mushrooms, then this poses the question already raised by Wasson: what relationship is there between the megalithic *kuda-kallu* cult and the *soma Veda* cult? There doesn't seem to be any direct connection, in the sense that the *kuda-kallu* is not a symbol of the cult originating or influenced by the *soma* cult. These monuments were erected by pre-Indo-European Dravidian populations. The cult associated with the *kuda-kallu* developed in a period preceding the Ari's contact with south India: the Ari had already left behind the knowledge of the original *soma* and instead worshipped using substitutes.

The megalithic cultures of south India and Europe share a number of common features, even though there is a chronological difference between them of at least a thousand years: a distance that appears to be a serious obstacle to those theories that would have the former civilization originating directly from the latter. Nevertheless, the similarities in Some of the characteristics of the two cultures are surprising and involve the shape of the *kuda-kallu* itself. The shape of some British and northern French dolmens brings the *kuda-kallu* dolmen to mind. Also, the whole range of European megalithic works should be subject by accurate ethnomycological research.

To corroborate this, one only has to take a look at the rock engravings on two of the monoliths in the most famous north European megalithic ceremonial site of Stonehenge (monoliths which have been classified by archaeologists with the numbers 4 and 53). The engraved images (Fig. 8) are part of the same figurative motif, interpreted by archaeologists as the symbol representing a sacrificial axe - an object that has actually been found in megalithic burial sites. Nevertheless, the variations in the shapes of the engraved axes seem to be unusuall with respect to axes shown on other monuments from the same megalithic culture. The unique characteristics of the Stonehenge axes are peculiar to this archaeological site and are such as so justify an ethnomycological hypothesis (Samorini, 1995b). As I recently maintained in my ethnomycological analysis of

Greek culture, "All too often researchers base their arguments on largely accepted opinions when interpreting unknown and repeated symbols found in archaeological documents. Maybe this is to avoid hurting the feelings of the author who - sometimes over a hundred years before - first gave his interpretation, or maybe it is simply due to interpretative indolence" (Samorini *et al.*, 1995: 321).

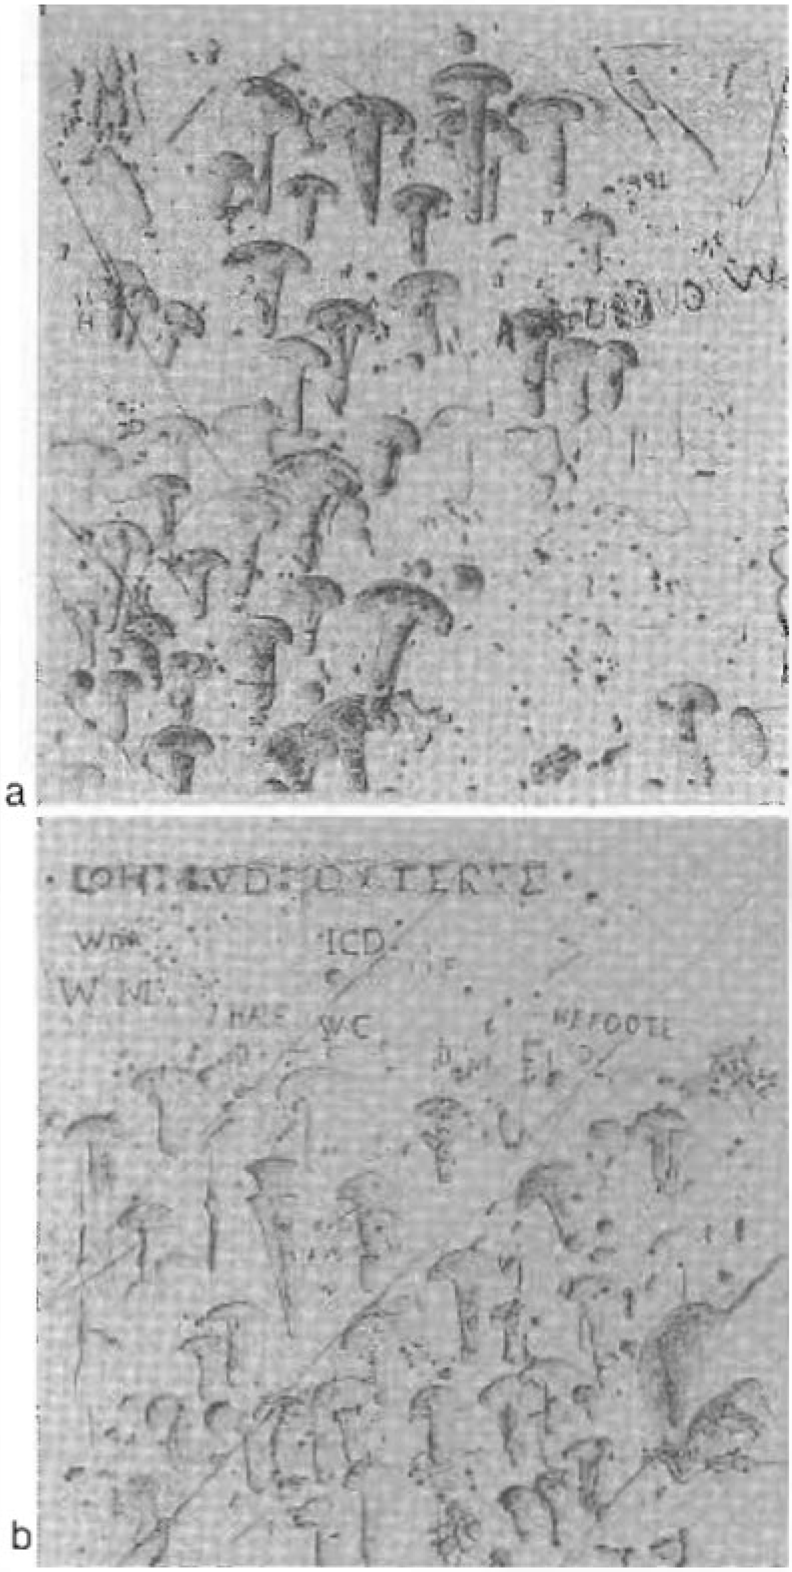

Figure 8. Design of rock art engraved on monoliths no. 4 (**a**) and no. 53 (**b**) from the megalithic site of Stonhenge (England).

The same evaluation holds both for the Stonehenge engravings and for the Kerala *kuda-kallu*. The *mushroom stones* of Guatemala were interpreted in the same way - for a long time they were stubbornly read as phallic symbols or pestles for mortars (Lowy, 1981).

The documentation about Stonehenge and Kerala suggests that the knowledge of the fly agaric was not unique to Indo-European civilizations; it will not surprise me therefore if, one day, the discovery that an archaic cult which made use of this mushroom will be made known, perhaps in southern Africa, that is, totally cut off from any Indo-European influence.

The Mount Bego rock-engraving

An interesting representation of mushrooms is seen in the rock art of the Maritime Alps of southern France. This document, noted by myself in the mid-1980s, was recently brought to the fore by a Frenchman named Patrick Duvivier and myself (Duvivier, 1998; Samorini, 1998b).

A mountain called Mt. Bego, located in the highest area of the Maritime Alps, has always been considered to be sacred since ancient times. On this mountain, and in the nearby Valley of Marvels, are thousands of rock engravings. Different stages and styles can be identified which span a period beginning in 2500 B.C. and running until the first decades of our own age.

In the highest part of the Valley of Marvels is an engraved boulder that is considered to be one of the most significant finds in the entire region's rock art; the boulder is commonly known as the "Altar Rock," and on its face is a scene of the so-called 'Tribal Chief." The rock itself is red-crimson in color and rises above a smooth, wide, rocky surface covered by hundreds of engravings. The rock stands like an altar on a history-seeped surface, in a position that dominates the valley, and so appears to be the central element of the cult associated with rock art (Fig. 9). It has been dated back to the first part of the Bronze Age, around 1800 B.C. (Lum1ey *et al*., 1990: 45).

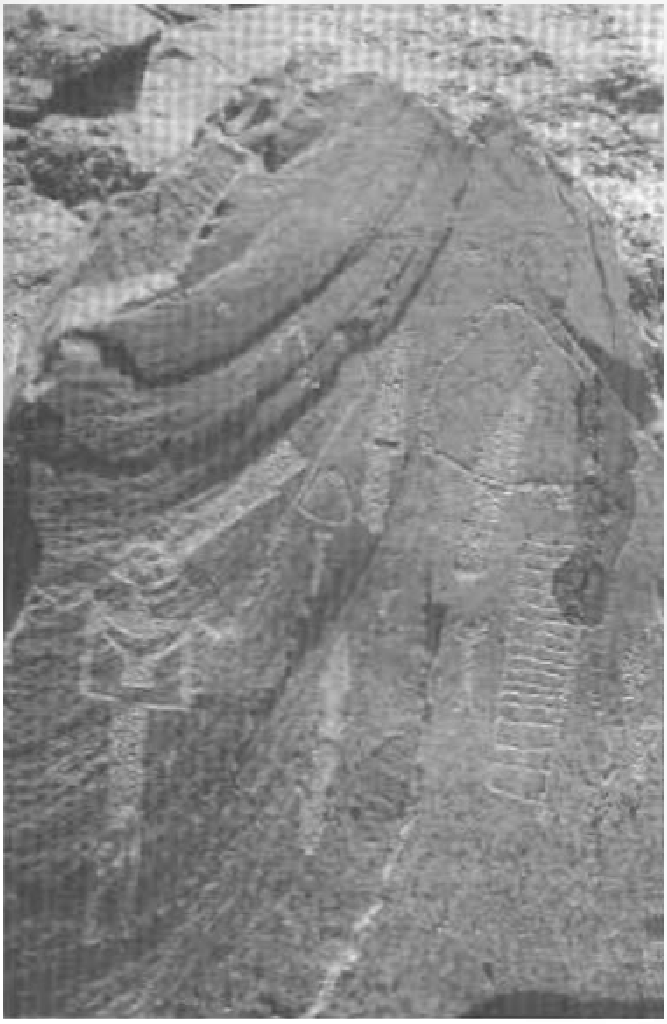

Figure 9. The "Altar Rock" prehistoric engraving from Valley of Marvels (Mount Bego), Southern France (1800 B.C.).

On the rocky "altar" surfaces some daggers, a stairlike design, a little figure in a praying position, and a larger anthropomorphic figure that was wrongly named the "Tribal Chief" - it is most probably a shaman - are engraved. Let us now consider the fungiform image in the scene (Fig. 10): it is on the right of the large anthropomorphic figure, next to the "dagger" or "bolt of lightning" hitting him on the head. This object has been interpreted in turn as an abstract design, a stylized bovine skull, and more frequently as a dagger or other ritual weapon. It is nevertheless difficult to see any kind of weapon in them. There are two details that may escape the attention of an archaeologist, although not the careful eye of a mycologist, which lead rather firmly to the interpretation of the object as a mushroom of the *A. muscaria* species. The first element regards the thickening seen in the upper part of the "stem," which would seem to portray the ring that runs around *Amanita* mushroom stems. The second detail concerns a collection of pointed engravings found on the top part of the "cap."

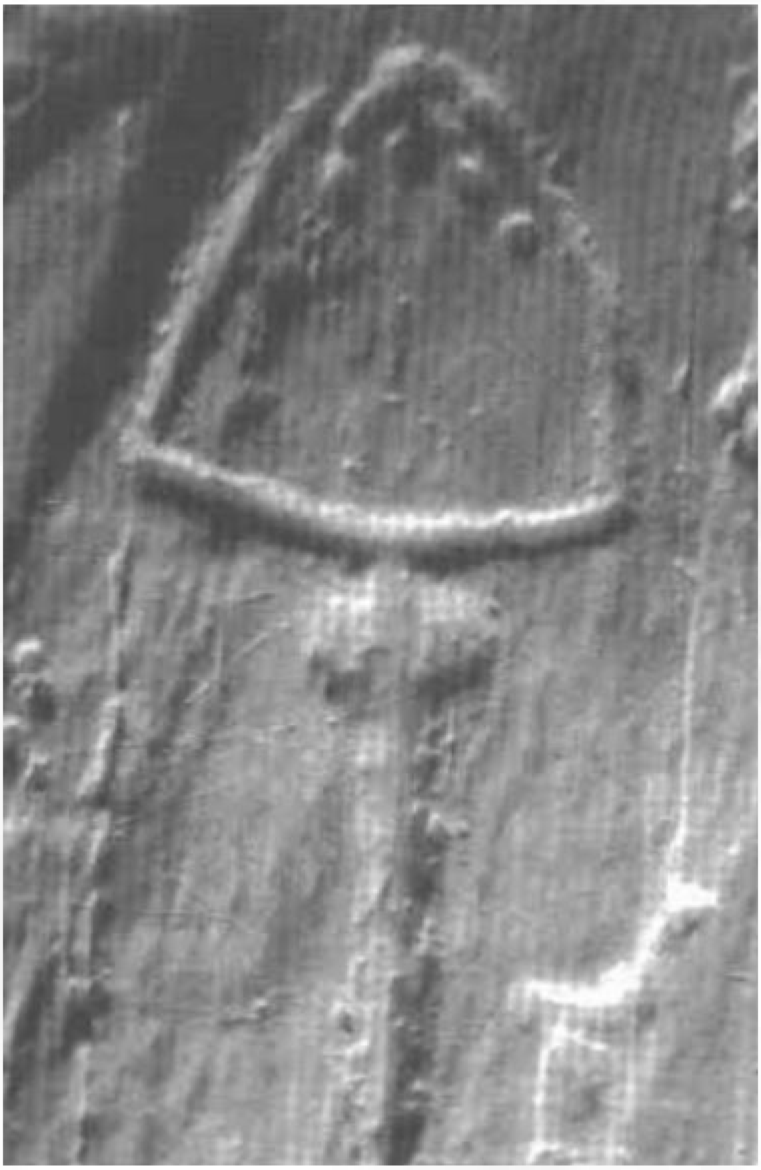

Figure 10. Detail of the mushroom effige in the "Altar Rock."

Let me remind you that the presence of "little dots" - either painted or engraved - on the image of the surface of a mushroom cap in a religious scene denotes almost without fail the *A. muscaria*, Or the related and equally psychoactive *A. pantherina*. Finding mushrooms in a religious context leads one to identify it as a hallucinogenic-type mushroom, that is, as a kind of vegetable whose ingestion induces mental experiences generally interpreted in terms of enlightenment and mystic-religious visions. Hallucinogenic mushrooms with "little dots" on the cap are typically either *A. muscaria* or *A. pantherina*. Going back to the "Altar Rock" scene at Mount Bego, the entire setting would seem to have shamanic connotations owing to the images of mushroom and stairlike drawings (perhaps a real stairway) - key elements of basic shamanism.

The Pharsalus Bas Relief

Let us move on now to Greek culture. In this section, I will confine my description to the so-called "Pharsalus Bas Relief" (Fig. 11). Dating from the second half of the 5th century B.C., it is currently preserved in the Louvre Museum in Paris (no. 701, titled "The Exaltation of the Flower" in the museum catalog). Various scholars have wanted to see represented in this exhibit the two goddesses of the Eleusinian Mysteries Demeter and Persephone - in the act of showing or exchanging certain objects, interpreted more or less as flowers (Baumann, 1993).

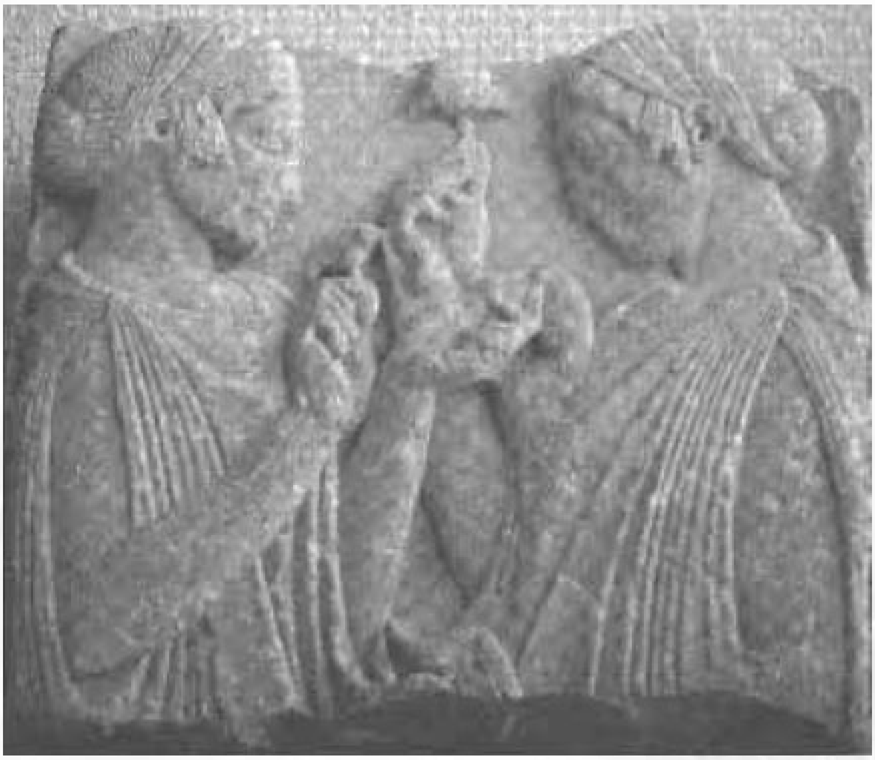

Figure 11. Pharsalus bas relief, from Thessaly, Greece (5th century B.C.) (Louvre Museum).

In actual fact, the object held in the hand of the figure on the right-hand side of the scene (likely, a younger looking Persephone) evokes more easily the shape of a mushroom rather than of a flower. Also the way in which the object is held in the hand, squeezing the inferior part of its "stalk" between the two fingers, is reminiscent of the way one holds a mushroom in ones fingers to show it. Robert Graves first proposed a mycological interpretation for this work of art in his book *Food for Centaurs* of 1956, in which he did not include a picture (according to the Spanish version of 1994). From his observation of the exhibit he concluded that the "fly-agaric is at the origin of the prophetic inspiration of the Eleusinian Mysteries" (Graves, 1994 [1956]: 92). A curious fact is that he brought it to R. G. Wasson's attention already in the distant 1956, which is tantamount to saying that Was son was familiar with this document some 20 years before he and his colleagues proposed the ergot as the Eleusinian entheogen (Wasson *et al*., 1978). But he did not discuss it in his writings.

In a preliminary way I have presented and discussed this document in other places (Samorini *et al*., 1995; Samorini, 1998a). In the bas relief three hands are distinguishable, each holding an object. The first object, the highest one in the bas relief, held by Persephone, is mushroom-shaped, like a *Psilocybe* or, even better, a *Panaeolus*. The second object, held by Demeter, is the same object, the same mushroom, but it is held at a slant and is broken. Therefore, it is possible to hypothesize that Demeter and Persephone are both holding a mushroom, attributable as a psilocybinic type.

But the true enigma of this scene is the third object held by Demeter in her left hand. Previously (Samorini, 1998a) I had observed that, if the first two objects represented psychoactive mushrooms, or rather they had psychopharmacological connotations, it is possible to imagine that also the third object had psychopharmacological connotations, immediately recognizable by the initiates as much as the first two objects. Therefore, we would be before two psychopharmacological keys: a fact that becomes evident when one observes the structure and the evolution of the Eleusinian Mysteries.

As far as the enigmatic third object held by Demeter, to this day I have not found a satisfactory answer. Beyond the rose or a more generic "flower," certain scholars have forward various possibilities: a phallus, a bag of seeds, or even a sheep's astragalus. A phallus is unlikely; Greek artists have never depicted the phallus in this way (Greek artists were masters of the representation of the phallus). Robert Graves has interpreted this object as a leather bag, "like the ones that were used to keep prophetic die" (Graves, 1994[1956]: 92), but the use of prophetic die or other divine practices is unknown in the Eleusinian Mysteries. Ruck and Staples (1999) see it as the symbol of the "old religion," previous to the reforms that the Eleusinian cult was certainly subject to. More recently, they hypothesized that we are dealing with a leather saddle bag (*pera* in ancient Greek) similar in type to the one that Perseus used to hide Medusa's head (who should be none other than a fungal mythological metaphor, cf. Heimich *et al*., 1999). Therefore in the bas relief the two goddesses would have brought the two mushrooms out of the saddle bag. But Ruck does not even abandon the hypothesis held in their period by Graves and Wasson that from that *pera* saw a snake coming out (ibid.). I am convinced, after my first-hand observation of the exhibit, that there is no representation of a snake and that it is not possible to come to any interpretative hypothesis on the Pharsalus bas relief through studying only photographs of the exhibit. In my opinion, that third object represents an important element for the identification of the original Eleusinian psychoactive brew.

To further complicate the matter, a new piece of data has been added. With a first-hand observation of the bas relief I have been able to confirm that originally Persephone's forearm and left hand were also represented, along the lower part of the bas relief, that here seems splintered. This hand held another object - the fourth of the whole scene - of which only the upper part is visible. Following a careful observation, I would say that we are looking at a flower from above, with a little circular center surrounded by large petals. The presence of a fourth object, probably floreal, complicates further the ethnobotanical interpretation of the scene, which is open to various solutions.

The 'mushroom trees' in christian art

The research that follows was described as "surprising" and "enigmatic" by many of those to which I have presented it. I must confess that the results and conclusions of this research are still uncertain, even to myself. Since the mid-1990s I have been following a "trail" within Christianity with the intention of following serious ethnomycological tracks and trails wherever they may take me (Samorini, 1998c).

This may bring John Allegro's hypothesis to the reader's mind - which saw both the Old and New Testaments as sprinkled with metaphors alluding to a cult based on the fly agaric - and one may even think that I too might plan to go over the same ground and validate the said hypothesis. Not at all. I believe that my research goes where the documentation takes it, while in Allegro's work the documentation was used to take the author where he wanted to go, a hypothesis that I consider strained and methodologically flawed.

My research is based on the study of a particular iconographic outline popular in ancient Christian art - the so-called "mushroom trees."

According to the historian of Christian art, Erwin Panofsky (cf. Wasson, 1968: 179-180) this type of tree - which resembles a mushroom and which, for this reason, is tenned *Pilzbaum* ("mushroom tree") in German - is widespread above all, in Romanesque and early Gothic Christian art. It has been considered the schematic representation of a conifer (the "umbrella pine") and there are hundreds of examples illustrating the gradual transformation from the naturalistic forms of the pine to the more schematic "umbrella tree," hence to the various forms of the mushroom tree.

The first of these mushroom trees that I would like to bring to the reader's attention - and which was previously discussed by other authors - is in the famous frescos of the Romanesque chapel of Plaincourault in the province of Indre in central France (Samorini, 1997). During a visit in May 1997, I was able to examine the frescos of the chapel (Fig. 12). Here, we find the scene of the Temptation with its mushroom tree-painted by the Knights of the Order of Malta on their return from the Crusades. Toward the beginning of the 20th century, a French mycologist put forward the hypothesis that the Plaincourault mushroom tree was a representation of *Amanita muscaria*, the well-known psychoactive mushroom with its white-spotted red cap. If this is the case, the esoteric content of the Temptation would appear evident, that is, identification between the Tree of Knowledge of Good and Evil and a mushroom capable of producing visionary states and "illumination."

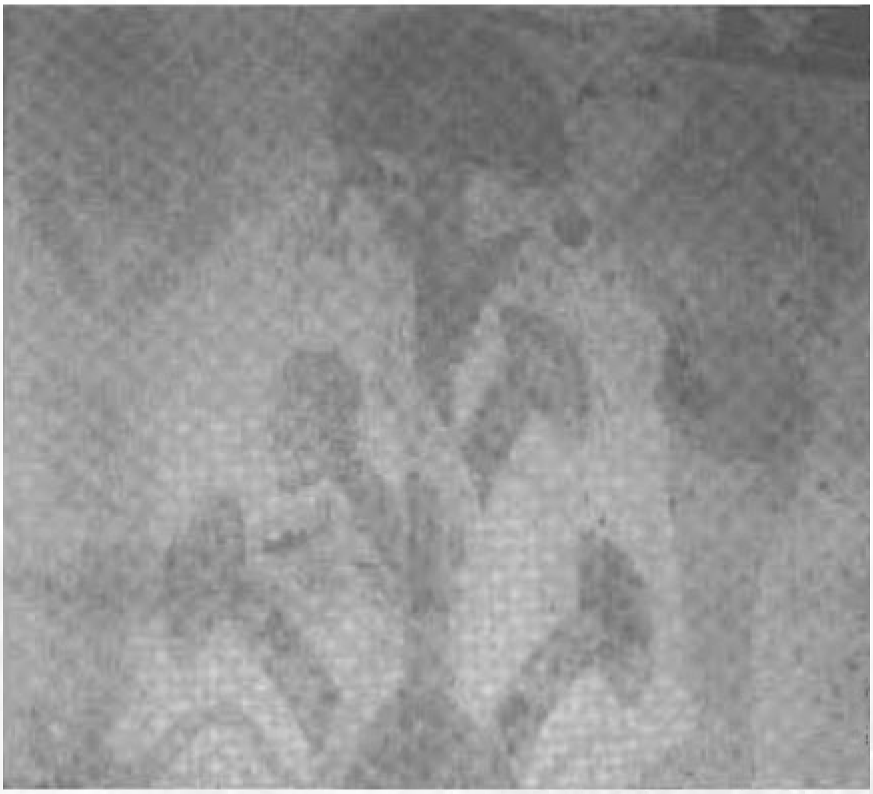

Figure 12. Romanesque fresco from the Plaincourault chapel, Central France (12th century).

After a hurried visit to the chapel in Plaincourault and, above all, after consulting the art historian Panofsky, R. G. Wasson categorically denied the validity of the interpretation offered by the French mycologist and supported and propagated by his followers. And yet, Wasson had already been confronted with at least one case of monodisciplinary blindness and interpretative slothfulness of professional researchers - that of the mushroom stones in Central America, interpreted for decades as phallic emblems by archaeologists. It is therefore quite strange that the father of ethnomycology stopped before the lapidary appraisal of an art historian and did oat, instead, follow the tracks of the other "mushroom tree" representations in Roman and Christian art as he should have done. The fact is that his conclusion appears rather superficial: "Mycologists should have consulted art historians" (Wasson and Wasson, 1958: (79). In fact Wasson, besides considering Panofsky's complete lack of knowledge of the history of psychoactive use, should have looked around him during his visit at Plaincourault, and tried to understand in which territory he was. If he could have the opportunity of seeing what can be found at just 9 km from Paincourault, at the famous Saint-Savin-sur-Gartempe Abbey, he would not surely have been cowed by the statements of an art historian.

With the premise that the problem of interpretation of the evidence consists in establishing the intention of these artists to represent the mushroom symbol as part of the esoteric content of their work, we may now consider a detailed description of the evidence.

In the Plaincourault mushroom tree form, we may note the following details: (1) The semispherical foliage or fronds is similar to the cap of a mushroom and is studded with spots (in this case, whitish on an ochre background); (2) two of lateral ramifications join the frond cap from below and symmetrically in relation to the main trunk of the tree. These two ramifications may be intended as a means of representing the three. dimensions of the tree with a serpent coiled around its trunk. From the mycological angle, however, these ramifications might represent the membrane enveloping mushrooms of the family of the Amanitaceae at the early stages of development. This membrane then breaks when the cap broadens out and separates from the stalk; (3) the roundish fruit of the tree is, here, held in the mouth of the serpent as it offers it to Eve; and (4) along and around the base of the main trunk we have ramifications that are also very similar to mushrooms in form surmounted by "caps" upon which once more we may note whitish spots.

I have also studied a number of other mushroom trees characterized by the same four iconographic features found at Plaincourault. Two examples are to be found in 4th and 5th century A.C. Tunisian mosaics. In Tunisia during the centuries of Roman domination (1st-4th centuries A. C.) there was a flourishing tradition of well-crafted mosaic work of considerable artistic value. This tradition was continued in the mosaic floors of the first Christian churches (Fantar, 1995).

The mosaic in Fig. 13 decorates the baptistry of the *henchir* Messaouda in the Tunisian region of Sfax. It probably dates back to the 5th century A.C., and here we have an iconographic scheme that was fairly widespread and of very ancient origin: two animals symmetrically placed beside the Tree of Life.

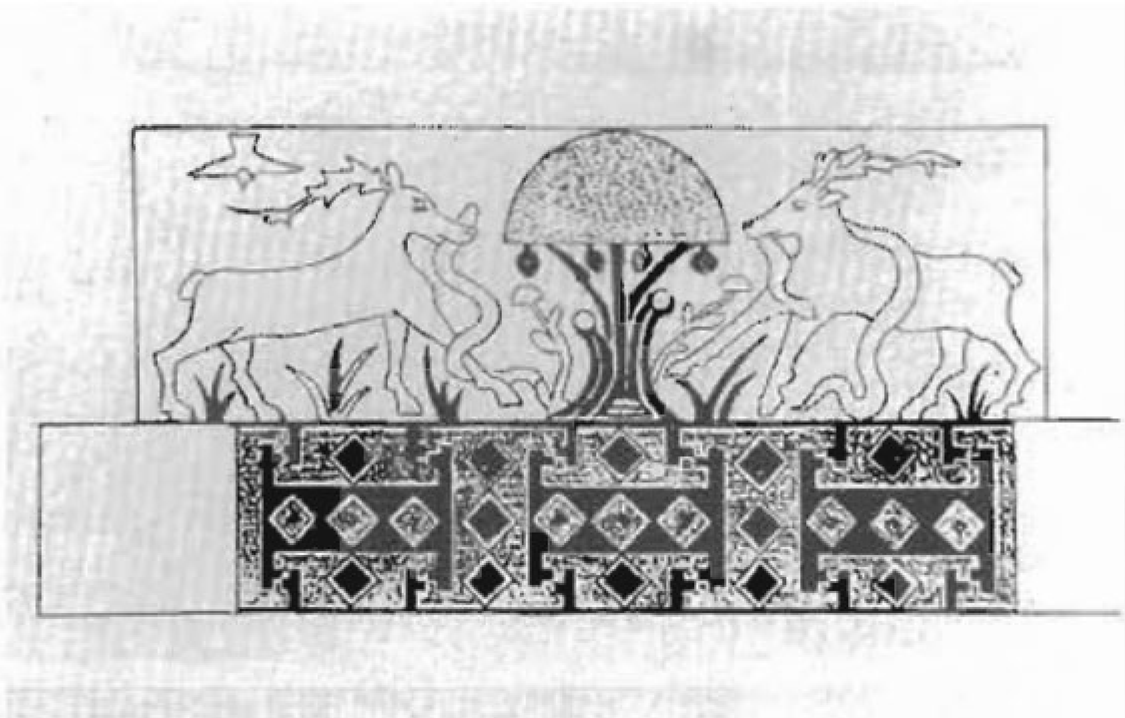

Figure 12. Design by a paleo-Christian mosaic from Messaouda, Tunisia (5th century).

The first representations of this arrangement date back to Sumerian art of the 3rd millenium B.C. The two animals are generally of the same species; they are horned wild animals or quadrupeds (above all, Cervidae) or birds. The object placed between them is the Tree of Life. A typical example is the two wild animals beside the sacred tree Horn (Haoma) of Persian art. Similar representations exist, such as a Plant of Life, a recipient containing the Water of Life, a Tree of Life from the foot of which rivers of the Water of Life spring forth (usually, four rivers are represented), or even a column (as in the famous "Door of Lions" at Mycene surmounted by two lions rampant upon a column). Sometimes the two animals feed on the Tree of Life or drink fro m the Chalice or the springs of the Water of Life. This variant is probably closest to the original iconographic scheme. This artistic scheme originates in the Middle East and spread to much of the Old World including North Africa as it underwent local stylistic modifications. According to Fantar (1995: 107), the Phoenicians brought it to Africa, where it passed into the hands of the Romans.

The Tree of Life is the element most subject to stylistic variation, from the most realistic to the most imaginative. The palm tree is one of the most widespread types. It may be more or less realistic, or represented by a single palm leaf the size of a tree. A further common type in the Mediterranean basin is the conifer tree, sometimes represented quite sim ply by a pine cone. The mushroom tree, which appears to derive from the conifer tree, seems to be less widespread than the other two types mentioned here. Christianity was one of the last and most important means by which the artistic scheme of the two animals and the Tree of Life spread. The two most frequently adopted animals were two lambs or two fishes. The *cantharos* (chalice) of the Water of Life or the Cross gradually took the place of Tree of Life. The esoteric meaning of the scene also changed, as Charbonneau-Lassay (1997: 54) has pointed out: "When, in the iconography of the first centuries of Christianity, two fish or animals surround an emblem, this always directly represents Jesus Christ; and the animals which accompany Christ are the symbolic representation of the Christian faithful." With the transformation of the Tree of Life into a Cross we therefore have an identification between the Tree and Christ. The Water of Life, placed in the *cantharos*, and which flows fro m the Tree of Life, becomes more and more closely identified with Christ's blood.

On further examination of the Messaouda mosaic, we may note that the two animals are deer, both of which are savaging a serpent. The deer savaging a serpent is also an iconographic scheme of pre-Christian origin. This motif is associated with the belief, recorded by writers in antiquity, that deer were fierce foes and persecutors of serpents (cf. Charbooneau-Lassay, 1994; see "Deer," 1:XXX; Puech, 1949). The tree placed between the two animals is a mushroom tree of the same kind as that found at Plaincourault and it is endowed with the same four characteristics mentioned previously: (I) the cap-shaped fronds, with many spots; (2) the two lateral ramifications of the main trunk joining the frond; (3) the round fruits (here, hanging from the frond); and (4) the fungoid protruberances at the foot of the tree. In the upper right corner of this scene we may note a dove, a widespread feature of Christian art with a great variety of meanings.

We also find another kind of mushroom tree in Tunisia. This is from the *henchir* Ounaïssia (6th-7th century), at the moment housed in the Museum of Sbeitla (Fig. 14, cf. Fantar, 1995:229). We might consider this scene a transition stage in an iconographic scheme that is only slightly different from that of the two animals symmetrically placed beside the Tree of Life; it might be considered a variant of a scheme that also originates in the Middle East and dates back to remotest antiquity. Here we have the two animals and *three* Trees or Plants of Life that are usually the same as each other, one between the two animals and the other two behind them.

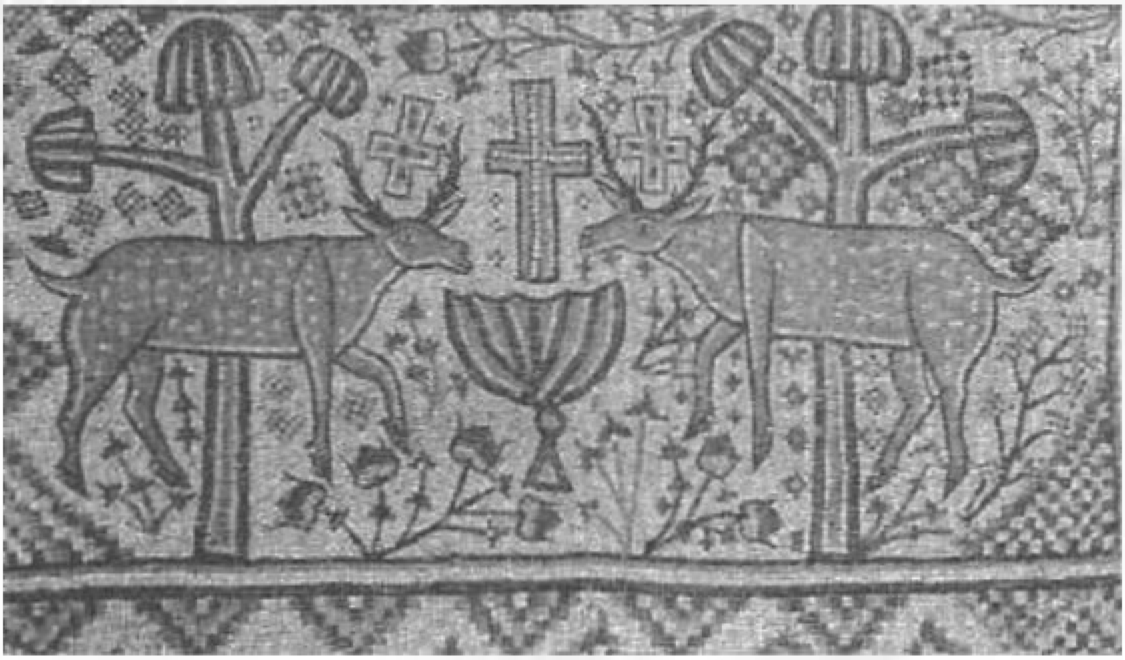

Figure 14. Paleo·Christian mosaic from Ounaïssia, Tunisia (6th-7th century).

During the last stage of absorption of this artistic scheme in Christian art (i.e., its full transformation into a "truly" Christian symbol) we may note the recurring image of the two animals combined with one Or more crosses. As we have already indicated, the Trees of Life become the symbol of the Cross; once Christianized, and the three parts constituting many examples of a certain type of Tree of Life become the three upper components of the Cross, and the various stages of the "crucifixion" of the Tree of Life become evident in paleo-Christian art. The Ounaïssia mosaic represents a stage in the transition of this iconographic scheme: the two animals are symmetrically placed and are once more two (ochre-colored and white-spotted) Cervidae; the tree placed between the animals has already completed its transformation into a "cross," and, below it, there is a *Cantharos* containing the Water of Life (at this stage, perhaps already considered the blood of Christ). We may also note that the other two Trees of Life, placed behind the animals, have not yet been fully "crucified." These two trees are mushroom trees of a different kind than the Plaincourault one. Both feature the three caplike fronds and, upon these, vertical lines have been traced that we may consider "striatures."

We find mushroom trees that are similar to the Ounaïssia examples in a fresco dating back more or less to the same period as the Plaincourault mushroom trees, and from the same area (central France). This fresco is in the Abbey of Saint-Savin-sur-Gartempe in the province of Vienne, about 40 km from Poitiers and only 9 km from Plaincourault. The Abbey's frescos are among the most highly admired works of French Romanesque art. They are dated ca. 1100, about 80 years before the Plaincourault frescos and, like these, they belong to the Haute-Poitou Romanesque Style (Oursel, 1994).

On the ceiling above the central nave of the church at a height of about 16 m, there are some scenes from the Old Testament. Figure 15a presents the scene of the fourth day of Creation with God placing the Sun in the firmament in the presence of two trees that could hardly be considered mere ornament. One of these is a mushroom tree. In the same figure we see part of the preceding scene (which has somewhat deteriorated) depicting the third day of Creation - the day of the Creation of vegetation. Here, we see two trees of two types (one, a mushroom tree) that are also like the ones on the right. A third tree of the same kind is depicted elsewhere among the nave frescos next to the scene of Moses in the presence of the Pharaoh (Riou, 1992: 35). The mushroom trees are all the same. They have a large trunk encroaching downwards on the lower scenes of the same wall, as we may note in the detail provided (Fig. 15b). These trees are also similar to the Ounaïssia mushroom trees. Here too, they present three mushrooms with striated "caps." Scholars have termed this kind of vegetation "mushroom tree," or even "tree with medusa-shaped frond" (Riou, 1992). Alternatively, it has been defined "mushroom-shaped flowers" (Thoumieu, 1997: 134).

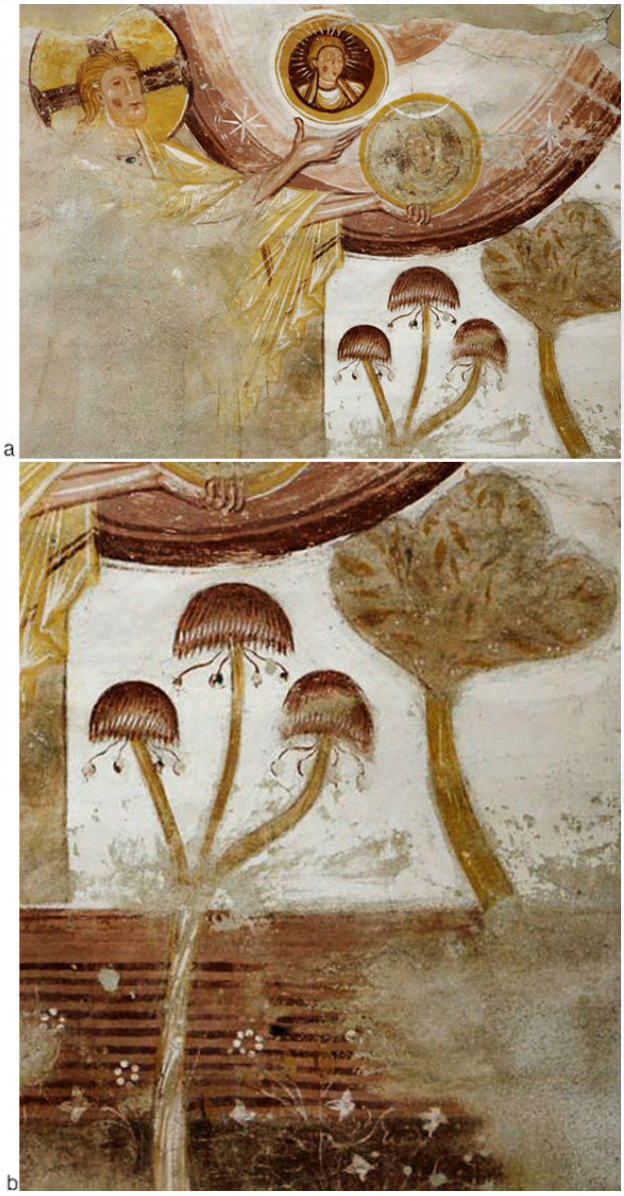

Figure 15. (**a**) Romanesque fresco from Saint-Savin-sur-Gartempe's abbey, Central France (12th century); (**b**) detail of the "mushroom tree."

The striatures hanging over the "frond" are very similar to the fringes on the caps of various species of *Panaeolus*. These striatures are more a feature of mushrooms than of trees; very many mushrooms, some of which are psychoactive, present these striatures. In fact, the mushroom striatures are caused by the juncture between the gills and the cap. The four cirrous adornments under each cap terminate with a small round object that might symbolize the fruit of the mushroom tree.

As Panofsky notes (in Wasson, 1968: 179), there are many mushroom trees in Romanesque art (more than I present here). Apart from the types described previously, there are others the styles of which are derived from local variants and individual imagination.

One example is the mushroom tree in the magnificent frescos in the small church in Vie, once more in central France, in the Berry region, some 80 km from Plaincourault. These 12th century frescos are the work of an anonymous artist, as are most of the works I present here. They therefore follow the Saint-Savin works, which are themselves only slightly earlier than the Plaincourault frescos. Although these frescos do not represent the Haut-Poitou Romanesque Style they are nevertheless considered part of the same artistic tradition (Grabar and Nordenfalk, 1958).

As Manuel and Dona Torres pointed out to me, the scene of Jesus entering Jerusalem is presented in the upper part of the right wall of the choir (Fig. 16). Christ is riding a donkey. Some people welcome Christ by laying their cloaks on the ground while others pluck flowers and leaves from the trees and offer them to him. The trees are stylized as palms in the manner of a familiar and fairly widespread typology. However, the upper part of one of the trees is quite unusual. It terminates with five umbrellas and may be defined a mushroom tree. The mushroom like appearance is further con filmed by the concave "caps," as depicted. Here, we might say, we have a "mushroom palm."

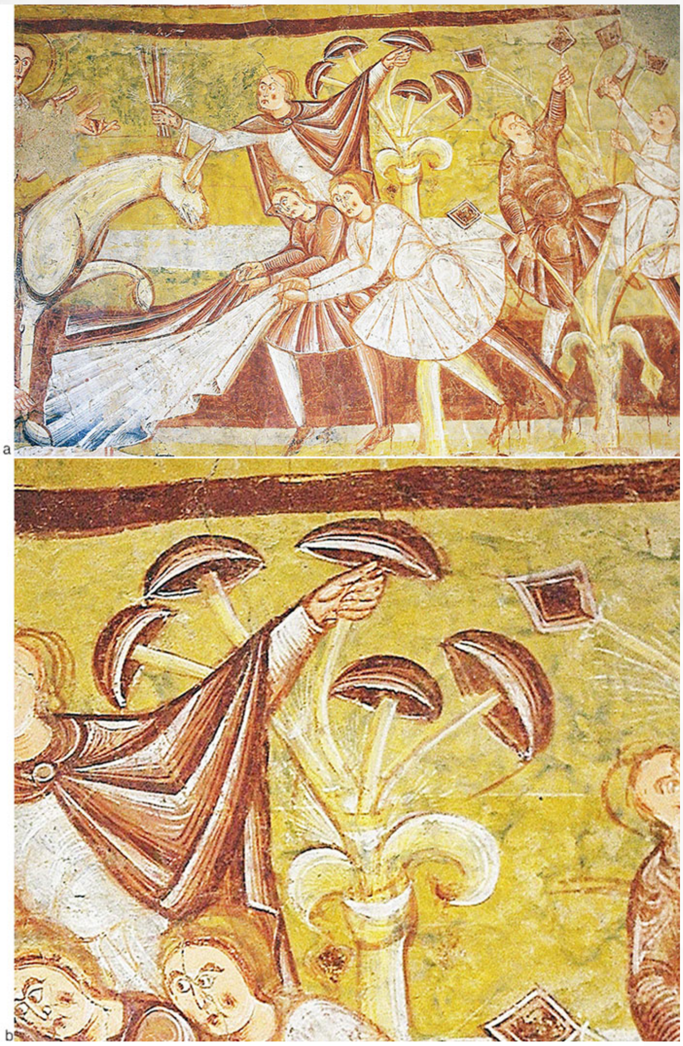

Figure 16. (**a**) Romanesque fresco from the Vic church, Central France (12th century); (**b**) detail of the "mushroom tree."

In the course of 3 second visit to the little church in Vic with Mr. and Mrs. Tones, in May 2000, they pointed out to me the existence of a second mushroom tree. The scene at the entrance of Christ coming into Jerusalem continues over the other part of the choir with the representation of Jerusalem's fortification. Despite the picture having been damaged along its length, one can still see a mushroom tree inside the city walls (altogether similar to the previous one); a couple of men are seen climbing the tree and are caught in the act of cutting off the mushrooms with knives (Fig. 17). We see only the hands of the second man; in one hand he is holding the knife. Thus, the point of the mushroom-esoteric message becomes even more believable.

Another mushroom, similar to the one at Vic and identified by J. M. Alarem from Barcelona, can be found in the 11th century fresco from Sant Sadurni d'Osormort, a Catalan church; now kept at the Episcopal Museum in the Catalan city of Vic (not to be confused with the little church in the central French town of Vic mentioned earlier). In this case, too, we see the theme of temptation. The Tree of Knowledge of Good and Evil, with the snake coiled around it, is shown with a normal treelike shape and is seen in the scene to the left of Eve (Fig. 18). A second tree-presumably the Tree of Life - is painted between Eve and Adam and is actually a mushroom tree, with six ochre-colored mushroom caps on the tips; highlighted in white on it are one to four lines that bring the streaking effect of mushrooms to mind. From a stylistic point of view this fresco, belonging to the "Osormort Maestro" series, was linked with the frescos from the Saint-Savin crypt, even though there is a chronological hiatus of at least a century between them (Ainaud de Lasarte, 1989: 50-1).

Bennett *et al*. presented the surprising image (Fig. 19) taken from a 14th century alchemical manuscript from the *Bodleian Library* in Oxford (England). They comment as follows: "The alchemical painting show a man intoxicated on *Amanita muscaria* mushrooms. He clutches one mushroom in his [left] hand as he dances about holding his other hand to his forehead as if the revelation is too intense. Behind him a tree grows with a spotted mushroom for a top" (Bennett *et al*., 1995: 240).

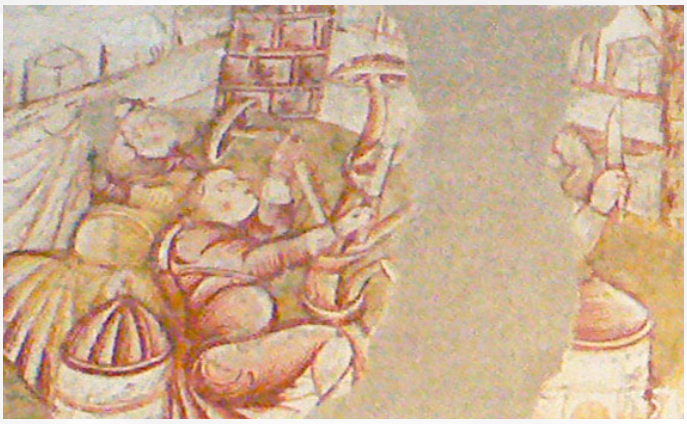

Figure 17. Fresco from the Vic church, with detail of the second "mushroom tree."

The tree in question is a mushroom tree of the Plaincourault variety. It presents the four particularities described in the preceding. The impression is that the man may be dancing; however, he may be swaying as a result of the overpowering effect of the mushroom. This latter impression is confirmed by the fact that his hand is on his forehead in the typical manner of a person in a state of mental confusion, inebriation, or dizziness. These signs are characteristic of the onset of the effects of fly agaric. If we follow this line of interpretation, and accept Benneu's hypothesis that the object in the man's left hand is also a mushroom, we are justified in thinking that the author of this manuscript intended to draw the tree with the semblance of a mushroom, and not just any mushroom; it is *A. muscaria*. This very picture, which we might consider an alchemical puzzle, parts of which we are trying to uncover, includes other interesting symbols. Beside the Amanita-tree we see one salamander, and another one above a fire. Here we find the first confirmation of something I personally have suspected for some time now, and that is that the salamander in certain circles engaged in alchemical studies during the Middle Ages may have been a secret symbol for fly agaric (due perhaps partly to the fact that the cap of the mushroom and the skin of the salamander are both maculate).

I have recently identified another mushroom tree on a capital in the famous Romanesque basilica at Vézelay, this too in central France. This basilica 's hundred capitals dating back to ca. 1135 are well known and are probably the work of one sculptor.

In Fig. 20 we see capital no. 50 with scenes from the biblical account of the struggle between David and Goliath (*I Samuel*, 17). The anterior face shows David decapitating the Philistine giant with his sword; on the right side, instead, we have the next scene in which David carries the head of the giant on his shoulders as a trophy he will display to King Saul in Jerusalem. The artist sculpted a mushroom tree by David's side in this scene and, if we look carefully, we may note that David, carrying Goliath's head, is walking on some leaves, one of which belongs to the mushroom tree.

This mushroom tree might be considered of the "Saint-Savin" type, given the evident striatures on the caps of the mushrooms, but here we have only two, and we are tempted to search for the third mushroom. Consider Goliath's helmet in the preceding scene. The shape and striatures (grooves, or fluting) of the helmet are quite similar to those of the two mushroom caps of the mushroom trees. If we examine one side of the capital and bear in mind that it is located well above the viewer, the "illusion" created - if we may call it that - is of a mushroom tree with three caps. For reasons of space, artists often had to eliminate details from scenes and would not hesitate to superimpose motifs and sequences otherwise represented in chronological order and therefore separately.

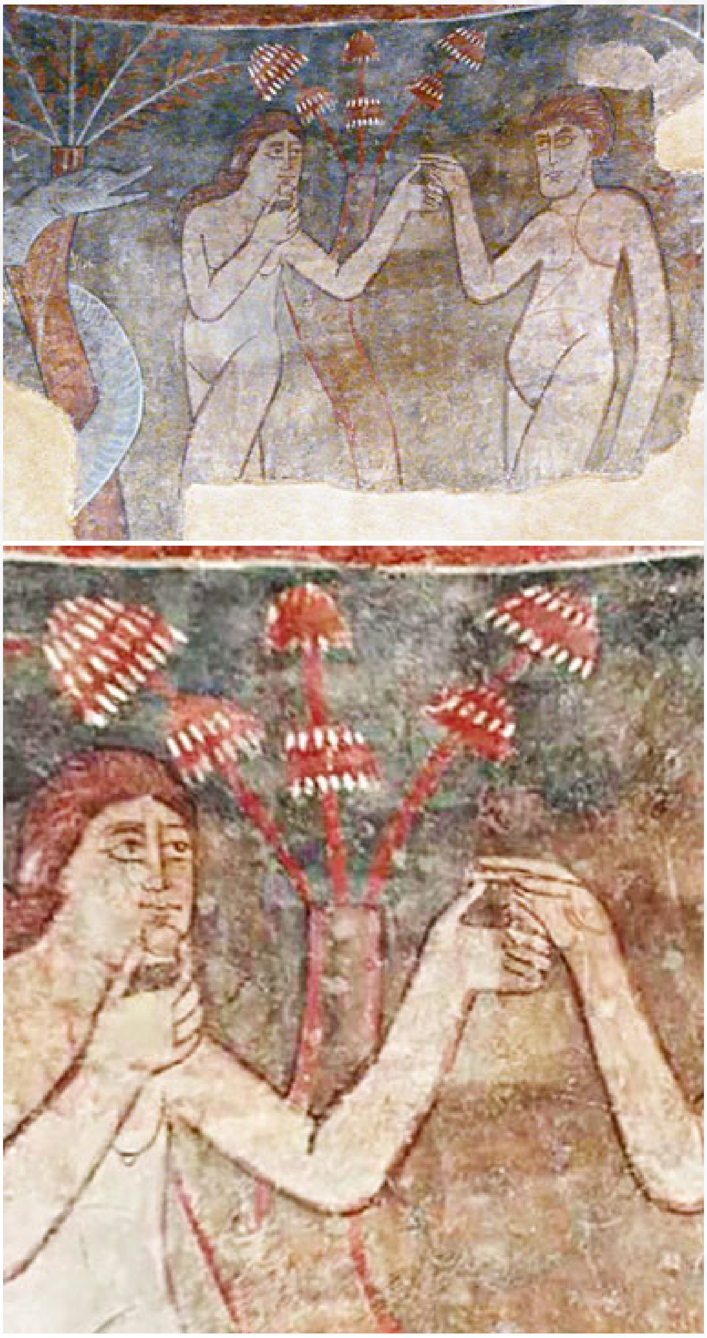

Figure 18. Romanesque fresco from the Catalan Sant Sadurni d'Osormort's church, Spain (12th century).

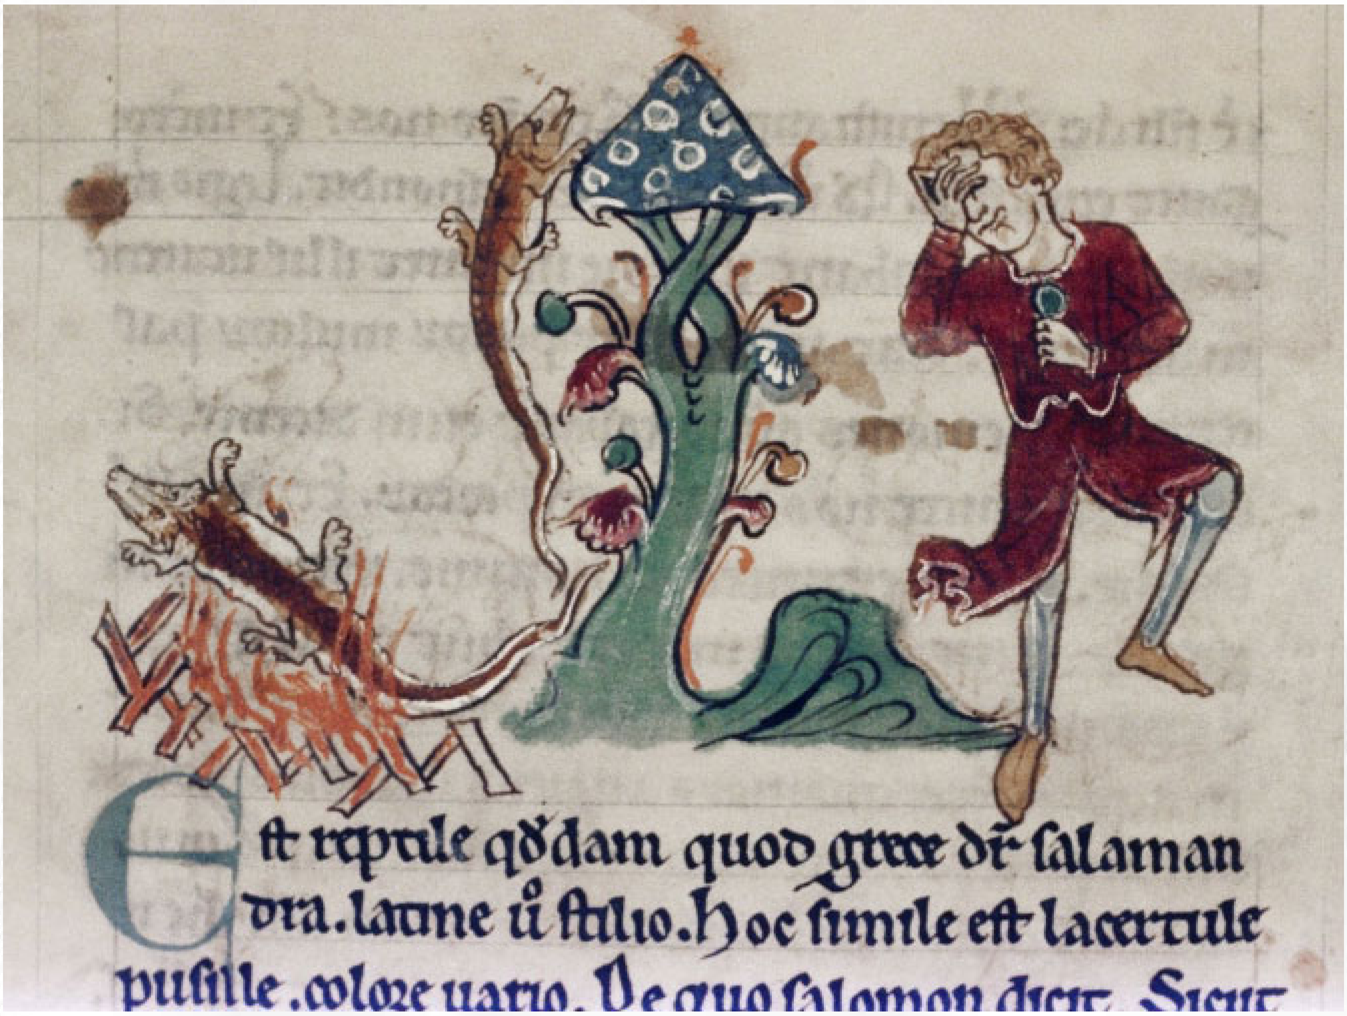
Considering this Vézelay capital, one might also be tempted to interpret the object that can only just be seen under David's foot on the anterior face as the "third mushroom." Thoumieu (1997: 149) comments: "David is so small compared to the giant that he has to climb up a sort of plant in order to decapitate him." This plant might be taken for one of the many decorative leaf motifs that are a feature of the Vézelay stonework. But it has a stalk and can hardly be thought of as a branch or petiole, and therefore might be a mushroom. If this is the case, the esoteric message is unfolded before our eyes: to gain enough strength to decapitate Goliath (allegory of the struggle between good and evil), David must "ascend" by means of something that will "imbue" him with courage and strength.



Est reptile qđdam quod grece dr salaman
dra. latine ū stilio. Hoc simile est lacertule
pusille. colore uario. De quo salomon dicit. Sicut

Figure 19. Painting from a 14th century alchemical manuscript (Bodleian Library, Oxford).

Mushrooms, the form of which is the same as that of the mushroom tree in capital no. 50, appear in the foliage of other capitals in the same basilica. The wealth of allegorical and esoteric material in each scene is evident and, indeed, has been fully acknowledged by all scholars active in this field.

In some cases we find ourselves before images of veritable mushrooms, rather than mushroom trees, as is the case with some of the above mentioned Vézelay capitals, or in the paleo-Christian mosaics in Aquileia.

I wish to refer to the observations made by Franco Fabbro (1999) on one of the mosaics of the paleo-Christian basilica of Aquileia in northern Italy (the Friuli-Venezia Guilia region). The mosaic forms part of the oldest paleo-Christian part of the basilica, known as the "*Cripta degli Seavi*,"dating to 314 A.D. (Marini, 1994). Among the various subjects - animals, crosses, geometric symbols - we may note a basket containing mushrooms (Fig. 21). Here, we have no mushroom tree but mushrooms themselves, represented as such by the artist.

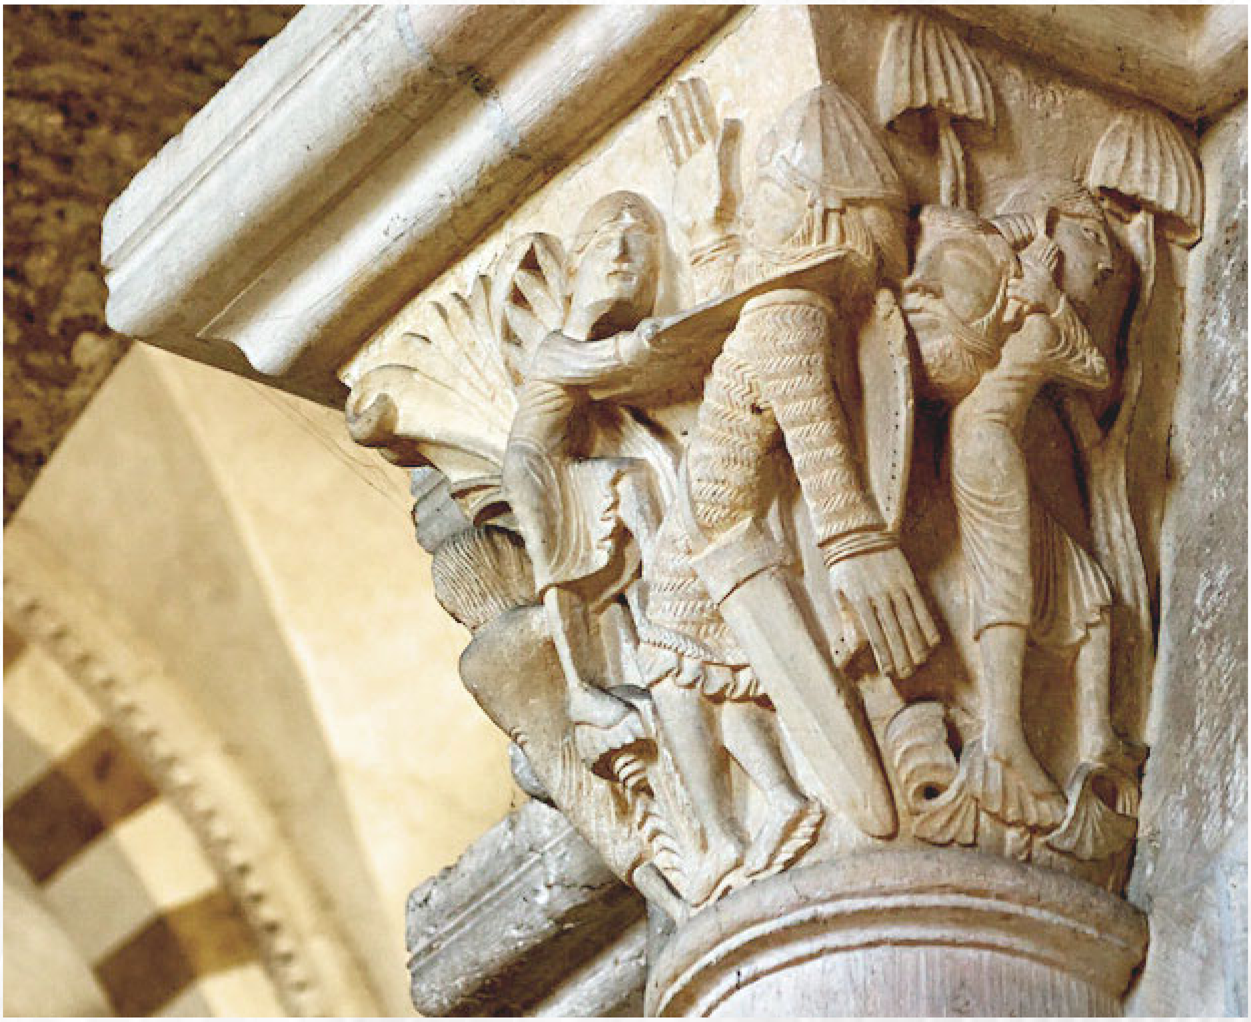


Figure 20. Romanesque capital from the basilica of Vézelay, Central France (12th century).

Fabbro appears to have no doubts as to the species of mushroom presented: fly agaric. Indeed, he is perhaps too self-assured and hasty in his conclusion that this Aquileia "find" provides corroborative evidence that the early Christians used fly agaric.

As Francesco Festi of the *Museo Civico* in Rovereto and I concluded (cit. in Samorini, 1998c), the mushrooms represented in the Aquileia mosaic were probably *Amanita caesarea*, also known as *ovulo buono* (royal agaric), an edible mushroom considered a delicacy by the ancient Romans and often included in the figurative works of the Roman imperial period. We based our view on the fact that the mushroom stalks are yellow and not white, this being one of the distinguishing marks between these two species. However, after paying a visit to the basilica J did note that the part of the mosaic corresponding to the inside of the caps, the gills, is white, as are the gills of the fly agaric, and not yellow (as in the royal agaric). Furthermore, while the gills of the royal agaric are always yellow, in some cases the gills and stalk of fly agaric present gradations of yellow (Arietti and Tomasi, 1975: 106). It was also noted that the artist had circumscribed the various areas of the mosaic to be filled in with different colors with dark-colored fragments, which means that the wrong color of fragment would not be able to make its way into another circumscribed zone of another color. Therefore we may conclude that the artist wished to portray these mushrooms specifically with white gills, and that there is good reason to doubt that these mushrooms are in fact *A. caesarea*. Another feature of this mosaic is that two of the eight mushrooms have stalks that are not entirely yellow but also white.

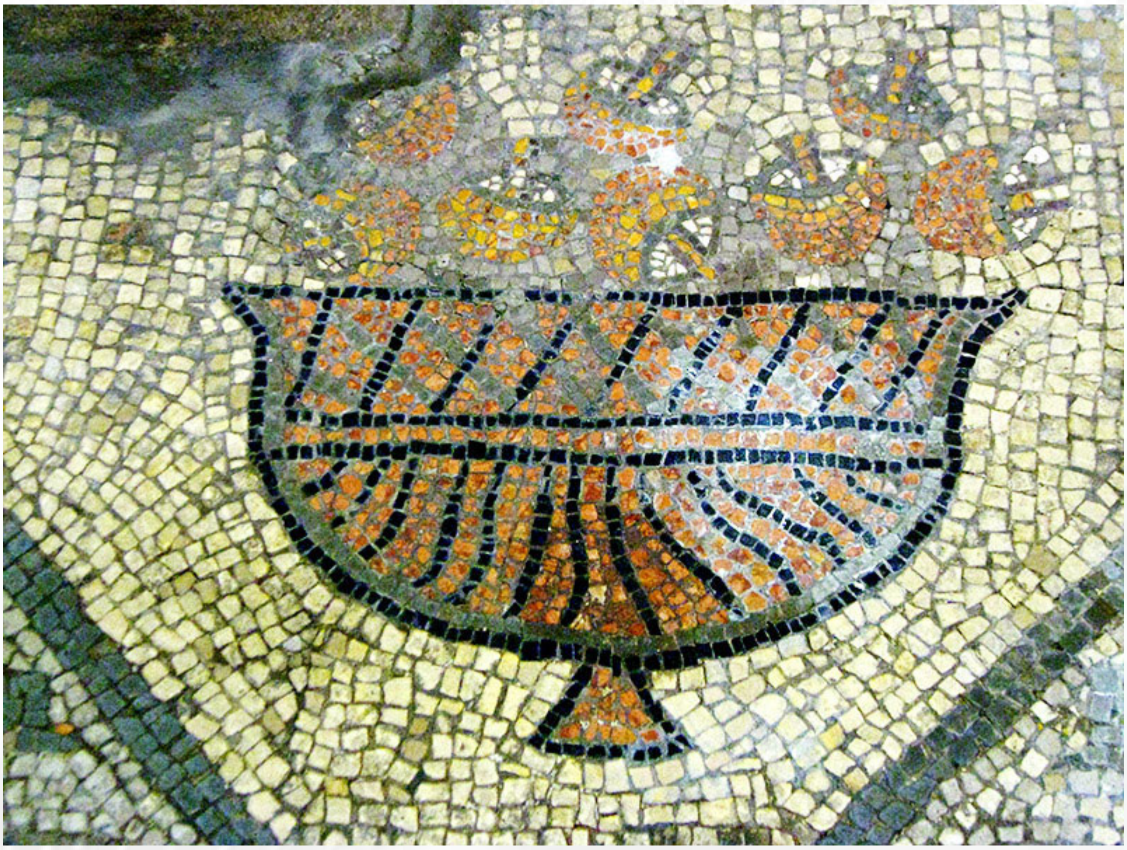

Figure 21. Mosaic from the paleo-Christian church of Aquileia. Northern Italy (4th century).

The Aquileia mushrooms would therefore appear not to be explicitly represented as belonging either to the fly or the royal agaric species. Representation of the royal agaric would not call for subterfuge, but fly agaric would. However, this may be yet another species of mushroom or quite simply a generic "mushroom." It has been hypothesized that the mosaic represents the food (including mushrooms) the faithful consumed during agapés (mysterious ritual feasts held by early Christians) (Brusin and Zovatto, 1957, cit. in Fabbro, 1999).

It is hard to reach a definite conclusion regarding the enigmatic presence of such mushroom symbols - in some cases clearly hallucinogens - in Christian art.

Although I try to be open to further potential interpretations, I have the tendency to consider these documents in a far broader context that foes beyond Christian culture. I see a religious, philosophical, and esoteric "mycological tradition" that holds in itself the knowledge and use of hallucinogenic mushrooms, with different cultural pathways and mushroom species. This knowledge originated in the most ancient times and was carried on throughout the centuries. In one century it will have been brought forward by Mitra disciples, in another we would see it in certain Gnostic sects; in yet another it would have been the Celtic druids or the Etruscan priests, or even the Dyonisos followers or followers of some Jewish alchemist scholar. In some cases, disciples of the mycological tradition will have been persecuted and forced to worship in secret, like certain European medieval sorcerers or some Christian sects considered to be heretical by the central ecclesiastical powers. Before Christ and after, both within and without Christianity, the tradition has been preserved, taking more than one direction in the tangle of Eurasian cultures, a tradition that was tenacious and unwilling to die out. The Mexican case is a perfect example: in it, the enteogenic mushroom cult, which was believed to have disappeared centuries before, wiped out by the colonial Inquisition, actually survived and made it to modem times.

It is in such a context that one can try to explain the references to the knowledge of psychoactive mushrooms within the vast Christian culture. The latter should not be seen as an inviolable cultural monolith, but rather as a "cultural pattern" that was repeatedly merged, both locally and marginally, with traditional cults or arts such as alchemy, in which Christians encountered the sacrament of "mycological tradition," expressing it in esoteric form in church frescos or alchemic books.

By following a transcultural path, the tradition has been perpetuated over centuries and millennias; the required faith has been continually revived by the direct experience of revelation and enlightenment provided by the sacrament. Many cults, religions, beliefs, and rituals of all ages, but one sacrament: the holy mushrooms.

Abstract

In light of new historical evidence regarding ethnomycologist R. Gordon Wasson's correspondence with art historian Erwin Panofsky, this article provides an in-depth analysis of the presence of entheogenic mushroom images in Christian art within the context of the controversy between Wasson and philologist John Marco Allegro over the identification of a Garden of Eden fresco in the 12th century Chapel of Plaincourault in France. It reveals a compelling financial motive for Wasson's refusal to acknowledge that this fresco represents *Amanita muscaria*, as well as for Wasson's reluctance to pursue his hypothesis regarding the entheogenic origins of religion into Christian art and artifacts. While Wasson's view - that the presence of psychoactive mushrooms in the Near and Middle East ended around 1000 BCE - prevailed and stymied research on entheogens in Christianity for decades, a new generation of 21st century researchers has documented growing evidence of *A. muscaria* and psilocybin-containing mushrooms in Christian art, consistent with ethnobotanist Giorgio Samorini's typology of mushroom trees. This article presents original photographs, taken during fieldwork at churches and cathedrals throughout Europe and the Middle East, that confirm the presence of entheogenic mushrooms in Christian art: in frescoes, illuminated manuscripts, mosaics, sculptures, and stained glass windows. Based on this iconic evidence, the article proposes a psychedelic gospels theory and addresses critiques of this theory by art historians, ardent advocates, medieval historians, and conservative Catholics. It calls for the establishment of an Interdisciplinary Committee on the Psychedelic Gospels to independently evaluate the growing body of evidence of entheogenic mushrooms in Christian art in order to resolve a controversial question regarding the possible role of entheogens in the history and origins of Christianity.

Keywords: Allegro, Christian art, Christianity, entheogens, psychedelics, Wasson

Introduction

The articles in this Special Issue on "*Psychedelics in History and World Religions*" offer compelling documentation of entheogen use in prehistorical and historical societies. Winkelman's review of the literature and summary of articles in this issue (see "*Introduction: Evidence for Entheogen Use in Pre-History and World Religions*") demonstrates that:

1. The entheogenic encounters that inspired the evolution of shamanism continued in the practices of historical and contemporary religions - Hinduism, Buddhism, Jainism, Judaism, Islam, and Christianity - providing widespread confirmation of entheogens in the formation of the major world religions, which often left evidence of these practices in art.
2. There is growing visibility in the past two decades of additional representations of psychedelic mushrooms in Christian art (see Brown & Brown, 2016; Hoffman, Ruck, & Staples, 2002; Irvin, 2008; Rush, 2011; Ruck, Staples, & Heinrich, 2001).

In this context, the major goals of this article are to provide an in-depth analysis of the "psychedelic gospels theory" regarding the presence of entheogenic mushroom images in early and medieval Christian art by:

1. Revisiting the Wasson-Allegro controversy in the light of new evidence, especially as it relates to the questions of psychoactive mushrooms in Christianity and the identification of an *Amanita muscaria* mushroom in the medieval Chapel of Plaincourault in France;
2. Presenting evidence of entheogens in Christian art and proposing the theory of the psychedelic gospels based on the authors' field research at abbeys, churches, chapels, and cathedrals in Europe and the Middle East;
3. Replying to critiques of the psychedelic gospels theory by art historians, ardent advocates, medieval historians, and conservative Christians.
4. Resolving "Wasson's paradox" and calling for the establishment of an Interdisciplinary Committee on the Psychedelic Gospels.

Wasson-Allegro controversy

The controversy between ethnomycologist R. Gordon Wasson (1898-1986) and philologist John Marco Allegro (1923-1988) over psychoactive mushrooms in Christianity in general, and over the identification of an *A. muscaria* mushroom (commonly known as "fly agaric") in the 12th century Chapel of Plaincourault in Central France in specific, has cast a lasting shadow over the study of entheogens in Christian art - a shadow that has shaped "*the academic response to Allegro's book and the opinions of subsequent generations of scholars*" (Winkelman, 2010, p. 106).

The significance of the identification of the mushroom tree in Plaincourault as a psychoactive mushroom is a landmark in psychedelic studies because it was the catalyst for the seminal debate between Wasson and Allegro about the role of entheogens in Christianity. If Wasson were right, then entheogens, especially sacred mushrooms, were only found at the very early stages of Judeo-Christianity ending around the time of Genesis, about 1000 BCE. However, if Allegro were right, then entheogens were integral to the origins of Judeo-Christianity with their usage persisting at least into medieval times, as evidenced by the Plaincourault fresco that was painted after 1000 CE. This positive identification of entheogens in Christian art would open the door to a line of inquiry that could ultimately require a reconsideration of the history of Christianity.

In his masterwork, *Soma: Divine Mushroom of Immortality* (1968), Wasson identifies the elusive Soma plantgod-juice of the Hindu *Rigveda* as the psychoactive *A. muscaria* mushroom. While concluding that mushrooms played a role in the religious life of our remote ancestors, Wasson (1970b, September 25) proclaims that "*My book brings the role of the fly agaric in the Near and Middle East down to 1000 B.C.*"

To defend this conclusion, Wasson had to come to terms with "a fly-agaric in the ointment": the controversial image of a large mushroom tree placed in the center of a medieval fresco depicting Adam and Eve in the Garden of Eden. Wasson first saw this late 13th century wall painting during his visit to the Chapel of Plaincourault on August 2, 1952. He later presented a drawing of this fresco as a color plate in *Soma* (Wasson, 1968, p. 180). Figure 1 is an unaltered photograph of the same fresco that we took during our visit to this chapel on July 19, 2012.

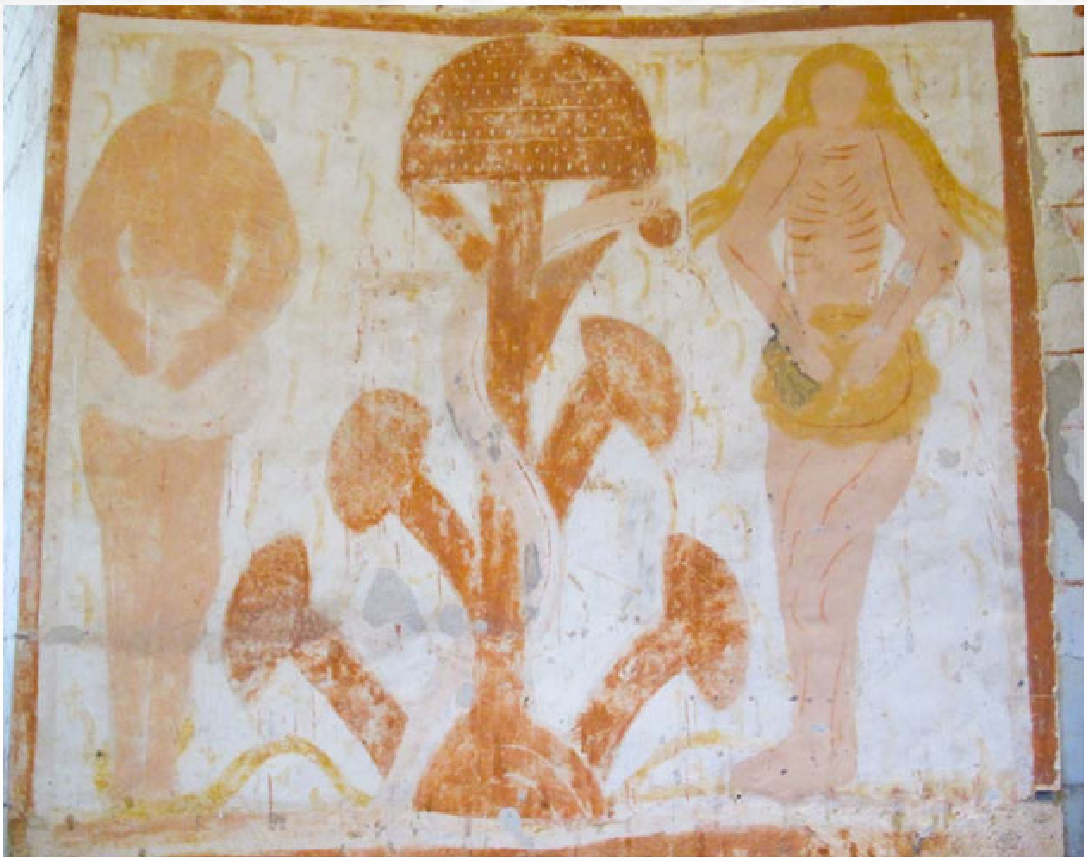

Figure 1. Temptation in the Garden of Eden, Chapel of Plaincourault, Indre, Central France, *ca.* 1291 (photo by Julie M. Brown)

Previous French observers had interpreted this image as a mushroom or mushroom tree. Writing around 1900, Abbot Rignoux describes this fresco as a "mushroom-tree with several heads." Soon afterward, a photograph of this fresco was shown at a meeting of the Société Mycologique de France on October 6, 1910. The gentleman who presented the fresco made what was then the sensational observation that "*instead of the customary Tree, the artist had given us the fly-agaric*" (Wasson, 1968, p. 179). More recently, the official guide book "Mérigny-Indre, Chapelle de Plaincourault" makes note of the "*tree of original sin depicted as an enormous mushroom*" (2009, p. 7).

Sacred mushroom seeker R. Gordon Wasson disagreed with these conclusions. Arguing that "The mycologists would have done well to consult art historians," Wasson (1968) cites a May 2, 1952 letter received from Erwin Panofsky, who has been lauded as "*the most influential art historian of the twentieth century*" (Smith, 2005, p. XXVII):

> *... the plant in this fresco has nothing whatever to do with mushrooms ... and the similarity with Amanita muscaria is purely fortuitous. The Plaincourault fresco is only one example - and, since the style is very provincial, a particularly deceptive one - of a conventionalized tree type, prevalent in Romanesque and early Gothic art, which art historians actually refer to as a "mushroom-tree" or in German*, Pilzbaum (Wasson, 1968, pp. 179-180).

In affirming that "*Professor Panofsky gave expression to what I have found is the unanimous view of those competent in Romanesque art*," Wasson (1970a, August 21) defers to the authority of art historians to close the door on the matter. In short, Plaincourault is categorically not a mushroom.

In opposition to Wasson, John Marco Allegro, a renowned Dead Sea Scrolls scholar, contended that this was clearly an *A. muscaria* mushroom. Writing in *The Sacred Mushroom and the Cross* (*The Sacred Mushroom*) 2 years after the publication of Wasson's *Soma*, Allegro (1970) states:

> *The prime example of the relation between the serpent and the mushroom is, of course, in the Garden of Eden story of the Old Testament. The cunning reptile prevails upon Eve and her husband to eat of the tree, whose fruit "made them as gods, knowing good and evil" (Gen 3:4). The whole Eden story is mushroom-based mythology, not least in the identity of the "tree" as the sacred fungus, as we shall see. Even as late as the thirteenth-century some recollection of the old tradition was known among Christians, to judge from a fresco painted on the wall of a ruined church in Plaincourault in France (pl. 2). There the Amanita muscaria is gloriously portrayed, entwined with a serpent, whilst Eve stands by holding her belly.* (p. 80)

Therefore, there began the furious "battle of the mushroom-trees." In a 1970 letter to the *Times Literary Supplement*, Wasson (1970a, August 21) publicly attacked Allegro's interpretation of the Plaincourault mushroom tree as an *A. muscaria*: "*Presumably he [Allegro] had read the footnote in which I dismissed the fresco on page 87 of Mushrooms, Russia and History and, more specifically, Panofsky's letter reproduced on page 179 of SOMA. He chooses to ignore the interpretation put on this fresco by the most eminent art historians.*"

Nevertheless, we find a certain disingenuousness in Wasson's position. While he famously cites this first Panofsky letter of May 2, 1952 - a letter that has often been quoted in academic discussions of Wasson and Allegro - to the best of our knowledge, Wasson never refers to or quotes the second Panofsky letter written shortly after on May 12, 1952. We obtained copies of both letters from the Tina and R. Gordon Wasson Ethnomycological Collection Archives (Wasson Archives) and believed this is the first time they have both been displayed together in print (see Figures 2 and 3).

Of great and until now overlooked historical significance for the Wasson-Allegro controversy is the fact that in this second letter Panofsky takes a step back and on reflection qualifies his initial categorical rejection of the Plaincourault fresco as *A. muscaria*. In the May 12 letter (Figure 3), Panofsky (1952) states:

> *The only possibility I should be prepared to admit is that, once the transformation [the development from pine tree to 'Pilzbaum'] had taken place and was generally accepted in art, some especially ignorant craftsman may have misunderstood the finished project, viz., the "Pilzbaum," as a real mushroom. But even that is not very probable because even the most*

> *mushroom-like specimens show some traces of ramification; if the artists had labored under the delusion that the model before him was meant to be a mushroom rather than a schematized tree he would have omitted the branches altogether.*

In the second sentence of this quote, Panofsky commits the logical fallacy of assuming the conclusion because *A. muscaria* mushrooms are often found growing in clusters. Given the lack of perspective in Romanesque art, this could be a two-dimensional representation by the artist of a mature *A. muscaria* surrounded not by "branches" but by four recently emerged smaller mushrooms.

This omission looms large in the context of Wasson's campaign not only to refute Allegro's claims but to unfairly discredit him. For example, in this same letter that appeared in the *Times Literary Supplement* Wasson (1970a, August 21) states, "*Mr. Allegro is not a mycologist but, if anything, a cultural historian.*"

As Irvin (2008) notes in his in-depth analysis of the Wasson-Allegro schism,

> *Wasson doesn't just say Allegro is not a mycologist, the likes of which he's just put down, but includes the caveat "if anything," purely as an insult to Allegro. Wasson himself was a banker and not a professional mycologist or art historian. Allegro, contrary to the image that Wasson wants to portray of him, was an eminent cultural historian, theologian, and philologist.* (p. 11)

End of the road for Allegro

After the publication of *Soma* (1968), Wasson's second career as an ethnomycologist flourished. He subsequently coauthored seminal studies of entheogens in ancient and contemporary religion, including *María Sabina and Her Mazatec Mushroom Velada* (1974), *The Road to Eleusis: Unveiling the Secret of the Mysteries* (1978), and shortly before his death *Persephone's Quest: Entheogens and the Origins of Religion* (1986). As accolade followed accolade, Wasson was acclaimed as "*the father of modern ethnomycology" and, like it or not, as a 'founder' of the 1960s psychedelic movement*" (Riedlinger, 1997a, p. 10).

However, of all the praise bestowed on Wasson none was more illustrious than being compared to one of the most brilliant minds in the history of science. The ethnobotanist Ott (1997) praised Wasson as "*a twentieth century Darwin*" (p. 190) noting that, just as Darwin developed a naturalistic theory of evolution to explain the origin and descent of man, so Wasson developed a naturalistic theory of entheogens to explain the origins and diffusion of religion.

Conversely, the publication in 1970 of *The Sacred Mushroom* destroyed Allegro's academic credibility. Until that time, he was well-known as a distinguished philologist and the most controversial member of the scholarly team studying the Dead Sea Scrolls, most of which were written in Hebrew and Aramaic as early as 300 BCE.

The Sacred Mushroom turned Allegro's fleeting fame into infamy and in some circles even into demonization as a radical who was out to destroy the Christian faith. The subtitle said it all: *A Study of the Nature and Origins of Christianity within the Fertility Cults of the Middle East*. As if suggesting that Jesus did not exist ("ahistoricity of Jesus") were not enough, Allegro argued that early Christianity was a fertility cult based on the ingestion of hallucinogenic mushrooms and that Jesus was merely a metaphor for the sacred mushroom. Consequently, he postulated that the entire bible was a "hoax," based on an elaborate secret code woven throughout the story by cryptographers to disguise the mushroom cult.

Certainly, earlier scholars had recognized the significance of entheogens in ancient religious cults that used sacred plants to achieve a sense of continuity with the ancestors and the gods. Yet, Allegro was the first to have the temerity to relate these themes to Judaism and Christianity, tracing their roots linguistically back to the earliest written Sumerian and Semitic language groups.

As Allegro's biographer (and daughter), Judith Anne Brown (2005), points out there were significant difficulties with *The Sacred Mushroom*. First, many of the archaic word derivations were highly speculative and needed further verification, leading to scathing critiques by linguistic experts in biblical languages. Second, the idea that much of the Old and New Testament was a secret code for a mushroom cult was simply too convoluted and improbable. Brown (2005) notes that "*However vast the amount of philological evidence, Christians could* *not accept that the New Testament was little more than a cover-story for the drug-crazed followers of a fungus cult*" (p. 207). "A sensationalist lunatic theory" wrote *The Times* in 1971, reflecting the prevailing public opinion in England (Brown, 2005, p. 213).

SCHOOL OF HISTORICAL STUDIES

May 2, 1952

Mr. R. Gordon Wasson,
J.P.Morgan & Co.,
23 Wall Street,
New York 8, N.Y.

Dear Mr. Wasson:

Many thanks for your kind words about my little talk and the photostat of the discussion centered around the fresco of Plaincourault. Please let me put in a word of warning. In my opinion -- which, I am confident, will be shared by any art historian you may care to consult -- the plant in this fresco has nothing whatever to do with mushrooms (which would indeed by surprising since it was the tree, and not the mushroom, of good and evil which brought about the transgression of the First Parents), and the similarity with Amanita muscaria is purely fortuitous.

The Plaincourault fresco is only one example -- and, since the style is very provincial, a particularly deceptive one -- of a conventionalized tree type, prevalent in Romanesque and Early Gothic art, which art historians actually refer to as " mushroom tree" or, in German writing, Pilzbaum . It comes about by the gradual schematization of the impressionistically rendered Italian pine tree in Roman and Early Christian painting, and there are hundreds of instances exemplifying this development -- unknown, of course, to mycologists. If you are interested, I recommend a little book by A.E.Brinckmann, Die Baumdarstellung im Mittelalter (or something like it), where the process is described in detail. Just to show what I mean, I enclose two specimens: a miniature of ca. 990 which shows the inception of the process, viz., the gradual hardening of the pine into a mushroom-like shape, and a glass painting of the thirteenth century, that is to say about a century later than your fresco, which shows an even more emphatic schematization of the mushroom-like crown. What the mycologists have overlooked is that mediaeval artists hardly ever worked from nature but from classical prototypes which in the course of repeated copying became quite unrecognizable.

With best regards,

Sincerely,
Erwin Panofsky.

THE INSTITUTE FOR ADVANCED STUDY
PRINCETON, NEW JERSEY

SCHOOL OF HISTORICAL STUDIES

May 12, 1952

Mr. R. Gordon Wasson,
23 Wall Street,
New York 8, N.Y.

Dear Mr. Wasson:

Many thanks for your letter of May 7. Unfortunately I know very little of folk lore and witchcraft (though I do know that those people in Kamchatka still induce ecstasy by eating amanita or drinking some sort of decoction thereof). So I have not the slightest idea as to whether the French witches also used the crapaudin (which, incidentally, seems to be fairly generic term originally, like our "toadstool"; I know it, e.g., as denoting a kind of cooking pan shaped like a mushroom , and even another plant, Sideritis) for similar purposes. However, even if so, I should be somewhat skeptical because the development from pine tree to "Pilzbaum" is so universal and takes place in so many representations other than the Fall of Man . The only possibility I should be prepared to admit is that, once the transformation had taken place and was generally accepted in art, some especially ignorant craftsman may have misuderstood the finished product, viz., the "Pilzbaum," as a real mushroom. But even that is not very probable because even the most mushroom-like specimens show some traces of ramification ; if the artists had labored under the delusion that the model before him was meant to be a mushroom rather than a schematized tree he would have omitted the branches altogether. In addition, religious mediaeval art at least had little reason to think of mushrooms at all. They do not occur in the Bible, so far as I know, nor in the legends of the saints.

With all good wishes,

Sincerely yours,

Erwin Panofsky.

Please keep my poor little pictures as long as you wish. But I really recommend to look up that little book by A. E. Brinckmann.

Figure 3. Letter of Erwin Panofsky to R. Gordon Wasson, May 12, 1952. Wasson Archives, Harvard University Herbarium, Cambridge, Mass

However, while the theory of the "bible as a secret code for a fertility cult" was soon forgotten, the search for evidence of mushrooms in Christianity persisted. In fact, later evidence showed that they occurred in Christian art much more widely than Allegro realized at the time of the 1970 publication of *The Sacred Mushroom*, prompting Judith Anne Brown to observe in her Foreword to the 40th anniversary edition of Allegro's (2009) book that "*Evidence from the art world might have gone a long way to convince his critics that his ideas were reasonable*" (p. xi). However, the sole image that Allegro presented was the Plaincourault fresco, which was printed on the book jacket of the original edition of *The Sacred Mushroom*. This image, along with Allegro's conclusion "There the *Amanita muscaria* is gloriously portrayed," directly challenged Wasson's interpretation of the Plaincourault fresco. But none of this survived the vehement rejection of *The Sacred Mushroom*. As Judith Anne Brown (2005) confesses, "*Instead, the book ruined his reputation. After it came out, very little he had said in the past or would say in the future was given any attention*" (pp. xv-xvi).

Chapel of Plaincourault, Central France

Wasson and his wife Tina visited Plaincourault in 1952. We entered the chapel in 2012, that is 60 years later. The chapel is situated close by the Plaincourault castle. Both were built in the second half of the 12th century by the Knights of the Order of Malta upon their return from the Crusades. The small chapel is 60-ft long and 20-ft wide. It is architecturally simple with a single nave (the main body of the church), which ends in a semi-circular apse (the end of the chapel). Originally, the walls of the chapel were completely decorated with scenes from the Old and New Testament interspersed with geometric and floral paintings.

In addition to the Temptation scene, the three other frescoes still recognizable today on the apse wall are the Virgin and Infant, the Scourging of Jesus, and the Crucifixion. In the vault of the apse is a painting of Christ Pantocrator (omnipotent ruler of the Universe) framed by a tetramorph. On the left wall of the nave (looking inward from the entrance) is a well-preserved scene of the legend of St. Eligio, the patron saint of blacksmiths, under a faint inscription in Latin that was interpreted as "We do not have the key."

The frescoes belong to the family group of "Romanesque wall paintings of Central France," which have been extensively catalogued and studied by art historians (Kupfer, 1993). These paintings use the Romanesque color palette including yellow, red, gray, ochre, white, and blue. The chapel was built in the 12th century and the Temptation fresco was painted in the late 13th century, *ca*. 1291.

The most well-preserved fresco is the Temptation scene depicting Adam and Eve and the Tree of the Knowledge of Good and Evil, around which is coiled a snake offering Eve the fruit of the Tree. The Tree is dramatically drawn in the shape of an enormous man-sized mushroom, with four smaller mushrooms protruding from the long stem of the central "mushroom tree."

Mushroom tree in Eden, Plaincourault

Close onsite observation reveals several intriguing aspects of this Temptation scene. As background for these observations, we present an enhanced version of the photo of this fresco taken during our 2012 visit to Plaincourault. This enhancement brings out the colors and contrast of the image but does not alter it in any other way.

First, the curved cap of the mushroom nearly touches the top border of the fresco, making it slightly taller than Adam and Eve. As an artistic technique, size matters in Romanesque art. It is therefore noteworthy that the mushroom tree is taller than Adam and Eve. Since mushrooms in nature would be diminutive compared to humans, the artist is obviously communicating the central significance of this mushroom tree in the Genesis story of the Garden of Eden.

Second, now Adam and Eve are aware of their nakedness covering themselves with round objects that regardless of what they depict are not drawn in the irregular shape of natural fig leaves. Furthermore, the size of these objects is larger than would be needed to simply provide cover.

Does Plaincourault represent A. muscaria?

Famed American ethnobotanist Richard Evans Schultes and Swiss pharmacologist Albert Hofmann, the first person to synthesize LSD, observe that "*The Tree of Knowledge, entwined by a serpent, bears an uncanny resemblance to the Amanita muscaria mushroom*" (Schultes & Hofmann, 1992, p. 83). The Italian ethnobotanist Giorgio Samorini (1998) analyzed multiple representations of mushroom trees, all of which have umbrella-shaped foliage and none of which resembles the uplifted branches of the Italian pine. Samorini (1998) contends that "*Wasson's conclusion may be considered premature*" (p. 88) and identifies Plaincourault as the prototypical *A. muscaria* mushroom tree.

In time, even the most vocal historical opponents of this identification either hedged their bet (Panofsky) or partially recanted (Wasson). As we have shown, in his second letter to Wasson, Panofsky (1952, May 12) confesses that he is "prepared to admit" that there is a possibility that the artist of Plaincourault drew "a real mushroom" (see Figure 3). Writing in *Persephone's Quest* shortly before he died, Wasson (Wasson, Kramrisch, Ott, & Ruck, 1986) admits:

> *I once said there was no mushroom in the Bible. I was wrong. It plays a hidden role (this is, hidden from us until now) and a major one, in what is the best-know episode of the Old Testament, the Garden of Eden story, and what happened to Adam and Eve. ... I hold that the fruit of the Tree of Knowledge of Good and Evil was Soma ... was Amanita muscaria, was the Nameless Mushroom of the English-speaking people.* (pp. 74-75)

While Wasson did not explicitly acknowledge that the fresco at Plaincourault attests to *A. muscaria*, his remarkable late-in-life admission makes this the logical next step. But before taking this next step, let us first consider three alternative explanations:

1. *It is not a mushroom tree; it is a stylized Italian pine tree*. We have already discussed and dispatched this Wasson-Panofsky interpretation.
2. *It is not a mushroom tree; it is an apple tree*. This is textually inaccurate for there is no identification of the "fruit" of the Tree to be found anywhere in the Bible: not in Genesis nor in any of the books of the Old or New Testament. In fact, the first reference to the fruit as an apple does not appear until the 16th century. Aside from this lack of scriptural references, the idea that the image at Plaincourault is an artistic representation of an apple would be far-fetched. No painter in the history of religious art has ever drawn half of an apple, systematically covered with identical spots, on top of the trunk of a tree planted in the center of Eden.
3. *It is not about the fruit; it is about the fall*. Writing succinctly, the apostle Paul declares "*For as in Adam all die, so also in Christ all will be made alive*" (1 Cor. 12:21-22). Citing Paul, other apostles, and a host of church fathers, historian Hatsis (2017a) argues that "*The fruit wasn't an actual, material thing that could be eaten (like an orange), but rather symbolic of strict adherence to divine law and the consequences for obstinacy*" (p. 19). For Hatsis, the fruit is a metaphor for obedience: for following God's commands and the consequences of defiance.

While this view is prevalent, it represents the imposition of a New Testament Christian metaphor onto an Old Testament Hebrew myth. The renowned mythologist Joseph Campbell (2018) observes "*Every myth, whether or not by intention, is psychologically symbolic. Its narratives and images are to be read, therefore, not literally, but as metaphors*" (p. 28). Therefore, it is important to let the myth speak for itself, metaphorically in its own words - especially a foundational myth that attempts to reconcile two opposites: why does evil appear so early in God's perfect creation?

In the words of Genesis from the King James Bible Online (2019): "*And the LORD God commanded the man, saying, Of every tree of the garden thou mayest freely eat: But of the tree of the knowledge of good and evil, thou shalt not eat of it: for in the day that thou eatest thereof thou shalt surely die*" (Genesis, 2:16-17). Next, the serpent appears saying: "*And the serpent said unto the woman, Ye shall not surely die: For God doth know that in the day ye eat thereof, then your eyes shall be opened, and ye shall be as gods, knowing good and evil*" (Genesis, 3:4-5). Finally, after both Adam and Eve have eaten the fruit, they do not die but are expelled from Eden, at which point God in a remarkable passage ponders what will happen next (speaking to whom? we can only wonder), "*And the LORD God said, Behold, the man is become as one of us, to know good and evil: and now, lest he put forth his hand, and take also of the tree of life, and eat, and live for ever, Therefore the LORD God sent him forth from the garden of Eden*" (Genesis: 22-23).

Aside from the enigmatic question of what this monotheistic Hebrew God means by becoming "one of us," let us focus on two intriguing aspects of the Plaincourault fresco from the perspective of Genesis. The first is the depiction of separate historical biblical events (also called "moments") in the same fresco. In this Temptation fresco, we see the serpent offering the forbidden fruit to Eve before she has eaten thereof, while at the same time Adam and Eve are covering themselves, which in Genesis takes place after they have consumed the fruit and become aware of their nakedness. From a Christian perspective, this scene represents both the Temptation and the Original Sin.

Second, we call attention to an aspect of the fresco that to the best of our knowledge has not been commented upon by prominent observers, neither by Allegro nor Wasson nor most recently Samorini. Looking at the enhanced photograph, we see that Eve has no breasts. In fact, her chest and arms are "skeletonized" (see Figure 4).

Anthropologist Furst (1976) points out that one of the most enduring aspects of shamanism is the idea that life is resident in the bones, which are the most durable part of the body lasting up to 50,000 years after death. Mircea Eliade (1974), one of the world's preeminent authorities on shamanism, writes that "*Bone represents the very source of life, both in humans and animals. To reduce oneself to the skeleton condition is equivalent to re-entering the womb of this primordial life, that is, to a complete renewal, mystical rebirth*" (p. 63). Medieval churches frequently preserved the bones of saints as sacred relics. In this context, the skeletonization of Eve suggests that she has crossed the threshold of an entheogen-inspired journey of death and rebirth, a central theme in shamanism.

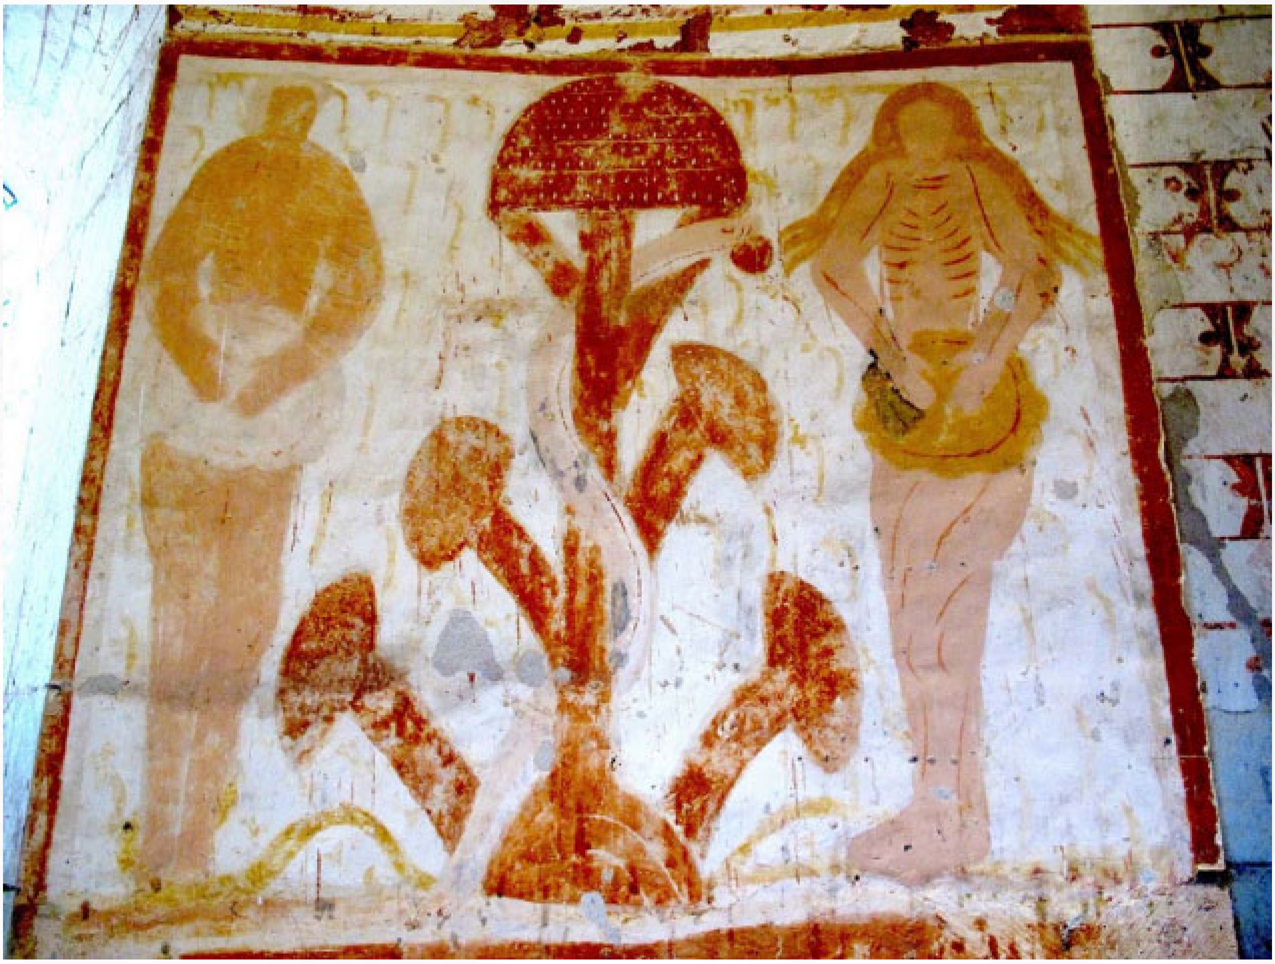

Figure 4. Temptation in the Garden of Eden. Chapel of Plaincourault, Indre District, Central France, *ca*. 1291 (color- and contrast-enhanced photo by Julie M. Brown)

Based on this analysis of the Plaincourault fresco, we agree with Wasson's (1968) entheogenic interpretation on Genesis as articulated in *Soma*:

> *Yahweh deliberately leads Adam and Eve into temptation by placing in front of them, in the very middle of the Garden, the Tree with its Fruit. But Yahweh was not satisfied: he takes special pains to explain to his creatures that theirs will be the gift of knowledge if, against his express wishes, they eat of it. The penalty for eating it (and for thereby commanding wisdom or education) is surely death. He knew the beings he had created, with their questing intelligence. There could be*

> *no doubt about the issue. Yahweh must have been secretly proud of his children for having the courage to choose the path of high tragedy for themselves and their seed, rather than serve out their lifetimes as docile dunces. This is evidenced by his prompt remission of the death penalty.* (p. 221)

Following Wasson's train of thought, we now propose a fourth possible explanation of the Plaincourault fresco:

4. It is about the Tree; it is an entheogen that offers higher consciousness. By placing a large *Amanita muscaria* mushroom tree in the center of Eden; by depicting two historical moments, before and after eating the fruit of the Tree, in the same scene; and by skeletonizing Eve, the painter or his priestly patrons captured the true meaning of Genesis.

To push this explanation to its apotheosis, the essence of Genesis is not about the fall; it is about transcendence. The serpent does not bring evil into God's perfect world; it brings wisdom. In addition, Eve is not a weak-willed woman who is responsible for the original sin and humanity's downfall; she is a courageous spiritual guide who leads humanity to exercise-free will and achieve higher consciousness. Invoking Occam's razor, we suggest that this interpretation of Genesis and Plaincourault parsimoniously resolves two biblical puzzles: the identification of the Tree and the presence of evil in the Garden of Eden - the latter posing a dilemma that has confounded Christian and Jewish theologians alike for centuries.

Despite Wasson's firm acknowledgment that the Tree of Genesis was a powerful psychedelic, one that could inspire knowledge and wisdom, he never took the final logical leap of concluding - as we do - that the Temptation fresco in the Chapel of Plaincourault represents an *A. muscaria* mushroom.

Samorini's mushroom tree typology

In an article on "'Mushroom-Trees' in Christian Art," Samorini (1998) analyzes multiple examples of "mushroom trees" found in early and medieval Christian art from churches in Tunisia, Central France, and other areas of Europe. He finds that "*the typological differentiation among the 'mushroom-trees' of these works would appear due to the natural variation among psychoactive mushrooms*" (p. 87). Based on these natural variations, Samorini develops a twofold typology: the "Plaincourault" mushroom tree (*A. muscaria*) and the "Saint Savin" mushroom tree (*Panaeolus*, *Psilocybe*, and other psilocybin-containing mushrooms).

Paraphrasing Samorini (1998, pp. 88-89), the major characteristics of the Plaincourault mushroom tree (see Figure 4), which is based on the Plaincourault fresco, are:

1. Semispherical foliage similar to a broad mushroom cap and dotted with whitish spots;
2. Two lateral ramifications (branches) that join the cap to the main trunk-stem of the mushroom tree, possibly representing the three dimensions of the tree or the remaining membranes from the early stages of the fungus' development;
3. The roundish fruit of the tree held in the mouth of the serpent which is offering the fruit to Eve; and
4. Around the base of the main trunk-stem, additional ramifications with caps also dotted with whitish spots.

In comparison, the Saint Savin mushroom tree is based on a ceiling fresco found in the Abbey of Saint-Savinsur-Gartempe (Saint Savin) located in the department of Vienne 6 miles east of Plaincourault (Figure 5). The Abbey's frescoes are prized examples of the Haute-Poitou Romanesque Style and are dated *ca*. 1100, nearly 200 years before the Plaincourault fresco.

We explored Saint Savin the day after our visit to the Chapel of Plaincourault. Painted 50 ft above the floor on a long-vaulted ceiling, which runs the length of the nave, is an elaborate series of 61 colorful frescoes that tell the story of the Old Testament. This biblical chronology begins in Scene 1 with Genesis and ends with Exodus.

In Scene 3, The Creation of the Stars, God wearing a cruciform halo places the sun and the moon into the sky. The moon and sun are each anthropomorphically represented by a head within a medallion and are placed in a heavenly realm separated from earth by a wide, multilayered barrier. Directly below the sun and the moon are two distinct types of plants: one, an umbrella-shaped mushroom with a down swept cap, resembling the psilocybin-containing species; and the other, an Italian pine with upswept branches (Figure 5).

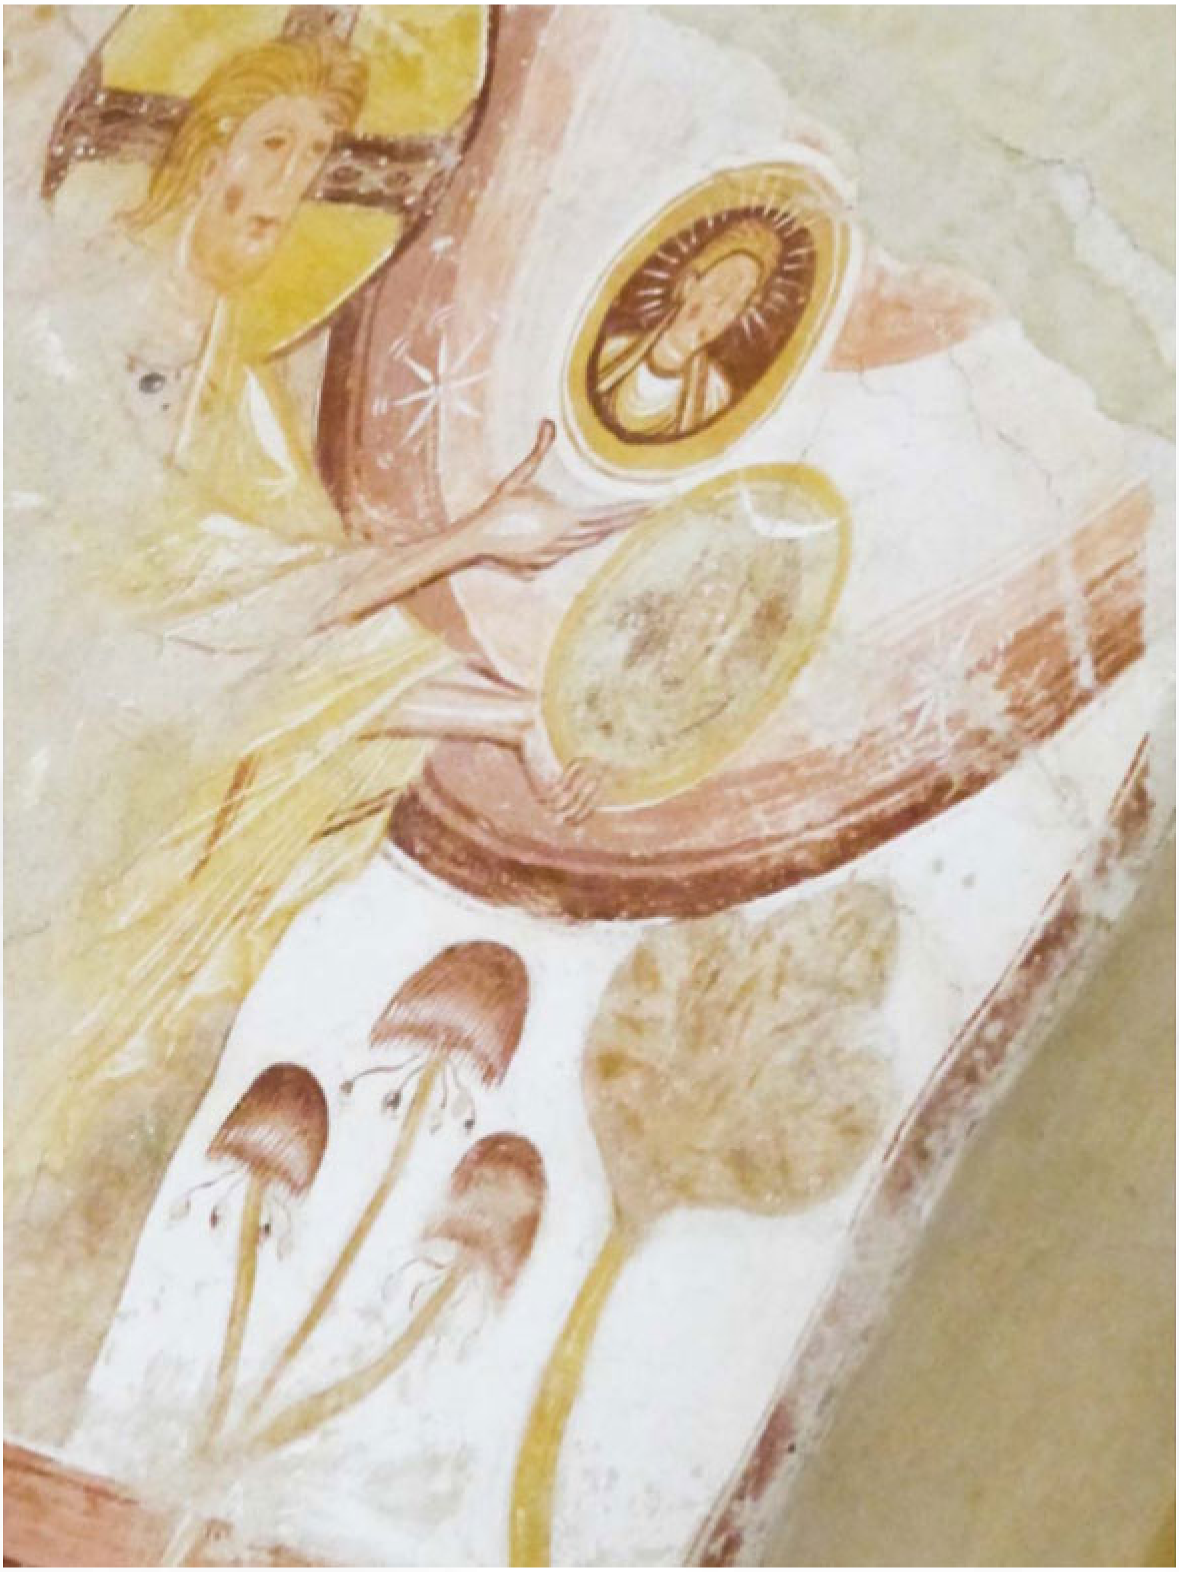

Figure 5. Genesis. The Creation of the Stars. Abbey of Saint-Savin-sur-Gartempe, 11th-12th century (photo by Julie M. Brown)

In contrast to the Plaincourault-type mushroom tree, the Saint Savin-type mushroom tree has the following characteristics:

1. Distinctly convex (downward-curved) cap, which may be "striated" (striped) instead of dotted;
2. The trunk-stem spreads out to form several branches, generally three, and in some cases the branches terminate in a dense, compact trilobite (three-lobed) leaf;
3. At times, this mushroom tree is depicted with characteristic "papilla" (a nipple-like shape), which forms

a point on the top of the cap, a characteristic of the common European psilocybin mushroom known as the Liberty Cap (*Psilocybe semilanceata*).

The botanical differences between Panofsky's Italian pine tree and Samorini's mushroom tree have been graphically highlighted by researcher Michael Hoffman (1985-2007b), who posted a photo gallery online showing marked similarities between the mushroom trees depicted in Christian art and actual mushrooms in nature.

Samorini argues that the Plaincourault-type mushroom tree has ancient roots - roots that reach far deeper into the past than acknowledged by Panofsky, who classifies the Plaincourault fresco as an example of a stylized tree "*prevalent in Romanesque and Early Gothic art*," which dates from the 11th to 16th centuries CE (see Figure 3).

However, Samorini (1998, pp. 90-93) traces the evolution of this mushroom tree back to the 5th and 6th century BCE mosaics, found in Tunisia. At that time, instead of Adam and Eve, two animals (i.e., stags and lions) were placed symmetrically on either side of the mushroom tree. From these ancient origins, this mushroom-like Tree of Life is subjected to wide stylistic variation, sometimes appearing as a palm tree, a conifer tree (the symbiotic host of *A. muscaria*), and even as a pine cone. As this ancient symbolism was adopted by Christianity, the two animals standing on each side of the mushroom tree became two lambs or two fishes, and the Tree of Life transformed into the Cross or the Chalice of the water of life.

Entheogens in christian art

With this background, we turn to the findings of our 2012 fieldwork in Europe and the Middle East in search of iconographic evidence of entheogens in Christian art. The catalyst for this fieldwork was the accidental discovery in 2006 of a mushroom (Figure 6) sculpted into the forehead of the most prominent Green Man of Rosslyn Chapel located just south of Edinburgh in Scotland, which we hypothesized was a representation of *A. muscaria*. Rosslyn was founded in 1446 by Sir William Sinclair, the last Prince of Orkney.

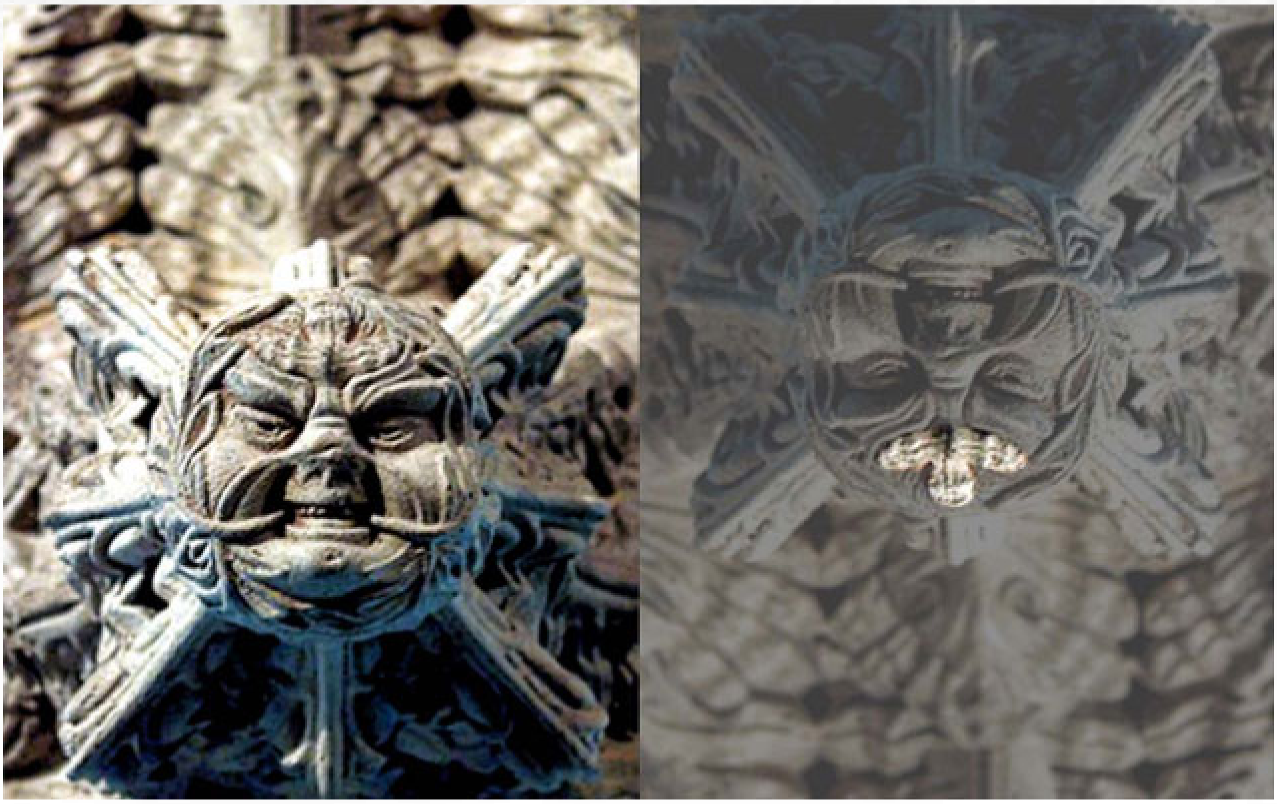

Figure 6. Green Man, Rosslyn Chapel, Scotland, 15th Century. Front view and inverted view with highlighted forehead (photo by Julie M. Brown)

On August 22, 2015, while writing *The Psychedelic Gospels*, we met Paul Stamets, one of the world's leading experts on mycology. Stamets had visited Rosslyn and confirmed that the mushroom in the Green Man's forehead was a "taxonomically correct *Amanita muscaria*" (Brown & Brown, 2016, p. 14).

As we considered the implications of this discovery, we asked ourselves a fundamental question: *Was this Green Man sculpture in Rosslyn Chapel, a 15th century Catholic church, providing a clue to the historical presence of sacred mushrooms in Christianity?*

We knew that the opinion of Wasson, a leading authority in the field of ethnomycology, proclaimed the absence of psychoactive mushrooms in early Christianity, and that his opinion had been taken as gospel by most, but not all scholars, involved in the study of entheogens and religion. Nevertheless, after researching this question for several years, we ultimately decided to carry out fieldwork on entheogens in Christian art.

In the summer and fall of 2012, we traveled to Europe (England, France, Germany, and Italy) and the Middle East (Turkey) visiting abbeys, cathedrals, chapels, and churches. During this research, we found and photographed psychoactive mushrooms, particularly *A. muscaria* and *Psilocybe*, in a variety of Christian art: frescoes, ceiling paintings, illuminated manuscripts, mosaics, sculptures, and stained glass windows. Figure 7 shows a map of the major churches and sacred sites (Eleusis in Greece) that we visited. What follows is a brief description of our major findings illustrated by original photographs of entheogens. A detailed description and discussion of these findings is presented in *The Psychedelic Gospels: The Secret History of Hallucinogens in Christianity* (Brown & Brown, 2016). The following discussion of the theory of the psychedelic gospels is mainly derived from the original research and materials presented in our book.

Saint Martin de Vicq, Central France

The small parish Church of Saint Martin de Vicq (Saint Martin) is located in the village of Nohant-Vic in the Indre department of Central France 50 miles east of Plaincourault. In the 11th century, the church belonged to the Benedictine Abbey of Déols in the old province of Berry. At that time, it consisted of a simple nave and choir. At the beginning of the 12th century, a semicircular apse was built and an exceptional set of murals was painted, first rediscovered in 1849. Restoration began in 1987 and was completed in 1991. A plaque describes the murals as "the work of an artist of genius," which "portray the theme of Redemption, from the Error of Adam to the Last Judgment."

In *Romanesque Wall Painting in Central France: The Politics of Narrative*, art historian Marcia Kupfer (1993) devotes a chapter to the history and interpretation of the Saint Martin murals. Typical of the fresco cycles found in the region, these paintings are the creation of a single workshop, usually consisting of a lone painter, perhaps with an assistant to help with the plastering and preparation of the pigments.

We traveled to Saint Martin because a book (Irvin, 2008) and an article (Samorini, 1998) included photographs of psilocybin mushrooms in one of the wall paintings. During our visit, we found that the panoply of frescoes in Saint Martin represented an illustrated Bible including a veritable Christology. Among them, we found several mushroom-tree images - significantly more than the single mushroom group mentioned in the literature - illustrating key scenes in the life of Jesus.

On the upper panel of the south choir is a wall-length fresco depicting side by side, the Old Testament story of the *Purification of Isaiah's Lips* with the New Testament story of *Christ's Entry into Jerusalem* (Figure 8). Located in the upper right-hand corner of *Christ's Entry* are the convex-shaped caps of five, large, smooth (non-striated) mushrooms that resemble psilocybin-containing species, possibly *Psilocybe azurescens*. Once again, we note that "size matters" for caps of these mushrooms are as large as the heads of the joyous youth welcoming Jesus to Jerusalem.

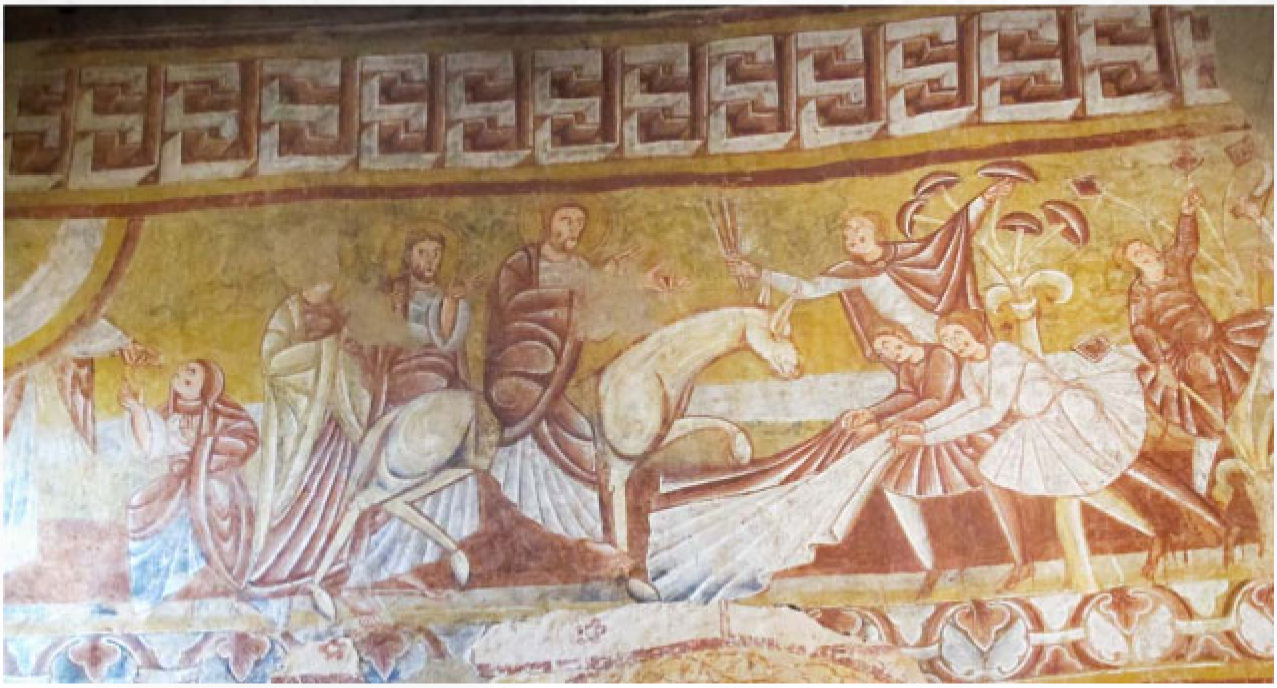

Figure 8. Purification of Isaiah's Lips and Christ's Entry into Jerusalem. Fresco on south choir wall, Church of Saint Martin de Vicq, France. Early 12th century (photo by Julie M. Brown)

Christ is riding on an ass with his arms outstretched to receive a plant-like gift (of which only the stems are visible), offered by one of the youth who with his other hand is holding the stem of one of the mushrooms. On the far right of the fresco stands another youth holding the stem of a diamond-shaped frond (possibly a palm frond) in his left hand and a long slightly curved sword in his right hand. Given that the caps are convex-shaped and without dots and that the main stem spreads out to form several branches, this is what Samorini labels a Saint Savin-type mushroom tree, which contains psilocybin.

As in the Garden of Eden scene in Plaincourault (see Figure 4), once again we see the fusion of two separate historical events, but in this case of events separated by centuries: the Old Testament's *Purification of Isaiah*'s *Lips* and the New Testament's *Christ*'s *Entry into Jerusalem*. Figure 9 shows a detailed view of the *Purification*.

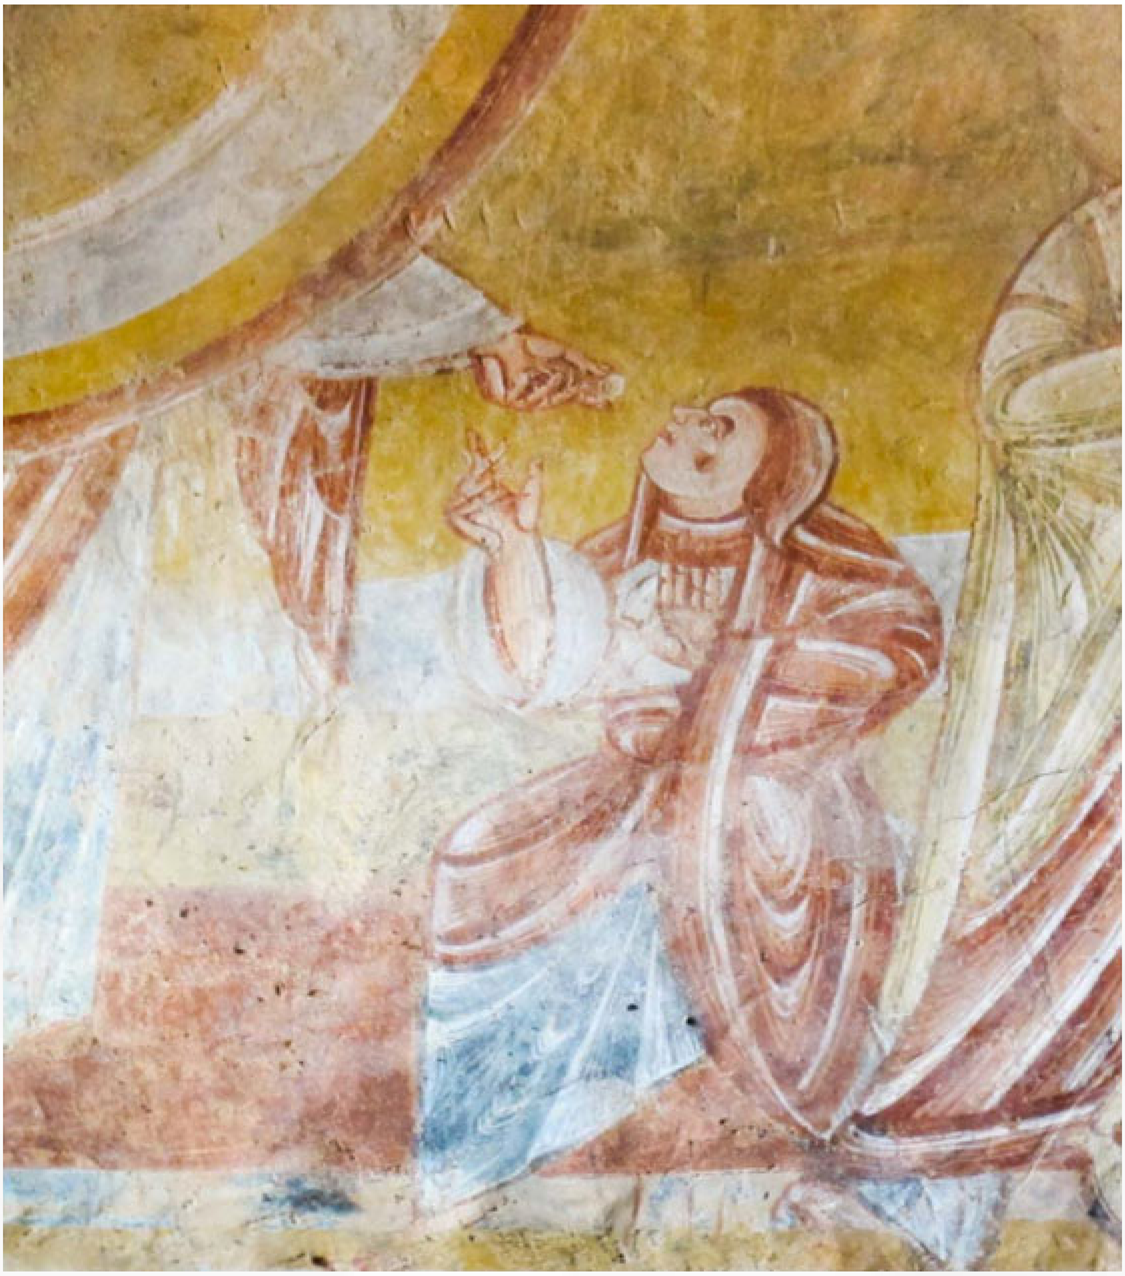

Figure 9. Detail of Purification of Isaiah's Lips. Fresco on south choir wall, Church of Saint Martin de Vicq, France. Early 12th century (photo by Julie M. Brown)

In addition to this fresco, we found other entheogenic images at Saint Martin. Looking to the right in the direction in which Christ is proceeding, on the facing wall, is a painting of the *Towers of Jerusalem*. Standing on the roof of the tower are two men, both dressed in mantels similar to those worn by the youth in *Christ*'s *Entry*. One of them is cutting through the stem of a mushroom tree (Figure 10), using a knife that is distinctly shorter than the sword shown under the diamond-shaped frond in the prior fresco. We can only speculate why a mushroom tree is growing on top (or out of) the roof of a stone tower. Perhaps, the artist is using this device to show the significance of these psychoactive mushrooms in the drama of the Christology unfolding before our eyes.

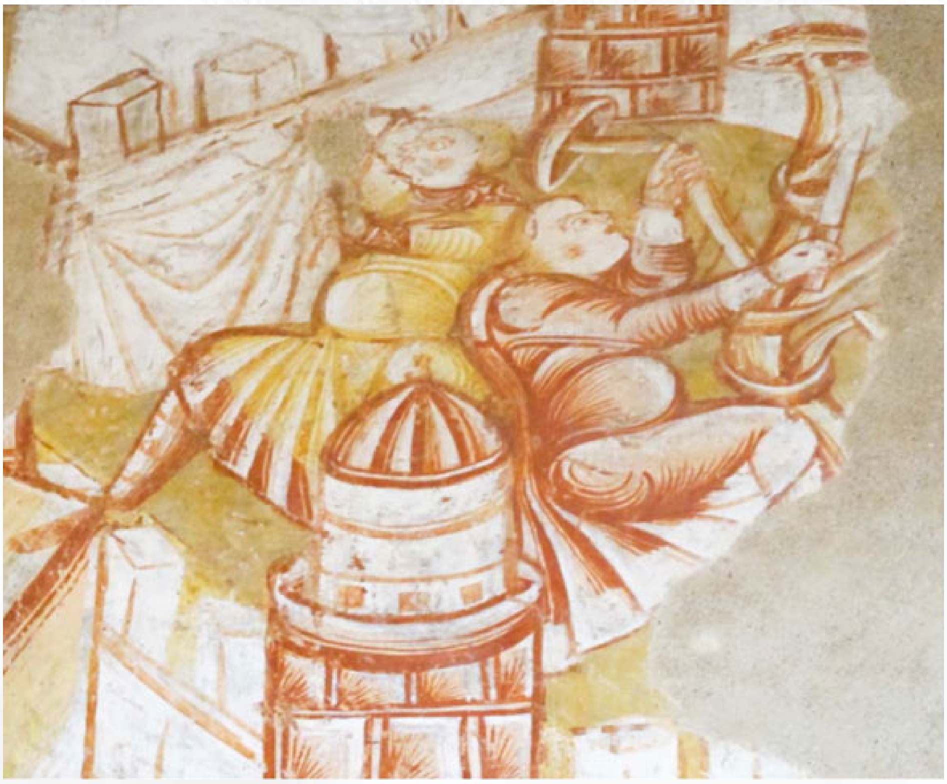

Figure 10. Detail from Towers of Jerusalem. Church of Saint Martin de Vicq, France. Early 12th century (photo by Julie M. Brown)

Immediately to the right of the *Towers of Jerusalem* and part of the same wall is a rendering of *The Last Supper* (Figure 11). Here Jesus and 11 of the disciples are seated behind the table. A 12th disciple, probably Judas, is set apart on the other side of the table, learning forward to ingest the offering (indistinguishable in the painting) that Jesus is holding out to him. On the table, there are four knives (three to the left of Jesus and one to the far right) similar in length, shape, and handle design to the knives used to cut through the mushroom stems on the *Towers of Jerusalem*. This is not a traditional Passover Seder, the Jewish holiday commemorating the Exodus from Egypt on which the Last Supper took place, because there is no Pascal lamb nor are there wine goblets on the table, only bowls and round objects. In fact, the mushroom caps on the top of the towers and the objects on the table share nearly the same round form, size, and coloration.

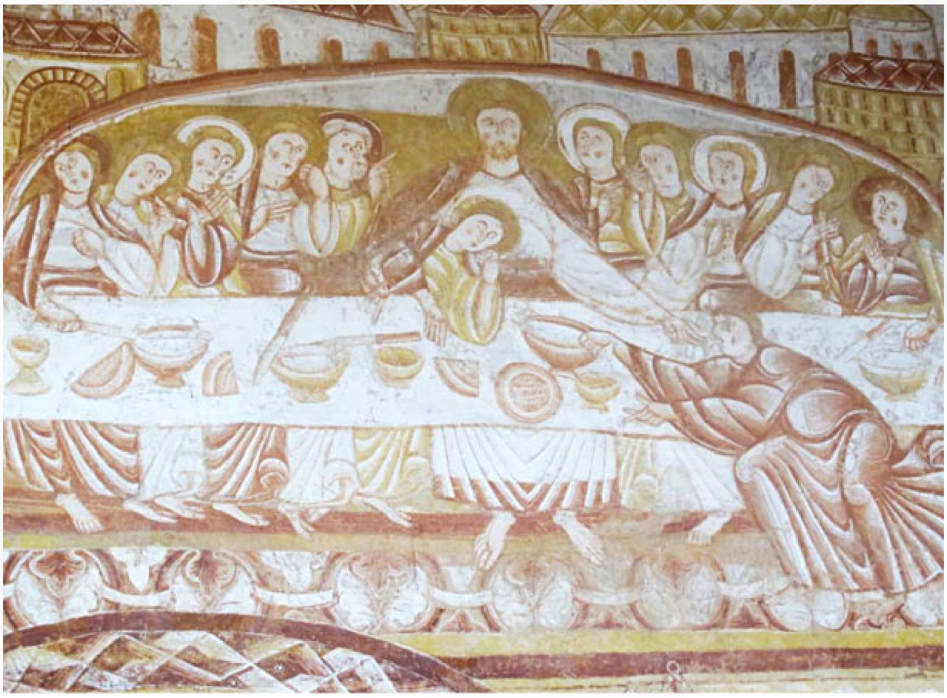

Figure 11. Last Supper, West Choir Wall. Church of Saint Martin de Vicq, France. Early 12th century (photo by Julie M. Brown)

This repetition of mushroom caps and knives connects the three scenes (*Christ's Entry*, *Towers of Jerusalem*, and *Last Supper*) visually suggesting that the mushroom caps in the first two scenes have been placed on the table of the *Last Supper*. The paring of the knives and the round objects implies that these objects have been cut, which is significant because, if these were loaves of bread, in that time they would have been torn apart by hand. In addition, by rotating the table forward, the artist is highlighting the objects on the table.

Finally, if we look closely at the robes of the disciples seated to the left of Jesus, we see discretely drawn into the folds of the hems are three distinct umbrella-shaped, mushrooms caps whose stems are all linked together (Figure 12).

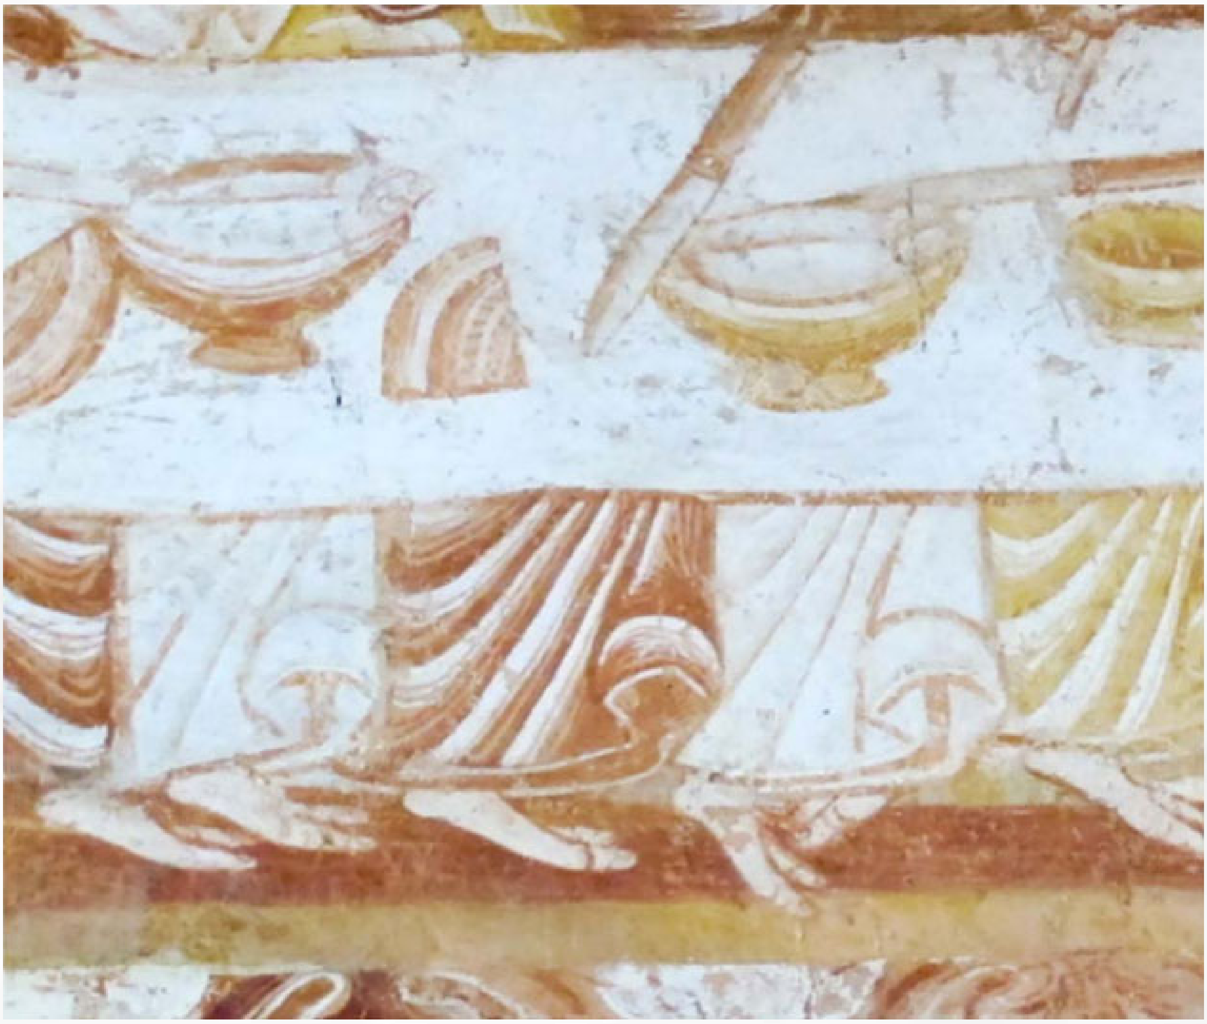

Figure 12. Detail of Last Supper, Saint Martin de Vicq. Showing Mushrooms in Hems of Disciples Robes. Early 12th century (photo by Julie M. Brown)

Purification of Isaiah's lips

In this context, we examine the Old Testament scene of the *Purification of Isaiah*, depicted to the left of *Christ's Entry* (see Figure 9 above). Here Isaiah is kneeling before an angel, whose partially visible body is bathed in concentric circles of light and who is entering the scene from above. The angel's hand is coming out of the circles of light. Between his thumb and index finger is a tan, roundish object that is being offered to Isaiah who reaches up to receive it.

The relevant Old Testament passage states, "*Then flew one of the seraphims unto me, having a live coal in his hand, which he had taken with the tongs from off the altar: And he laid it upon my mouth, and said, Lo, this hath touched thy lips; and thine iniquity is taken away, and thy sin purged*" (Isaiah, 6:6-7). However, in this medieval fresco of the Isaiah story, the object that the seraphim is holding out is round and tan, not the fiery red color nor even the glowing black one would expect of a burning coal. Furthermore, the angel is not holding this offering with tongs, but between his fingers.

Psychedelic gospels theory

According to Kupfer (1993), given that the Old Testament prophet Isaiah foresaw the coming of Christ, the essential themes of this visual sequence are purification and prophecy as preconditions for spiritual passage and entry into the kingdom of heaven. Kupfer (1993) sees the luminous coal as a manifestation of Christ, which reveals the inner spiritual meaning of the *Entry*. "*If the radiance of the coal symbolizes the mystery of the Incarnation, it's perfectly round shape may further suggest the form in which this mystery is materially embodied on earth. The particular gesture with which the angel displays the coal appears visually to identify the small disk with the Eucharistic host*" (p. 143). In other words, just as Isaiah feels the coal's purifying touch on his lips, so the Christian believer receives the sacred host of the Eucharist in his mouth.

As the late afternoon sunlight filled the choir of the church, we had an "ah ha" moment. Here, at Saint Martin de Vicq, these frescoes were revealing an alternative history of Christianity, a psychedelic gospel inspired by entheogenic mushrooms.

We contemplated the incontrovertible facts portrayed in the wall paintings before us: the pictorial fusion of Jesus entering Jerusalem with the purification of Isaiah; Jesus with arms outstretched toward the large psilocybin mushrooms in the *Entry*; the joyful youth cutting down mushrooms with a long knife on the *Towers of Jerusalem* adjacent to the scene of the *Last Supper*; and the orderly row of mushrooms hidden in the hems of the disciples.

Drawing on what we had observed at Plaincourault and Saint Savin, we contemplated an entheogenic interpretation of what these Saint Martin frescoes implied: first, that the angel was purifying Isaiah's lips with a holy psychoactive mushroom, which inspired his prophetic visions of the future coming of Christ and which was also the catalyst for Christ's elevated state of consciousness; and, second, that the Last Supper and the First Eucharist that Jesus was sharing with his disciples was actually a meal of sacred mushrooms. This is indicated by the mushroom forms depicted in *Christ's Entry* and the *Towers of Jerusalem* and by the otherworldly expression on Jesus' face.

If our theory of the psychedelic gospels is true, it leads to the controversial conclusion that early and medieval Christians experienced purification, healing, divinity, and even immortality by means of sacred plants. Obviously, we are not the first researchers to document psychoactive mushrooms in Christian art. That said, what is unique about our research is the combination of onsite fieldwork on entheogens in Christian art with the theory that they represent an alternative history of Christianity - a history that challenges aspects of the master story presented in the Canonical Gospels.

In evaluating the psychedelic gospels theory, we had to consider an alternative less contentious explanation. Perhaps, the mushroom icons we had found to date were simply the eccentric creations of an heretical Christian cult flourishing deep in the forests of Central France far from the control of church and crown. With this caveat in mind, we decided to travel north to the grand cathedrals of Chartres in France and Canterbury in England, as well as to Saint Michael's Church in Germany, in order to see if we could find additional evidence of entheogens in the high holy places of medieval Christendom.

Because they were the catalyst for the theory of the psychedelic gospels, we have provided detailed descriptions and interpretations of the entheogens investigated at Plaincourault, Saint Savin, and Saint Martin, space limitations do not permit similar in-depth discussions of our subsequent findings at Chartres Cathedral, Canterbury Cathedral, and Saint Michael's Church. Therefore, in the next section of this article, we simply present original photographs of the entheogenic mushrooms found along with a brief description of each image. A comprehensive discussion of these findings is provided in the relevant chapters of *The Psychedelic Gospels* (Brown & Brown, 2016, Chapters 10-11).

Chartres Cathedral, France

Our Lady of Chartres is one of the finest examples of French Gothic architecture. It is a UNESCO World Heritage Site and the destination of one of the Catholic Church's most popular pilgrimages in honor of the Virgin Mary. The cathedral is massive. Its spires rise 375 ft above the city streets. But due to its perfect proportions and airy stained glass windows, it does not feel heavy or imposing. Lattice-like flying buttresses allowed for the opening up of the walls to accommodate two tiers of stained glass windows.

The current cathedral is one of at least five, which have occupied the site since the 4th century. After a catastrophic fire, the cathedral as it now stands was reconstructed between 1194 and 1220. What makes this cathedral special is its exceptional state of preservation. The majority of the original windows has survived intact from the 12th and 13th centuries.

Among the cathedral's 176 stained glass windows, we documented at least 13 Old and New Testament stories showing mushroom images, including several stories related to the life of Jesus. The Old Testament stories include the Zodiac Window, showing the cycle of the "labors of the months," along with the stories of Adam and Eve and of Joseph and Noah.

The Saint Eustace window is representative of these New Testament stories (Figure 13). The opening panels of this window show Placidas (the future Saint Eustace) hunting stag on horseback, surrounded by hunting horns, huntsmen and hounds. In the next panel, we see the Conversion of Placidas to Saint Eustace. Flanked by sacred mushrooms, he kneels and prays before the crucifix, which appears between the antlers of a stag standing regally before him. This parallels Samorini's (1998, pp. 89-90) description of the pre-Christian 5th century BCE Tunisian mosaic where the mushroom tree stands between two deer. Here, in the medieval Christian era, the Cross has replaced the mushroom tree.

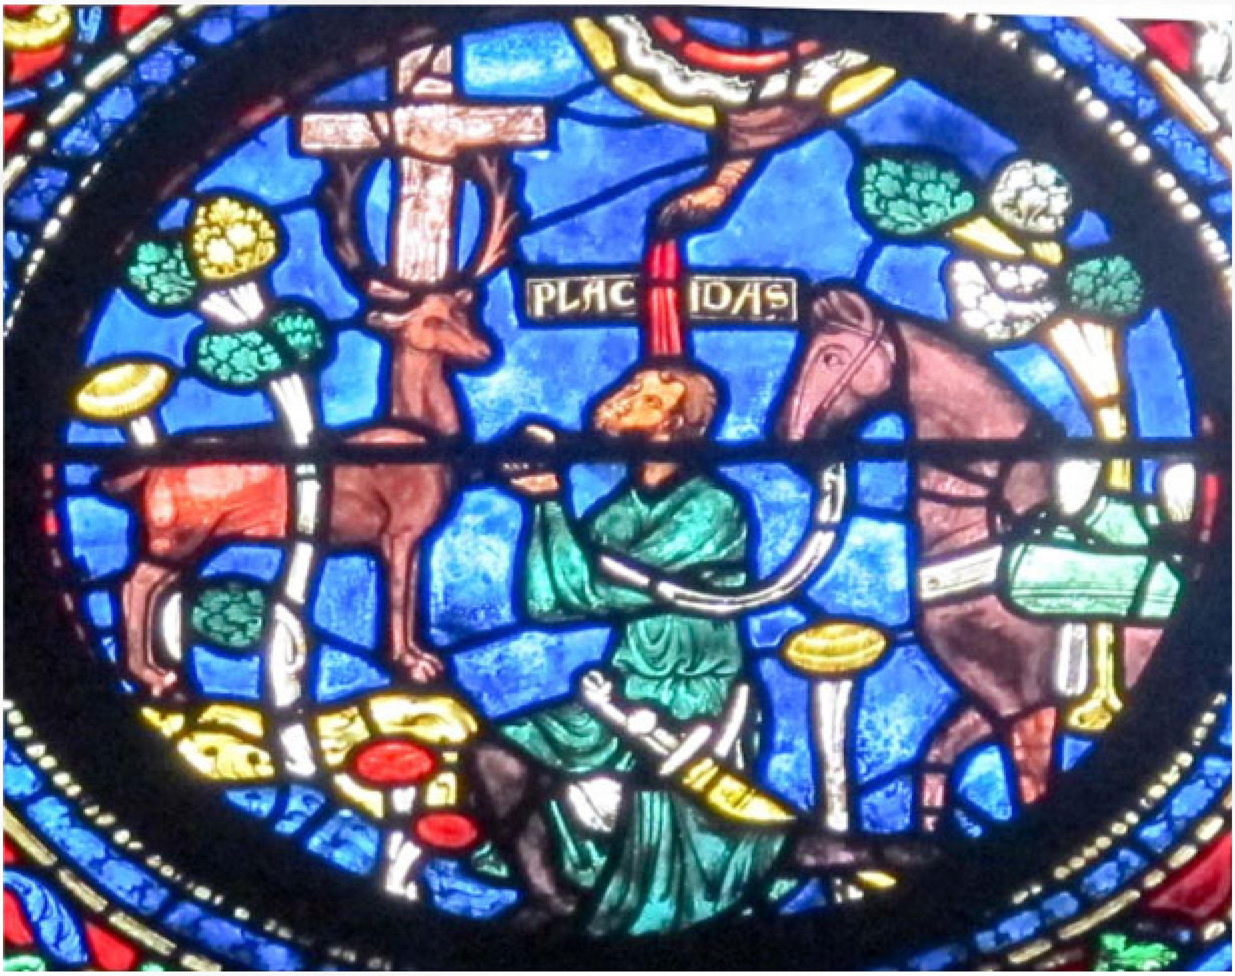

Figure 13. Conversion of Placidas, Saint Eustace Window. Chartres Cathedral, France, early 12th century (photo by Julie M. Brown)

As in the fresco of the *Purification of Isaiah's Lips* at Saint Martin's (see Figure 9), entering this Saint Eustace scene from above are multicolored concentric rings - representing the separation between heaven and earth - from which an angelic hand emerges to anoint Saint Eustace's head with red rays of "uncircumscribable light." This scene strongly suggests that entheogens played a seminal role in Saint Eustace's awakening, conversion, and entrance into Christ consciousness because of the fungiform representations surrounding the kneeling figure.

Canterbury Cathedral, England

The Great Canterbury Psalter (13th century), which according to art historian Rosa Alcoy (2015) has been described as "*a peerless masterpiece*" (p. 1), is a magnificent illuminated manuscript (19" high × 13" wide) originally bound in leather and covered with precious gems. Curiously, the *Psalter* has two distinct parts created in two separate regions at historically different times. The first and oldest, which contains the entheogenic images, was produced around 1200 in the Christ Church scriptorium in Canterbury, England. Then, after mysteriously disappearing for more than a century, the unfinished psalter emerged in Catalonia (today part of Spain), where it was completed between 1340 and 1350.

The *Psalter* opens with 8 stunning folios (pages), each containing 12 lavishly colored, gold-embellished miniature paintings. These opening folios depict the history of the world according to the Scriptures, from the Creation to the life of Jesus. While the biblical narrative is traditional, offering psalms, songs, and prayers, the illustrations are exceptional.

Numerous red, blue, orange, and tan stylized mushrooms are found in the first 100 pages, including this picture (Figure 14) showing God as the Creator of Plants, or more specifically as Creator of Sacred Plants. The red mushroom on the far right with white speckles is *A. muscaria*. The second one on the right is blue, manifesting the classic bluing reaction of psilocybin-containing mushrooms. While several authors have identified the third plant as a Syrian Rue (*Peganum harmala*) pod, careful inspection reveals that it bears no resemblance. Rather the color, shape, and fringes of the eight tiny mushroom images embedded in the cap suggest *Panaeolus*, a psilocybin-containing mushroom found in England and Northern Europe. While other authors have described the fourth plant on the far left as "an Opium Poppy in the shape of a mushroom," again, there is little resemblance either to the flower or the pod of the opium plant. Instead, this more likely represents another mushroom of the genus *Psilocybe* (see Brown & Brown, 2016, pp. 137-138).

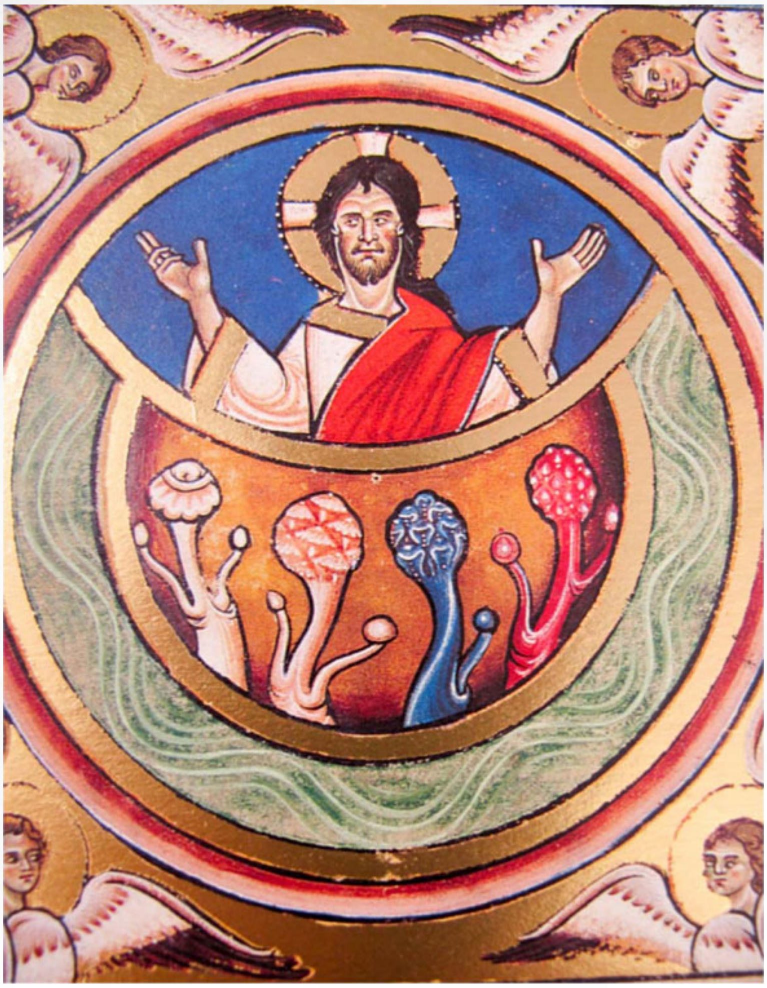

Figure 14. God Creates Plants. Great Canterbury Psalter Folio 1, England, *ca*. 1200 (courtesy of the Bibliothèque nationale de France, Paris)

In the 10th Panel of this folio under the title "Healing of the Leper" (*De curatione leprosi*), we see Jesus laying hands on a leper and performing a healing ceremony (Figure 15). The scroll in the leper's left hand translates as "*Master, if you want, you may cleanse me.*" Curiously, the scroll is not directed toward Jesus, but points to and merges with the stem of the tan mushroom at the base of the panel. In turn, Jesus is holding a scroll in his left hand that extends to the back of the leper, saying "*I want to: Be cleansed.*" Here, we suggest that the scrolls represent a direct link between Jesus' healing ministry and the curing power of sacred mushrooms.

Saint Michael's Church, Germany

In the case of Chartres Cathedral, we wondered who placed these sacred mushroom images in the stained glass windows. Was it the royalty and aristocrats who financed the reconstruction of the cathedral in the 13th century? The bishops and monks who supervised the rebuilding project over decades? The master artisans who designed, cut, and installed the stained glass windows? Or all of them collaborating together?

In the case of Saint Michael's Church, we know exactly who created the mushroom images. In 993, when the urbane but mystical Bernward (960-1022) became the 13th bishop of the Holy See of Hildesheim at the age of 33 years, he was given a splinter of the Holy Cross by Emperor Otto III, whose teacher he had been for a long time. In honor of this relic, he inaugurated a chapel and planned a monastery on a hill on the outskirts of the city. The foundation of Saint Michael's Church (*Michaeliskirche*), the church for the monastery, was laid in 1010. The church was consecrated on Saint Michael's Day (September 29) in 1033. Bernward was canonized as Saint Bernward in 1192, more than a century after his death.

To commemorate the millennium, in 1015 Bernward cast a bronze door (the Door of Salvation) featuring Old and New Testament scenes in high relief. As a companion piece, Bernward designed a tall bronze column (the Christ Column) depicting the life of Christ, which he placed prominently behind the altar for all to see. The column was completed in 1020 just 2 years before Bernward's death.

Each work of art has a distinctive biblical theme. For the bronze door, it is the Fall and the Resurrection; for the column, it is the Life of Jesus. Viewed as a unified body of work, the fungiforms in the Door of Salvation and the Christ Column indicate the intention to represent an entheogenic legacy that was deliberately created by a saint of the Catholic Church.

In the fourth panel on the left wing of the "Door of Salvation," Bernward portrayed the tree in the Fall of Man as a mushroom tree. Here having eaten of the Forbidden Fruit, Adam, who is standing before an angry Lord, is pointing at a cowering Eve. Eve in turn is blaming the winged serpent coiled at her feet, the incarnation of the Tempter. Bernward left no doubt that one of the three mushrooms had already been eaten by Adam and Eve, as indicated by the broken branch springing from the lower part of the mushroom tree (Figure 16).

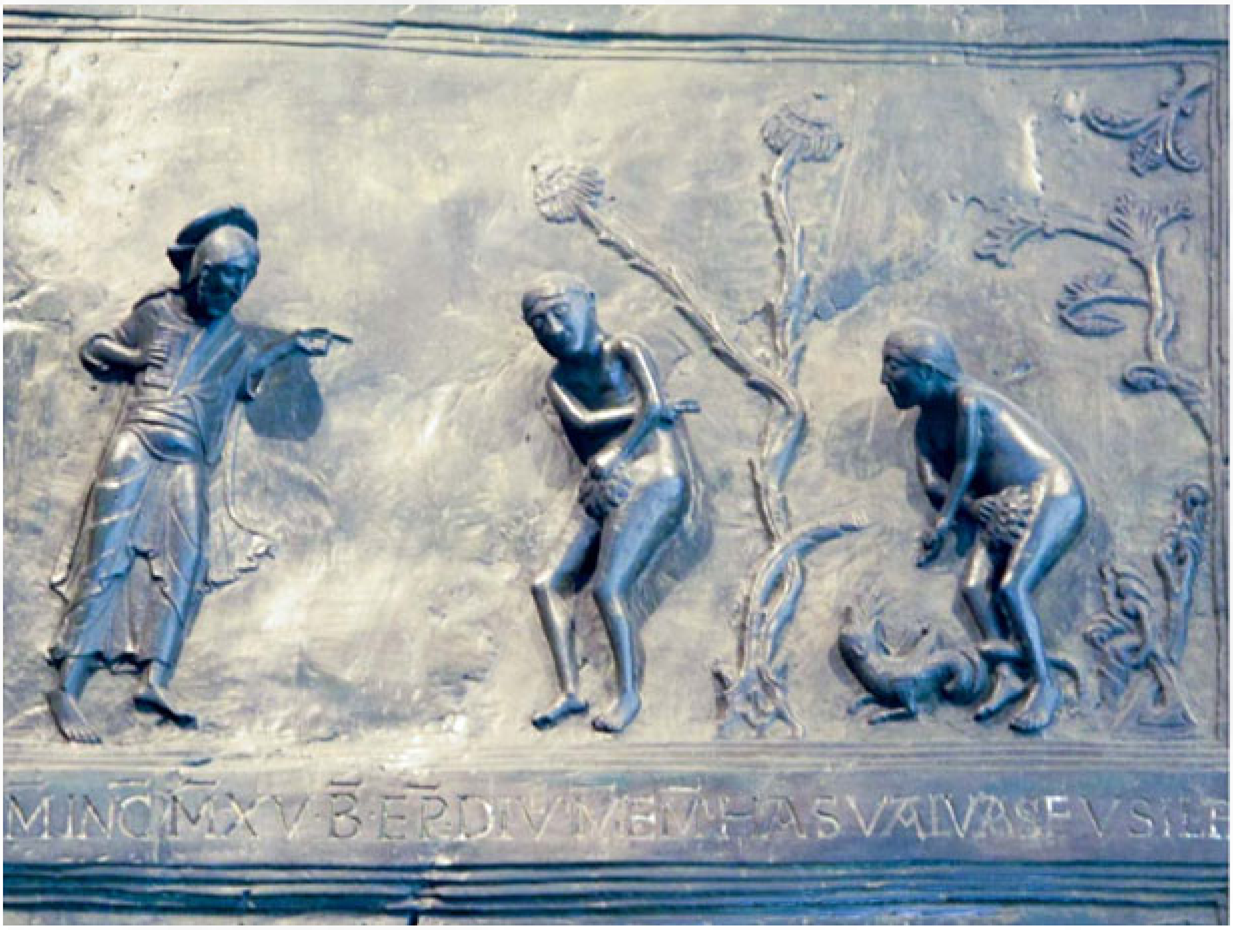

Figure 16. Panel 4, Adam and Eve, Bernward's Door of Salvation. St. Michael's Church, Hildesheim, Germany, 1015 (photo of Julie M. Brown)

In casting the door, Bernward took special care to provide details that precisely identify the species of psychoactive mushroom in this bronze bas-relief. As ethnobotanist Samorini (1998) observes, "*The mushroom-tree is realistically rendered with a precision not far short of anatomical accuracy and can be identified as one of the most common Germanic and European psilocybin-containing mushrooms, P. semilanceata (Fr.) Quél*" (p. 103), known as the "Liberty Cap." The Saint Savin-type mushroom tree between Adam and Eve sprouts two umbrella-shaped mushrooms with pointed nipple-like tops (papillae) and furrowed (striated) caps.

The bronze "Christ Column," which Bernward cast in 1020, stands over 12-ft tall and is nearly 2 ft in diameter. Ascending from the base in a coiling helix are 28 scenes from the life of Jesus, starting with his baptism and ending with his entrance into Jerusalem. To instruct the initiates in the "holy of holies," Bernward had strategically placed trifold mushroom trees, similar in every detail to the one in Eden on the Door of Salvation, in five of the seminal episodes of the life of Jesus including the Transfiguration.

In the Transfiguration, the apostles Peter, James and John go with Jesus to Mt. Tabor where the Old Testament prophets Moses and Elias appeared (Figure 17). There, Jesus transforms before their eyes so that "his face did shine as the sun." According to Matthew (17:5), "*a bright cloud overshadowed them: and behold a voice out of the cloud, which said, This is my beloved Son, in whom I am well pleased; hear ye him.*"

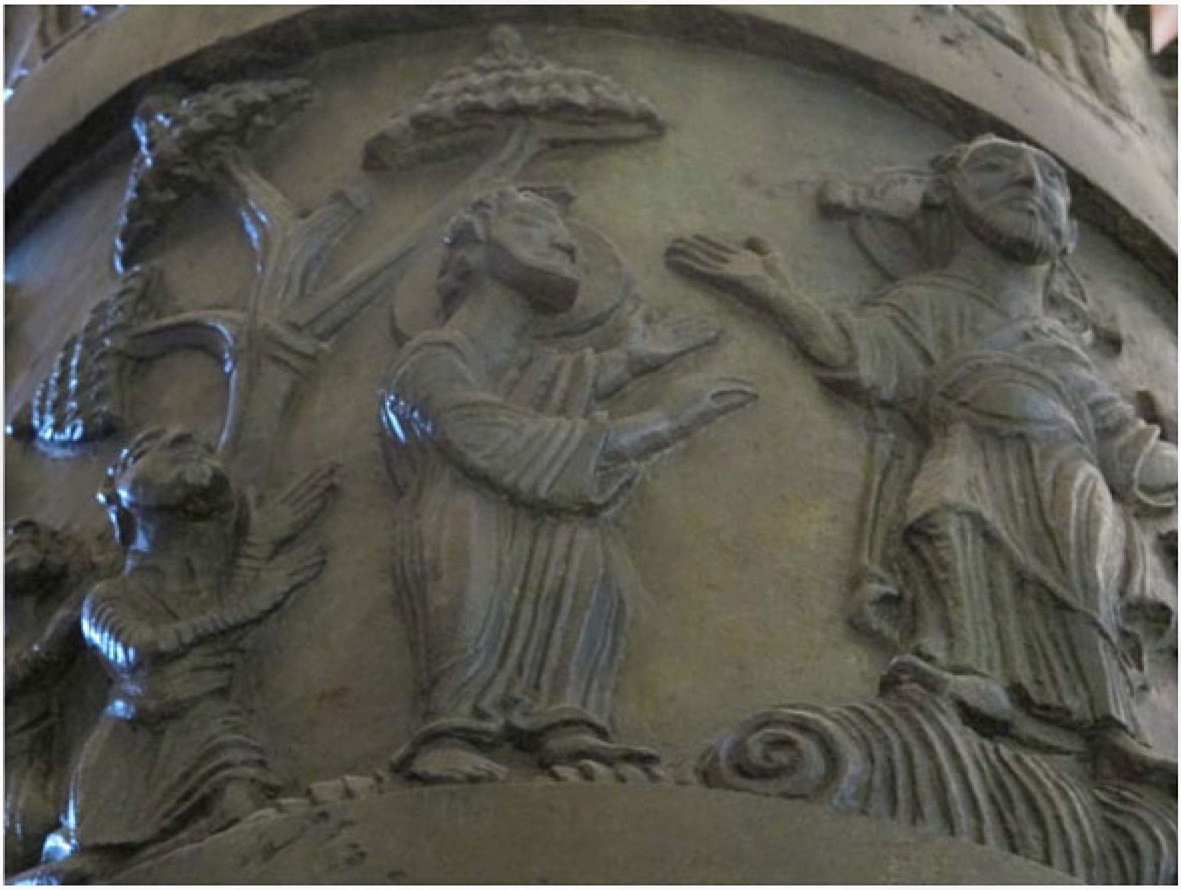

Figure 17. Transfiguration of Jesus, Christ Column, 1020. St. Michael's Church, Hildesheim, Germany (photo by Julie M. Brown)

Bernward's portrayal of the sacred entheogenic mushroom tree in the Transfiguration of Jesus is of particular significance for the psychedelic gospels theory, given that the Transfiguration is one of the main miracles attributed to Jesus in the Gospels. Unlike other miracles which were performed *by* Jesus, this one happens *to* Jesus, reaffirming, as did the baptism by John, his divinely chosen role as the "Son of God." Thus, the Transfiguration is a pivotal moment of the New Testament where humankind intersects with God. As Bernward implies artistically, access to the divine is mediated through the sacred sacrament of psychoactive mushrooms.

Due to space limitations, we cannot present and adequately discuss all of the entheogenic mushroom images documented in *The Psychedelic Gospels* (Brown & Brown, 2016). Notable among these images are:

1. Germany - the ceiling painting of the Jesse Tree carried out by Saint Bernward's successors in 1240, showing the Temptation in Eden against the background of a resplendent red and gold *A. muscaria* mushroom cap (color plate 20);
2. Italy - a mosaic of a basket of *A. muscaria* mushrooms in the Basilica of Aquileia, ca. 330 (color plate 21), whose botanical identification has been addressed by Fabbro (1996, 1999) and Samorini (1998, pp. 105-106);

3. Turkey - a never-before-reported *A. muscaria* mushroom painted around 1050 on the tip of the sponge of the Crucifixion in the Dark Church of the Open Air Museum in Göreme (color plates 23-24); and
4. Turkey - an angel holding an *A. muscaria* painted in the Yilanli Church in the Ihlara Valley, an area to which Christians fled as early as the first century in order to avoid Roman persecution (color plate 26).

Entheogens and early Christianity

We have identified *A. muscaria* and *Psilocybe* images in several examples of medieval Christian art and, based on these case studies and other examples found in the literature, inductively proposed the theory of the psychedelic gospels. The only evidence we have from early Christianity is found in the mosaics of the Cathedral of Aquileia, which date *ca*. 330 CE.

Meeting the challenge of finding additional evidence in earlier Christian art is problematic, if not impossible. Due to poverty and persecution, early Christians had limited opportunities to express their beliefs in images. As Spier (2007) observes in *Picturing the Bible* "*no churches, decorated tombs, nor indeed Christian works of art of any kind datable before the third century are known*" (p. 1).

To look for corroborating evidence of entheogens in early Christianity, we must turn to the written word - to the texts of the New Testament and the Gnostic Gospels, as well as to the commentaries of church fathers and other writers including poets, patricians, and historians. Since Christianity emerged in a Mediterranean region rife with Egyptian, Greek, Judaic, and Roman mystery cults, many of which possessed a sacred pharmacopeia, there is robust documentation of early entheogen use. It is therefore not surprising that "*Christianity absolutely had psychedelic mystery traditions throughout its history - nearly up to the modern day. From the Nazarene apoclypticists having visions of the end-times, to the various gnostic magic and mystery traditions, to the orthodox appropriation of various pagan theogenic experiences... psychedelia has been a part of Christianity since its earliest days*" (Hatsis, 2018, p. 170).

For example, based on an examination of textual evidence from the New Testament and the Nag Hammadi Library, which presents translations and commentaries on 52 Gnostic texts (Robinson, 1990), we have established "*a temporal and cultural link between entheogen use in Classical mystery cults and their possible use in a segment of the early Christian Gnostic Church*" (Brown & Lupu, 2014, p. 64).

In an intriguing passage from the Gnostic Gospel of Thomas, Jesus tells Thomas that they have both received knowledge from the same source:

> *Jesus said to his disciples, "Compare me to someone and tell me whom I am like ...." Thomas said to him, "Master, my mouth is wholly incapable of saying whom you are like." Jesus said, "I am not your master. Because you have drunk, you have become intoxicated from the bubbling spring which I have measured out .... He who will drink from my mouth will become like me. I shall become he, and the things that are hidden will be revealed to him.*" (Robinson, 1990, pp. 127, 137)

In terms of dose, while the psychoactive elixir is not identified, the fact that Jesus has "measured out" the drink suggests he knows the amount that should be ingested. In terms of effects, it appears that Jesus and Thomas are participating in a powerful transpersonal experience, one beyond words, in which they are literally sharing consciousness.

This widespread acknowledgment of entheogens in early Christian writings documents a psychedelic mystery tradition that persisted through the Dark Ages and flowers in the form of rich artistic renderings during the Middle Ages. The prevalence of this psychedelic tradition in a wide variety of texts and artistic media including illuminated manuscripts, bronze castings, and stained glass windows in the high holy places of Christianity shows that this tradition was not suppressed by the early Church, but to the contrary was made available as a secret practice for initiates.

The presence of psychedelics in Christian works of art should not be surprising, if we consider the teachings of Pope Gregory I (540-604), known as "the Father of Christian Worship." Pope Gregory believed that paintings of bible stories were an essential tool for the education of the faithful most of whom could not read. In this way, Christian art and images became "the Bible of the illiterate."

Critiques of the psychedelic gospels theory

To be sure, we are taking a large theoretical leap in generalizing from a relatively small sample of psychoactive mushroom images in Christian art to a theory of the psychedelic gospels, which suggests that early and medieval Christians experienced healing, divinity, and immortality by means of sacred plants. To address this gap, we propose an interdisciplinary research project that could independently gather sufficient evidence to test and ultimately prove (or disprove) this theory. But before outlining this project, it is instructive to consider several critiques of the theory of the psychedelic gospels. These include implicit critiques by art historians and explicit critiques by ardent advocates, medieval historians, and conservative Christians.

Ignorance by art historians

Aside from the pivotal Wasson-Panofsky interpretation of the Plaincourault fresco, art historians have been notably silent on the subject of entheogens in medieval Christian art. Why have these entheogenic icons remained "hidden in plain sight" to scholars who specialize in medieval manuscripts, frescoes, and stained glass windows? Does their collective silence represent an implicit denial of the validity of this theory?

Perhaps not. For example, during our research on the *Great Canterbury Psalter*, we spoke over phone with Nigel Morgan, Emeritus Honorary Professor of the History of Art, University of Cambridge, England. Morgan coauthored a commentary volume released with an exact replica of the *Psalter* by M. Moliero, a Spanish publishing house that specializes in the reproduction of illuminated manuscripts from the 8th to 16th centuries. When we asked Morgan if he had ever noticed the colored mushroom shapes in the Genesis folio (Figure 14), he replied "*I haven't the faintest idea what you are talking about. As a matter of fact, I wouldn't know a mushroom if I saw one*" (Brown & Brown, 2016, p. 145).

In her discussion of *Christ's Entry to Jerusalem*, art historian Marcia Kupfer is ostensibly unaware of the prominent mushrooms painted in the upper right-hand corner of this fresco in the Church of Saint Martin (Figure 8). According to Kupfer (1993), as Christ rides the ass followed by his disciples "*several youths excitedly **clamor up trees to break off branches**, while others unfurl their mantels at his feet. The second phase of the episode on the west wall isolates the walled city of Jerusalem ... Youths, their mouths open in song, crowd the gates; others within the city drape the walls or **cut away at the treetops***" [emphasis added] (p. 122).

Kupfer (2003, p. 1) observes "*To see works of medieval art solely with the naked eye is to remain blind.*" Unfortunately, when it comes to interpreting the frescoes at Saint Martin and elsewhere, it is frequently art historians who "remain blind." Due to their lack of knowledge of ethnomycology, they mistake psychoactive mushrooms for trees and branches and as a result err in their interpretation of some Romanesque religious paintings.

That this is not an error of commission but one of omission was confirmed by Charles Insley, senior lecturer in medieval history and keeper of a replica of the *Psalter* housed at Christ Church University in Canterbury. As Insley told us when asked about the silence of art historians and theologians on sacred mushroom images in the Psalter and in Christian art in general, "*It's not that they are purposely ignoring them, as some might think. Rather I believe that most art historians and theologians are not aware of them*" (Brown & Brown, 2016, p. 145).

Overenthusiasm by ardent advocates

Since the publication of Wasson's *Soma* (1968) and Allegro's *The Sacred Mushroom and the Cross* (1970), new evidence has emerged on websites (Michael Hoffman, 1985-2007a) and in articles (Samorini, 1997, 1998) and books documenting the presence of sacred mushrooms in Christian art. Several of these books are: *The Holy Mushroom* (Irvin, 2008) and *The Mushroom in Christian Art* (Rush, 2011) - both of which contain color photo galleries - and *The Effluents of Deity* (Ruck & Hoffman, 2012), which does not present photos but offers extensive analysis of medieval religious art.

While Irvin's (2008) work focuses mainly on a critical reevaluation of the Wasson-Allegro schism, it also presents 43 color plates to document the presence of psychoactive mushrooms in frescoes, stained glass windows, illuminated manuscripts, and sculpted capitals. Two thirds of these images fall within the 11th, 12th, and 13th centuries. Rush's (2011) book is accompanied by a DVD containing 252 colored images from three time periods: Early Christian Art (200-1000), Middle Christian Art (1000-1550), and Late Christian Art (1550-the Present).

Unfortunately, what at first glance appears to be a treasure trove of newly uncovered entheogenic icons - the nearly 300 images presented by Irvin and Rush - fades upon critical inspection. The first problem is a technical one created by accessing these European, Middle Eastern, and Russian images at a distance. By necessity, in reviewing art works from different time periods and diverse countries, Irvin and Rush have often relied on low-quality, sometimes corrupted, digital copies of these works found on the Internet. This has resulted in errors in reproduction and, consequently, in interpretation.

To cite one example, in plate 32 of *The Holy Mushroom*, Irvin (2008) describes St. Walburga as "*holding a distinct Amanita muscaria in its young, bulbous state of development, complete with white spots*" (p. 136). During our research trip to Germany, we realized that St. Walburga was not holding a mushroom but a vial containing healing ointment, as confirmed in numerous other artworks and accounts of her life (Figure 18).

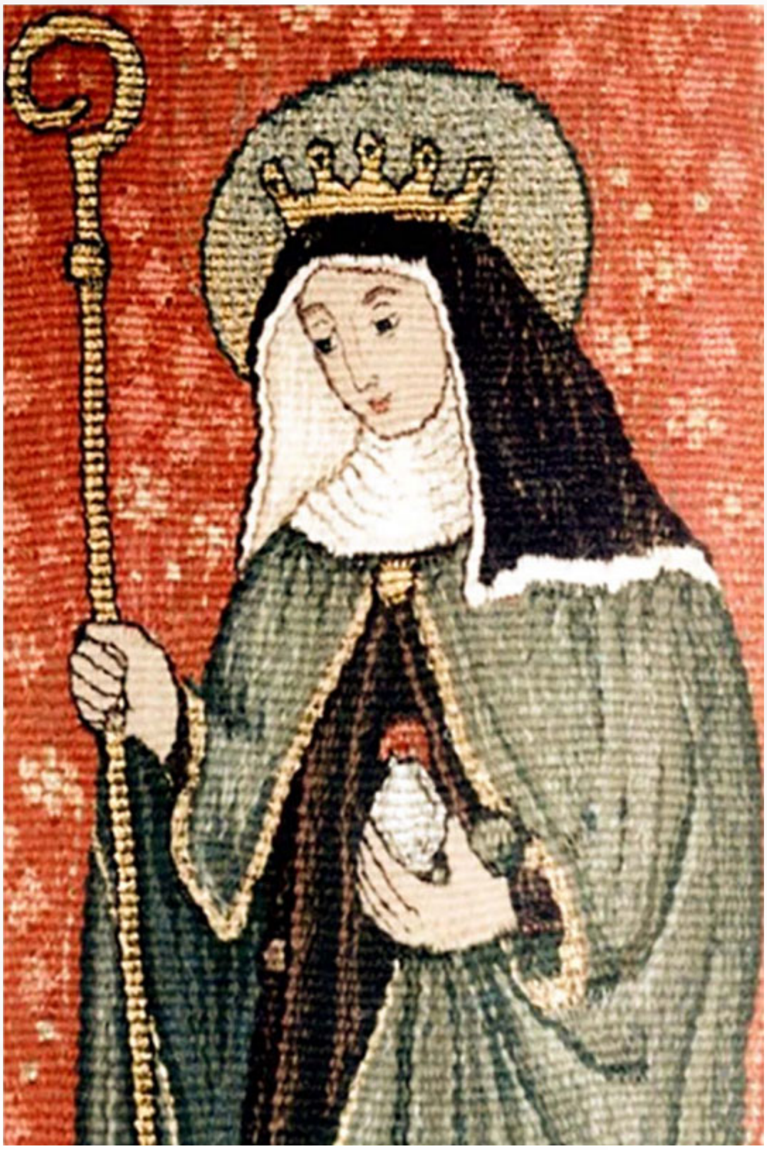

Figure 18. Tapestry of Saint Walburga. Woven by Sister Gretschmann, Abbey of Eichstätt, Germany (courtesy of the Abbey of Saint Walburga)

To cite another, the caption accompanying Rush's (2011) image of God creating Plants from the *Great Canterbury Psalter* reads "*Notice that the deity has something in the palm of his right hand and at the tip of his left index finger*" (DVD plate 1:9a). And in the text describing this image, Rush adds "*God is likewise holding something that looks suspiciously like a mushroom, but it might be a symbol for alpha and omega*" (p. 202). In reality, our image of God creating Plants, reproduced directly from the original *Psalter* housed in the Bibliotèque nationale de France, clearly indicates that God is not holding anything in either of his hands (Figure 14).

In addition to these technical errors, significant methodological questions have been raised. To allay the argument that holy mushroom critics "only addressed one picture," Hatsis (2017b) examined many of the images presented by Irvin and Rush and frequently found their analysis to be flawed.

After reviewing the 40+ plates showing the sacred mushroom in Christian art that Irvin includes in *The Holy Mushroom*, Hatsis (2017b, September 12) contends that "*Irvin's only criterion for interpreting the artwork is that if something looks like a mushroom, it is a mushroom - a weak methodology that we shall see has many problems, the first of which lets a self-fulfilling prophet see whatever he wishes.*"

In comments on plate 33, a depiction of "The Last Judgement" from the *Holkham Bible* (c. 1320-1330, England), Irvin (2008) observes that "*The angel on the left stares at three distinct mushrooms that he holds in his hand ...*" (p. 137). On the contrary, Hatsis (2017b, September 12) points out that "*a careful investigation shows that the supposed three mushrooms are the 'three nails' of the Arma Christi.*" Also known as the "Instruments of the Passion," the Arma Christi is a collection of objects associated with the Passion and the Crucifixion.

Similar concerns have been raised regarding Rush's *The Mushroom in Christian Art*. In contrast to Irvin who focuses mainly on distinctive mushroom images, Rush (2011) argues that the mushroom "*has many disguises, and thus we need to build a mushroom typology*" (p. 12). In constructing this typology, Rush postulates that, while in some of the art, the mushroom is quite evident, in others it is represented by analogies and symbols, such as, "*for example, halos, crosses, bread, books, wounds, and blood ....*" (p. 17). Irvin's ahistorical and Rush's symbolic approach to entheogen research frequently leads to spurious arguments, dogmatic conclusions, and untestable statements such as "*the value of the [mushroom] motif is its visible invisibility*" (Hatsis, 2017b, September 12).

This analysis of psychedelic images often devoid of historical context stands in sharp contrast to the more rigorous scholarship of Ruck and Hoffman (2012) in *The Effluents of Deity*. Here, the authors apply the interdisciplinary tools of art history and comparative religion to uncover the role of botanical eucharists in medieval artistic masterpieces such as Van Eyck's Ghent Altarpiece (Belgium), Grüenwald's Isenheim Altarpiece (France), Bernward's *Michaeliskirke* (Germany), and the frescoes of the Baptistery in Parma (Italy).

Oversimplification by medieval historians

Hatsis has performed a valuable service in calling attention to the excessive enthusiasm of some researchers. Unfortunately, he makes the same mistake - favoring dogmatism over fact - but in the opposite direction. When it comes to the study of entheogens in Christian art, Irvin and Rush tend to see mushrooms "everywhere," whereas Hatsis cannot see mushrooms "anywhere." The reasons for Hatsis' (2018) oversights and oversimplifications are contained in this revealing quote in *Psychedelic Mystery Traditions*:

> *In recent decades, scholars and conspiracy theorists alike (taking note of the psychedelic mystery traditions ubiquitous in paganism) have wondered about the possibility of such practices in the emerging Christianity of the first few centuries CE. Working off of the theories of the now discredited John Marco Allegro (1923-1988), these researchers have argued that the main Christian entheogenic sacrament was the Amanita muscaria mushroom.*[4] *Personally, I find the lack of evidence for this claim disappointing. The supposed mushrooms that appear in Christian art are easily explained away through a series of sound, tried-and-true historical criteria, which those who still support the theory (in one variety or another) have simply not considered ....*
>
> *Here is where the discipuli Allegrae and I part company. While they believe that the key Christian*

> *psychedelic mystery traditions rest in the forbidden fruit that Eve and Adam ate in the Garden, I hold a different opinion. There isn't a shred of evidence to suggest that medieval artists secretly signified entheogens as the fruit by depicting the Amanita muscaria into art.* (pp. 113-114)

Let us analyze one by one the oversights and oversimplifications found in this passage.

First, Hatsis (2018) sets up a bogus straw man by classifying all researchers who support the "holy mushroom theory" as "discipuli Allegrae," which he defines as "*a general term I use to refer to those who agree with the theories of John Marco Allegro, whose book The Sacred Mushrooms and the Cross (1970) argued that Christianity evolved out of a magic mushroom-eating sex cult*" (p. 108).

Since footnote 4 (first paragraph of the above quote) cites *The Psychedelic Gospels*, Hatsis obviously considers us to be "discipuli Allegrea." This is false since we state unequivocally in *The Psychedelic Gospels* that:

> *... our theory differs from Allegro's in three fundamental ways. First, while Allegro denies the existence of Jesus, we agree with those scholars of religious studies who believe that Jesus was an historical figure. Second, while Allegro bases his theory on the speculative interpretation of ancient languages, we base our theory on the plausible identification of visual entheogenic images. Third, while Allegro hopes that his writings will liberate people from the thrall of a false Christian orthodoxy, we hope that our discoveries will educate people about the history of psychoactive sacraments in Christianity.* (Brown & Brown, 2016, p. 217)

That said, it is important not to throw the baby out with the bathwater. In this case, the bathwater contains the spurious, discredited claims Allegro made about the ahistoricity of Jesus, and the origins of Christianity as a mushroom-sex cult. The baby refers to Allegro's thesis that visionary plants had been widely used in Western culture and religion throughout the ages including the mystical experiences of early Christianity. According to Hoffman (1985-2007a), this view is supported in one form or another by a variety of entheogen scholars including Chris Bennet, Peter Furst, Clark Heinrich, Jonathan Ott, Carl Ruck, Huston Smith, and R. Gordon Wasson, to name a few.

Second, Hatsis claims that the one and only entheogenic sacrament that holy mushroom theorists find in Christian art is the *A. muscaria*. This is a significant oversight easily corrected by consulting the literature. While some researchers consider this to be the case, *The Psychedelic Gospels* (Brown & Brown, 2016) and Samorini's (1998) typology of mushroom trees, among others, have identified the presence of mushrooms in Christian art that reflect the distinctive features of psilocybin-containing *Psilocybe* and *Panaeolus* species of the region. In at least two cases, the bronze Door of Salvation and the Christ Column cast by Bishop Bernward, the distinctive features of the mushrooms are depicted so accurately that ethnobotanists can determine their botanical classification as local psilocybin-containing species.

Third, Hatsis also contends that "*The supposed mushrooms that appear in Christian art are easily explained away through a series of sound, tried-and-true historical criteria.*" Aside from implying that the interdisciplinary research carried out by Ruck and Hoffman (2012), the ethnobotanical research conducted by Samorini (1998), and the anthropological field research conducted by the authors of this article (2016) are somehow not "tried-and-true" methodologies, Hatsis is making a daredevil leap of logic. Hatsis (2017b) assumes that, just because he has "debunked" *a few* erroneous claims regarding the presence of mushrooms in Christian art, he has *ipso facto* dispensed with *all* reported cases of iconographic evidence of entheogens in Christian art.

To be sure, Hatsis (2018) does raise a valid question in asking, "*Why would church leaders espouse their ideas about mandrake, opium, and cannabis, all the while never mentioning anything about an Amanita muscaria mushroom - least of which that they were painting them into art to teach people about Jesus?*" (p. 170). In legal circles, it is a shibboleth that the "absence of evidence" - in this case corroborating textual evidence - does not prove "evidence of absence." In other words, just because textual evidence of mushrooms has not been found yet does not prove it does not exist. Nevertheless, the lack of "ink" on this topic in the writings of church leaders poses a valid question worth pursuing.

Overture by conservative Christians

To the best of our knowledge, there has been no response by Christians to recent discoveries of psychoactive mushrooms in Christian art. However, Michael Pollan's best-selling book, *How to Change Your Mind, What the New Science of Psychedelics Tells Us about Consciousness, Dying, Addiction, Depression and Transcendence* (2018) has inspired a response by conservative Christians. Reflecting positively on Pollan's work in a post in the American Conservative titled "*A Christian Approach to Psychedelics*" (2018), senior editor Rod offers the following observations for consideration by fellow Christians:

1. We should not dismiss psychedelics out of hand - not for the sake of treating those suffering from mental disorders or terminal illness, but also for those interested in studying consciousness.
2. It is compatible with the metaphysics of premodern Christian tradition - especially Eastern Christianity - to believe that God is everywhere present, and in some sense (not just symbolic) fills all things. Orthodox Christianity (and Catholicism?) posits that this is a theological and metaphysical truth. It has been confirmed by Christian mystics. Psychedelic drugs may reveal this truth in a different way.
3. Pollan is correct to say that a purely neurochemical explanation for these states does not negate their spiritual meaning. Certainly not for Christians in the sacramental tradition, who take for granted that God can and does communicate with His creation through matter.

Obviously, it is one thing to propose an overture in which Christians can acknowledge that psychedelics may reveal that "God is everywhere present," a truth confirmed by Christian mystics through the ages. It is quite another to suggest as proposed by psychedelic gospels theory that Christianity itself has a psychedelic history.

Ultimately, we hope that the growing gallery of evidence of entheogens in Christian art will not undermine anyone's faith in Christianity but rather illuminate a mystery that applies to many religious traditions. In effect, these studies promise to contribute to the growing awareness that entheogens have provided an authentic pathway to the divine in the past and will continue to do so today and into the future. For example, the endorsement of Santo Daime churches, which use ayahuasca as a sacrament, by the Brazilian Council of Bishops demonstrates that entheogenic-inspired religions can find acceptance within Catholic orthodoxy.

That Christians may embrace entheogens theologically is confirmed by Brother David Steindl-Rast (2001), a Catholic Benedictine monk, who observes, "*Because I have faith in the Church's traditional sacraments, I ought to be able to stretch that faith to include the possibility of encountering God through all available sacraments... Faith, simply accepted with gratefulness that God works through all created things. All? If we can encounter God through a sunrise seen from a mountain top, why not through a mushroom prayerfully ingested?*" (p. xii).

Interdisciplinary committee on psychedelic gospels

We have revisited the Wasson-Allegro controversy, presented iconographic evidence of entheogens in Christian art, and examined critiques of the psychedelic gospels theory. In this context, we can now address Wasson's paradox and the need for an Interdisciplinary Committee on the Psychedelic Gospels.

Wasson's paradox

In our book, we state that "*In our opinion Wasson's greatest paradox was this: the discrepancy between his zealous exploration of a controversial theory about the role of entheogens in early religion and his reluctance to pursue this theory past the portals of the church and into the hallowed halls of Christianity*" (Brown & Brown, 2016, p. 7). This paradox is especially poignant in the case of the Eden fresco at Plaincourault. Here, Samorini (1998) remarks that "*It is therefore quite strange that the father of ethnomycology stopped before the lapidary appraisal of an art historian and did not, instead follow the trail of additional 'mushroom-tree' representations in Roman and Christian art as he might have done or scheduled*" (p. 31). Given his reputation as an indefatigable seeker of sacred mushrooms, why did Wasson not travel a mere 6 miles west of Plaincourault to Saint Savin (Figure 5) or 50 miles east to Saint Martin's (Figure 8) where he would have undoubtedly discovered additional examples of entheogens in Christian art?

Several explanations of this egregious oversight have been suggested. Samorini (1998) proposes that Wasson's reluctance grew out of a realistic concern that acknowledging *any* evidence in support of "Allegro's sensational thesis" would deal "*a serious blow to the new science of ethnomycology of entheogenic mushrooms*" (p. 32). Early in our research, we wondered if as the son of an Episcopalian minister, Wasson felt "*a filial allegiance to his father and a loyalty to the church*" (Brown & Brown, 2016, p. 7).

While these may be contributing factors, we later uncovered a more compelling explanation. During our 2012 visit to the Vatican Museum in Rome, we were inspired to Google the words "Wasson, Vatican" which immediately produced several search items including one that said "*Wasson was an account manager to the Pope and Vatican for J.P. Morgan*" (Irvin, 2012). Wasson joined the Wall Street investment banking firm of J.P. Morgan in 1934, where he helped develop the new field of banking public relations.

Upon further research, we found that Wasson's direct financial involvement with the Vatican was confirmed by DeWitt Peterkin, a retired J.P. Morgan, Vice President. In an interview for *The Sacred Mushroom Seeker*, a book of essays in tribute to Wasson, Peterkin reveals that "*Unbeknown to most people, we were for many years one of the bankers for the Vatican... . And Gordon used to have private audiences with the Pope*" (Riedlinger, 1997b, p. 51).

Wasson never mentions his role as a Vatican banker in his writings. This role provides a clear financial motive for Wasson's reluctance to explore entheogens in Christian art. This may have been reinforced by a legally binding confidentiality and non-disclosure agreement between banker (J.P. Morgan) and client (the Vatican), given that such agreements are common in the investment banking field.

Regardless of motive, due to Wasson's preeminent position as a leading authority on the study of entheogens and religion, this lack of disclosure was especially damaging to the nascent field of ethnomycology. In effect, Wasson's lack of transparency combined with his relentless personal and professional attacks on Allegro stymied widespread scholarly inquiry into the study of entheogens and Christianity for nearly half a century.

Call for an interdisciplinary committee

Samorini (1998) closes his survey of "mushroom-trees" in Christian art by stating that "*we may confidently conclude from what has emerged that justifications do exist for serious and unprejudiced ethnomycological study of early Christian culture, and it is our hope that such studies will take place*" (p. 107).

Given the conflicting interpretations of entheogenic mushroom images in Christian art, and the controversial implications of the psychedelic gospels theory, there is an obvious need to establish sound methodologies and objective criteria for a rigorous, unbiased evaluation of this iconographic evidence. Achieving this goal will require more than a de rigueur appeal for "additional studies." For this reason, we call for the establishment of an international Interdisciplinary Committee on the Psychedelic Gospels (Committee).

This Committee could be housed at a major university or museum and co-chaired by an ethnobotanist and church historian with relevant credentials. It would be charged with collecting, cataloging, and curating potential psychoactive images in Christian art from around the world, and evaluating them for the presence of evidence indicating that they represent entheogenic species. Toward this end, the Committee would integrate research methodologies from anthropology (fieldwork), art history (iconography, iconology), church history (textual analysis), ethnobotany (cultural uses of mushrooms), mycology (fungus identification), and theology (exegesis).

The Committee would establish criteria for peer-review evaluation of critical questions. Are the images clear and unambiguous enough to facilitate a definitive identification of the genus and species of psychoactive mushroom? Or if the mushrooms shown are stylized mushrooms (such as "mushroom trees"), are there artistic traditions of interpretation that contribute to determining that they were intended to depict entheogenic species? Does the art tradition and history surrounding the image enhance the determination of the intent to represent psychoactive mushrooms or other entheogens? Are there relevant texts and/or other historical documents that corroborate these findings?

Unlike the political infighting that delayed publication of the Dead Sea Scrolls for decades, the workings of the

Committee must be transparent. The Judeo-Christian art images and religious texts in question should be made available online for public viewing and comment. It is through this interdisciplinary peer-review process that the theory of the psychedelic gospels can be independently confirmed (or refuted) by the Committee, and thereby potentially gain credence in scientific and theological circles as well as among thought leaders, policy makers and the mainstream media.

Conclusions

Revisiting the epic Wasson-Allegro controversy in light of new evidence reveals that Wasson did behave in an academically irresponsible manner in not publishing the second letter from art historian Panofsky that favors Allegro's interpretation of the 13th century Plaincourault fresco as a psychoactive *A. muscaria* mushroom. During his 1952 visit to the Chapel of Plaincourault in Central France, Wasson mysteriously did not investigate the nearby Abbey of Saint Savin or the Church of Saint Martin de Vicq, which would have provided significant evidence of entheogens in medieval Christianity, thereby contradicting his claim in *Soma* that their remote role in Judeo-Christianity ended around 1000 BCE. Wasson's function at J.P. Morgan as the "Pope's banker" furnishes a powerful financial motive for his refusal to pursue the thesis regarding the entheogenic origins of religion into Christian art and artifacts, as well as for his rejection and ridicule of Allegro's writings in *The Sacred Mushroom and the Cross*.

While Wasson's views stymied research on entheogens in Christianity for decades after the publication of *Soma* in 1968, a new generation of 21st century researchers has documented growing evidence of psychedelic *A. muscaria* and a variety of species of psilocybin-containing mushrooms in Christian art, consistent with Samorini's typology of "mushroom-trees." *The Psychedelic Gospels* contributes to these entheogenic studies (a) by providing original photographs and analysis of psychoactive mushroom images in several churches and cathedrals in Europe and the Middle East; (b) by arguing that based on the presence of these images in the high holy places of Christianity, these psychedelic traditions were not suppressed by the Church, but were rather maintained for the secret instruction of initiates and possibly for the education of the illiterate masses; and (c) by proposing a psychedelic gospels theory, which hypothesizes that these images represent an alternative history of Christianity, suggesting that early and medieval Christians experienced healing, divinity, and immortality by ingesting sacred psychoactive sacraments.

In evaluating critiques of the psychedelic gospels theory by art historians, ardent enthusiasts, medieval historians, and conservative Christians, it is important for entheogenic researchers to avoid the dual dogmatic pitfalls of either seeing mushrooms everywhere or refusing to see mushrooms anywhere. To provide a rigorous methodology for testing this controversial theory, the authors call for the establishment of an Interdisciplinary Committee on the Psychedelic Gospels. In addition to being charged with collecting and vetting images of psychoactive mushrooms and other entheogens in Christian art, the Committee would also search for textual confirmation of entheogens in the Bible, in the Gnostic Gospels, and in the writings of church fathers and other commentators.

The receptivity of some conservative Christians to the medical and mystical findings of the current Psychedelic Renaissance may open the door to a dialogue between the Church and the psychedelic community regarding the past role of entheogens in Christian art and history and their possible future role in ritual as a sacred sacrament and pathway to the divine.

Table of Contents:

PART ONE: Entheogens and the Origins of Religion
Prelude
CHAPTER ONE - Persephone's Quest
Interlude
Our discoveries
1. Soma and the Vedic Culture
2. The Mystery of Eleusis
3. Our First Velada
4. The Grecas
5. The New World and the Thunderbolt
6. The Meaning of Kakuljá Hurakan
7. A Glimpse of the Domestic Use of Soma
8. The Chinese and the Nivkhi
9. Greece and Soma
10. Soma among the Mediaeval 'Monsters'
11. The Chukotka
12. The Fool's Mushroom
13. 'Happiness Mushroom'
14. The British and the 'Nameless Mushroom
15. The Vikings and Soma
16. The Tree of the Knowledge of Good and Evil
EPILOGUE: The Age of the Entheogens
Unfinished Business
CHAPTER TWO - Lightningbolt and Mushroom
CHAPTER THREE - The Mah&amacr;v&imacr;ra Vessel and the Plant P&umacr;tika
The Secret of the Cut-off Heads
The Elixir of Life: Soma and P&umacr;tika
Putka and the Santal of Eastern Bihar
The Mah&amacr;v&imacr;ra Vessel
The Later and Separate Lives of Mah&amacr;v&imacr;ra and P&umacr;tika
CHAPTER FOUR - The Last Meal of the Buddha
What was S&umacr;kara-Maddava?
The Santal and the Putka
The death of the Buddha
The Buddha's last meal
The Indus Valley and Kashmir
Memorandum by Walpola R&amacr;hula of the early sources for the meaning of s&umacr;karamaddava
Epilogue
CHAPTER FIVE - Carved 'Disembodied Eyes' of Teotihuacan

PART ONE

Entheogens and the Origins of Religion

> '*We have no knowledge... but what has been built up by pleasure, and exists in us by pleasure alone... The knowledge both of the Poet and the Man of Science is pleasure.*' Wordsworth's insistence in the 1802 preface to the *Lyrical Ballads* on the inseparable association of knowledge and pleasure takes us straight to a profound conjunction in the work of scientist and creative writer... The 'happy ending' of successful theorizing, satisfactory experiment, achieved work of art, creates pleasure. And so does the process, or story, of discovery.
>
> *Gillian Beer,* TLS, *2 Nov. 1984, p. 1255*

Prelude

In the opening chapter of my SOMA I said that there always hovered in my mind's eye the admonitory finger of Tristram Shandy's warning against the occupational hazard of those who advance hypotheses:

> It is in the nature of a hypothesis when once a man has conceived it, that it assimilates everything to itself, as proper nourishment, and from the first moment of your begetting it, it generally grows stronger by everything you see, hear or understand.

I was reasonably sure of my ground but also I knew how fallible I was, and I added Laurence Sterne's danger sign, in case I had committed a blunder. Nevertheless now it turns out that I was right the first time, and I present this book with the proofs from various angles corroborating each other. We are well beyond the stage of hypotheses.

CHAPTER ONE

Persephone's Quest

by R. Gordon Wasson

> *As I am nearing the end of my days, I will draw up an account of our mushroom quest, Valentina Pavlovna my late Russian wife's and mine, followed by the highlights of our discoveries as I see them.*

THE QUEST

Back in 1921 I fell in love with a Russian girl, Valentina Pavlovna, in London, where she was studying medicine. We got married at the end of 1926 in England and came to America where she requalified as a physician. I was a newspaper man covering the Wall Street bank-run for the old *Herald Tribune*. We took our delayed honeymoon late in August 1927 in Big Indian, the Catskills, in a chalet lent to us by Adam Dingwall, a publisher. On our first day, after lunch, we went for a walk, down a path that led by a pond and then a clearing on the right, and, on the left, the upward slope of a forested mountain. We were hand in hand and a picture of bliss. Suddenly, before I knew it, my bride threw down my hand roughly and ran up into the forest, with cries of ecstasy. She had seen toadstools growing, many kinds of toadstools. She had not seen the like since Russia, since 1917. She was in a delirium of excitement and began gathering them right and left in her skirt. From the path I called to her, admonished her not to gather them: they were toadstools, I said, they were poisonous. 'Come back, come back to me!', I pleaded. She laughed the merrier and continued picking, as it seemed to me indiscriminately. To make a long story short, we had our first marital crisis. During our five year engagement mushrooms had never come up between us and here she was possessed by the mushrooms! Our walk ended then and there, she with her skirt full of mushrooms of various kinds. Some she put into the soup when she prepared our supper, others with the steak, others she strung together carefully by the stipes and hung out to dry in the sun, for use in winter, she said. I was beside myself. I acted the perfect Anglo-Saxon oaf confronting a wood nymph I had never before laid eyes on. I would eat nothing with mushrooms in it. Later she said I had predicted I should wake up the next day a widower, but I have always denied this allegation.

We checked the attitude to mushrooms with our respective friends, - mine Anglo-Saxon mycophobes, hers Russian mycophiles. Then we looked at the vocabularies: the English use three working words, - first and foremost the 'toadstool' (with no translation in Russian), then a Latin quasi-scientific term, 'fungus', and third the uncertainly defined 'mushroom' borrowed from the French *mousseron*. The Russian vocabulary was endless.

Well, we were off. Our primary preoccupation was with our careers, hers in medicine; mine in Wall Street. Our secondary avocation was mushrooms, gathering notes of all kinds, in various languages, stopping on our travels to talk, preferably with professors or unlettered peasants. Then, late in the 1930's, we held a fateful meeting to decide our course of action, either to launch a systematic and massive assault on many fronts, or abandon the quest entirely. At that meeting we made a discovery to our mutual surprise. Each of us had harbored a nascent thought that we had been too shy to express even to each other: religion possibly underlay the myco-philia/phobia contrast that marked the peoples of Europe. This religious twist struck us as absurd, yet we agreed that the evidence pointed in that direction. If religion it was, it had to date back to prehistory, and as for us, we had to try and write a book.

A little thing, some of my readers will say, this difference in emotional attitude toward wild mushrooms. Yet my wife and I did not think so, and we devoted a part of our leisure hours for more than thirty years to dissecting it, defining it, and tracing it to its origin. Such discoveries as we have made, including our documentation of the religious role of the entheogenic mushrooms by the Algonkian nation in North America[1] and the Maya in Mesoamerica,[2] by the identification of the sacred Soma of the Aryans as *Amanita muscaria*, and the religious use of the same species of mushroom by the most ancient tribes in the northern wastes of Siberia, in short the religious use of *A. muscaria* around the globe, can be laid to our preoccupation with that cultural rift between my wife and me, between our respective peoples, between the mycophilia and mycophobia (words that we devised for the two attitudes) that divide the Indo-European peoples into two camps. Moreover this religious role of *A. muscaria* is accompanied by a startling identity of vocabulary, of religious observances, that bespeak a trait going back for tens of thousands of years, when the virtue of the sacred fungus was first discovered, somewhere in Eurasia.

If this hypothesis of ours be wrong, then it must have been a singular false hypothesis to have produced the results that it has. But it is not wrong. Thanks to the immense strides made in the study of the human psyche in this century, we are now all aware that deep-seated emotional attitudes acquired in early life are of profound importance. I suggest that when such traits betoken the attitudes of whole tribes or peoples, and when those traits have remained unaltered throughout recorded history, and especially when they differ from one people to another neighboring people, then you are face to face with a phenomenon of profound cultural importance, whose primal cause is to be discovered only in the well-springs of cultural history.

The next event, momentous for the success of our fungal enterprise, was our encounter with Roman Jakobson, Russian refugee lately arrived on our shores, prodigious scholar, breath-taking lecturer, bon vivant. We met him in the early '40's and disclosed to him our feeling about the religious role played by mushrooms in the prehistoric background of the European peoples. His response bowled us over. The thought had never occurred to him, but his instinct told him we were right. He could not contain his enthusiasm for our idea. We became fast friends: he and his wife often dined with us and we with them. A Russian friend of ours, Katya Ladyzhinskaya, a colleague of my wife's, became tired of hearing us praise Roman's qualities so highly and we challenged her to attend a lecture of his, any lecture. She did so one afternoon on Morningside Heights. Before entering the lecture room, Katya looked at the announcement on the bulletin board. The lecture, to last a double period, one hour and forty minutes, was to be 'On the third person singular of the Russian verb'. 'Goody, goody', Katya said to herself in Russian, I've won my case. No one could make that subject interesting, let alone for a double period.' She entered the lecture hall just before Roman arrived. He launched into his theme immediately. She quickly found herself sitting on the edge of her chair, spellbound by his lecture and by his command of the classic Russian language, and so she remained till the end of the double period. He was incomparable. She telephoned us later that she had to come to dine with us and surrender.... Such was Roman.

So long as they were in New York we saw much of the Jakobsons. He moved to Harvard, later to M.I.T. This took us to Cambridge often, and he would stop sometimes with us when he came to New York. He fed us ideas about mushrooms continually, citations in books, proper names in Russian derived from the mushrooms, rare and archaic mushroom names in Russian with their etymologies. With Roman spurring us on, we never more considered dropping our mushroomic theme.

Full of years, Roman died on 18 July 1982, and at his funeral friends, admirers, scholars, from all over the country - California, Texas, *etc* - gathered in the Russian Orthodox Church in Boston to do him honor.

★

In the 1940's we felt increasingly the need of a mycologist to be our guide in the arduous discipline of mycology. I had been reading the *Revue de Mycologie*, drawn to it by its surprising interest in aspects of mushrooms of a nature that goes far beyond the usual preoccupation of the professional mycologist. The editor of the *Revue* was Roger Heim, *directeur* of the *Laboratoire de Cryptogamie*, *membre de l'Académie des Sciences*, destined to be chosen *Directeur* of the *Muséum National d'Histoire Naturelle* in 1951 and to be elected for a term *Président* of the *Académie des Sciences* in 1963. In the spring of 1949 I was in Paris and I decided to invite Heim to be our guide in mycology. As I climbed the steps to enter his *Laboratoire* I asked myself what my reception would be. A colleague of his whom I had just met that day had volunteered to 'phone him and say that I would call. When I was announced, he came out of his laboratory to the elevator door and welcomed me. We hit it off immediately. I outlined to him what Tina and I were doing and what we needed: a mycologist to consult on themes both simple and remote. I added that I wished to illustrate our forthcoming book with the mushroom watercolors of the late Henri Fabre and asked how I could win permission to do so. It turned out that they were now owned by the French state and lay under Heim's jurisdiction in Fabre's *harmas*, in Sérignan, four kilometers from Avignon! (*Harmas* means in Provencal any arid little property. Fabre had bought an *harmas* but under his loving care the arid little property had become a luxurious tropical garden, but still called 'Fabre's *harmas*.) We arranged that I would come back shortly with Tina and our daughter Masha and we would all drive south together, to the *harmas* of Henri Fabre. This plan we put into effect soon thereafter, stopping on the way south in Vienne, on the Rhone, to have dinner *chez Point*, already sporting three stars in the Michelin. We chose our illustrations in the working laboratory of Fabre.

On 19 September 1952 I received an envelope from Robert Graves in Majorca with a clipping of the house organ of Ciba's U. S. subsidiary making known that one Richard Evans Schultes, Professor of Botany at Harvard and shortly to become Director of the Botanical Museum there, had published two papers containing the startling news that a mushroom cult had been reported by the sixteenth century friars in Mexico and also that Schultes had brought back from Mexico specimens of the entheogenic mushrooms! On the same day, Friday 19 September, I phoned Schultes and though he knew as little about me as I knew about him, we talked for a long time. He had been alerted by Bias Pablo Reko to the survival of the cult in a remote village in the State of Oaxaca, and he invited Reko to go with him to the Indian village, Huautla de Jiménez, in 1937. Schultes returned to Huautla again in 1938 and also in 1939. He published two papers on his discoveries, one a Harvard *Botanical Museum Leaflet* in 1939, the other an article in the *American Anthropologist* in 1940. Tina and I resolved to visit the village in the rainy season of 1953 with our daughter Masha. I naturally cultivated the acquaintance of Schultes and we became friends. Until the following June Tina and I were reading the narratives of the sixteenth century friars who accompanied the Conquerors in Mexico, giving their observations on the native way of life. In Mexico we leaned on Roberto Weitlaner and his daughter Irmgard, veterans in knowing how to behave with the natives. (Reko, after writing me one most helpful letter, had died that spring.)

Over the years Professor Schultes has done well by me, arranging for the President and Fellows of Harvard College to appoint me to an honorary post on the faculty of the Botanical Museum in 1960 and renewed through the years, a post that I still hold. This has given me the privilege of contributing to the Harvard *Botanical Museum Leaflets*, and helped me much when I spent years in the Far East in the 1960'$. He has conferred on me a room in the Botanical Museum to house my books, slides, files, and collection of valuable mushroom artifacts, designated as The Tina and Gordon Wasson Ethnomycological Collection'.

And so we made the first of ten annual visits to Mexico, exploring the villages of Oaxaca and of the other states thereabouts, where many native tribal languages were living tongues. On our pressing invitation Roger Heim came over and joined us in 1956, 1959, and 1961. We made notable visits to the Chatino country, to the Mixe where we were lavishly entertained by the notorious *cacique* don Luis Rodríguez but where we learned that he penalized any native (no laughing matter!) who would take the entheogenic mushrooms, and of course repeatedly to Huautla de Jiménez (and there discovered the *Sabia* María Sabina), destined to become the Mecca of entheogenic mushroom hunters.

Meanwhile a terrible tragedy was taking place. In 1956 Tina's health began to fail. We precipitated work on our book: it was to include our first reports on our Mexican findings. The work, *Mushrooms Russia & History*, was brought out on May 13, 1957, - 512 copies in two large octavo volumes stunningly illustrated and printed by Giovanni Mardersteig in Verona, on the finest paper, boxed, at $125. It was published by Kurt and Helen Wolff. Simultaneously *Life* in the issue of May 13 featured an adventure story that I wrote on our discoveries. (Harry Luce gave orders that not a word of my text was to be altered.) The price of our books rose slowly in the auction market and among antiquarian bookdealers until, years later, a high of $2,600 was established. The price is now (December 1983) down: an antiquarian bookdealer in Los Angeles is offering a set at $1,750. My wife's health grew worse and she died of cancer on the last day of 1958 in the evening. Heim and I had been working hard on a book to be published by the *Muséum*, also a large octavo handsomely illustrated, *Les Champignons hallucinogènes du Mexique*. It was dated 1958 but appeared early in 1959. Without telling me, Heim had dedicated the volume to the memory of Valentina Pavlovna and signed the dedication with his initials and mine. Heim's *Préface*, five pages long, was a warm tribute to us both.

In 1963 Heim flew to New Guinea, he from Paris, and I by freighter from San Pedro, Cal., to look into the 'mushroom madness' of the Kumá people, on which we reported in a paper, 'La Folie des Kumá', published in French in the *Cahiers du Pacifique*, and also in English in the Harvard *Botanical Museum Leaflets*, Vol. XXI, No. I, June 11, 1965. In 1968, again on my invitation, Heim from Paris and I from New York took planes to Calcutta, where we met on the Dum Dum airport landing field. This time we were to visit the Santal villages in Orissa and the Santal Parganas in Bihar. We were seeking an answer to the strange fact that a mushroom, one single species, the *putka*, was 'animate' in their language, was 'endowed with a soul', like all animals and human beings, but unlike all other vegetation, which is construed grammatically as 'inanimate', as 'without a soul'. Heim identified scientifically the *putka* but no one could tell us why it alone in the plant world enjoyed its enviable distinction. It was not entheogenic. Our prize informant in the Santal Parganas, Ludgi Marndi, gave us a hint on our last day in Dumka, shortly before we left. We had solicited the talk and we covered the same ground as before. We were getting nowhere. Suddenly our informant leaned over the table and said in a whisper to Mrs Strenstad, the wife of the missionary who served as our translator, 'I will tell you why I think the *putka* has a soul'. We too leaned over the table. She went on, 'You must eat the mushrooms quickly, for if you don't they will stink like a cadaver'. We knew not what this meant, but I wrote it down in my notebook. We published a paper on this anomalous situation in the *Cahiers du Pacifique*, 'Les *Putka* des Santals champignons doués d'une âme', No. 14, September 1970. The mystery baffled us for several years, until one day we received a telephone call from Professor Stella Kramrisch, the famous Indologist and authority on Indian art, who had come upon our French article, read it, and perceived at once that the *putka* was derived from the Sanskrit *p&umacr;tika*, the name of a plant never theretofore identified that the Aryans had used as the first surrogate for Soma. What a powerful argument this was for our candidate for Soma, that its surrogate turned out to be another mushroom! Furthermore this other mushroom, the *p&umacr;tika*, gave off a bad odor just as the *putka* of the Santal does, after a matter of hours, thus clinching its identity! (*P&umacr;tika* is the same word as our 'putrid'.) Its bad odor served a purpose in the Pravargya sacrifice, when the clay of the Mah&amacr;vira pot was mixed with the mushrooms and then was fired and the smell burned away! It was a mushroom whose identity had been lost for three millennia! Our trip half-way around the world to the Santal country thus proved in the end richly rewarding.

On all our trips Roger Heim was the best of traveling companions, whether to remote places or in big cities. He entertained me when I was in Paris and I played the host when he was in New York. On our journeys to far parts, each of us paid his own way.

There was another great scholar that I must dwell on, who led us to make our Santal trip. I had told Roman I intended to visit Afghanistan after I retired in 1963 and specifically Nuristan and the Hindu Rush. He said I had to meet Professor Georg Morgenstierne of Oslo University. I went to Oslo, was charmed by his graciousness and by his lively interest in my search for the identity of Soma, and discovered that he would like to go to Afghanistan in the spring and summer of 1964. He specialized in the five languages spoken in the Hindu Kush that he said split off from the root stock of common Indo-European even before Sanskrit. He knew those languages better than any other scholar, but he knew well the whole medley of languages spoken in Afghanistan, and the Dardic group in west Pakistan, also Sanskrit with its prolific progeny. He was such a winning person and knew so much about languages! It was he who had told me, since I was specially interested in mushrooms, about the *putka* of the Santal, and got me a copy of Bodding's five hefty volume dictionary of the Santal language where I could read about the *putka*. He was able to tell me about Faroese and Frisian and Tadzhikistan! He gave me a key passage in the Avesta that strengthened my case for my identification of Soma. Traveling with him in Nuristan, to Kamdesh and Bagramatal, was one of the richest experiences of my life.

★

And so we completed ten trips in the rainy season to parts of Mexico that were among the most interesting, parts never visited by tourists or trippers. On our tenth trip, in 1962,1 was accompanied by Albert Hofmann, the Swiss chemist, specialist in the alkaloids of ergot of rye, the discoverer of LSD, and his wife Anita. He had analysed our *Psilocybe* mushrooms and I also had sent him from Mexico the seeds of the two species of entheogenic morning-glories. He was amazed to discover that these phanerogams produced chemicals of the same family as our Mexican mushrooms, as well as ergot, and when he presented a paper setting forth that fact to an assembly of chemists in Australia, they had been plainly incredulous! Mushrooms are of a lower order of plant life and their chemistry had been considered of necessity distinct. On our Mexican excursion in 1962 we visited the Mazatec country, entering the area on 30 September with animals from Jalapa de Díaz, spending that night in La Providencia, reaching Ayautla on 1 October. We stayed in the inn of doña Donata, who served us her delicious rural Mexican fare, going on to San Miguel on 5 October, and then the next day passing down to San José Tenango. Finally we backtracked and climbed up to Huautla de Jiménez where we stayed until the 13th, the Hofmanns coming to know the *Sabia* María Sabina. They formally presented her with a bottle of synthetic psilocybin pills and she performed for them a *velada* where she took the pills rather than the mushrooms!

I have one more publication to report in the Mexican field. In 1958 I taped a complete ceremony of María Sabina's *velada*, as we have come to call the customary night-time session. A boy about 17 years old had contracted a serious illness when working down in the hot country: something was gravely wrong with his liver or kidney. María Sabina would devote her healing *velada* to asking the mushrooms whether the boy would live or die, and if he was to live, what he should do to recover. The verdict however was that the boy had to die: within weeks he was dead. It took us some fifteen years to publish the *velada*, in Mazatec, in Spanish, and in English, the English and Spanish texts being translated from the Mazatec directly by George and Florence Cowan, experts in the Mazatec language, and printed in parallel columns with numbered lines. They proof-read the Mazatec and added notes, and an essay on the Mazatec language with its oddities. We invoked the help of Willard Rhodes, Professor emeritus of Music at Columbia University and Director emeritus of the Center for Studies in Ethnomusicology. He wrote out the entire musical score and was in charge of its printing. I described the setting for the rite. We gave over the left hand page to the Mazatec text and printed the text in English and Spanish on the right hand page in parallel columns. Rhodes prepared sections of comment on the work, and many others contributed notes for relevant texts. We ran Allan Richardson's photographs assembled in sequence.

So far as I am aware, no one has paid the slightest attention to *María Sabina and her Manatee Mushroom Velada*, but I am prouder of it than of anything else I have done. I think it was the first time a shamanic performance had been fully taped and published in the native language with musical score and editorial comments.

★

Just as the '50's were devoted to our studies of the entheogens of Mexico, the '60's were dedicated to Soma, a plant that the Aryans when they moved into the Indus Valley in the second millennium BC, were worshipping as a god. They elaborated an extraordinary culture, their society divided into castes, and the Brahmans, the superior caste of priests, were the custodians of the secrets of Soma. Over centuries and in different centers they composed a collection of 1028 hymns in their Sanskrit language and as they had no method of writing, of course they learned to sing them by heart. The collection was called the *Rig Veda* and the *Rig Veda* was permeated by Soma. From the hymns it was clear that the Soma was pressed, then mixed with other ordinary potable fluids such as milk but *not* alcohol, and drunk by the Brahmans and perhaps a few others, who thereupon passed some hours in what we now call the bliss of an entheogenic experience. The late Louis Renou, a great Vedist, one of the foremost that the world has produced, once wrote that the whole of the *Rig Veda* was summed up *in nuce* in Soma. But its identity was never explicitly disclosed, and *no Sanskrit scholar* *had sought its identity.*

I recalled in the course of my inquiries concerning the Aryans that my father, who had studied Sanskrit briefly in the 1880's, had told me about the mystery of Soma. In the light of our Mexican discoveries, I was now asking myself whether Soma could have been a mushroom. I said to myself that inevitably the poets would introduce into their hymns innumerable hints for the identification of the celebrated Soma, not of course to help us, millennia later and thousands of miles away, but as their poetic inspiration freely dictated.

However, I felt the need of a Sanskrit student versed in the *Rig Veda* to consult at every step. I reported to Roman Jakobson on my need and he introduced me to Daniel H. H. Ingalls, Wales Professor of Sanskrit in Harvard. Ingalls wrote me that there was one student of his, a doctoral candidate, who would be ideal but she was much too deeply involved in living and would never accept. There was another student whom he would approach, if I wished. I asked him why he declined on behalf of the ideal student, not allowing her to decline: why make up her mind for her? He asked her and she accepted instantly and with enthusiasm.

Wendy Doniger was outstanding in many ways. She was young, stunningly beautiful, smartly dressed, gracious; conversant with Latin, Greek, German, French, Russian to come, and of course at home in Sanskrit. She was an extraordinarily speedy worker, prompt in replying to letters, single-spacing her typewritten replies on postcards, filling the available postcard space to the final fraction of an inch, where her final sentence seemed always to finish with a graceful flourish. (Her typewriter permitted her to type to the very bottom line!) Our friendship was chiefly by correspondence, New York↔Harvard, later New York↔Oxford. When I was with her she seized my questions before I had finished asking them. She took her doctor's degrees at Harvard and Oxford, then went for a year to Russia where she made cordial friendships with the Toporovs, he a leading Indo-European scholar and she the outstanding Vedic scholar in Russia - and Wendy learned a substantial amount of Russian. After teaching a few years in the London School of Oriental and African Studies, and after that in the University of California, she is now at the University of Chicago Divinity School where she is professor of the History of Religion and of Indian Studies.

I asked Wendy to write the history of Soma from the time when it was abandoned down to date. Strangely, this had never been done. For my reading only, she prepared such a survey quickly. I then suggested that, using her paper as a draft, she write Part II of *SOMA: Divine Mushroom of Immortality*, 'The Post-Vedic History of the Soma Plant'.

Here I must mention the one setback that I have had in our Soma researches: the death, premature and tragic, of Louis Renou. I visited him twice in Paris, where on a later occasion Professor Heim and I had dinner with him and Mine Renou, and they were my hosts for a weekend at their Normandy retreat. He was obviously one of the supreme Vedists of our time: there is no one left in France to compare with him. In his correspondence with Daniel H. H. Ingalls, he was so open to new ideas. He is greatly missed. All of my exchanges with him were years before our *SOMA* appeared.

At the end of 1968 or the beginning of 1969 our *SOMA* finally appeared, Wendy Doniger O'Flaherty writing Part II and I the rest. I supervised the translations that finish the book. We both made endless suggestions to each other, all of them received gratefully and considered, and some even incorporated! The Sanskrit faculties of the world were not ready for a book identifying Soma: they had never heard of anyone who had even thought of tackling this. Most of them were unprepared by training or instinct for botanical arguments and they had, each of them, their own exegetical problems on their desks. What would they do when letters came asking their opinion about *SOMA*? I know that many of them simply referred the inquirer to thirty pages of congested type of a review article in the *Bulletin* of the London School of Oriental and African Studies, Vol. 34, Part 2, 1971, and espoused the writer's views. Written by John Brough, Professor of Sanskrit to the University of Cambridge, an outstanding exegete of Sanskrit and kindred tongues, his views were unfavorable. He had never heard of me, nor had he ever tried to identify Soma. Vedic scholars who were shocked by our *SOMA* rallied behind the eminent Brough: even though few if any read him, they endorsed him unread. I did read him, every page of his congested type, and found it weak, unworthy of this eminent authority.

Brough decided to cross the Atlantic with Mrs Brough after his critique had appeared, ostensibly to visit his brother in Tarrytown; he wrote me that they would like to call on me in Danbury. I invited them to lunch with me on Sunday, 8 August 1971. The weather was at its best and we had a lovely lunch together on my garden porch. At the end of lunch he presented me with an offprint of his review, 'With compliments'. Though I knew it was coming and the tenor of its argument, I had not seen it. In 1972 I published my *Rejoinder*.

Early in 1984 in his home town of Bishop's Stortford Dr. Brough was struck by a car and instantly killed. This was a blow to me. That he had crossed the ocean with his wife really to present his review article to me had impressed me greatly, and his geniality capped his visit mightily. I was convinced that in the end I would convert him, and in this book we have mobilized evidence that sums up to proof. Our progress has gone far beyond our initial hopes, discovering as we have done a whole chapter in prehistory never before suspected to exist. Our subject turned out to be the entheogens, primarily but not solely the fungal entheogens: the phanerogams were important also. But Soma turned out to have had the longest and most widespread human history. Ergot, growing millennia later on certain cultivated grains, seems to have coincided in its arrival on the human stage with the discovery by Man of agriculture. Our remote unlettered ancestors, characterized by us as 'savages' from the lofty eminence of our own conceit, knew how to cope with these miraculous entheogens, not talking noisily and ignorantly about them as some of us do, until I virtually despair of our technicians ever being able to explore thoroughly their possibilities. Competent teams fear to be linked unjustly to the 'Drug' abuse.

Three of us have written another book, this time a small one for a change: *The Road to Eleusis: Unveiling the Secret of the Mysteries*, by R. G. W., Albert Hofmann, and Carl A. P. Ruck, Professor of Greek in Boston University. It came about thus.

One day in July 1975 I asked my house guest, Albert Hofmann, when we were visiting together on my studio porch, whether Early Man in Ancient Greece could have derived an entheogen from the ergot that would have given him an experience comparable to LSD or psilocybin. He said he would reflect on my question and when he had thought it through, he would send me his reply.

As Albert well knew, my thought was to arrive at the active agent in the potion drunk at Eleusis, and that gave to Eleusis immense prestige over the whole of the known world in antiquity. About two years later he wrote me that, yes. Early Man in Ancient Greece could have worked out a potion with the desired effect from the ergot of wheat or barley cultivated on the famous Rarian plain adjacent to Eleusis; or indeed from the ergot of a grass, called *Paspalum distichum*, that grows around the Mediterranean. If the Greek herbalists had the intelligence and resourcefulness of their Mesoamerican counterparts, they would have had no difficulty in preparing an entheogenic potion: so said Albert Hofmann and he explained why. Just as I received that answer from Albert, I came to know Carl A. P. Ruck, and I invoked his indispensable help in writing our book. This was a providential encounter for me. He was a brilliant Greek scholar and specialized in the role played by botany in ancient Greek life and he proved a marvelous partner in our enterprise. Our volume came out in 1978, published by Harcourt Brace Jovanovich as a Helen and Kurt Wolff book, written by the three of us. Dr. Danny Staples composed for us a new translation of the *Homeric Hymn to Demeter*. So far as we could see our new book had no impact. The Greek departments both in American and British Universities seem intellectually inert. (Ruck was certainly not 'intellectually inert'! He was the exception.) One well known English professor of Greek burst out in anger at our saying that a potent potion was drunk at Eleusis: we had touched him at a sensitive spot. He seemed to wish to join the class of those pastors in our Bible Belt who, when Prohibition was flying high, seriously pretended that Jesus served grape juice, not wine, at his Last Supper! Why do he and many colleagues of his feed such patent pabulum to their students? Greek studies would be far more exciting if the students were taught Greek history as it was. It is astonishing that no students rebel against their teachers on an issue such as this. Today we know much more than we did previously about the mighty entheogen and the role it played in prehistory, and also for a millennium and more in Early Greek History.

I cannot refrain from citing, if but briefly, two other Sanskrit scholars who have meant much to me, not only for their help but for the spirit behind that help.

Sir Harold W. Bailey, who is about my age, has been encouraging from the start. I have sought his aid when I needed guidance, by letter and when I called on him repeatedly in Cambridge. Until his retirement he was the Professor of Sanskrit to the University of Cambridge. When he came to New York to deliver some lectures a few years ago, I had the privilege of entertaining him over a weekend. His knowledge has always seemed to me fabulous.

One day in the middle '60's I found myself in Poona, and I put up for the night in the American Institute of Indian Studies. There was only one other guest. In India I did not normally discuss my mission with strangers. But this scholar, Henry von Stietencron, was so engaging and obviously knew so much about India that I broke my rule. He was fascinated by my interest in Soma and asked me endless questions. His University connection was at Heidelberg, to be changed in a couple of years when he was appointed successor to the famous Paul Thieme who had graced for many years the Sanskrit Chair in Tübingen University, in the heart: of idyllic Swabia. Henry and his lovely family have made me welcome in Heidelberg and later in Tübingen.

Let me add, before I end this initial stretch of my essay, that my practice, almost invariable, was not to ask whether, even after my *SOMA* appeared, Sanskrit scholars were for or against my thesis. I knew what it would cost them, or some of them, in principle, being only human, to admit to me that I was pursuing the right track: they were almost compelled to withhold assent, though perhaps not to reject my case outright. I did not learn Wendy O'Flaherty's attitude until I read her note to 'The Last Meal of the Buddha' in the *Journal of the American Oriental Society* and also in this book! (p 138)

We were in a peculiar position: not scholars, my wife and I had chosen to pursue the entheogens, a project that no one else had tackled. When we started, before we knew anything of the field, it seemed a formidable task. During the first thirty years we were educating ourselves. With limited time at our disposal, we nevertheless made major progress. We gained field experience in Mexico. Rather quickly we laid out the dimensions of the subject and saw clearly that Soma could be only *Amanita muscaria*. Shortly after the death of Valentina Pavlovna, I retired from my bank and was free to study and travel. Soma - as I will call it hereafter - was common everywhere in the woodlands of the temperate zone. All in all, Soma was the entheogen of choice, until grains came to be cultivated in prehistory and then ergot emerged as a major alternative, also thoroughly safe to those who knew how to use it. No genuine entheogen is, so far as I know, an addictive under any circumstances. All entheogens inspire awe and reverence and possess power for good.

Interlude

I will take advantage of the Interlude to explain a word that I have already used: 'entheogen'.

In Antiquity people spoke of the Mystery of Eleusis, of the Orphic Mysteries, and of many others. These all concealed a secret, a 'Mystery'. But we can no longer use 'Mystery', which has latched on to itself other meanings, and we all know the uses and misuses of this word today. Moreover, we need a word that applies to the potions taken in the antique Mysteries, now that at last we are learning what they were. 'Hallucinogen' and 'psychedelic' have circulated comfortably among the Tim Leary's and their ilk, and uncomfortably among others including me for want of a suitable word: 'hallucinogen' is patently a misnomer, as a lie is of the essence of 'hallucinogen', and 'psychedelic' is a barbarous formation. No one who respects the ancient Mystery of Eleusis, the Soma of the Aryans, and the fungal and other potions of the American natives, no one who respects the English language, would consent to apply 'hallucinogen' to those plant substances. Antiquity remained silent on these plant substances, for they were never mentioned, except perhaps person to person in a low voice, by the light of a candle at night.

It is natural that a new discipline, as it works out its course, should find occasion to coin words for new meanings, creating neologisms. Some of us formed a committee under the Chairmanship of Carl Ruck to devise a new word for the potions that held Antiquity in awe. After trying out a number of words he came up with *entheogen*, 'god generated within', which his committee unanimously adopted, not to replace the 'Mystery' of the ancients, but to designate those plant substances that were and are at the very core of the Mysteries.

A distinguished English scholar, sensitive to the language that he used, was unable to find a word when speaking of the sacred plant substances in Mesoamerica, and took refuge in 'narcotics', sleep-producers, an absurd term, for the potion keeps you awake so long as its influence lasts. That English scholar surely never ingested our mushrooms and he took liberties assuming they were opiates! Again, hashish has been used for millennia as a recreational drug like alcohol and it is not entitled, I think, to be called 'entheogen', any more than alcohol is an entheogen.

We must break down the 'Drugs' of popular parlance according to their properties and overcome our ignorance, which in this field is still monumental. 'Entheogen' is a step in that direction.

★

At this point I will dwell on certain unusual circumstances that have marked our pursuit of the cult of the entheogenic mushrooms. The West had tidings of such a cult in Siberia since near the start of the eighteenth century, where it surprised the travelers, was described briefly, and generally dismissed as unworthy of serious study.

In India, Soma was not to be the subject of botanical inquiry and identified, an attitude hardly surprising since Soma was at the heart of their religion. Three millennia ago Soma was known to the Brahmans, who composed many hymns exalting it. The hymns to Soma are still being sung, yet no one, not even among the Brahmans, knows what it was. Nowadays Soma grows in a mystical garden forbidden to all mankind. I understand and sympathize with the Brahmans. But I have been surprised to find a school of Western scholars who felt I was doing something untoward, improper, even to the point that in one country I have been shunned, formally ostracised, for pursuing the identity of the Sacred Plant! They have even warned off their interested publishers from my books.

In sixteenth century Mexico distinguished Spaniards wrote about the entheogenic mushrooms of that land, ably though briefly: Francisco Hernández the King's physician, friar Diego Durán O. P., the Franciscan friar Bernardino Sahagún, the first two from families of converted Jews and the third probably so. At first there were many other references to our mushrooms but the flow quickly dried up. From 1727 for two centuries I have found one mention of them and that one trifling, and one famous Mesoamerican scholar even forgot that they had ever existed![3]

Reko backed up by Schultes was on the point of calling attention to the Mexican entheogenic mushrooms when the cataclysm of the Second World War broke out and engulfed us all. Schultes was destined to go to the Amazon Valley where he remained for years, seeking to mobilize and increase the flow of rubber to the U.S.A. A full decade later Valentina Pavlovna and I came upon the Schultes papers and upon Schultes himself.

The Indian (or more precisely Amerindian!) communities that knew the sacred mushrooms continued to treat them with awe and reverence and to believe in their gift of second sight, - rightly so, as the reader will see when he reads our account of our first *velada*, pp 33-8. Traditionally they have taken the simple precaution not to speak about them openly, in public places, or in miscellaneous company, only with one or two whom they know well, and usually by night. White people seldom know the Indian languages and seldom live in Indian villages. And so, without planning, the Indian by instinct has built his own wall of immunity against rude interference from without.

[3] *The Wondrous Mushroom*, pp 212-214

Our discoveries

1. Soma and the Vedic Culture

With the aid of Stella Kramrisch, Wendy O'Flaherty, and other scholars, we have identified the plant-god of the Aryans as *Amanita muscaria*, a mushroom, as I have said, that carries no name today in English, though it is one of the commonest and perhaps the most beautiful in our woodlands. It must have been the victim of a religious tabu. We have been accumulating proofs of its identity for more than half a century. It is the plant that pervades the *Rig Veda*, the plant that the Aryans were worshipping until shortly after BC 1000, the plant that the Hindus still venerate nostalgically, though it does not grow there commonly. It is the plant that the Maya worshipped in antiquity as they made clear in their pre-Conquest poem the *Popol Vuh*, the plant that the Nahua worshipped, and also the Algonkians in North America, the ancient Paleosiberian tribesmen in Siberia, and the Ob Ugrian and Samoyed, and some of the Finnic peoples, the Lapps too and probably many many other peoples whose traditions and languages we have lacked the opportunity to examine. In fact, among the entheogens, Soma seems to have been in prehistory the focus for the awe and reverence of our ancestors for countless millennia. It heightened their powers, physical and mental, and people referred to it with many evasive terms that would not be understood by the uninitiated, such as One-Leg, Single-Eye, Tongue-in-Belly. It stepped up the physical endurance of one who took it and also endowed him often with what the Scots call second sight.

Entheogens are extraordinarily rare in the Eurasian botanical world, and *Amanita muscaria* was *the* entheogen of the ancient world. The citations of Soma in the *Rig Veda* are all consistent with this reading, and some fit *A. muscaria* like a glove, *eg* Ap&amacr;l&amacr; with Indra, *Rig Veda* 8.91; infra p 54.

2. The Mystery of Eleusis

Carl A. P. Ruck, Albert Hofmann, and I have advanced a theory that explains the Mystery of Eleusis, a major focus of the religious life of the ancient Greeks: it was well within the capacity of the hierophants of Eleusis to prepare a water solution of the *Claviceps purpurea* (ergot) growing on their wheat and barley or the water solution of the powdered ergot of *Paspalum distichum*, a grass growing around the Mediterranean, both of which would give the worshippers an entheogenic experience with no danger of a deleterious effect.

3. Our First Velada

We have published the story of our first *velada* only once, in *Mushrooms Russia & History*. The account was lost in the two big volumes: just as we wanted it to be. A few readers commented on it personally to us but it drew no public attention. I had always had a horror of those who preached a kind of pseudo-religion of telepathy, who for me were unreliable people, and if our discoveries in Mexico, including our initial *velada*, were to be drawn to their attention we were in danger of being adopted by such undesirables. The story of the *velada* itself in *MR&H* was largely written by Roberto Weitlaner, an old hand at this sort of thing, but we three read over the script most carefully and what we printed in *MR&H* had the approval of the three of us. We here detach those details that are pertinent to our present purpose and add some comments. The *velada* was held on the night of Saturday, 15 August 1953 stretching into the early hours of the following day, in Huautla de Jiménez, Oaxaca.

We had already engaged animals for Sunday to return to Teotitlán and a car to go from there to Tehuacán. We were talking with one of our best informants in Huautla, don Aurelio Carreras, a one-eyed butcher. (He had lost an eye to a bull many years before.) He had furnished us with entheogenic mushrooms of two species and clearly meant us well. We had had no success in finding a shaman: none of those who had been promised us had turned up. An inspiration seized Roberto. As we chatted with Aurelio, quite casually, don Roberto asked,

'And tell us, Aurelio, when you give treatments (*hace curaciones*), are they successful?'

'Always', he answered.

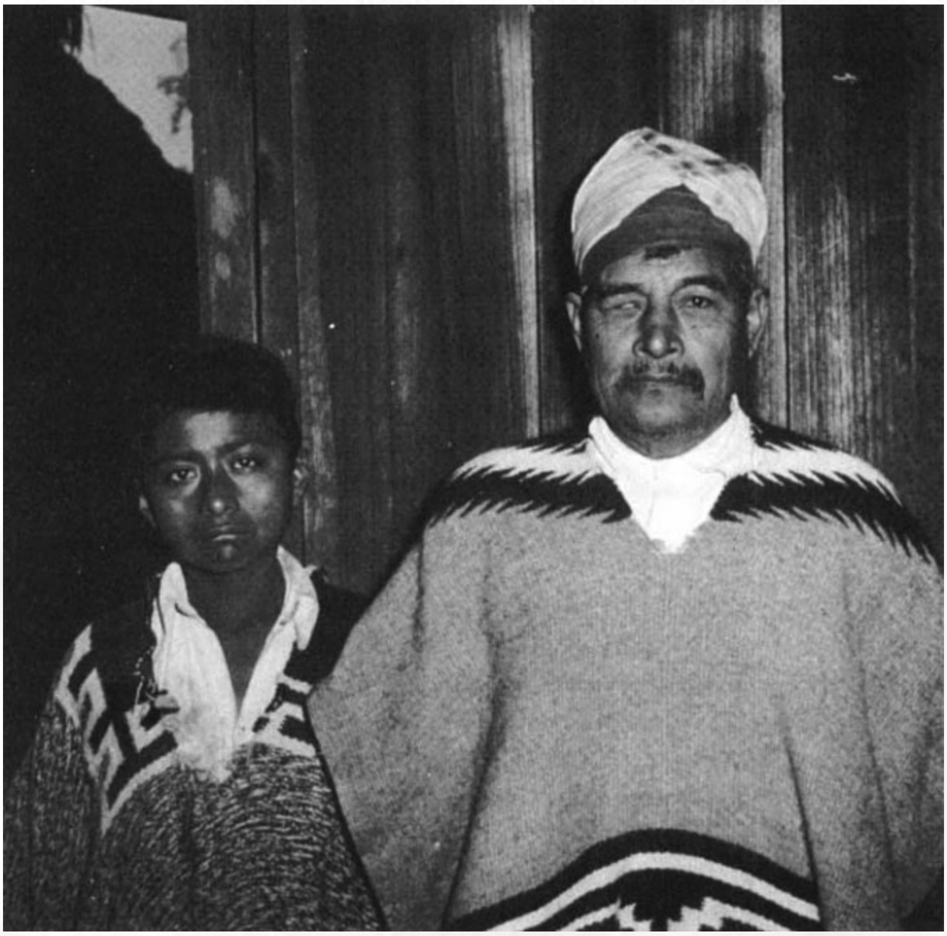

Fig. 1. Aurelio Carreras and his son Mauro (Huautla de Jiménez, 5 July 1955).

For days we had been talking to a *čo^{4}ta^{4}či^{4}ne^4* ('one-who-knows' in Mazatec, 'shaman') all unawares.

Don Roberto went right on. 'Will you help us this night?' Aurelio hesitated. He needed time to think the matter over. It turned out that his late wife's mother lay on the point of death in her house and there might be objections on the part of kin. But the kin advised him that we had come from afar, and he should help us. He asked us to make our way to his compound at nine o'clock.

Aurelio explained to us that his method of handling the *velada* differed from others'. The mushrooms spoke only in Mazatec and his son Demetrio would translate the Mazatec for us into Spanish. (In the early morning hours the mushroom began to speak either in Mazatec or Spanish.) He would take thirteen pair of mushrooms, the good-sized *derrumbe* (Sp. 'landslide') mushrooms (*Psilocybe caerulescens*), but as he lacked just one of the *derrumbes*, he would make up for it with three of the little ones (*P. mexicana*), figuring that they were equivalent to one *derrumbe*. He never sang nor did he recite any fixed text. He would speak only when the mushrooms spoke to him. Wrapped in his sarape, he sat on his stool or shifted to his chair. After having slowly eaten the thirteen pair of mushrooms, he smoked a big, black, strong cigar all night in a room lighted only by his draughts on his cigar, by embers in a receptacle on the floor, and from time to time by wax tapers. He sweated profusely.

Aurelio asked us what problem troubled us. We said we wished to have news of our son Peter, age 18, from whom we had not heard for many days. (Peter did not know our address.) This seemed a legitimate reason. He asked where Peter was. We said on the outskirts of Boston, a big city. (Peter was working for the summer in a plant near Boston making iron lungs.) A little later, Aurelio says he has trouble seeing Peter because he is so far away in a city big and strange. Finally, after a long interval, he says that Peter is alive but 'they' are reaching out for him to send him to war. Possibly 'they' won't 'get' (Sp. *agarrar*) him, but it is hard to say.

Then, after an hour's silence, loud and clear, Aurelio declares flatly that Peter is in his home in New York. (Demetrio was translating Aurelio's Mazatec.) He says Peter's thoughts are on us to the point of tears (*hasta las lágrimas*). He is in turmoil, he is well but in a difficulty that he can hardly cope with, he is stumbling, he is not used to this difficulty where he finds himself and does not know how to go about writing to us to tell us about it. Then Aurelio suddenly says we may smoke and the room is illuminated with two more cigars, Roberto's and Demetrio's.

After another interval Aurelio suddenly declares that a relative of mine is destined to fall seriously ill within the year, and gravely fixes on me his single eye. It is now about 1.45 o'clock. Some time later he repeats that a relative of mine is destined to fall ill within the year. This information about my relative was volunteered by Aurelio: it was not solicited by me.

Here we should prefer to bring our story of Huautla to an end, but candor compels us to add a few more lines. Our attitude toward the divinatory performance and especially the oracular utterances had been one of kindly condescension. We said to ourselves it was cruel on our part to ask Aurelio, locked up in his unlettered Indian world, to enter understandingly into the problems of the Wassons of New York. His divinatory powers, put to this test, had seemed to us thin, but of course we had duly entered in our notes all that he had said. In brief, he had declared that Peter was not in Boston as we had said, but in our home in New York, that Peter was alive but in a deep emotional crisis and longing for our help, and finally that the army was reaching out for him and might get him. There was a hint of foreign military service - Germany was mentioned as a possibility. Later in the night Aurelio predicted ominously that a member of the Wasson family would be gravely ill within the year.

We reached home in the second week of September a month later. In the kitchen of our New York apartment we found the leavings of a party that during our absence Peter and his friends had held. The bills from the purveyors supplied the date: the weekend of 15-16 August! Peter easily confirmed this when we saw him. Laughingly we credited the sacred mushrooms and Aurelio Carreras with a hit, a palpable hit, and then gave the matter no more thought.

Aurelio's prediction about the army had seemed badly aimed. After all, Peter at the age of 17 had enlisted in the National Guard, and this exempted him from the draft. Soon after our return to New York, I left for Europe on a business trip, and late in the morning of Monday, 3 October, I arrived at the Hotel du Rhône in Geneva. There a cablegram from home awaited me with sensational news: Peter had just made known his settled determination to enlist in the regular army for a three year term. He had come to this decision after a prolonged emotional crisis involving a girl, and that crisis, we now learned, had been boiling while we were in Mexico. Would I please send a cablegram at once begging Peter to postpone his rash step? I sent the message but, before it reached Peter, he had signed up. The army, after all, had reached out and got hold of him! At the moment of the October crisis our thoughts were so far removed from Huautla that days passed before suddenly Aurelio's pronouncement came to mind. Another hit, a palpable one indeed!

A few months later, after the usual training period, the army sent Peter abroad for duty, but to Japan and Korea, not Germany.

There remained one final prediction: grave illness was to strike the Wasson family (not Tina's) within the twelvemonth. (In the Mazatec world the 'family' embraces all the kin.) This seemed on its face unlikely, for my family is unusually small. No one of the previous generation survived. I had only five first cousins and three first cousins once removed. In January one of my first cousins, in his 4o's and abounding in vitality, suddenly died from heart failure.

Aurelio did not tell us that Peter was in distress over a girl who rejected him. Did Aurelio know it was a girl and did he withhold that fact so as not to add to our distress? We do not know. Peter, after some time in the Far East, was sent to Germany for years, then to Viet Nam for two tours of duty, a gunner in a helicopter.

In 1958, at the *velada* that we held for the sick boy Perfeto, María Sabina officiated with Aurelio Carreras. I observed that she treated him with marked deference, among other indications calling him *čo^{4}ta^{4}či^{4}ne^4* - *Sabio*, 'one-who-knows'. The intelligent villagers have known each other all their lives and appraise each other accurately.

No one in all of Mexico, least of all the Wassons, knew what Aurelio told us in the course of that *velada*. We did not question him about his utterances because we did not believe him. But all that he said turned out to be true. The entheogen, at least when taken by a wise shaman, also by the interested party, conveys information -

but how?

We visitors had fallen into the rude habit of speaking among ourselves about the sacred mushrooms as the 'instant postoffice'. The natives told us of other wonders within the power of the mushroom: i) if a young wife vanishes, the mushroom tells in a vision where she is; 2) if money has disappeared from a secret place, the mushroom reveals who has it and where it is; 3) if the *burro* has disappeared, the mushroom says whether he is stolen and toward what market he is being driven for sale, or else whether it has fallen into a *barranca* where he lies with a broken leg; 4) if a boy in the family has gone away into the world, perhaps to the States, the mushroom will bring news of him. The Indians are agreed on these matters.

4. The Grecas

As we delved into the Mexican past, we were startled and at first baffled to find *grecas*, 'greeks', playing a well known role in its pre-Conquest archaeology, yet no one else was surprised by this term, taking it for granted. *Grecas* are what we in English call 'frets', - abstract designs, angular or curvilinear, serpentine, sinuous, often repeated in a band or a border, ornamentally pleasing. Such designs were characteristic of the archaic period in the painted pottery of ancient Greece, ending about BC 620; whence they are called in Spanish and Italian *grecas*. Today this word is a common noun in Spanish and Italian and no one (except me) thinks of its origin when it is used.

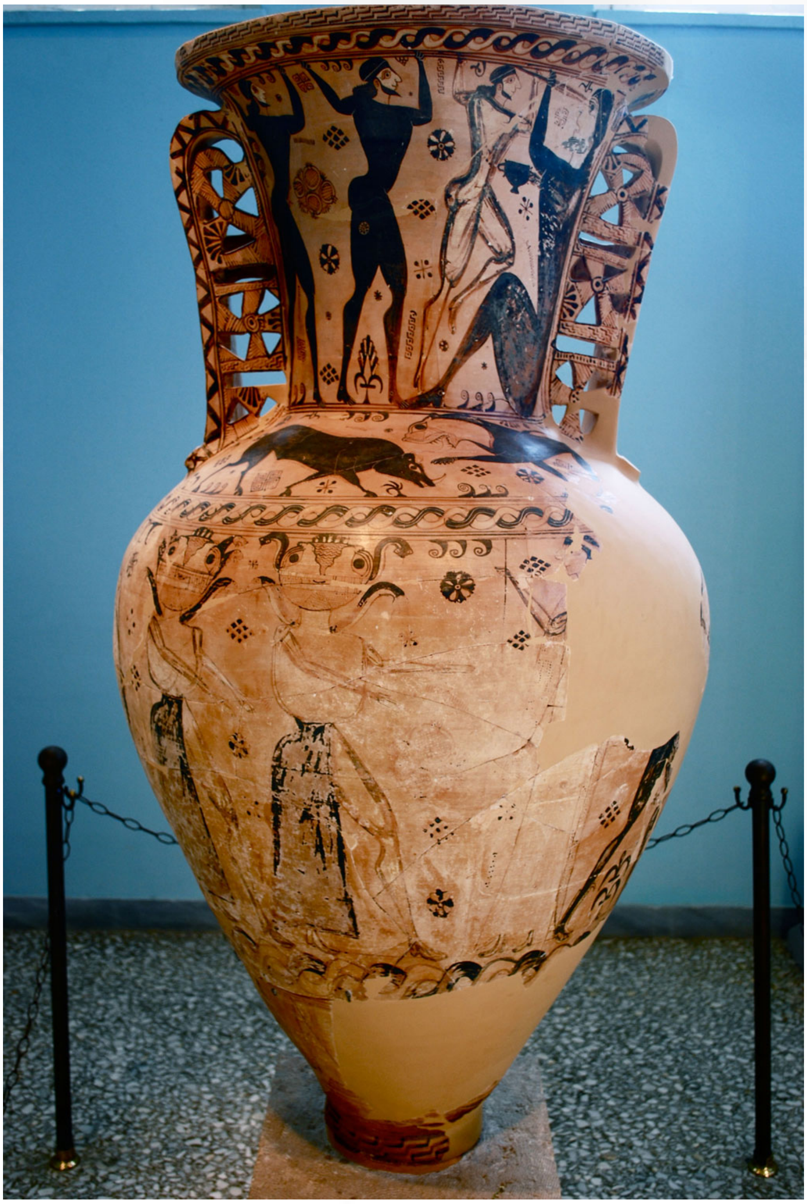

Fig. 2. Archaic Greek amphora, found at Eleusis. Notice the 'frets' or 'fillers' or *grecas*, abstract designs embellishing the mythical scene.

We reproduce a superb archaic amphora from Eleusis, *ca* BC 640, and draw attention to the numerous *grecas* or frets that grace its decoration. During the entheogenic experience there comes a time when one is apt to see visions, eyes closed or eyes open in a darkened room, of *grecas*. The frets usually are seen in the opening phase of the entheogenic experience. In the dark they are seen more clearly, eyes open or closed, than anything seen in this world. They impress the observer uncannily, as though they are components that come down from the Creation, from the Beginning, into the Night of our *velada*, our Entheogen. Once seen, they are not forgotten: they survive in stone carvings, in paintings on *terra cotta* pottery. (I can hardly believe that, of all people, it falls to me to draw attention to the inspiration for these frets, these *grecas*.) There have been many discussions about particular designs, whether they are of independent invention or borrowings. Whenever this issue comes up, the question to ask first is whether those who drew the designs knew the entheogens and the *grecas* that usually accompany them. Are not the *grecas* of Greek art, as elsewhere, an attempt to depict that special moment when the artist communed with the spirits of the sacred myths - or at least a stylized remembrance of such a tradition?

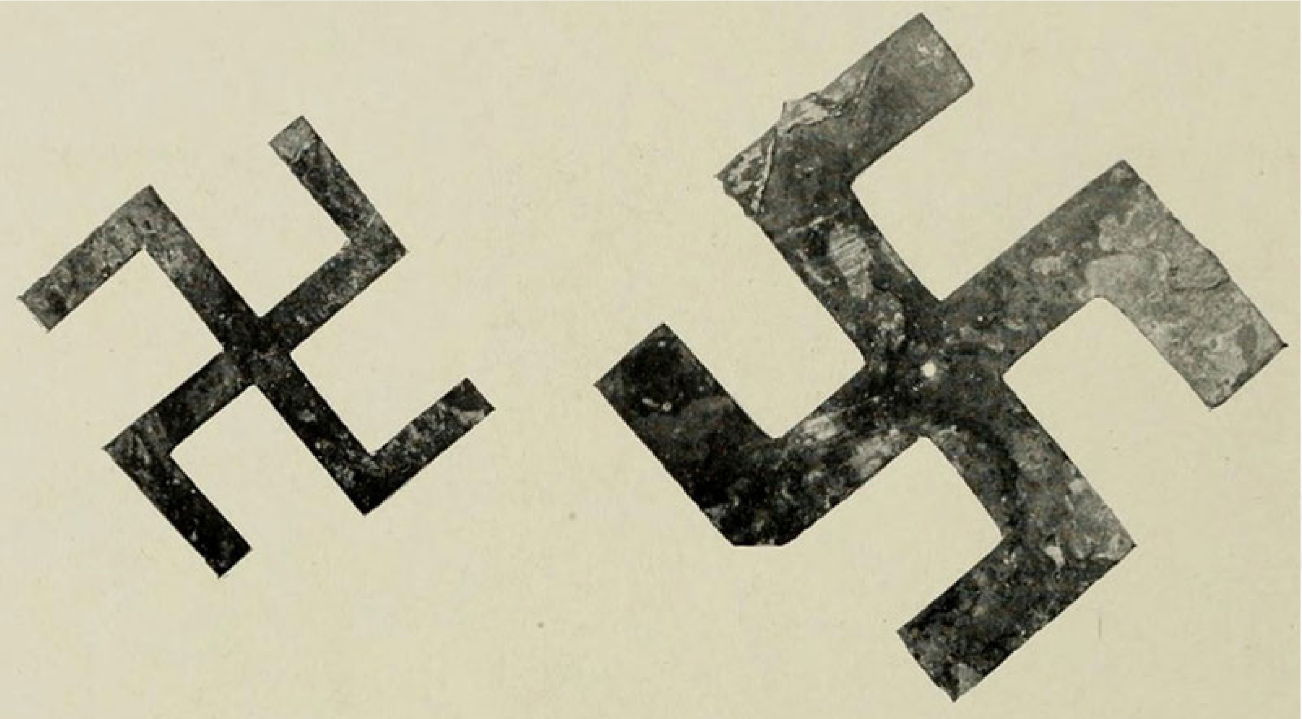

Fig. 3. Copper swastikas, found in Hopewell mounds of Ohio, *ca* AD 500.

The *Swastika*. Stanley A. Freed and Ruth S. Freed in the January 1980 issue of *Natural History* published an article on the widespread and early dissemination of the swastika. Among many others, they showed copper swastikas uncovered in the Hopewell mounds of Ohio, dating from about AD 500, now on exhibit in the Field Museum of Natural History in Chicago. 'Because of its isolated occurrence,' they say 'this find may be interpreted as a case of independent invention of a shape whose symbolism, if any, would have been unrelated to the swastika of the Old World.' The authors could not have known, since no one of our culture knew, the entheogenic experience. In Ohio, where I am assuming these swastikas were made, they could have been inspired by several fungal entheogens such as Soma, by the seeds of an entheogenic morning-glory, or, through trade with the Southwest, by the buttons of the *peyotl* cactus. It seems that the Old World swastikas, widely disseminated as they are, were a fret ('*greca*') inspired by entheogens, many of which we are now uncovering for the first time.

Marija Gimbutas, the distinguished prehistorian holding a chair in the University of California L. A., published in 1974 her *Gods and Goddesses of Old Europe: 7000-3500 BC* (Univ. of California Press) and it marked a breakthrough for the English-speaking world, a fresh chapter in the history of the Balkans and adjacent lands. Her book deals with prehistory long before the Greeks and other Indo-European peoples had swept in from Asia and overrun the peoples who already lived there, whoever they were and whatever languages they were speaking. We are going to devote two pages to reproducing from the Gimbutas book (with her express and most gracious permission but without committing her to my conclusions, of which she is unaware) samples of her illustrations of artifacts made from BC 5000 to BC 3500. The ones that we have chosen are beautiful examples of the *grecas* one may see in the course of the entheogenic experience. Professor Gimbutas tells us that the 'Old Europeans' were cultivating wheat and barley: therefore I suspect their entheogen was ergot. These designs preceded by millennia Eleusis, and Greek civilization, and Greek archaic pottery. The Eleusinian ritual was originally performed in Thrace and it moved south to Eleusis early in the first millennium BC. *The Homeric Hymn to Demeter*, expressing the lovely myth of Demeter and Persephone was composed, it is believed, early in the first millennium.

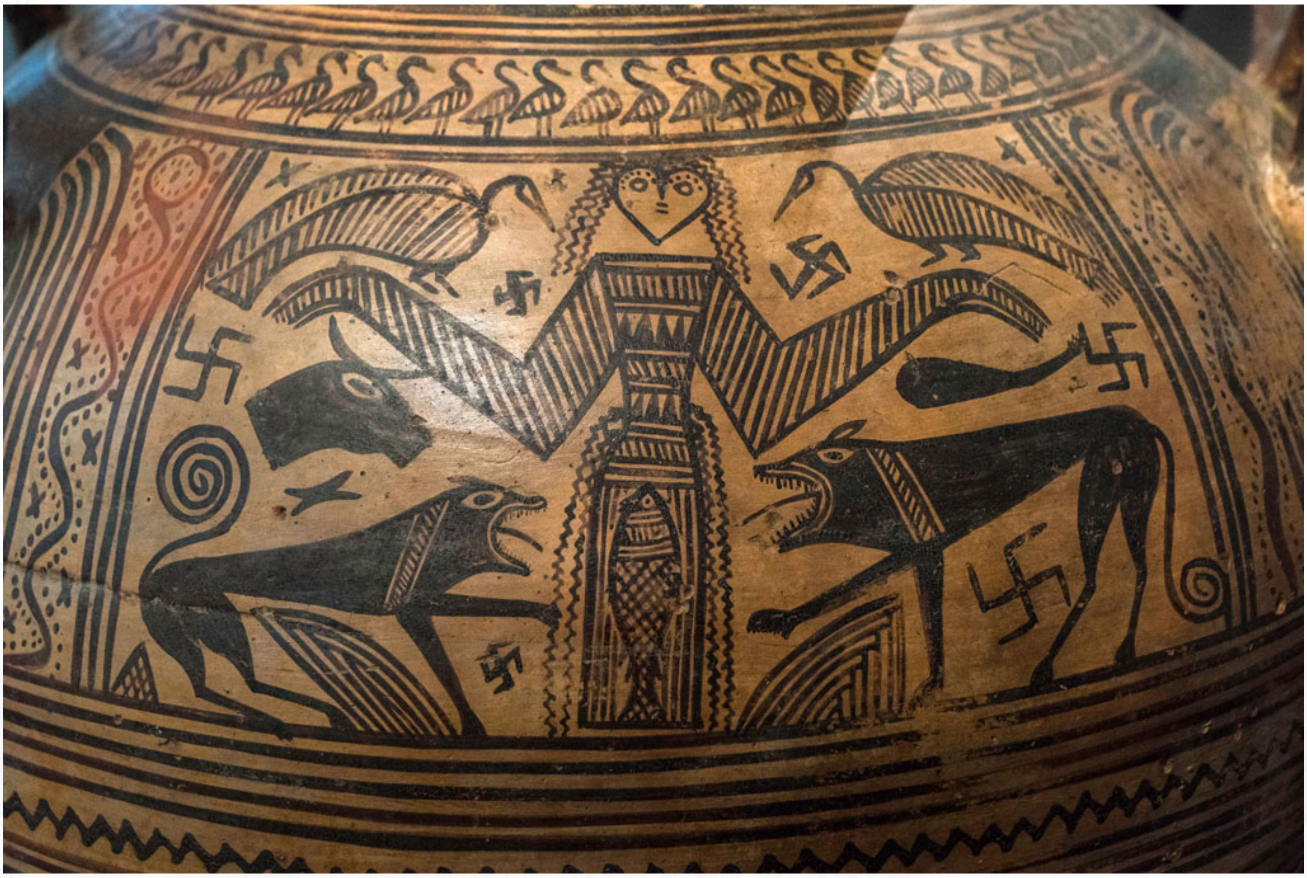

Fig. 4. A bee goddess with animals, birds, and swastikas, found in Boeotia, dating from *ca* BC 700. Gimbutas: *The Gods and Goddesses of Old Europe*. Such archaic and prehistoric swastikas have been found widely scattered, and we feel certain that they are among the visions produced by the entheogens.

Here is proof that '*grecas*' antedated Greek civilization by millennia, just as Mesoamerican civilization shows '*grecas*' flourishing in America long before the Conquest. In all three cases the same cause inspires the same art.

Plato's '*Ideas*'. No one knows whether Plato had been an initiate at Eleusis; we have no knowledge either way. But as a well born young man in Athens, it would have been normal for him to go through the Lesser and then on to the Greater Mystery. The 'Forms' that he would see in the early phase of the effects of the potion at the Greater Mystery would be commanding in his mind and he could easily have transmuted them into his famous 'Ideas', a realm existing somewhere that harbored the archetypes of everything in our life on earth, *eg* the Chair, the Dog, the Stone. Plato's revelation of this would have violated the Athenian law, which set the severest penalties on disclosure of the secrets of Eleusis, but since he did not mention his source, the hierophants of Eleusis could not have brought charges against him without themselves giving away a portion of the secret of the Mystery. Many Greeks in Antiquity must have suspected where Plato's inspiration for his 'Ideas' lay, but I am the first in modern times to be familiar with his source for the '*grecas*'.

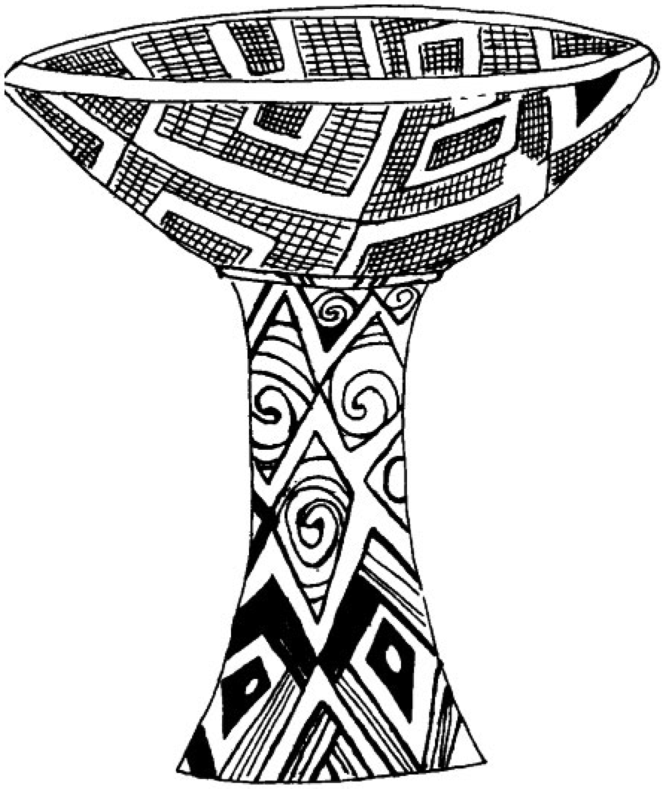

Fig. 5. 'Frets' or *grecas* from Professor Gimbutas' 'Old Europe'. The ones that I reproduce on these two pages all date from BC 5000 to BC 3500. She found them in paintings on pottery in archaeological diggings in the present-day Balkans, Hungary, and the marches of Russia. The Greeks had not invaded what is now Greece.

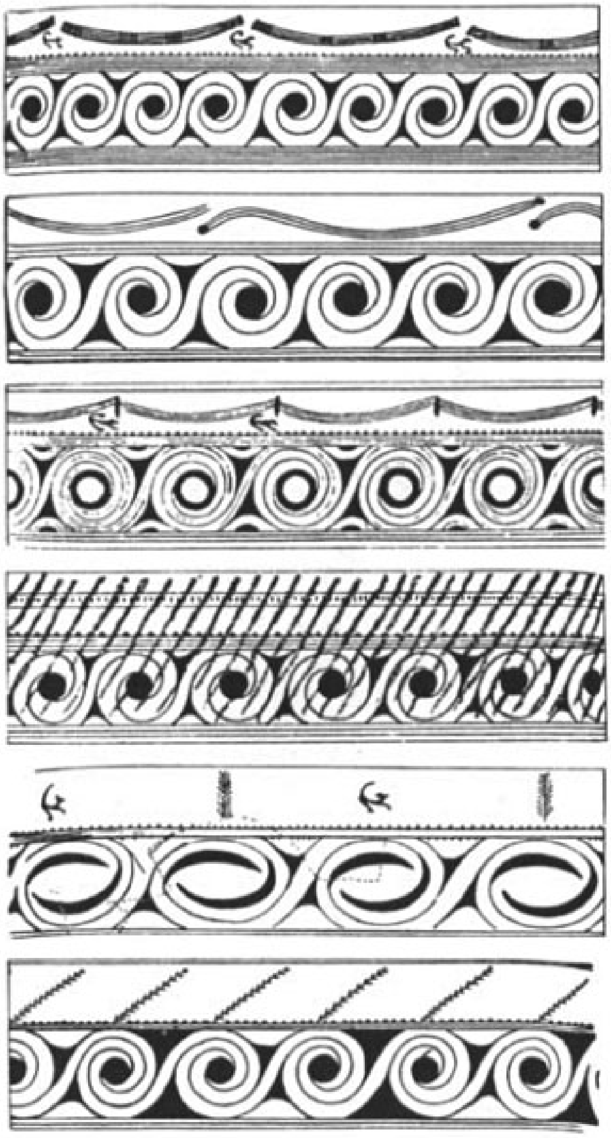

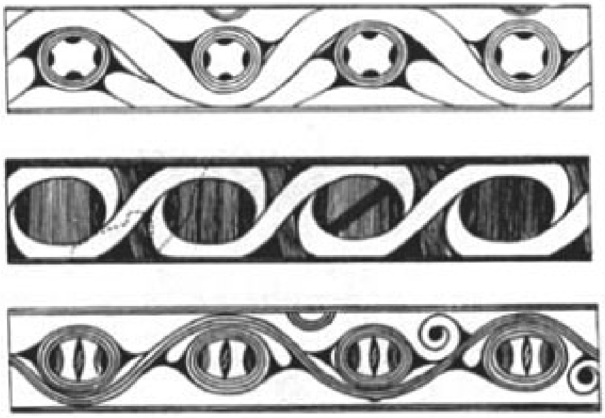

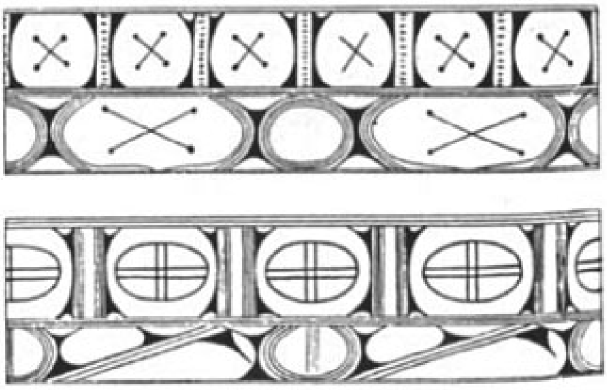

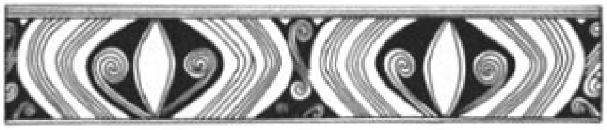

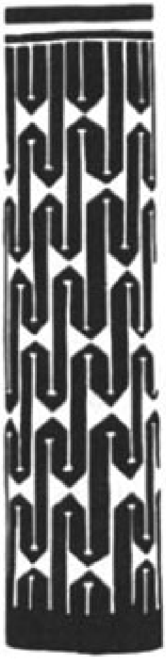

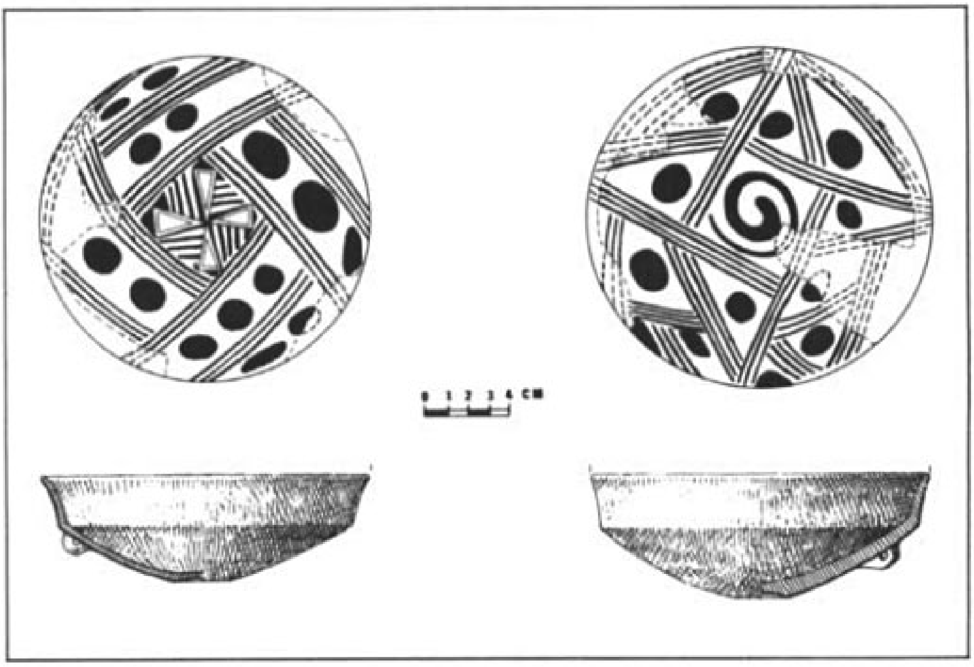

0 1 2 3 4 CM

When I visited the Santal and Ho peoples in India in 1965 and 1967, on this second trip accompanied by Roger Heim, two good informants, Ludgi Marndi in Dumka as center of the Santal Parganas in Bihar, and Ganesh Ram Ho, Chief of the village of Nawana in the Simlipal Hills in Orissa, both volunteered to tell us that there was a common entheogenic mushroom and they led me to believe it was often consumed. During our fleeting visit their efforts to find specimens were unsuccessful. It grew in cattle dung, *never near* the dung, and was white rising to yellow at the peak of the rounded pile us when mature. This should be *Stropharia cubensis*. The Santal and Ho peoples are closely related to each other and are not Hindus. We did not discover whether the Hindus ever eat these mushrooms: the three upper castes are forbidden by their religion to eat mushrooms but the fourth caste, the *&sacute;&umacr;dras*, are free to eat them and they are more numerous by far than all the other castes taken together. If the *&sacute;&umacr;dras* ate the mushrooms, might not the cows have gradually acquired the sanctity for which they are famous today? In historic times the cows were not always holy. Just as the lightningbolt was credited with planting the divine Soma in the rain-softened earth, so cows gave birth in their dung to the humbler but still marvelous entheogenic *chattra* (= mushroom).

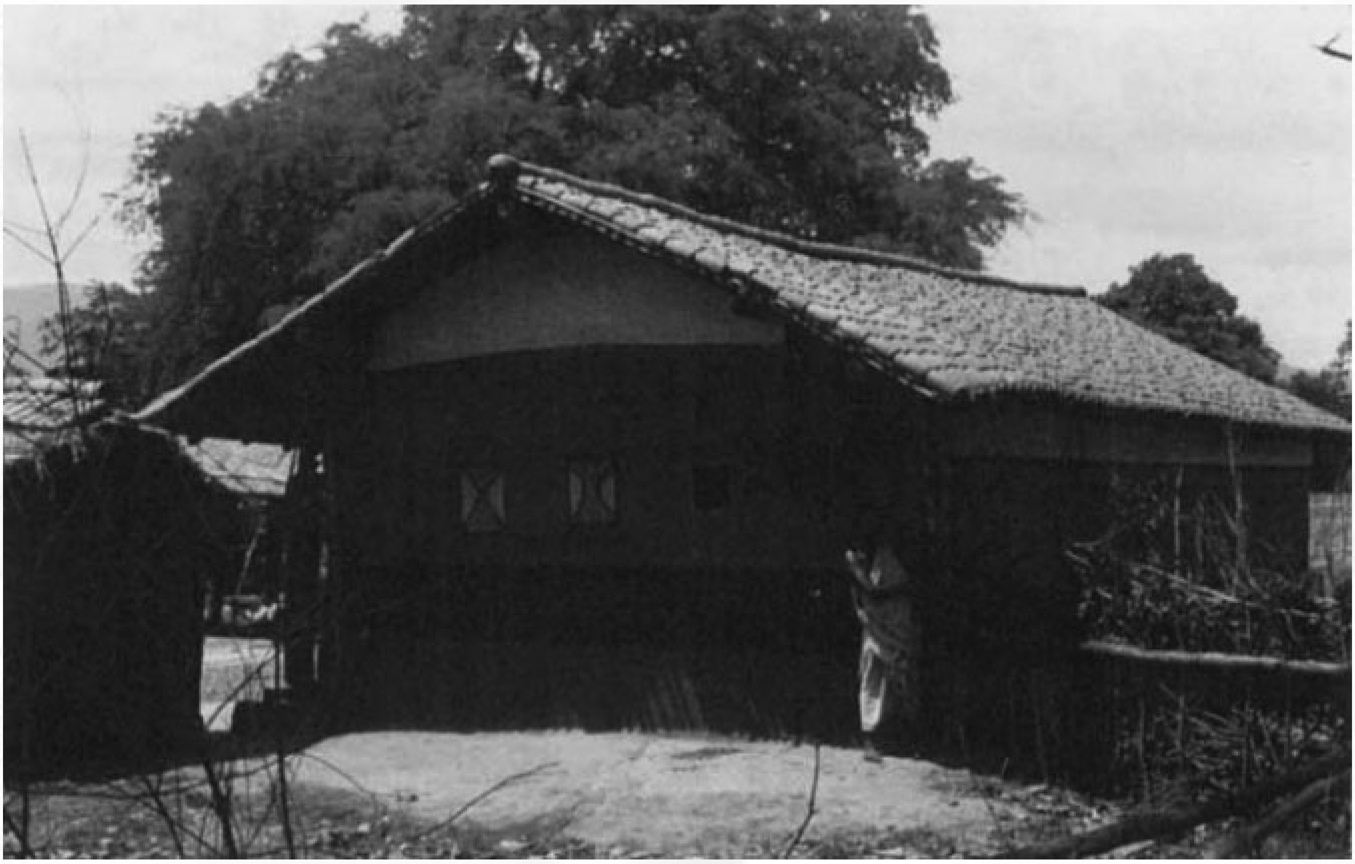

Fig. 6. A farmer's cottage in Orissa, India, in Santal country. It is suggested that geometrical patterns painted on walls, such as we see here, were inspired by entheogenic mushrooms. In the Santal country of India such paintings are common on the houses, and the Santal people are also familiar with entheogens.

The Santal often paint on the exterior of their homes geometric designs in color, thus adding to their attractiveness, their modest houses and farmyards being already models of neatness inside and out. We reproduce a photograph that we made in Orissa of a farm house showing such a painting in duplicate. We think the artist may have taken his inspiration from a vision of *grecas* seen in an entheogenic experience.

5. The New World and the Thunderbolt

In July 1955 Roberto J. Weitlaner and I were spending a few days in San Agustín Loxicha, a village of Zapotecs high in the mountains looking south over the Pacific, many miles away.[4] At that time Spanish was spoken by few of the inhabitants. The language of the village was one of the seven unwritten dialects, mutually unintelligible, of Zapotec, known to linguists as the dialect of the Sierra Costera. We were successful in our main object, which was to attend a midnight *velada* wherein a *sabio* ('wiseman'), don Aristeo Matías, consumed some entheogenic mushrooms and, later after they had taken effect, chanted for us the traditional melodies. In the days before and after the *velada* we asked don Aristeo such questions as seemed to us pertinent for shedding light on this religious observance hitherto neglected by scholars. In the course of our questioning we asked don Aristeo whether any special observances marked the gathering of the mushrooms, and he startled us by telling us what follows, as translated into Spanish by our interpreters and into English by us:

I make a practice, four days after gathering the mushrooms, of returning to the same spot, with candles and flowers, and I address a supplication for an increased yield the following year. My prayer is directed to [three] Beings:

Fig. 7. Aristeo Matías, center; Roberto Weitlaner, right; interpreter, left.

1. the earth, God the Father Most Holy (a post-Conquest interpolation), the Trinity (a post-Conquest interpolation)
2. the Great Lightning Bolt that bred [*crió*] the *piule*[1] [5] (*mdi'ndó' pse' bìul*), and
3. the Great Lightning Bolt that put blood into the *piule*[1] (*mdi'ndó' blò ren bìul*). In Spanish: *El gran rayo que le echó sangre al piule*.

Omitting the two post-Conquest interpolations, we are left with a pre-Conquest explanation of the generation, not of all mushrooms, but of the entheogenic species, and that explanation lies in the sexual union of the lightningbolt and the fecund mother earth. As Aristeo put it through our interpreters, *el rayo es la fuerza de la tierra*. Our interpreters made abundantly clear that the lightningbolt carried the sperm, the spunk, to the soft mother earth. The entheogenic mushrooms are the miraculous fruit of this coitus. Aristeo Matías was explicit in his explanation, which we had gathered elsewhere, notably in the *Rig Veda*, but only as a strong inference.

---

4. To grasp fully the meaning of this Discovery, it is advisable for the reader to have read Chapter 2.
5. In Zapotec there are three tones: I have indicated high by ´, low by &grave; and middle by no accent. In our spelling 'j' is as in 'judge'. The apostrophe represents a glottal stop. *Piule* is the word in the native languages for our 'entheogen', probably derived from *peyotl*.

I propose the following: in this remote corner of the world the same belief prevails in a far earlier stage of evolution than we have found in Eurasia. In Europe it still survives as a moribund relict, a verbal fossil, repeated by half-literate peasants out of habit, but retaining with remarkable persistence the one requirement that the verbal fossil relates to a single kind of mushroom, though a different kind in each region. When the original belief in the entheogenic mushrooms - those mushrooms that take one to a miraculous haven for some hours - gave way to other religious beliefs, each region chose a substitute to replace the entheogen and the belief lived on without a *raison d'être*. In Asia the belief existed in a far earlier recension in the *Rig Veda*, where we find *Aja Ekap&amacr;d*, 'not-born single-foot', not-born because not born from seed but miraculously from lightning, and single-foot because the mushroom has only a single Toot' or stipe. In Mesoamerica the belief in the entheogen survives and Aristeo is ready to give Plutarch[6] the answer to his question why thunder makes a certain mushroom to grow: Aristeo speaks out of prehistory, a voice from the millennia before mankind devised the art of writing.

6. The Meaning of *Kakuljá Hurakan*

From the village of San Agustín Loxicha, in Zapotec country, we will now visit the lands of the Maya, a few score miles due east as the bird flies, where the natives speak Tzeltal and Tzotzil, Mayan tongues in the Mexican State of Chiapas; and some score miles further, in the Guatemalan highlands where they speak Quiche and Tzutuhil. The Quiche were and are the most numerous of the Maya peoples. It is they who have left us as a legacy the *Popol Vuh*, a preConquest poem almost 8600 lines long, which has inspired many translations into Spanish, English, French, German, and Russian, plus two translations from these languages into Italian and Japanese. Mushrooms are mentioned expressly once in the *Popol Vuh*, in what is a religious context.[7] The mushroom caps lie in deerskin and are carried to the top of the mountain, - doubtless a sanctuary. We are given no hint of their species nor what was done with them.

The mycologist Bernard Lowy, now retired from his chair in the State University of Louisiana, had decided many years ago to pursue my subject - ethnomycology - and early on chose the Maya region to see what discoveries awaited him in that ancient and storied land. In the last decade he has made a dramatic break-through, reenforcing mightily the trend of my findings, already strong. Knowing of my preoccupation with lightningbolts and mushrooms, when he went down in June of 1973 to Guatemala he felt the need to familiarize himself with the vocabulary for lightning in the Quiche language. To this end he consulted the professional linguists of the Proyecto Francisco Marroquin in Antigua and specifically Dr. William Norman, a specialist in Quiche. He learned that in Quiche *kakuljá* is the word for lightning.2 But did it correspond with *rayo* in Spanish or simply with *relámpago*? *Rayo*, definitely. *Rayo* is the powerful word corresponding to *foudre* in French. *Rayo* provokes the tension of a nearby flash of a blinding lightningbolt and a deafening clap of thunder. *Relámpago* corresponds to *éclair* in French and, as he was told, to *xkoyopá* in Quiche. English is singularly weak in its thunderstorm vocabulary.

In July of that same year Prof. Lowy went on to Chichicastenango, in the heart of the Quiche country, and some kilometers north in the forest-covered mountains, where he gathered specimens of *Amanita muscaria* and *A. caesarea*. He brought his mushrooms down to the marketplace in the city and displayed them to the women mushroom vendors squatting on the sidewalk. They knew his mushrooms at once and he was admonished not to eat the *kakuljá*: it was *itzel ocox*, the 'evil or devilish mushroom'. So *kakuljá*, 'lightningbolt' in Quiche, really was the ordinary name of Soma! Originally it must have served as a most powerful metaphor, but now no one thinks of 'lightningbolt' when speaking of fungi. Lowy asked the women to pronounce the name slowly and carefully. It was the same as the word for the mighty lightningbolt, unmistakably.

The clergy in the Quiche country and, much later, the anthropologists and linguists when they arrived on the scene, were of West European stock and therefore probably mycophobes who ignored the toadstools of the country, until Prof. Lowy turned up in 1973 with his persistent questions. Scholars only now are, a few of them, learning of the importance of entheogenic mushrooms in prehistory, including our own Indo-European

7. *The Book of Counsel: The* Popol Vuh *of the Quiche Maya of Guatemala*, tr. and ed. by Munro S. Edmonson, Publication 35, Middle American Research Institute, Tulane University, 1971; line 6266.

collateral ancestors, in the Indus Valley, who had not yet learned the art of writing.

Do all those among the Quiche who characterize the *kakuljá* as *itzel ocox* believe this, or may these short words serve as an amulet to free them from the disapproval of the authorities? Are there possibly Quiche or Tzutuhil who ingest the *kakuljá* according to age-old rites?

In the summer of 1978 Prof. Lowy spent some time in Santiago de Atitlán, where Tzutuhil is spoken. There he investigated the beliefs concerning the gods in which, it seems, they still believe. I shall give these beliefs as he recorded them, in a document, dictated to him by a foreign resident of the village. Here is what he wrote down:

> According to Tzutuhil legend as narrated to me by Martín Prechtel, a talented painter and linguist living in Santiago de Atitlán, there once were 12 sacred trees, each of them associated with a different species of mushroom. The Nahuales decided to select one of these trees to rule over men on earth. Each tree in turn was asked whether it would accept the heavy responsibility. Only one accepted, an unlikely, undersized candidate called *chipi* or Little Brother. He said he had a dream or vision in which he was directed to find a certain hill at the foot of the volcano San Lucas (still venerated by the Tzutuhil) where a tree called the *palo de pito* grew surrounded by numerous mushrooms. As the tree was approached, a strong south wind arose bringing with it a violent storm, and presently the tree was split by a thunderbolt. The tree was hollow, and within it *chipi* observed a vague countenance which he then proceeded to carve out of the soft wood. This effigy became the god Maximon. Each stroke of *chipi*'s knife was accompanied by a sacred word, and each stroke likewise gave origin to a musical note, tone, or *son*. The notes provided the musical basis for traditional songs. When Maximon was fully formed, each Nahual conferred upon the newly created god a special power. Then Maximon was commanded to stand, for he was to be tested to determine whether he was able to use the powers conferred upon him. A deaf mute from the village was brought before him and Maximon was directed to cure his infirmity. According to one version of the legend, a fragment of one of the mushrooms growing around the *palo de pito* was fed to the man, who thereupon became rejuvenated and his infirmity disappeared. The Nahuales were pleased, and Maximon has ever since presided over the Tzutuhil people. It is this divine mushroom which is known among the Quiche as *kakuljá*, only recently identified as *Amanita muscaria* and which takes its name from the Maya god whom it personifies. *Kakuljá* is one of a trinity of gods referred to in the *Popol Vuh* as *kakuljá huracan*, the others being *chipi kakuljá*, and *raxa kakuljá*.
>
> The first of these, *kakuljá huracan*, enigmatically refers to a single leg, *huracan*, that is, the single shaft of the thunderbolt. Where this shaft struck the earth the miraculous mushroom *Amanita muscaria* arose.

Martín Prechtel is married to a Tzutuhil woman. The *palo de pito* is a leguminous tree, *Erythrina rubrinervia*. Prof. Lowy's account of the Tzutuhil folk belief appeared for the first time in the spring of 1980, in the *Revista-Review Interamericana*, p 100, Vol 10 No i, Copyright © 1981 Inter American University of Puerto Rico. Professor John Zebrowski is the Director-Editor of the *Revista* and he graciously granted us permission to quote from Prof. Lowy's article.

In Chiapas the vocabularies of both Tzeltal and Tzotzil also link Soma with the lightningbolt mushroom. Dr. Robert M. Laughlin, Curator of Anthropology of the Smithsonian, the authority on Tzotzil, tells us that Soma is called *tzajal yuy chauk*, meaning 'red thunderbolt's *yuyo*', *yuyo* being, it seems, a Quechua word. In San Cristóbal Lowy found that the fly-agaric is commonly still called by natives *yuyo de rayo*. These names raise the question whether Soma, when *yuyo* originally came to be used for the fly-agaric, was considered by the natives as edible: we hope this question will engage the attention of linguists, who should also be asked to explain the presence of a Quechua word in the native languages of Chiapas. Quechua is the dominant language of the Indians of Peru.

Dr. Laughlin gives us supporting evidence for the former currency of *kakuljá* in a *Vocabulario de Lengua Kiche* copied in 1787 from a now missing original by D. Fermín Joseph Tirado. On p 119 of vol. 2 it reveals *cakolha* in the last entry as an *hongo ponsoñoso*, 'poisonous mushroom'.

The famous 'mushroom stones' of the Mayan archeological world never resemble the numerous species of *Psilocybe* that are much sought after throughout Oaxaca and thereabouts, but they present, most of them, good profiles of Soma, and this adds support (as if support were needed!) to the linguistic evidence that the Maya people used Soma as their most holy entheogen.

From the *Popol Vuh* we learn that there were three kinds of *kakuljá* in traditional belief:

1.
kakuljá hurakan
Lightningbolt One-Leg

2. *chipi kakuljá*
Dwarf Lightningbolt

3. *raxa kakuljá*
Green Lightningbolt

There is no doubt about the priority of *kakuljá hurakan*. When the three are first mentioned in the *Popol Vuh* their ranking is made clear:

Quiche text		*Edmonson Translation*
R umal ri, u K'ux Kah	183	Through him who is the Heart of Heaven,
Hu r Aqan u bi	184	One-Leg by name.
Ka Kulaha Hu r Aqan nabe	185	One-Leg Lightningbolt is the first,
U kaab g'ut Ch'ipi Ka Kulaha,	186	And the second is Dwarf Lightningbolt
R ox chik Raxa Ka Kulaha	187	Third then is Green Lightningbolt,
Chi'e q'u oxib ri, u K'ux Kah.	188	So that the three of them are the Heart of Heaven.

Ka Kulaha Hu r Aqan	in the Preconquest *Popol Vuh* becomes
Kakuljá *Hurakan*	in contemporary Quiche and
Lighningbolt One-Leg	in English.

The three kinds of *kakuljá*, making up a trinity, are jointly cited eight times in the *Popol Vuh* but not repetitiously. Each citation is in a fresh context and is itself freshly composed. The eight citations in Edmonson are centered on lines 188, 235, 353, 1496, 1741, 2282, 4982, and 5187, each of these being several lines long. But special distinction is conferred on one of the three: *hurakan*, the 'oneleg' first member of the trinity, being cited alone five times, in lines 506, 712, 1512-1524, 4016, and 8198. Furthermore, in the eight joint citations, the 'dwarf and the 'green' are in each instance linked to *kakuljá*, whereas *kakuljá* appears with *hurakan* only the first time, showing that *hurakan*, 'one-leg', is strong enough to stand alone when it means the sacred mushroom.

There can be no question that *hurakan*, the 'one-leg', loomed large in Quiche and Tzutuhil minds, larger than the other two.

Certain it is that these uses of *kakuljá* do not mean lightningbolt at all. They refer to entheogens, the secondary meaning. The 'one-leg lightningbolt1 means Soma. The 'dwarf lightningbolt' means the various entheogenic *Psilocybe* species, normally much smaller than the fly-agaric, by comparison 'dwarfs'. The 'green lightningbolt' is the entheogenic morning-glories and any other phanerogamic entheogens. These are obvious interpretations for anyone who knows the entheogens.

Lowy's discovery of a secondary meaning for *kakuljá* is a major development in Quiche linguistics, a long step forward toward a grasp of the meaning of the *Popol Vuh*, a promising key to hitherto hidden (from us) meanings of other passages. It is certainly also a brilliant climax to Valentina Pavlovna's and my suspicion in the 1930's that mushrooms had played a major role in religion, a confirmation of Roman Jakobson's enthusiastic response to our presentation of our feelings. And what that religious role was! In India and among the Maya, not to speak of other peoples. It must be seldom that in these remote fields one achieves such success.

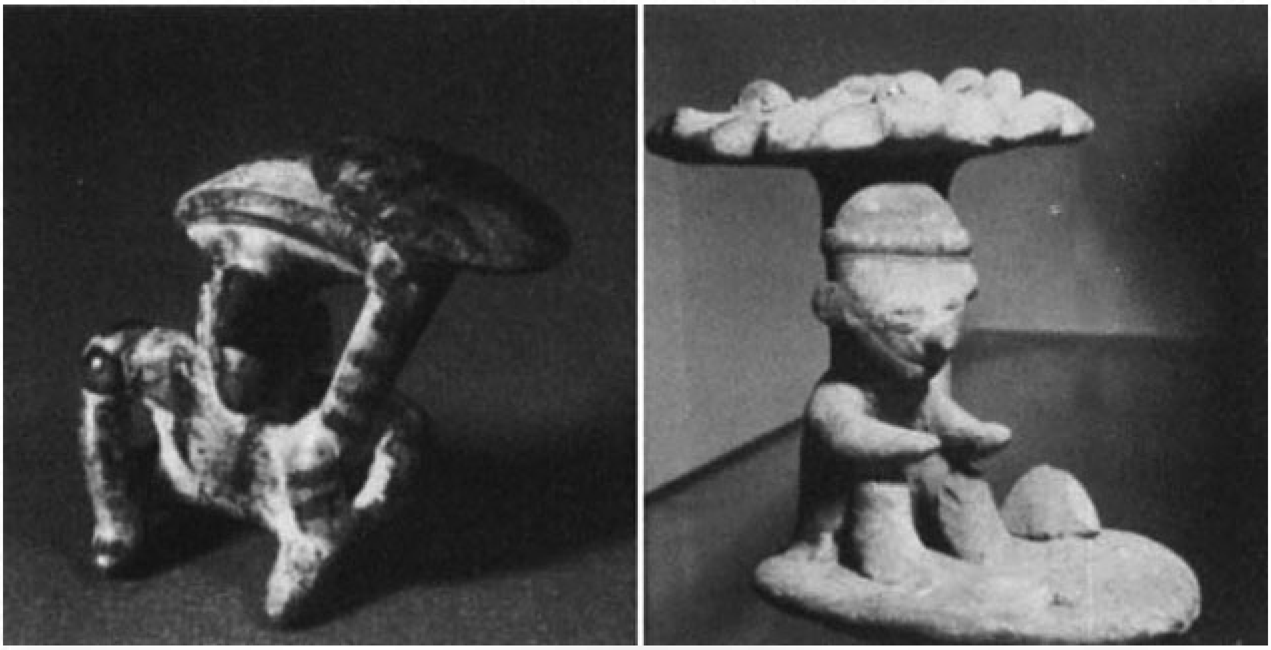

Fig. 8. *Terra cotta* figurines suggestive of Soma, *ca* AD 100, from Mexico, discovered by Peter T. Furst.

It is clear that Soma enjoyed a marked priority as the entheogen of choice, at least as late as when the *Popol Vuh* was written and perhaps as late as the Conquest, but the other Mesoamerican entheogens had gained a foothold among the Quiche. We must remember that the Algonkian nation were using Soma until only yesterday, and there may still be use there among the Ojibway and Chippewa. In Nayarit and in the region of Guadalajara, Peter T. Furst has photographed *terra cotta* mushrooms that date from *ca* AD 100 and that suggest Soma. This Maya discovery of Bernard Lowy's quickens the significance of those artifacts.

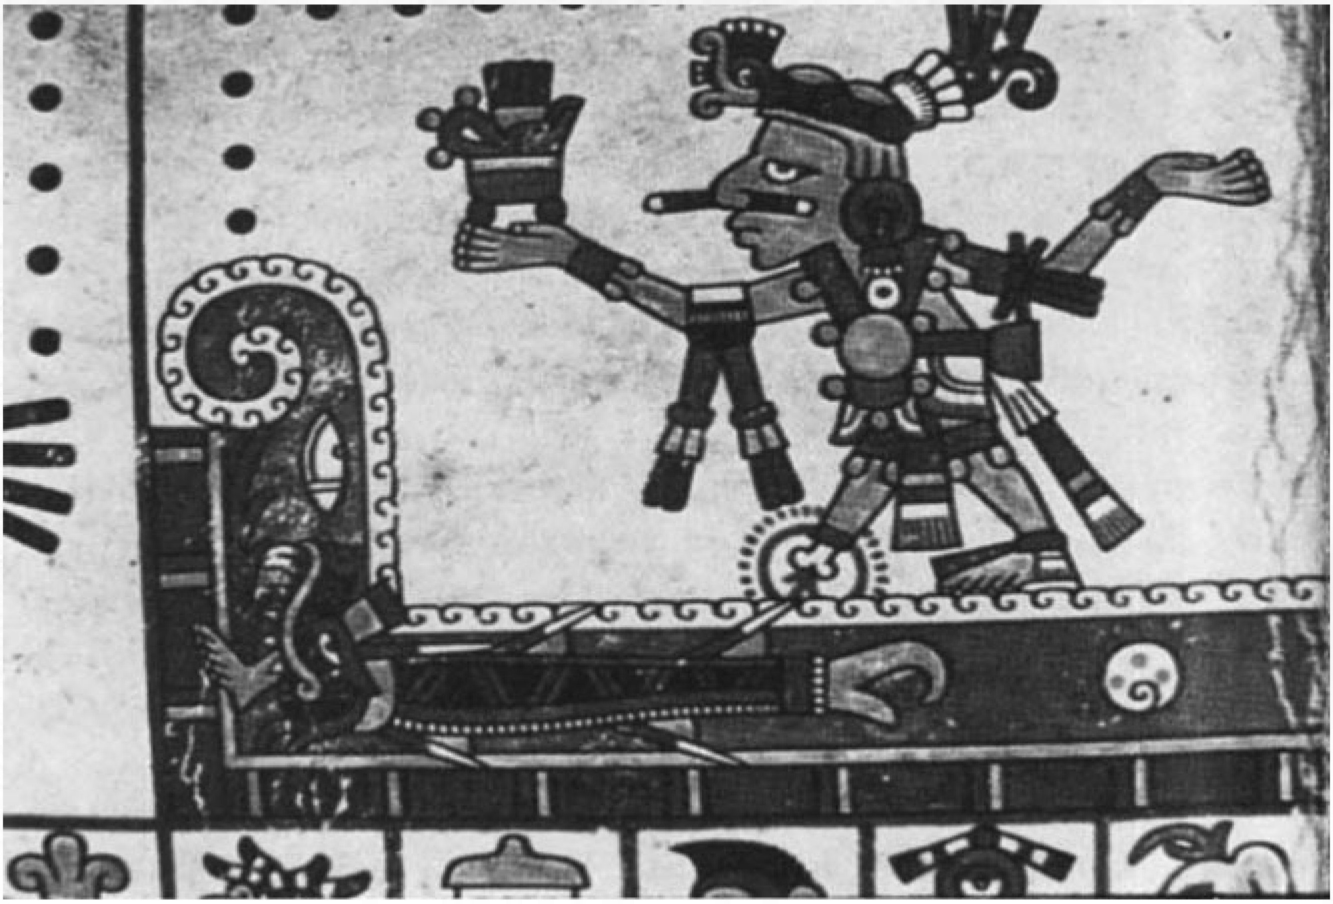

Fig. 9. The Black Tezcatlipoca, in aspect of Huitzilopochtli. Note that he is Uniped, 'Hurakan'. Both pictures are from *Codex Fejérvary-Máyer*, Liverpool Museum.

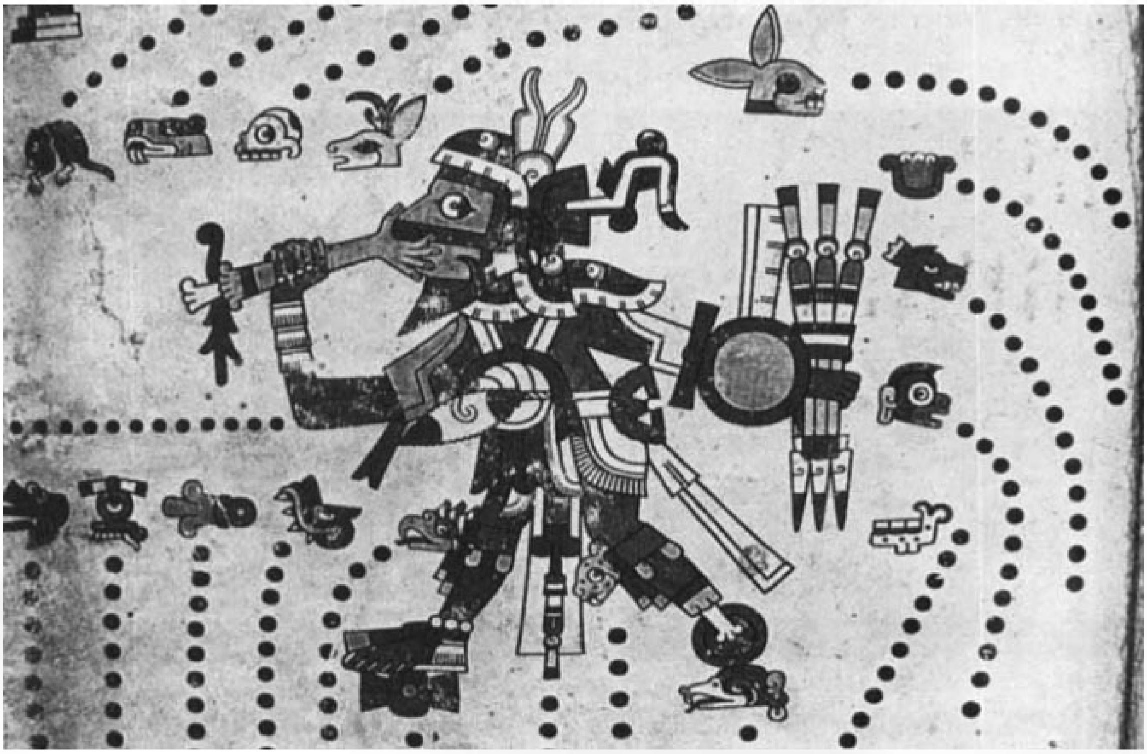

The Spanish missionaries reached Quiche country and began proselytizing about 1540. An unidentified member of a noble Quiche family about ten years later began to write out the *Popol Vuh* in the Latin letters (with modifications to accommodate sounds that Latin lacked) that he had learned from the clergy, and he finished the task in less than five years. Apart from being of lofty lineage, his identity is unknown. Strangely, the manuscript seems to have enjoyed little circulation during the next century and a half. Then the Rev. Francisco Ximénez O. P., who had mastered well the Quiche language, shortly after the turn of the i8th century, was asked by his superiors to copy that Quiche manuscript. He did so and the original manuscript was shortly afterwards returned to its home. It has never been seen since. It must have been lost or deliberately destroyed. Or does it possibly still exist, hidden in some conventual cupboard or Quiche secret place?

It is idle to speculate on the age of the *Popol Vuh*. That it goes back, far back, long before the Conquest, is obvious. A link between Soma and lightningbolt existed among the Aryans, just as it does among the Quiche, the Zapotecs, the Algonkians, and countless others, just as it did until yesterday among the Paleosiberian tribes. The presence of the entheogen has hung over the soul of the tribes in each of these places. The entheogen has drawn no study from linguists or anthropologists. The Sanskritists, as I have said, made no effort to find the Soma until I came along and with the essential help of Wendy Doniger O'Flaherty and other friends identified it as *A. muscaria*. As for Mesoamerica, conventional scholars are still apt to call the entheogens 'narcotics' and ignore their place in the lives of the natives. How misleading and odd is this unnatural reticence of scholars, even some of the greatest of them!

For years I had been seeking a pre-Conquest divinity of the Nahua who would be charged with the entheogens. Thanks to the brilliant analysis of H. B. Nicholson in the *Handbook of the Middle American Indians*, Vol. 10,1971, it seemed to me that Tezcatlipoca was the mighty god suitable for the role. When I discovered that in his aspect of Huitzilopochtli, he had only one sound leg, this was good evidence that here was One-Leg, Tezcatlipoca paralleling the role of the Quiche *hurakan*! Anthropologists had of course known this for a long time, but now we see Tezcatlipoca in the mighty personage of Soma. At about the same moment I learned of the twenty-seven line poem in the Tzotzil language discovered and revealed to us by Dr. Robert M. Laughlin, Curator of Mesoamerican Anthropology at the Smithsonian, and Professor Evon Z. Vogt of Harvard, ending with the lines:

> They saw that it was the same as, the same size as a hawk,
> Having to do with the father-mother (*Totilme'il*)
> 'One-Leg' as we call it.

I felt confident that here we have to do with the lightningbolt mushroom (Soma), though the various interpretations of the poem leave it still as obscure to me as it was when I first read it.

There has been discussion whether the Tzotzil borrowed this notion from the Quiche or from the Nahua of the Valley of Mexico. But did they not, all three of them, inherit it from far back? Did not the idea come with their ancestors from Asia? In the *Rig Veda*, *Aja Ekap&amacr;d*, the 'Not-Born Single-Foot', is cited seven times and in 1972, in my *Rejoinder to Professor Brough*, I suggested that this meant Soma. There is a verse in the *Rig Veda* that says Parjanya, the god of Thunder, was the father of Soma and in the next hymn we learn that 'the gods, those fathers with a commanding glance, laid the Somic germ'. The *Rig Veda* hymns were composed, as I have mentioned, in the second millennium BC and this is a possible date for the composition of the *Popol Vuh*. How odd it would be if the Brahmans in the Indus Valley were composing their hymns invoking the Not-born Single-foot (*Aja Ekap&amacr;d*) at the same time as the Mayan priesthood were paying obeisance to One-Leg Lightningbolt (*kakuljá hurakan*)!

7. A Glimpse of the Domestic Use of Soma

By rare chance we have caught a domestic practice, a peculiar way, in the consumption of Soma that is identical among the Koryak in the 19th century and among the Aryans, separated by 3,500 years and thousands of miles of most accidented terrain. It must have been a widespread custom, a noteworthy sharing of Soma with the women folk.

In 1903 J. Enderli published in *Petermanns Geographische Mitteilungen*, pp 183-4, an account of the Koryak, of which the following excerpt interests us:

> ... [the Koryak] have another substance with which they can produce narcotic intoxication. ... At the man's order, the woman dug into an old leather sack, in which all sorts of things were heaped one on top of another, and brought out a small package wrapped in dirty leather, from which she took a few old and dry fly-agarics. She then sat down next to the two men and began chewing the mushrooms thoroughly. After chewing, she took the mushrooms out of her mouth and rolled them between her hands to the shape of a little sausage.
> ... When the mushroom sausage was ready, one of the men immediately swallowed it greedily by shoving it deep into his throat with his indescribably filthy fingers, for the Koryak never wash in all their lives.
>
> [My *SOMA*, pp 261-262]
>
> This has been translated from the original German.

Vladimir Jochelson in his account of the Koryak confirms this account:

> As far as I could see, in the villages of Penshina Bay, the men, before eating it, first let the women chew it, and then swallow it.
>
> [My *SOMA*, p 266]

Vladimir Bogoraz[8] says the same thing:

> Among the Koryak, the woman chews the mushroom, and offers the ready quid to her husband to swallow.
>
> [My *SOMA*, p 273]

---

[8] '*Amanita muscaria* and the Thunderbolt Legend in Guatemala and Mexico', by B. Lowy, *Mycologia* LXVI.1, Jan.-Feb. 1974.

Traveling now back some three thousand five hundred years from the scenes in the Koryak country, and thousands of miles to the Indus Valley, we see a clinching detail of the continuum of Soma worship. We will quote three verses from a hymn of the *Rig Veda*, 8.91:

1. A maiden going for water found Soma by the way. She brought it home and said, '*I will press it for you, Indra*; I will press it for you, mighty one.
2. 'Dear man, you who go watchfully into house after house, drink this that *I have pressed with my teeth*, together with grain and gruel, cakes and praises.
3. 'We do not wish to understand you, and yet we do not misunderstand you. Slowly and gently, ever more gently, flow for Indra, O drop of Soma.'

This is the translation by Wendy Doniger O'Flaherty published in the Penguin Classics. Unlike most of the Hymns, it gives us a domestic scene, where we see (as I let my fancy free) a young lady, Ap&amacr;l&amacr;, going for water to the spring and returning home, one arm balancing the water vessel on her head, two or three Soma plants in her right hand held by the stipes [Sanskrit: *aṃ&sacute;&umacr;*], full of joy as she planned her cakes, gruel, and grain for her most distinguished guest. On arriving home her first duty was to dry the Soma plants, placing them near the fire where they would dry quickly but not so near that they would begin cooking. When Indra arrived home, all was ready, and her happiness knew no limit. Mighty Indra possessed her and naturally her affliction was healed.

Little did the nineteenth century actors in the Koryak country know the antiquity of what they were doing, and the foreign observers were ignorant. Here are two views of the same scene, one *en beau* and inviting, the other repulsive, but both scenes of the same informal manner of serving Soma at home. I think this way of consuming Soma was probably the common one, in the Aryans' homeland, whence they emigrated to south Asia, rather than the exalted sacrifice with a full complement of chanting priests.

I would not have my readers think that this episode of Ap&amacr;l&amacr; and the Koryak account three or four thousand years later offer us weighty evidence in favor of the fly-agaric as Soma. Here is corroborative evidence in favor of our case: in both instances the woman in the household masticates the Soma for her man. That is all and it is a good deal when we are discussing how the essential Element in a most ancient and truly universal religion is handled. In the Koryak case the quid is passed to the man after thorough mastication; presumably the woman has swallowed the juice. In the Aryan instance, the young lady conserves the juice in a container of some sort and presents it to Indra to drink. (The Sanskrit word is *piba*, from the root *p&imacr;*, cognate with English 'imbibe'.) This would call for skill on her part, and the drink would be a mixture of *pávam&amacr;na* (a Sanskrit word for the expressed and filtered juice of Soma) and her saliva. Was the poem composed in the Indus Valley where the Soma plant was notoriously scarce and was the poet unfamiliar with the details about the quid? Did Ap&amacr;l&amacr; swallow the quid? Or do we see an Aryan poet paying obeisance to an inaccurately remembered practice of the Aryans in the land whence they had emigrated generations earlier?

★

Soma is the only mushroom whose biography lends itself to being written up, but this must await some future scholar. It will be an absorbing theme, the life story of the supreme entheogen of all time, which survived (and survives!) prehistory only in spots and but briefly, the cult in disarray and pitiful, its practitioners in Siberia generally despised and downgraded by those Europeans who have been privileged to establish contact with them. The visitors exercised their power to impose their distilled liquor (vodka, whiskey, and gin) in place of the 'toadstool', smugly certain that they were doing the natives a favor. They disregarded the testimony of the natives, who said they preferred the mushroom: it left no hangover and the inebriation was superior. Among the visitors there were some competent observers, but culturally even these were so far removed in time from the people before them that they could not be expected to appraise adequately what they were witnessing.

8. The Chinese and the Nivkhi

In the lower valley of the Amur[9] there lives a people from time immemorial formerly known to the West as the Gilyaks but now as the Nivkhi. They are one of the Paleosiberian peoples, speaking a language related to no other. They number between 20,000 and 30,000. In my *SOMA* I did not cite them for at that time I had learned little about them. I now have learned that they practiced shamanism, at least until recently, with *Amanita muscaria* as their entheogen. Furthermore, it is said that they once had important cultural contacts with the Daoists of China.[10]

I will now quote from a Nivkhi myth, translated from their tongue into Russian and thence into English:

> Two titmice brothers, living under the shelter of a hummock, were at that time the only inhabitants of the earth. The titmice lived for a long time, not knowing what was to be found along the river beyond their hummock. Then they decided to go and look. The younger brother went up the river, the elder down the river. As he went up the river, the younger brother saw a larch, 'A thick larch rising to the very sky.' At the foot of the larch there was food, grown and placed there by the 'masters of the larch,' unknown to the brothers. The younger brother tasted the food and took some to give to the older one. The next day the titmice brothers proceeded together to the source of the food. There they met heavenly people, two little birds, a silver and a gold one, who had descended to the base of the larch and declared themselves the masters of the food.
>
> [*Studies in Siberian Shamanism*, edited by Henry N. Michael, Univ. of Toronto Press, published for the Arctic Institute of North America, 1963. A. F. Anisimov: 'Cosmological Concepts of the North', Chap 1, pp 169-170,173-4]

The larch, a conifer with deciduous needles, is for the Nivkhi the Tree of Life, the Tree of the Knowledge of Good and Evil, and is revered accordingly by them. Why? Because there springs up under its boughs *A. muscaria*, the 'food' mentioned in the above myth. Throughout Siberia, indeed Asia, wherever grow the trees that serve as hosts to *A. muscaria*, - the birch, the pine, the cedar, the larch, others - that tree is revered as giving birth to the Marvelous Herb. The entheogen at the foot of the tree is the explanation of the reverence paid to the tree by the natives round about. How has the world overlooked for so long a time this key to the mystery of the Tree of Life?

With the reticence that we find everywhere in the world where the entheogens are encountered, the identity of the food found at the foot of the larch is not disclosed in the Nivkhi myth that I have quoted but it would be obvious to any Nivkh and, as the Nivkhi would think, to any stranger worth his salt. That the tree is revered goes without saying but it is not so holy as to be subject to the verbal tabu sheltering the miraculous plant at its base, a plant whose name is pronounced only in a whisper and only when two or three are gathered together, preferably at night. And even then when one examines that name, it is invariably a euphemism; *ie*

Sanskrit *Soma*:	'the pressed one'
Sanskrit *Aja Ekap&amacr;d*:	'not-born single-foot'
Quiche Maya *kakuljá*:	'an overwhelming lightning strike'
Quiche Maya *hurakan*:	'the one-legged one'
Mazatec *ˀnti*^{1}*xi*^{3}*tho*^{3}:	'The Holy [Ones] that leap forth'

We do not know the Nivkhi name for the plant that grows at the foot of the larch but it would be noteworthy, indeed unique, if it were not another euphemism.

---

[9] Bogoraz and Jochelson knew each other and I am uncertain whether this is independent testimony or whether it merely repeats Jochelson.

[10] See map, p 69; the Amur is at lower left.

★

When I brought out my *SOMA* at the end of 1968, I failed to deal with China and the use of entheogens there because I felt inadequate. Since then I have learned much and will now give my views.

If indeed the Daoists in the early days were in touch with the Nivkhi, they must have shared with each other the knowledge of the mighty and holy entheogen. No one can say which had the knowledge first: it goes back so far that the origin is forever lost and unimportant. We shall see in Chap 2 (p 90) that the lightningbolt belief is securely grounded in the Chinese culture and vocabulary: proof as I see it that they shared with others in their high regard for the sacred entheogen. In the *Li ji*, one of China's 'Thirteen Classics',[11] there is a significant statement that the *zhi* 芝 defined as an herb, 'a small plant that is not woody', was eaten by the Emperor as a ritual food. It was therefore edible and sacred. Nothing is said that others were prohibited from eating it. It would be natural for the hierarchs of the Daoists to share in it, and the Court circles, perhaps others, possibly many others. China was more wooded then than now but we do not know whether there was overharvesting, nor whether the Chinese knew how to harvest the mushrooms without breaking the tie with their mycelium. At any rate in the reign of the First Emperor Shihuang, before the Han, we hear for the first time that there are big troubles, the necromancers looking in vain for a sacred herb, and for the first time the *ling zhi*, 靈芝 as distinct from the simple *zhi*, is cited. Clearly there was a crisis in the supply that agitated the Court circles, as the *zhi* faded from view and the *ling zhi* became the official surrogate. The replacement took place only after the voluble élite circles of the Chinese made a furor that we can document in historical texts, in poetry, in paintings, and in carvings, and that lasted into the Later Han. In the reign of the unpopular Wudi there took place what would be called today a remarkable and successful 'public relations ploy', which the reader can learn about in *SOMA* (p 85) with unalloyed admiration, and which served to strongly consolidate the legitimacy of the changeling. Suffice it to say that the replacement of the *zhi* (*A. muscaria*) by *ling zhi* (*Ganoderma lucidum*), of the 'not woody herb' by the 'woody herb', stunning in its protean shapes and with its deep red lacquered finish, won the day. But the Chinese never let out the secret of the small 'not woody' herb.

This explanation meets all the peculiar circumstances of the event, including the character of the Chinese people. I am convinced that it is right.

The High Priests of the Daoists today wear vestments that are bespattered with the auspicious *ling zhi*, and they also wear emblems of the *ling zhi*. How much of this history - the adoption of the changeling to replace the 'not woody herb' - is known to them?

Far to the south of them the Brahmans of India faced an identical problem, when they had to make do with a changeling, the *P&umacr;tika* replacing the Soma. But the different circumstances permitted them to be far more discreet and hide the identity of both plants until Professor Heim and I visited the Santal and learned the fungal identity of the substitute, the *P&umacr;tika*.

9. Greece and Soma

Carl Ruck has discovered in ancient Greek an assemblage of rare words that can only apply to Soma, but we cannot be sure, in the light of the circumpolar field that we have found for the adoration of this plant, whether the Greeks derived their knowledge of it from the Indus Valley to the east, or from the north whence they had migrated, or both; or perhaps some Greeks had always known it as a part of traditional family lore. Ruck's exposition of this aspect of Greek culture is in the early pages of his first essay in this book, pp 151-178.

---

11. To follow my argument the reader should refresh his memory of what I said in *SOMA*, pp 80-92. (In the first edition and early reprintings of *SOMA* I committed an error, unimportant but inexcusable: where I mention *Pleurotus ostreatus*, p 82, I should have said *Auricularia auricula-Judae*.)

A traveller named Skylax early in the fifth century BC is mentioned in Herodotus as having visited the Indus Valley. Herodotus says little more and the book by Skylax has not survived but he is cited by various writers including Pliny and is reported to have said that the Indus Valley was the homeland of the 'Shade-foot' (Gr.: *Sciopodes*) people, who possessed a single powerful leg on which they leapt with astonishing vigor or else lay on their backs and shielded themselves from the sun with their single foot serving as a parasol. Another Greek name (though surviving only in Latin sources) for these creatures was 'One-legs' (Gr.: *Monocoli*), and a third term, used only by the seventh century poet Alcman, is 'Cover-foot' (Gr.: *Steganopodes*). If indeed Alcman in the seventh century BC wrote of the 'Cover-foots', here is proof that the Greeks possessed information about the marvelous entheogen before Herodotus, who also has told us (4.33 *et seq*) that Greece was in regular contact with the Hyperboreans, in the heart of Siberia, since long before his time, possibly since the Greek migrations. Another Greek, Ktesias, made a journey to India a century after Skylax, and his narrative survives in part. It is noteworthy that the Greeks knew about the entheogens down the centuries, but characteristically hardly mention them, so that Western scholars ignore them.

In Vedic Sanskrit we find the congener of these Greek words, *Aja Ekap&amacr;d*, 'Not-born Single-foot', referring to Soma: 'not-born' because born without seed, but conceived miraculously, from the coitus of a lightningbolt with mother earth rendered soft by rains, and 'single-foot' because the divine Soma plant had only one leg, the stipe (or stem, *aṃ&sacute;&umacr;*[12] in Sanskrit) of the mushroom. The word in Sanskrit for a mushroom, introduced in post-Vedic times, was *chattra*, whose primary meaning was 'parasol'. We will find the 'parasol' reappearing centuries later in the manuscripts written in the Middle Ages. The mushroom (= Soma) has gills (or *laminae*) suggestive of the struts of a parasol. This is as much as a Greek traveller could have learned in the Indus Valley about Soma. The use of Soma there had been abandoned centuries earlier and the Brahmans, who were the custodians of the secrets of Soma, were now intent on suppressing every memory of the marvelous herb. It was unlikely that a Greek would ever meet a Brahman, and if he did, the Brahman would not engage in a discussion of Soma with him.

The Arimaspians, a people allegedly possessing only a single eye, were placed near the Hyperboreans by Herodotus, though with naive charm he expresses scepticism about their very existence (3.116). What he is talking about is the race of Cyclopes and we now understand them for the first time: they are of course the personification of Soma as a single eye. The Cyclops is originally Soma under an aspect different from the 'Cover-foots'. In *SOMA* I published, all unknowing, in Plate 10, a picture of Soma as a 'single-eye' and on pp 46-47 I published a list of the 'single-eye' citations that occur in the 9th mandala of the *Rig Veda*. The Cyclopes evolved far in Greek culture and their origin may well have been lost to view by most Greeks in the time of Aristophanes. The single eye and the single leg are combined in a 'one-sided man or woman' shown to us in *The Chukchee*, where V. G. Bogoraz says he represents the spirit of the estuary of the Anadyr River. Rodney Needham calls this creature a 'unilateral figure' in his *Reconnaissances*. Others have called it a 'halfling'.

Rudolf Wittkower in his classic 'Marvels of the East: A Study in the History of Monsters'[13] recognized that both Greeks and Indians possessed cyclopic races and he adds: 'they may have had a common mythical origin in times beyond our historical reach.' He divined what we have established, the common origin of the Indian and Greek Cyclopes, a common origin but *not* a mythical origin, a common origin in Soma the Divine Mushroom.

Our third 'monster' has no head but his face is in his torso, extending from his shoulders to his belly: he is called in Greek a 'Tongue-in-Belly' (Gr.: *Englottogastor*), a *hapax*. The divine being, Soma, has only his torso to live in (apart from his Single-Leg), no head, and his eyes and nose and mouth must be in his torso.

Carl Ruck has identified the Greek mythological archetype of all the 'Tongues-in-belly': it is lambe-Baubo, who enters into the *Homeric Hymn to Demeter* (11. 200-210), in the famous scene where Metaneira offers her grieving guest wine to drink, but the Goddess says that to drink red wine would be a sacrilege. This was just after Iambe-Baubo had brought her a stool and had thrown over it a lamb's fleece for her to sit on:

---

[12] The *Li Ji* was put together in the Early Han but from documents that date from the late Zhou, BC 700 to the third century BC.

[13] Another word for Soma, far less holy, is *aṃ&sacute;&umacr;*. Those whose function it was to handle the plants every day - receiving them, drying them, storing them, producing them for the Offices - needed a word without the exalted attributes of 'Soma'. Some of the observers in Siberia have noted that the merchants string the plants to gether in threes, threading them together through the relatively tough stipes. Some such method must have been used in Vedic times and here we have an explanation of the term of art, *aṃ&sacute;&umacr;*. There was an imperious need for a word to serve that function. Do we not have it in *aṃ&sacute;&umacr;*? Renou translates *aṃ&sacute;&umacr;* felicitously by *tige*, stem or stipe.

> *Thus she remained until the scheming Iambe amused the holy lady with jokes and made her smile, then laugh, softening her heart - Iambe who in later times pleased her at her rites of Mystery.*

Iambe-Baubo is a strange character: she has no head and her face is in her torso. We here present three examples of this figure. 'Iambic' is the poetic meter used in ancient Greece for erotic verse and Baubo is doing what is expected of her in this scene with Demeter. We also learn that she played a role in the rites of the Mystery of Eleusis. Some scholars have held the view that Baubo is an androgyne: the legs are joined throughout their length, the arms are only suggested, and as head and neck are absent, the whole figure suggests an erect penis.

This common fund of evasive euphemisms is used for the mighty entheogen, whether in the Indus Valley, in Siberia, in Greece, or indeed in some cases in the far off highlands of Mesoamerica. The evasive euphemisms were understood and used throughout vast stretches of the world. We are now bringing this vocabulary to scholarly attention. Aristophanes was an outstanding playwright, popular, and when he used Sciapodes and *Englottogastor* in *The Birds*, we can rest assured that Aristophanes knew he would be understood. These words drawn from the sacred vocabulary are rare in surviving documents but their rarity does not tell the story of their oral usage. *Sciapodes* and *Englottogastor* serve in the strophe and antistrophe of the Chorus in *The Birds*: Ruck thinks that in the case of *Englottogastor*, it may have been invented *ad hoc* by Aristophanes. Either way, invention by playwright or not, it had multiple progeny many centuries later. Just as in Mexico today, the sacred vocabulary seldom erupts in large and mixed gatherings but recurs in private conversations among people well known to each other. To the end in ancient Athens plays were tinctured with religion, and Aristophanes used in his comedies a freedom of expression that would not have been proper in the Agora.

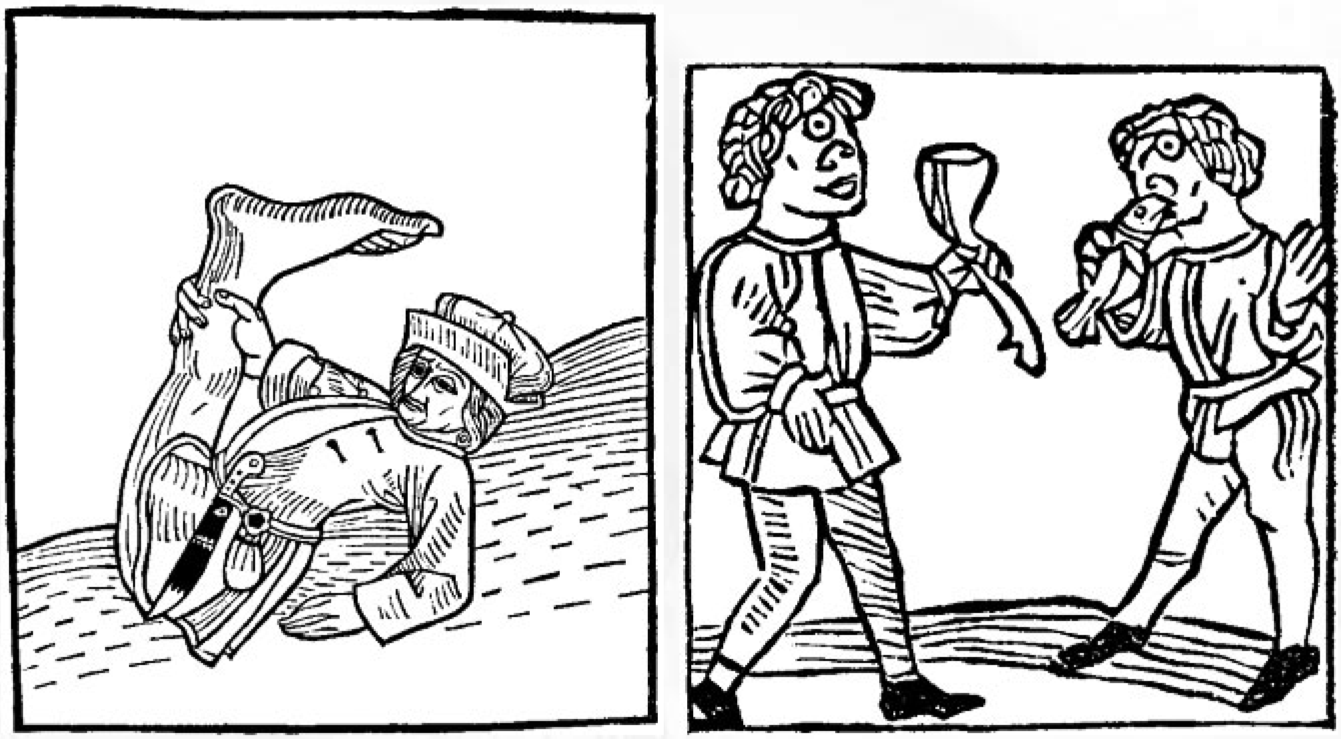
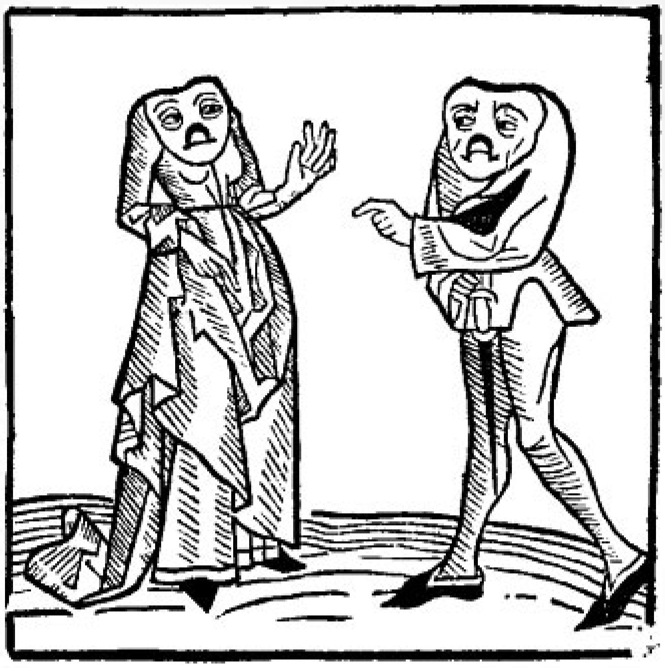
10. Soma among the Mediaeval 'Monsters'

It is surprising enough that these evasive euphemisms for the plant Soma occur in classical Greece; but, doubly surprising, throughout the Middle Ages the scriptoria of Western Europe were busy with the 'monsters' that dwelt beyond the limits of the known world. Occasionally they hit on genuine peoples such as the pygmies of Africa, but mostly the scribes and artists contented themselves with perpetuating the same fanciful 'monsters' down through the ages. They derive their inspiration largely from classical sources, notably from the *Historia Naturalis* of Pliny the Elder, who drew on the Greek sources that we are now familiar with. These illuminated manuscripts seem to have been immensely popular among the literate and many people at first may have half believed in the imaginary creatures that they read about and saw pictured. But there was never an edition that tried to explain our three 'monsters'.



a. Single-footed man

b. Cyclopes



c. 'Tongue-in-Belly'

Fig. 11. 'Monsters' repeatedly appearing in manuscripts of the late Middle Ages, reputedly from creatures living beyond the known world. As we have shown in the text, these stem from *A. muscaria*, difficult as this is to imagine, going back through classical Greece.

The three pictures on this page are all taken from *The Travels of Sir John Mandeville, Kt.*, Strassburg, 1501, p 71. Courtesy of The Pierpont Morgan Library, New York.

Those three do of course appear separately but what impresses me is that they often appear together. In an especially fine manuscript in the Bibliothèque Nationale designated Fr. 2810, one of the early versions of Marco Polo's account of his travels to the Orient that was commissioned as a gift from John the Fearless to the Duke of Berry, there comes the point where Marco Polo tells about his visit to Siberia. Of course he does not mention any 'monsters' but nonetheless the Boucicaut Master in charge of the manuscript (volunteering irrelevant illustrations as was often done) offers us a miniature of a Cyclops, a Sciapous, and a Tongue-in-Belly in Siberia. They are placed in a mountain scene where Soma might be growing in Siberia. One inevitably asks oneself when confronted with a manuscript such as this whether some even in the late Middle Ages had information withheld from our other sources, in short whether there were individuals who knew what our three 'monsters' meant.

Shortly after the middle of the 14th century a book destined for great fame was dictated to an amanuensis in French in Liège purporting to be the story of the travels of a fictitious Englishman, Sir John Mandeville, Kt., as related by himself. This was the supreme travel yarn telling with mock solemnity of the monsters, just as Cervantes with Don Quixote, two and a half centuries later, made fun of the chivalry and knighthood that had lingered on into his day. *Sir John Mandeville, Kt.* was translated into almost all the languages of Europe including of course English and, with the invention of printing, was published in innumerable editions. In the 19th and 20th centuries a few such editions continued to appear but only as picturesque period pieces. Here was a book that expressed the increased scepticism of the Renaissance.

The question will surely be asked why people devised words such as Tonguein-Belly, Cyclops, and Shade-foot when speaking of Soma. But the answer seems to me obvious: wherever religious feeling is deep and sincere as it was among the Brahmans in Vedic times and others who worshipped Soma, everything associated with the holy and especially the name of the mighty plant is subject to a religious tabu. The sacred words must not be spoken openly and commonly. Originally the three names of our 'monsters' could be pronounced freely in the presence of strangers, of *&sacute;&umacr;dras*, without danger that the Most Holy would be befouled by those unworthy clods, as the Brahmans considered all the lower orders to be. In the Middle Ages the pictures and the names had lost contact with their own origins and they were mere oddities. They were perhaps the 'science fiction' of their day.

ARTHUR LAYARD

f. Nineteenth century reproduction of the 'Folk with but One Foot' from *The Travels of Sir John Mandeville, Kt.*, edited and illustrated by Arthur Layard, published by Archibald Constable, Westminster, in 1895.

11. The Chukotka

A Russian archaeologist, N. N. Dikov, who lives in Magadan, a city on the Pacific Coast of Siberia (as is only too well known to all Russians), in 1967-1968 discovered mushroom petroglyphs on the eastern bank of the Pegtymel' River. In many instances the mushrooms were associated with human figures, all apparently female, a mushroom crowning the head. The petroglyphs were small, some centimeters in height, and the mushrooms were larger in scale than normal. Did the mushrooms signify mushroom possession? Their size would suggest this. Collateral evidence permitted Dikov to speculate that the petroglyphs might date from the end of the stone age or the beginning of the bronze age, *ie* around BC 1000. The figures with mushrooms were far from isolated: reindeer, dogs (or wolves), foxes, a kayak, fish, and seals were also portrayed. The mushrooms were doubtless *A. muscaria*, and the women wearing them on their heads may have been engaging in a ritual dance, but I prefer a different explanation. In *SOMA* I quoted, pp 288 *et seq*, various tales in which the Kamchadali and the Koryaki introduce us to the 'little folk' of their entheogenic world as little girls, small, only a few centimeters high. (We are reminded of the 'little people' of the Oaxaca world, playing-card in size: see *The Wondrous Mushroom*, pp 136 *et seq*) I think the petroglyphs of the Pegtymel' River represent the 'fly-agaric girls', and the mushrooms serve to identify the pictographs. For me a striking feature of these petroglyphs was their location: the Pegtymel' River flows north into the Arctic Ocean in the eastern reaches of the Chukotka, the huge peninsula jutting out towards Alaska. The petroglyphs are only sixty kilometers from the river's mouth, in a ravine where the eastern bank of the river is a rocky formation rising high above the flowing water. Today this is Chukchi country and it may well have been so three millennia ago.

I thank Mr. Dikov for having sent me his writings about the petroglyphs and the pictures. The map was made by my cartographer, Jean Tremblay.

12. The Fool's Mushroom

In Magyar there is a phrase that circulates (in translation) in Southern Europe to this day, a conversational cliché, *bolond gomba*, 'fool's mushroom', as when one asks of a person behaving foolishly, 'Have you eaten of the fool's mushroom?', or when one rejects a proposition by saying, 'Do you think I have eaten of the fool's mushroom, that I should do such a thing?', or again, 'He is laughing as though he had eaten the fool's mushroom.' In Hungary the 'wise-woman', *javas asszony*, is said to use this same mushroom in love philtres, and the angry lover sends the philtre to the object of his passion. At our request considerable effort has been expended in Hungary to find out whether the peasants in any region of that country identify the *bolond gomba* with a particular species, with no success. But did the inquirers reach out to include the 'wise women'? They would be the last to lose this knowledge, though they would perhaps be reluctant witnesses.

Fig. 12. Map of the Chukotka region and chart of mushroom shapes.

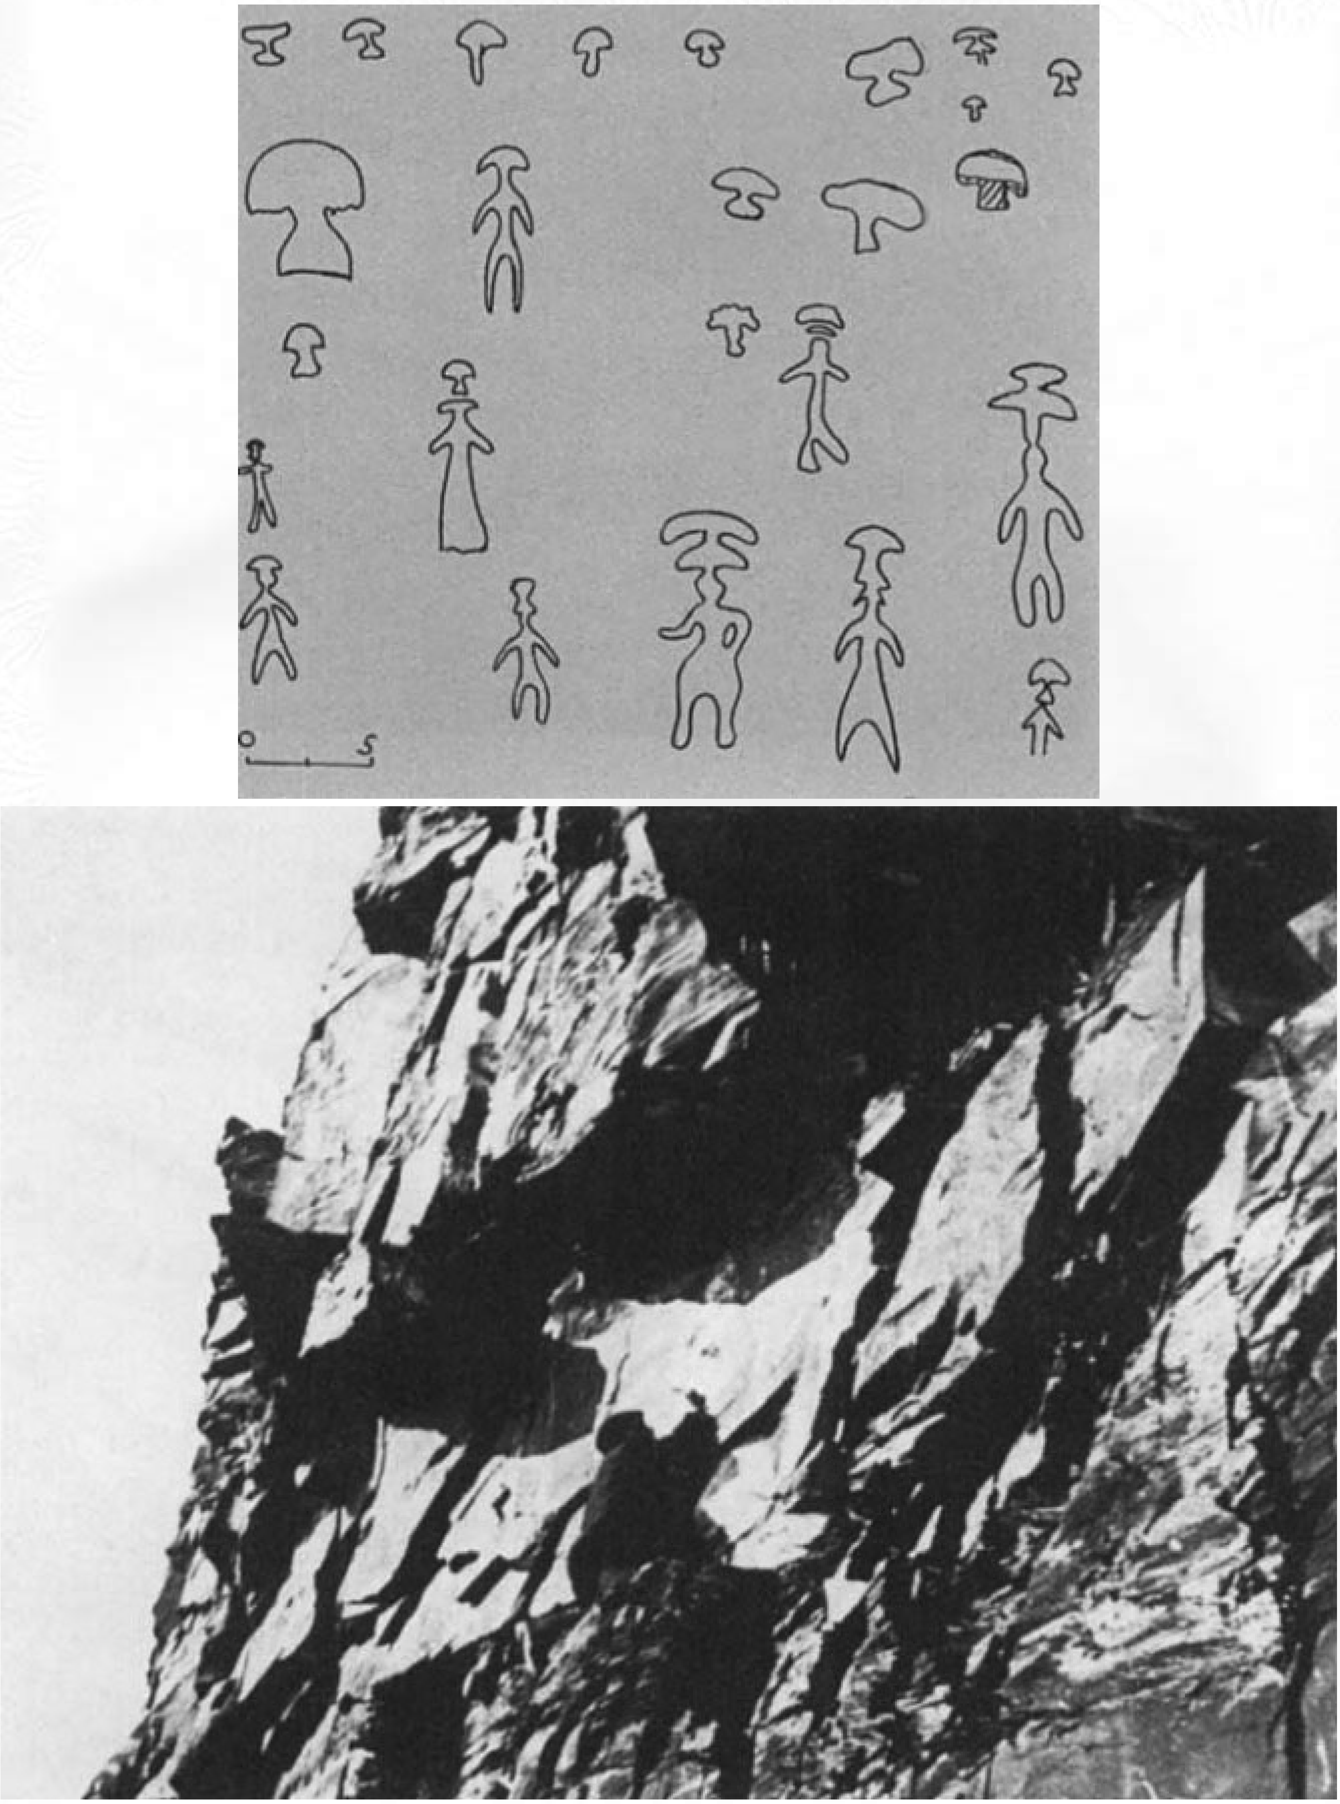

Fig. 13. N. N. Dikov, copying petroglyphs and view of mushroom carvings.

Our sacred mushroom's peculiar virtue was widely known though its identity was perhaps intentionally lost. In Yugoslavia one still says, *Najeo se ljutih gljiva*, 'He has eaten enough of the fool's mushroom'. In Vienna one may hear, *Er hat verrückte Schwammerl gegessen*, 'He has eaten the mad mushroom', though having no particular mushroom in mind... How faint are these dying echoes of the Soma of the Aryans and of the *kakuljá hurakan* of the *Popol Vuh* in the Quiche Maya country!

In the spring and again in the summer of 1967 I visited Dr. János Gulya in Budapest, to consult with him in the field where he is the master, the Finno-Ugrian languages, and especially the Ugrian cluster - Magyar, Khanty, and Mansi. Out of his knowledge of these, to us, remote languages he drew to my attention a usage in Khanty (spoken in the valley of the Ob) that is relevant to our inquiry. The word *tulpanx*[14] occurs in two Heroic Songs in the Khanty tongue, formerly called Ostyak, in one as part of the hero's name, and in the second, repeatedly in the course of the narrative. Professor Gulya explained that '*tul*-' means 'fool' or 'foolish', *panx* meaning of course the entheogenic mushroom, Soma. This serves to nail down the source of expressions that have circulated in past centuries in many parts of Europe, but whose specific sense has long been up in the air. What we strongly suspected is now confirmed.

John Parkinson in his *Theatricum Botanicum* (1640) speaks of the 'foolish mushroom', but he is leaning on his Continental sources. The 17th century Polish poet Waclaw Potochki warns his readers in the *Unweeded Garden* against a kind of mushroom called *szmer*, lest it render the eater foolish (*szale&cacute;*) 'as from opium'. He was passing on hearsay as no mushroom could be confused with opium. A Slovak informant from the Tatra Mountains tells us that rejected mushrooms are variously called by his people *&zcaron;abaci huby*, 'toad mushrooms' (inedible but harmless fungi?), *hadaci huby* and *hadunke huby*, 'viper mushrooms' (deadly mushrooms?), and *šalené huby*, 'mad mushrooms'. To the east of Slovakia, in the Ukraine, the natives call any wild mushroom that they reject *zhabjachyj hyrb* - 'toad-like mushroom'.

Names of Soma that reflect widespread knowledge of its psychic effects are numerous: in France in the Aude the *mijoulo folho*, around Toulouse the *mujolo folo*, in the Aveyron the *coucourlo fouolo*, in distant Trento *ovolo matto*, 'mad mushroom', and across the border in Cataluña, *oriol foll*, 'mad oriol', *oriol* being the name of

---

14. Journal of the Warburg and Courtauld Institutes V.5:159-197, London. My quotation is from p 163. As a source Wittkower's paper is essential reading.

A. caesarea, a delectable species, and *oriol foll* its evil counterpart. They both belong to the same genus *Amanita* and some people confuse them! In Crete, in modern Greek, we have come across a text that speaks of the 'mad mushroom', *trellomanitaria*, inebriating mushroom, probably Soma.

Almost ten years after my *SOMA* appeared I received a letter from a Catalan, a stranger to me, living in Barcelona, by name Josep Barba Formosa. He informed me that in Catalan the phrase is common, *Está tocat del bolet*, 'He is touched by the mushroom', meaning Soma and used precisely as the phrase is used in Austria, Yugoslavia, and Hungary. He attributes it to the refugees who crossed from France *ca* AD 1300, fleeing from persecution in western and southern France ('Occitania') in the course of the bitter religious war against those we generally call the Cathars or Albigensian heretics.

13. 'Happiness Mushroom'

There is one instance of children's verses in Germany that I am at a loss to explain. Everyone born to German learns these verses and they stay with him throughout life:

Ein Männlein steht in Walde	A manikin stands in the wood
Ganz still und stumm.	Stock-still and mute.
Er hat von lauter Purpur	He has of purple pure
Ein Mäntlein um.	mantle around him.
Sag' wer mag das Männlein sein	Say, who may the manikin be
Das da steht auf einem Bein?	Who stands there on one leg?

Alternative ending:

Sag' wer mag das Männlein sein	Say, who may the manikin be
Das da steht im Wald allein	Who stands there in the wood alone
Mit dem purpur roten Mäntlein?	With the purple red mantle?

Children:

Glückspilz! Fliegenpilz!	Happiness mushroom! Fly-agaric!

By a happy though perhaps a fortuitous chance, the answer posed by this riddle:

Say, who may the manikin be
Who stands there on *one leg*?

is our Soma who stands there *auf einem bein, ekap&amacr;d, hurakan*. History is punctuated by ironies, and how ironical it is that a century and more ago, Max Müller, at a loss about the identity of Soma, and all later Vedists, plunged in problems of remote Sanskrit exegesis and Aryan Indian mythology, could have found the answer to Soma by listening to the children playing around their feet in the German world! As for the children's two answers, 'the first is clear, but the second, - *Fliegenpilz*, 'Fly-fungus' - its meaning is two-fold, - for most listeners it means simply the 'fly-killer', but originally, when Albertus Magnus first named and described it, with a pejorative twist, in the 13th century, the 'fly' may well have meant a psychic force. We have written on this at length in Chap. 13 'The Flies in the Amanita', of *Mushrooms Russia & History*.

Could children have originated these verses? I think not. Only adults would devise them. But what adults, and when, and why? Are the verses old, in what recensions? Are there dialectal variants? How far back do the verses go? The tone of the verses runs counter to European prejudices that date back centuries. Who can elucidate these verses? Am I wrong and did some German folk ingest Soma for its psychic powers, but who and when?

14. The British and the 'Nameless Mushroom

The toad and Soma seem to be associated together from earliest times. In China Soma is called the *hama jun*, 'toad-mushroom'. In France there is a dialectal name, *crapaudin*, based on the name of the toad, but which also is Soma. The English 'toadstool' I think originally designated Soma, but the mushroom labored under such fearsome ignominy that the name came to be withdrawn from specific use and to be applied to the whole world of wild mushrooms, and since the English are mycophobes, this satisfied and reenforced their prejudice. Perhaps the most common mushroom and certainly handsomest is without a name - a shameful situation - that makes discussion of the plant difficult for those who do not know its Linnean name. I think I am the first to call attention to this tabu that leaves Soma without a name in English, and certainly the first to suggest that we call it 'Soma1 out of respect for what it has represented for the human race, in the Old World and the New.

15. The Vikings and Soma

Samuel Ödman in 1784 first propounded the notion that the Berserkers' ragings were initiated by Soma. He had not the slightest evidence to substantiate this and none has been produced since then. According to his notion, Soma inebriation was simply a mightier alcohol, and since the north Europeans regardless of class were and are addicted to alcohol and obsessed with it, this explanation of the Berserk raging needed no study: it won the day almost without a fight. In my *SOMA* I demolished this yarn and I now reiterate my position. There is not a shred of historical evidence that the 'rages' were provoked by Soma. Nowhere in the Soma world, neither in the New nor the Old World, is there support for the notion that it made warriors better fighters. On the contrary, the evidence shows that it is a pacifying agent. Soma may have been consumed, and I think it was, by those who lived in Scandinavia, but this was two or three thousand years earlier: *vide* Reid W. Kaplan, 'The Sacred Mushroom in Scandinavia', *Man* (N.S.) 10.72-79. We know not who they were nor what language they spoke. Ödman must have been a mycophobe - all his compatriots were - and he knew nothing about mushrooms.

16. The Tree of the Knowledge of Good and Evil

I once said that there was no mushroom in the Bible. I was wrong. It plays a hidden role (that is, hidden from us until now) and a major one, in what is the best known episode in the Old Testament, the Garden of Eden story and what happened to Adam and Eve.

I suppose that few at first, or perhaps none, will agree with me. To propose a novel reading of this celebrated story is a daring thing: it is exhilarating and intimidating. I am confident, ready for the storm.

I hold that the fruit of the Tree of the Knowledge of Good and Evil was Soma, was the *kakuljá*, was *Amanita muscaria*, was the Nameless Mushroom of the English-speaking people. The Tree was probably a conifer, in Mesopotamia. The serpent, being underground, was the faithful attendant on the fruit. (See my *SOMA*, p 214) Please read the Biblical story in the light of all I have written on the awe and reverence that *A. muscaria* evokes, and how the knowing ones speak of it only when alone together, preferably by night. Gradually it will dawn on you that the 'fruit' can be no other than Soma. Everyone mentions the tree but its fruit is nameless. There were two trees in the Bible story, the Tree of the Knowledge of Good and Evil, whose fruit Adam and Eve were forbidden to eat, and the Tree of Life. Adam and Eve ate of the fruit of the Tree of the Knowledge of Good and Evil, but they were expelled from the Garden to prevent them from eating of the Tree of Life, which would have conferred immortality on them.

Now please read the following text, from the American revision made from the 1611 version, revised by the American Revision Committee in 1881-1885 and again in 1901. I give only the passages that are pertinent for our purpose. I quote from *Genesis*, Chapters 2 and 3.

> Chap. 2.9.: And out of the ground made Jehovah God to grow every tree that is pleasant to the sight, and good for food; the tree of life also in the midst of the garden, and the tree of the knowledge of good and evil. ... 16. And Jehovah God commanded the man, saying, of every tree in the garden thou mayest freely eat; 17. but of the tree of knowledge of good and evil, thou shah

> not eat of it, for in the day that thou eatest thereof thou shall surely die. ... 25. And they were both naked, the man and wife, and were not ashamed.
>
> Chap. 3.1-13: Now the serpent was more subtle than any beast of the field which Jehovah God had made. And he said unto the woman, Yea, hath God said, Ye shall not eat of any tree of the garden. And the woman said unto the serpent, Of the fruit of the trees of the garden we may eat: but of the fruit of the tree which is in the midst of the garden, God hath said, Ye shall not eat of it, neither shall ye touch it, lest ye die. And the serpent said unto the woman, Ye shall not surely die: for God doth know that in the day ye eat thereof, then your eyes shall be opened, and ye shall be as God, knowing good and evil. And when the woman saw that the tree was good for food, and that it was a delight to the eyes, and that the tree was to be desired to make one wise, she took of the fruit thereof, and did eat: and she gave also unto her husband with her, and he did eat. And the eyes of them both were opened, and they knew that they were naked; and they sewed fig-leaves together, and made themselves aprons. And they heard the voice of Jehovah God walking in the garden in the cool of the day: and the man and his wife hid themselves from the presence of Jehovah God amongst the trees of the garden.
>
> And Jehovah God called unto the man, and said unto him, Where art thou? And he said, I heard thy voice in the garden, and I was afraid, because I was naked; and I hid myself. And he said, Who told thee that thou wast naked? Hast thou eaten of the tree, whereof I commanded thee that thou shouldest not eat? And the man said, The woman whom thou gavest to be with me, she gave me of the tree, and I did eat. And Jehovah God said unto the woman, What is this thou hast done? And the woman said, The serpent beguiled me, and I did eat.

Therefore Jehovah God inflicted the penalties for their disobedience: on the serpent, he was to go for evermore on his belly; on Eve, she would suffer the pangs of childbirth; on Adam, he would undergo a lifetime of drudgery. We continue quoting from the text.

> Chap. 3.22-24: And Jehovah God said, Behold, the man is become as one of us, to know good and evil; and now, lest he put forth his hand, and take also of the tree of life, and eat, and live for ever - therefore Jehovah God sent him forth from the garden of Eden, to till the ground from whence he was taken. So he drove out the man; and he placed at the east of the garden of Eden the Cherubim, and the flame of a sword which turned every way, to keep the way of the tree of life.

Adam and Eve became self-conscious from eating the 'fruit' and wove fig leaves into aprons to cover themselves from each other and from Jehovah God. The story carries the mystical resonance of the early days, in Mesopotamia, where grew cedars and other conifers.

Some months ago I read the Garden of Eden tale once more, after not having thought of it since childhood. I read it as one who now knew the entheogens. Right away it came over me that the Tree of Knowledge was the tree that has been revered by many tribes of Early Man in Eurasia precisely because there grows under it the mushroom, splendid to look upon, that supplies the entheogenic food to which Early Man attributed miraculous powers. He who composed the tale for us in *Genesis* was clearly steeped in the lore of this entheogen: he refrained from identifying the 'fruit': he was writing for the initiates who would recognize what he was speaking about. I was an initiate. Strangers and also the unworthy would remain in the dark. Adam and Eve had eaten the 'fruit', being led to do so by the serpent, the faithful attendant on the 'fruit', what the mycologists call *Amanita muscaria*, what the initiates call by a variety of euphemisms, which change from time to time, and we have seen to what strange lengths the uninitiated go when these euphemisms are detached from the 'fruit' that they represent. The priestly redactor who set down the *Genesis* tale, an initiate and a believer, attributed to the 'fruit' the gift of self-consciousness, a remarkable observation because self-consciousness is one of the major traits that distinguish humankind from all other creatures. Is it not surprising that the composer of the story gave credit for this particular gift to our mushroom? It is unlikely that he was alone in doing so.

*

In various places of Eurasia where Early Man has been discovered revering a 'Tree of Life', he is fixing his attention on trees that harbor a mycorrhizal relationship with *Amanita muscaria*, the entheogenic mushroom. The Genesis story introduces an elaboration on this theme. The 'Tree of Life' in it confers on those who eat of it immortality, and Jehovah God, lest Adam and Eve eating of it become his equal, expels them from the Garden. Not surprisingly, no one has ever seen this 'Tree of Life'. But a 'Tree of the Knowledge of Good and Evil' is also introduced and the serpent gave of its fruit to Eve. This was the tree that is usually called the 'Tree of Life'. That Adam and Eve had eaten of its 'fruit' became clear when Jehovah God perceived the change in their behavior: they had acquired self-consciousness, which distinguishes mankind from all other creatures. Being naked in each other's presence and in Jehovah God's, they were embarrassed. They gave themselves away and confessed. They may have become aware of their nakedness, but their self-consciousness was key to far more than that.

Valentina Pavlovna and I were the first to become familiar with the entheogens and their historical role in our society. My discovery of the meaning of the Adam and Eve story came as a stunning surprise. That meaning was obvious. The larch of the Nivkhi (pp 60-62) is the Tree of Knowledge, and there are many species of tree that serve as host to *A. muscaria*. The tree is revered but only because it harbors the entheogen that grows at its base, and the entheogen is far too sacred to mention commonly, and in mixed company.

When my wife and I discovered the magnitude of what was revealed to us, what were we to do? We were profoundly grateful to our Indian friends for having given us their confidence. But, with the swift and thorough expansion of European culture, the few remaining islands of traditional entheogenic use will vanish. Valentina Pavlovna and I resolved to do what we could to treat our subject worthily, devoting our lives to studying it and reporting on it.

EPILOGUE: The Age of the Entheogens

My prime candidate for the earliest religion in the world is the cult that became known to us, much much later, as the cult of Soma. In our woodlands, Soma is one of the commonest of mushrooms, growing wherever conifers and birches grow, as well as with certain other trees. Soma is found also in the Tropics, at an elevation in the forested mountains. In the tundra of the north, it has been reported as living with dwarf birches. Soma is breathtaking in its beauty, both at a distance and close up, and it is fortunately not to be confused with any other mushroom. Soma is the supreme mushroom, and while all mushrooms seem mysterious, Soma is the most mysterious of all. Before mankind existed, our bestial ancestors must have known it: gathering herbs for food, they would have tried it and found it good, and they must have seen other herbivorous fellow creatures do likewise.

At the point in his evolutionary progress where we first call him 'Man' beyond a doubt - *Homo sapiens sapiens* - and when he came to know, also beyond a doubt, what awe and reverence were, he clearly felt that Soma was conferring on him mysterious sensations and powers, which seemed to him more than normal: at that point Religion was born, Religion pure and simple, free of Theology, free of Dogmatics, expressing itself in awe and reverence and in lowered voices, mostly at night, when people would gather together to consume the Sacred Element. The first entheogenic experience could have been the first, and an authentic, perhaps the only authentic miracle. This was the beginning of the Age of the Entheogens, long, long ago.

A little later, someone, perhaps an inspired poet, made the suggestion that the miraculous plant, clothed in radiant raiment, was the fruit of the coitus of the lightning strike in the moist mother earth, and the suggestion was welcomed and adopted by the neighbors, by all the users of the plant, and thereafter spread by descent, by parents to children, a gladly accepted dogma, the first Dogma. From early times there was a subsidiary belief: just as the lightningbolt hit mother earth with a single shaft, it gave rise to offspring with a single leg, not a plant because it had no seed, but a unique creature with a single leg or 'stipe1 and with its radiant raiment, a spark of its almighty father. These beliefs still exist, in their pristine shape in areas where mankind is still far behind the times, and moribund among peasants who are not caught up with their own leaders. These beliefs are very old, antedating the settlement of America from Asia by millennia. They survive out of habit, demonstrating to us how slowly cultures used to change in our previous incarnation.

In prehistory, running back to paleolithic times, many tombs have been found over most of the Eurasian continent, in which the skeletons are covered with red ochre. A plausible explanation is that the cadavers were given ochre burials to express the fervent hope that Soma, the divine mushrooms of immortality, would keep the departed one in their good care. In China, in documents that tell of very old events, there is occasional mention that cadavers are covered with 'leaves'. Western readers are not apt to remember that 'leaves' have in Chinese the additional meaning of *pilei* of mushrooms. Is not this the meaning in those old documents? Any contemporary Chinese would grasp the meaning. Were they the *pilei* of *A. muscaria*?

★

Some Vedic scholars have raised a ballyhoo because we have declared Soma to have been the white-spotted scarlet mushroom. The Aryans were only one of many peoples, scattered world-wide, to have revered Soma, and they enjoy the unique distinction of having developed a cult and a culture surpassing all others in that period for richness and subtlety, a truly memorable religion that we can only admire and study thousands of years later, the flowering of a people not yet possessing an alphabet, who left to posterity a collection of hymns in their tongue - Sanskrit - a tongue that we are proud to say is a collateral ancestor of our European dialects. What an incredible achievement!

When Valentina Pavlovna and I, in August of 1927, started out on our pilgrimage in the Catskills, little did we dream that it would transport us so far. All *Rig Veda* scholars knew much about the *Rig Veda*, but things irrelevant for our purpose, and so when it comes to *A. muscaria*, they must admit that their ignorance is total. They denounce our *SOMA* as 'outrageous' and of course cite Brough's review article in the *BSOAS*. They know the tenor of his argument and did not even need to read it, accepting it enthusiastically on Brough's great authority. I have yet to meet any Vedist who has read it carefully. To approach the subject, one had to know what we now call the entheogens, and I can testify personally that Brough's knowledge of them was nil.

Does 'toadstool' date from before Christianity came to us, and did not 'toad' carry an endearing flavor to our remote ancestors, as it does still in China, and also in the remote areas of Lithuania - the Lithuanians being the last people in Europe to convert to Christianity? The prejudice against *A. muscaria* is so powerful that it has led many writers of mushroom manuals, mostly by mycologists, to say it is toxic, and even sometimes to cast anathemas on it - the distant rumblings of ancient religious disputes. Anyone who undertakes to study soberly its properties is inviting disaster to his career - a strange aberration in the scientific realm, really derived in all likelihood from the religious world.

★

A prodigious expansion in Man's memory must have been the gift that differentiated mankind from his predecessors, and I surmise that this expansion in memory led to a simultaneous growth in the gift of language, these two powers generating in man that self-consciousness which is the third of the triune traits that alone make man unique. Those three gifts - memory, language, and self-consciousness - so interlock that they seem inseparable, the aspects of a quality that permitted us to achieve all the wonders we now know. With our computers we seem ben t on dispensing with human memory as we have known it in prehistory, and even in the modest degree that our parents knew it. I am asking myself whether Soma could have possessed the power to spark what I have called these triune traits.

Rodney Needham of All Souls, Oxford, in 1980 has posed, in an elegant essay *Reconnaissances*, published elegantly by the University of Toronto Press, a problem that bears directly on our work. He draws attention to the wide dissemination of the 'Unilateral Figures' that are scattered around the world, from the Eskimos of the extreme North to the Yamaha of Tierra del Fuego, from the Nahua of Mexico to the folklore of Greece and Romania. He has dealt with a surprising number of instances, far more than I have cited. We reproduce his illustration of a 'Unilateral Figure' taken from Vladimir Bogoraz' opus on the Chukchi published at the turn of this century by the American Museum of Natural History. But Needham never mentions what we call the entheogens nor the supreme entheogen, Soma. If the cultures where Needham finds 'unilateral figures' there was knowledge of the entheogens, here then will be proof that this ancient religion has existed even more widely than I thought: I will be less surprised than overjoyed.

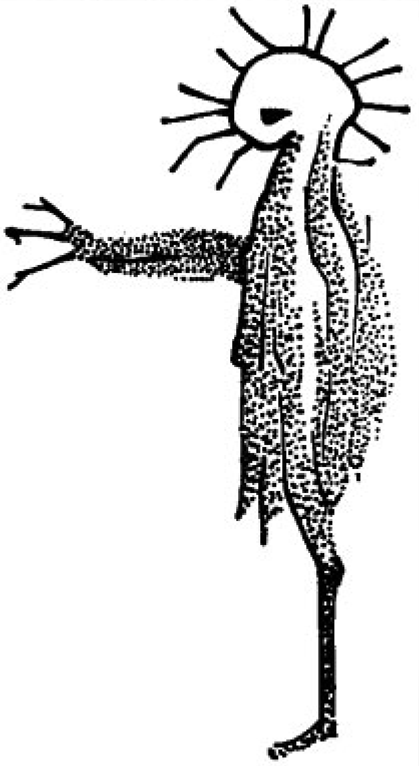

Fig. 14. One-sided man, or 'unilateral figure', or 'halfling': from monograph on the Chukchi by Vladimir Bogoraz, published by American Museum of Natural History in various editions at turn of the century. His 'one-sided man' was republished by Rodney Needham.

After their long and important history, Soma and the other entheogens have disappeared almost without a trace. How odd! The Divinity Schools seem not to know that they exist. Anthropologists have long had contact with them but have not specialized in their study.

Unfinished Business

One quasi-divinity or malign spirit in our world has been Satan. He also is a cripple, either a club- or a splay-foot is his deformity. In Old French Satan was often called simply *le bot*, now-a-days usually heard in the form *pied bot*, 'club foot'. *Le bot* served also for 'toad' and 'a mushroom'! Mark you, 'a mushroom'. Not any mushroom. Was the French lexicographer unsure of the species, or did he possess no name for it, or was he inhibited by the same tabu that the English and most other West Europeans felt and feel, and so he refrained from saying it was what the French today call *le crapaudin*, or '*la fausse oronge*', as well as '*le tue-mouche*', and what we call Soma? How odd it would be if here we come, once more, upon One-Leg: *ekap&amacr;d*, *hurakan*, *auf einem Bein*, in our familiar Satan! If so, when and how did he inherit (or usurp) this most ancient honor (or stigma)? Must we entertain the notion that by a prodigious feat of prestidigitation, acting true to character, he arrogated to himself the attributes of the Almighty Lightningbolt?

This may be only an aberrant idea of mine, but I think it is worth pursuing: why is Satan a Single-Foot?

CHAPTER TWO

Lightningbolt and Mushroom [1]

by R. Gordon Wasson

The inquirer who turns to Littré to learn about truffles, on reading the entry under *truffe*, comes upon a nugget of curious information that certainly fails to catch his attention. It seems in certain regions of France (presumably there where truffles abound) the country folk in thundery weather are wont to say, *Voilá un ban temps pour les truffes*, 'What fine weather it is for truffles!' Why in thundery weather? Not when it rains, mind you, but when it thunders. Nothing in Littre alerts the reader to the mystery that here lies hidden. The saying of these French rustics seems to be one of the surviving traces in Europe of a belief that reaches back in time deep into prehistory and in space wherever Eurasians or their descendants have lived. It is the end of Ariadne's thread that we propose to follow far and to a far-reaching end.

Pliny the Elder declared that truffles were disposed to grow in the time of autumnal rains, and above all (in the full-bodied Elizabethan translation of Philemon Holland) 'if the aire be troubled and disquieted with many thunders: during that season there will be good store of such Mushromes, etc, especially (I say) if it thunder much':

> *De tuberibus haec traduntur peculiariter: Cum fuerint imbres autumnales, ac tonitrua crebra, tunc nasci, & maxime e tonitribus.* [*Hist. Nat.*, Bk 19:37]

When Philemon Holland around 1600 rendered *tuberibus*, 'truffles', by 'mushromes', the word 'truffle' and the plant it represents were as yet unknown to the English-speaking world.

Juvenal wrote of the longed-for thunder in springtime [*sic*] that replenishes the table with truffles:

> *Post hunc tradentur tubera, si ver tunc erit et facient optata tonitrua cenas maiores.* [*Satire V*: 116-118]

Strange: Juvenal speaks of tables laden with truffles in springtime, associated in men's minds as this season is with frequent thunderstorms. But in Italy truffles come in the fall and early winter until February. What was Juvenal thinking of? Was he conforming to a popular belief at the cost of doing violence to nature? Pliny had spoken of autumnal thunder-showers, adhering to the right season.

The *tuber* was an underground fungus, apparently embracing all species of both truffles and the genus *Terfezia*. The many species of *Terfezia* are often confused by travelers in the Mediterranean and Near East with truffles, but *Terfezia* and truffles, though both of course fungi, belong to different families, not merely distinct species. *Terfezia* flourish in the arid areas around the Mediterranean and eastward, and when classic writers refer to the Libyan truffles as especially good, they are speaking of *Terfezia*. In Greek the *tuber* was the *hydnon*, and Plutarch, in an essay now virtually forgotten, asked why people said thunder made the *hydnon* to grow. He asked why, not whether, the thunder made them grow, apparently accepting the fact, and he found no sure answer.[2] There was an underground fungus that the ancient Greeks called the 'lightningbolt' - *keraunion* - was it an alternative name for the *hydnon*? In Thrace *keraunion* was called the *oiton*: this word is a dialectal variant of *hydnon* and the mushroom presumably the same. Athenæus, writing in the third century after Christ, quotes Theophrastus five centuries earlier on these Thracian fungi:

> Concerning these a singular fact is related, *viz*, that they grow when autumn rains come with severe thunderstorms; the more thundering there is, the more they grow, the presumption being

---

1. In 1956 I published 'Lightningbolt and Mushrooms: An Essay in Early Cultural Exploration' in a Festschrift: *For Roman Jakobson* (Mouton, The Hague) on his 60th birthday. It was my first paper on ethnomycology, a discipline that I founded. Here is that same paper, revised, reworked and shortened.
2. Plutarch's *Moralia*, *Table-talk* IV, Question 2. Loeb Classical Translations, Vol VII, p 316ff.

> that this is the more important cause. [*Deipnosophists*, Loeb translation, Bk 11:62]

(Theophrastus did not make Juvenal's mistake: he adhered to *autumnal* thunderstorms.) In ancient Greece and Rome we have to do with a notion that everyone accepted, a cliché, perhaps a tiresome conversational tag. 'It's not the rain, it's the thunder that makes them grow,' people would say, just as today in summer the New Yorker insists, 'It's not the heat, it's the humidity.' Did the Greeks and Romans arrive at this belief, which for them pertained to underground fungi only, by observing nature? The answer to this question had best be deferred until we have completed our pilgrimage throughout Eurasia and the lands to which in prehistory the Eurasian tribesmen emigrated, to wit, Polynesia and the New World.

This essay on its first appearance in 1956 prompted our friend Georges Becker, gifted *savant* and humanist of the countryside of eastern France, to recall an ancient belief surviving in and around his native village of Lougres: the people there hold that *Boletus satanas* and *Boletus luridus*, as well as those other species of mushrooms that turn blue on breaking, grow where lightning has struck, around isolated trees in meadows. Furthermore, he had a friend, an aged countryman, who often gave utterance, in the patois of Lougres, to an old saw:

> *Lou mâ temps, c'â lou bon temps des craipâs et pe des tchampégnôs*. (*L'orage, c'est le bon temps pour les crapauds et les champignons*.) (Thunderstorms are good weather for toads and mushrooms.)

The saying hides a pun: in the local dialect *mâ temps* means both 'bad weather' and 'thunderstorm' and therefore what is 'bad weather' for human beings is 'good weather' for toads and mushrooms.

The Piedmont in Italy is preeminent in that country for mycophilia, and immense quantities of fungi are marketed there and consumed. The towns of Alba and Cuneo are especially noted for their 'white truffles' (*tartufi bianchi*), *Tuber magnatum*. The reader will recall the classic tradition that links thunder with truffles. But in the Piedmont, strange to say, the 'thunder-mushroom', *trun*, (in Piemontese, 'thunder') is not the *tartufo bianco*. It is any market *Lactarius*, the common species being *L. sanguifluus* and *L. deliciosus*.

Among the English I have not yet found any trace of the ancient belief in a tie between mushrooms and thunder, but there is one quotation on the subject that should be carefully read. On 2,2. February 1774 Sir Alexander Dick, a retired physician, wrote to James Boswell a letter from which I will extract one sentence:[3]

> While I was at London, I alwise found plenty of Mushrooms at Covent Garden, good & reasonable during the Summer Season - this was the year 1760 and made Dr. Armstrong, quite of my opinion, who partook frequently of my Mushroom breakfasts - and *as Mushrooms often arise from Lightning, when they came well dressed to table we used to stile them Ambrosia*...

I have italicized the ending. I feel fairly confident that this reference to mushrooms and lightning goes back to ancient Greece and Rome, rather than the Anglo-Saxons or ancient Britons. Dick was the educated 18th century Englishman, thoroughly grounded in the classics. Mushrooms in his mind were linked to lightning and ambrosia was also; whence the playful association of mushrooms and ambrosia.

From our citations we see that the linking of thunder with mushrooms is not with *all* mushrooms but only with this kind or that, and the kind changes according to the region. In the temperate zone thunder is associated primarily with spring and early summer, but truffles are a product of the fall and early winter. Of course thunder *in spring* might produce truffles *in fall*, but no where in the classic sources is such a sophisticated idea hinted at. (Later we shall see that this very belief is actually entertained by the Bedouin of the Arabian desert.) While thunderstorms of course occur at all seasons, even in mid-winter, is it not odd that in classical times people sometimes linked springtime thunder and truffles? This bad fit in the popular belief must have been what led Juvenal and a few late writers to assert that the best truffles, contrary to fact, come in the spring. For example, Franciscus Marius Grapaldus in his *De Partibus Aedium*, *ca* 1492.:

---

[3] By courtesy of the Editorial Committee of the Yale Editions of the Private Papers of James Boswell, New Haven, Conn.

> ... But truffles (= *tubera*) the pigs root out of the earth with their snouts. Truffles are surrounded on all sides by earth, without roots, neither thickly growing in [one] place nor cracking out among the dry and sandy thickets. [They] are to be called certainly nothing other than flesh of the earth. *Best at spring and more often during thunder, they are said to arouse dying love*. [Book II Chap. 3, italics mine.]

Grapaldus was forcing nature into the Procrustean bed of Juvenal's text and the popular belief.

The Germanic world yields us one pleasant citation associating mushrooms with thunderstorms. The Rev. Robert B. Reeves, Jr., Chaplain of the Presbyterian Hospital in New York, wrote me 9 March 1960 these words:

> In Harrisburg, Pa., where I lived from 1915 to 1923, my mother employed a Mrs. Tetzer, who was 'Pennsylvania Dutch', to bake Christmas cookies and help with the fall and spring housecleaning. She was full of country lore and would hold us children in fascination around the kitchen table or the stove, talking as she worked. One of the things she told us was that the time to gather mushrooms was after thunderstorms; that we should watch for the lightning, notice carefully where it struck, for wherever the lightning entered the ground mushrooms would spring up. These were the only kind that were fit to eat. The others, that grew without benefit of lightning, were toadstools and poisonous.

The Pennsylvania Dutch are descended largely from pioneers who hailed from the Palatinate. I have had no opportunity to take soundings there.

Many Polish and Czech friends of the recent emigration speak of a folk belief in their countries tying the growth of mushrooms to thunderstorms, but I have yet to find an informant who can pin down these beliefs in specific fashion. Similarly Ivan Sechanov, the Bulgarian mycologist specializing in the higher fungi, writes me that the Bulgarians link mushrooms with lightning, 'especially *Morchella* spp. and some others.' Probably field work in the west Slavic countries and in Bulgaria would yield more evidence than I present here.

The Great Russians, who know by cultural inheritance incomparably more about mushrooms than the classical writers did, call a particular kind of rain *gribnoj dozhd*', 'mushroom rain'. Mushrooms, they say, come after a warm and steady and gentle rain, emphatically not the quick, violent, driving rain that we associate with thunderstorms. This 'mushroom rain' of the Russians leads to the growth of all kinds of mushrooms proper to the season, and mycologists agree with the Russians. For the Russians *gribnoj dozhd*' is a term used often to describe a particular kind of rain, even when mushrooms are not under discussion.

Roman Jakobson has drawn my attention to an obscure book by S. V. Maximov entitled *Lesnaya Glush*', 'The Backwoods', published in St. Petersburg in 1909, in which the author dwells lovingly on the customs and beliefs that survived in the remote and impoverished village of Parfentief, some 300 miles northeast of Moscow. The villagers there were much given to mushroom-gathering and every year with the spring thaw an ancient of the village, Ivan Mikheich, would celebrate the event with a feast of morels. At that banquet without fail the host would explain, as a prelude, that the morel was good to eat only before the first thunder of spring. Thereafter, according to him, a snake would inject venom into the mushroom and cause it to rot and disappear. Only three times in his life had he heard thunder before trying out the fresh morels.... In the story of Ivan Mikheich the two essential elements are present, the thunder and a kind of mushroom. But here in the East Slavic world, far distant in time and space, our episode takes on a reverse twist. The morel is of course a springtime mushroom and thereby Ivan Mikheich avoided the uncomfortable discrepancy of Juvenal and Grapaldus. But with him the role of the thunder, while it is still vital, is unfavorable to the fungi. It casts an evil spell on them, and works hand in glove with the serpent, who now enters the scene for the first time.

The late Professor Georg Morgenstierne of Oslo has pointed out to me how widespread even now is the belief in our myth on the other side of our Indo-European world. He quotes an informant in Persepolis as saying that the *dumbal&amacr;n* are thought to grow in the desert after lightning;[4] *dumbal&amacr;n*, literally 'sheep's fries', is apparently the name given to an underground species of *Terfezia*.

In Tadzhikistan, around Match and in the Yaghnob Valley southeast of Samarkand, Iranian dialects are spoken that come down from the ancient Sogdian language. In those two regions the belief persists that the thunder comes when the sky-borne divinity known as *Mama*, 'Grandmother', shakes out her bloomers, and then from her bloomers lice tumble down to earth, and from the lice springs up a crop of mushrooms.[5] (A similar belief about the genesis of mushrooms from the shaking of old furs is reported from the neighboring Turkic peoples.) At the thunderclap the children around Match cry out: *Puri*, *puri*, *xor&ccaron;*, *puri* being the name of a plant, an annual, whose identity we do not know, and *xor&ccaron;* being the word for the mushroom. There is reason to think *xor&ccaron;* is the specific name of *Pleurotus fossulatus*; if so, *puri* must be a dead umbellifer, its saprophytic host. In the Yaghnob Valley the children's cry is different: *Katta xar&ccaron;ak man, pullja xar&ccaron;ak tau*, which is to say, 'The big mushroom is mine, the little one yours.' How enigmatic and tantalizing are these odd bits of our popular belief discovered in the heart of Asia! Perhaps they will fall into place as our pattern takes shape.

In the east of the Pashto-speaking area of Afghanistan the *zməkəy goša*, 'earth meat,' grows 'with the first roar of thunder accompanied by rain.' This mushroom is certainly a morel, called by the Uzbeks in their Turkic language *qozaqarni*, 'baby lamb's belly,' and they too link its appearance with spring thunder and rain. In Farah, in the southwest, Pashto speakers associate thunder with a mushroom called *gobalakə*, whose identity I do not know but by the description given me think it is *Phellorina* sp. At Bargramatal, a town in the northeast of Afghanistan, in the Hindu Kush where they speak the ancient Katei language, an informant told us of a mushroom, *gokluk*, that he said was produced in spring by thunder. He drew it and his drawing strongly suggested *Coprinus comatus*.[6]

In Kashmir certain edible gilled mushrooms known in Kashmiri as hedur and *h&ecaron;nḍa* are supposed to emerge after thunder, but this belief attaches above all to the morel, called locally *kana-g*^{ü}*ch*, 'ear-mushroom'. The Kashmiri do not go out looking for morels until there has been thunder. They are clear about this, and also that the morels are powerful aphrodisiacs, to be eaten at weddings, if you can afford them. I gathered this information from Kashmiri informants when I was in Srinagar in April 1965. Even more interesting are the verses in the Sanskrit lyric *Meghad&umacr;ta*, 'The Cloud-Messenger', composed c AD 400 by *K&amacr;lid&amacr;sa*. In verse 11 the exiled *yaksha* or demigod addresses the raincloud drifting northward over India: 'When they eagerly hear thy sweet-sounding, fertilizing thunder, which can cover the earth with mushrooms...!' The *thunder* covers the earth with *mushrooms*! In the heart of this mycophobic Hindu people we find an outstanding poet giving voice to the same notion that we find elsewhere. But he does not suggest that the *mushrooms* replenish the tables: for upper caste Hindus, mushrooms are tabu. Here 'mushroom' is *&sacute;il&imacr;ndhra*, a puzzling word of odd aspect that Professor Morgenstierne thinks was probably borrowed from some pre-Sanskrit language of India. From a variant of the poem it is clear that a mushroom with pileus was meant, and one lexicographer says that this mushroom was linked with cow-dung: these hints may point toward *Stropharia cubensis*. The ending *-dhra* could mean 'carrying' and *&sacute;il&imacr;-*, a rare and doubtful word, might mean a worm or a female toad. Such clues, having little weight by themselves, may become clothed with meaning in the context of other evidence. We recall that in India Hindus of the three upper castes are forbidden by their religion to eat mushrooms of any kind.

Now let us look beyond the confines of the Indo-European world.

---

4. *BSOAS*, 1957, XX, p. 453. I take this oppormnity to express my gratitude to Professor Morgenstierne for his help and counsel throughout my inquiries. His specific help mentioned in divers places in this paper does not begin to repay my indebtedness to this great scholar.
5. The Tadzhik and Yaghnob references appear in M. S. Andreev's 'Po Etnografii Tadzhikov,' a contribution in *Tadzhikistan, sbornik statej*, a volume edited by N. L. Korzhenevskij and published in Tashkent (1925), pp 172-3, which we consulted. Heinrich F. J. Junker uses the material in *Arische Forschungen: Yaghnobi-Studien*, I, p. 106 (= *Abhandlungen d. philol.-hist. Klasse d. sächsischen Akademie d. Wissenschaften*, Band XLI, No. 2, Leipzig, 1930.)
6. For the Afghan fungal vocabulary I am indebted to M. Ch. M. Kieffer, the Alsatian specialist in the Afghan languages, for an

invaluable 26 page memorandum prepared on my instigation in March 1965.

In a personal letter to me dated 27 May 1950, Colonel H. R. P. Dickson, author of *The Arab of the Desert* and an outstanding authority on the life of the Bedouin, confirmed that the Bedouin are great lovers of *Terfezia*. He said that in the season of the *wasm* (October to early November) they look for heavy rains accompanied by *thunder and lightning*, and if the weather is propitious then, they know that some months later, in February and March, *Terfezia* will abound, and when the days are fulfilled, then the black-tent folk strike their tents and make their way across the desert to the places where grows the rugrug bush, known to botanists as *Helianthemum lippi*, for the *Terfezia* thrive close by this plant. Then at dawn and dusk, by the horizontal rays of the sun, the women and children and shepherds detect the shadows cast by the slight monticules caused by the swelling underground fungi, and gather them, and every one feasts on them.... There is a metaphorical expression for a fungus found in a dictionary of classical Arabic,

بَنَاتُ الرَّعْد

BAN&Amacr;T^{U}'R-RA'D', 'the Daughters of Thunder', but we are left in the dark as to the species so designated. It might be a name for the *Terfezia* that Dickson speaks of.

In India around Mysore, in Dravidian country, the thunder is said to be linked to the appearance of species of the genus *Phallus*. In the Northeast of India the Santal, an aboriginal tribe living on the western fringes of West Bengal, in eastern Bihar and in northern Orissa, call certain mushrooms *putka*, and the mushrooms so named grow always after thunder: so the Santal tell us. The mushrooms called *putka* are a *Scleroderma*, and also a false putka that is a puffball.

In Tibet by far the most popular mushroom is the *ser sha*, 'yellow flesh'; it is reputed to grow after thunderstorms. Despite our strenuous efforts we have failed to obtain a specimen of this mushroom and it remains unidentified. A painting of this mushroom in the Kew mycological collection was repudiated emphatically by my Tibetan friends in India.

Now let us turn to the Chinese. There came into my possession in 1951 a copy of a handwritten work in eight volumes on ethnomycology entitled in Japanese *The History of Mushrooms*, dated 1811 and composed by Karashi Masujima, who wrote under the pen names of Ranen, 'orchid garden', and Gushá, 'the fool.' (In choosing his field of research he preceded the Wassons by a century and a half!) He was a Japanese scholar teaching in Yedo at the school for samurai called Shoheiko. In this book are discussions of three kinds of Chinese mushrooms linked with thunder by the people of Suzhou and the Province of Juangzhou:

雷驚蕈	雷聲菌	雷菌
leijing xun	*leisheng jun*	*lei jun*
Thunder-aroused Mushroom	Thunderbolt Mushroom	Thunder Mushroom

The description of these mushrooms is insufficient for identification, but they all grow above ground. The three names may be variants for a single species. There is no reason to suppose that the thunder myth was confined to Suzhou and Juangzhou Province. When I was in Taiwan and Hong Kong in 1964-1966 the thunder association was commonly attributed to species of *Termitomyces*, a delectable table mushroom. The late Professor Roger Heim, the famous French mycologist and a gastronome, ranked them first among the edible mushrooms of the world. In the Philippines the mycologist José Miguel Mendoza reports in his *Philippine Mushrooms*[7] the common native belief throughout the islands that thunder and lightning cause the generation of mushrooms, and in the spring of the year, when people hear the thunder roll, they rush into the fields to gather the edible kinds. In the Pampango tongue, spoken in central Luzon, *Termitomyces albuminosus* (Berk.) Heim (formerly *Collybia albuminosa*) is called *payungpayungan kulog*, where the first element means 'parasol-like' and *kulog* is the word for thunder in both Tagalog and Pampango. This undoubtedly reflects the native

[7] Published in *The Philippine Journal of Science*, LXV, Jan.-April 1938.

belief to which Mendoza refers. I am told that the same association with thunder exists in Kyushu and the Ryu Kyu islands. The termites build their nests there and the farmers rate the termite-mushrooms highly. These offshore manifestations might easily mark the spread of a Chinese concept.

The thunder association of particular species of mushrooms runs all through the mycological writings of the Chinese. It seems to be more prevalent there than anywhere else. The sclerotia of *Omphalia lapidescens* Berk., which grow in Southern China as pellets of little balls on the roots of bamboo trees, are called 'thunder-balls' 雷丸, *lei wan* in Chinese or *raigan* in Japanese, and they were esteemed in Chinese medicine. The knowing-ones must have believed them to be aphrodisiacs. These balls were so highly regarded that the Japanese emperor Sh&omacr;mu in the middle of the 8th century, when he and later his widow K&omacr;my&omacr; created the Sh&omacr;s&omacr;in Temple in Nara, depositing in it all the treasures that he most prized, included in the collection some of these sclerotia.[8] At that time the Japanese Court was under strong Chinese influence and the 'thunderballs' had probably been imported from Southern China. In China the famous *ling zhi* 靈芝 'divine mushroom of immortality', has occasionally been called the *lei zhi* 雷芝, 'thunder zhi'.[9] In that idyllic text, *The Mushrooms of Wu*, 吳蕈譜 *Wuxun pu* written by Wu Lin 吳林 shortly after 1662 and published in 1703, in which the author dilates with love on the rich mushroom life of the countryside around his native village of Wu, the beneficial effect of thunder on certain mushrooms figures conspicuously. Let it be noted that in China, as well as elsewhere, the role of thunder always applies to particular species, never to the fungal world as a whole.

Now we shall shift the scene to Madagascar, where the indigenous cultures are dominantly Malayo-Indonesian, Professor Heim has reported an extraordinary practice of the Tanala people there.[10] They dry and convert to powder the giant sclerotium (known to mycologists as *Pachyma cocos*) of the mushroom *Lentinus tuber regium* Fries, on which the Tanala people bestow the name *olatafa*. Then when a thunderstorm of fearful violence breaks, the natives quickly put some of the powder moistened with water into their mouths, and as the lightningbolt streaks by, they spit forth the fungal paste into the teeth of the storm crying *Fotaka*! or else *Fotaka malemy*!, which is to say, 'Earth!' or 'Soft Earth!' The word *olatafa* appears to be related to *tafa*, meaning 'unbalanced' - a startling association of ideas, as we shall soon see. Professor Heim goes on to say that neighbors of the Tanala people in Madagascar - the Betsimisarakas, the Antimoros, and the Tsimihety - also make use of the *Lentinus tuber regium* to protect themselves against the fury of lightning, but they merely spread around them, on the ground, the dried powder of the sclerotium at the moment when the thunderstorm develops a frightening intensity. These three peoples like the Tanala speak languages of the Malayo-Indonesian family. Recent linguistic studies have indicated that they broke away from their kin in Southeast Asia before the Hindu influence made itself fully felt there, certainly before the 4th century AD,[11] perhaps much earlier.

The Maoris of New Zealand, pure Polynesians, possess the thunder link with mushrooms. In the Maori language *whatitri* means 'thunder'. *Whatitiri* is a female ancestor of the Maori race. Her son (or grandson) Tawhiki was linked with lightning, which flashed from his armpits. In 1963, when I was in New Zealand, Kiri Maniapoto, a Maori woman of Rotorua, told me (and I paraphrase what she said) that when it thunders, the Spirits are defecating, and the turd falling to earth is the *tutae whatitiri*, the fungus ball that quickly expands into the strange, the astonishing, net- or basket-fungus common in New Zealand and called by mycologists the *Clathrus cibarius* (Tul.) Fischer. *Tutae* means 'faeces'.

---

[8] At the end of the second World War in the wake of the Japanese defeat these treasures were opened for inspection, and a few of the 'thunder-balls' were shown to a leading Japanese mycologist, Yoshio Kobayashi, on the staff of the Ueno National Science Museum. He confirmed their identity, twelve centuries after they had been deposited.

[9] The Chinese *ling zhi* has been identified as *Ganoderma lucidum* by two Japanese mycologists, Iwao Hino in 1937 and Rokuya Imazeki in 1939. See *Transactions* of the Asiatic Soc. of Japan, 3rd series Vol. 11, 'Mushrooms and Japanese Culture', by R. G. Wasson, p 10; 'Japanese Mushroom Names', by Rokuya Imazeki, p. 40.

★

In the course of my inquiries I have found only one chlorophyll-bearing plant linked to thunder or lightning: the mistletoe, - like the mushrooms, linked with religion.

My survey of the evidence is certainly not exhaustive. It comprises the documentation gathered intermittently by one man over a few decades. There must be many variants that I have missed. I have dealt only with the peoples of Eurasia and their offspring, the Polynesians. In black Africa I have taken soundings among the Baganda of Uganda, the Ibo and Hausa, and Fulani (= Peul) peoples. The results were wholly negative. If this prove true of all the peoples of black Africa, it would localize the origin of the myth in Eurasia. The Kumá people in the Wahgi Valley in the center of New Guinea know nothing of a fungus-thunder tie, though their empirical knowledge of the higher fungi is impressive.

An intelligent observer in Eurasia familiar only with the folk beliefs of his own area might naturally conclude that the local notion linking thunder with a particular species of mushroom derived from a subtle observation of nature on the part of his countrymen. But faced with the diversity of beliefs in various parts of the Eurasian world, he would have to pause and admit that the natural causes must be remote and involved. He would observe that except in two or three places such as Madagascar and the Maoris of New Zealand, the survivals are mere verbal fossils: nothing is left of them save a phrase repeated out of habit, thoughtlessly.

Our survey of the fossilized myth shows that in different regions it is linked with species of some fifteen genera:

Boletus
Clathrus
Coprinus
Lactarius
Lentinus
Morchella

Omphalia
Phallus
Phellorina
Pleurotus
Terfezia
Termitomyces

Tuber (This includes the black truffle of Périgord and the truffle esteemed by the Romans, perhaps the *tartufo bianco* of contemporary Italy.)

Scleroderma
Lycoperdon
{ thunder-engendered mushrooms called *putka* among the Santal of India

and the genus represented by the unidentified Tibetan *ser sha*. The species include inedible (*eg*, *Phallus*, *Clathrus*) as well as edible kinds, and the myths show a wide variety in the details of the folk beliefs, the most elaborate of the myths being found among the Tadzhiks, the Tanala of Madagascar, and the Maori of New Zealand.

In every instance there is one common denominator: the link between a designated species of mushroom and the thunderbolt.

Of a belief associating mushrooms generally, regardless of species, to thunderstorms, we have found evidence in only two regions, both in Europe. In France, apart from the specific associations that I have already noted, belief in the favorable influence of thunder showers on the growth of mushrooms is widespread, as it seems also to be in Poland and Bohemia. Further inquiry on the ground would probably bring out added details corresponding to those we have found elsewhere. In the temperate zone thunder and lightning come mostly in spring and early summer though not exclusively, and mushrooms in late August and September, and the mythic belief makes no effort to reconcile this contradiction.

As for the mycologists, when confronted with the many faces of this belief, they offer no help in explaining them.

CHAPTER THREE

The Mah&amacr;v&imacr;ra Vessel and the Plant P&umacr;tika

by Stella Kramrisch[1]

The Mah&amacr;v&imacr;ra vessel is an anointed, empty earthen pot glowing red hot in the sacrificial fire. Its function, in the first and original part of the Pravargya rite of which it is the center, is symbolic. It is only in the second and subsequent parts of this rite that the vessel will be filled with milk, that it will be replete with perceptible contents.

Pravargya means that "which is to be put on the fire," *viz*. the Mah&amacr;v&imacr;ra vessel. In the later Vedic age, in the White Yajurveda, the Pravargya sacrifice had been combined with the Ṛg Vedic Soma sacrifice, the Pravargya being performed just before or at the beginning of the Soma sacrifice. Myth and ritual of the two sacrifices were coordinated in one configuration. The head of this configuration is called the Head of Makha.

The Head of Makha of which the Mah&amacr;v&imacr;ra vessel (*ukh&amacr;*) is the symbol, is the main and central sacred object of the Pravargya sacrifice. The vessel is made of clay to which four other ingredients are added. P&umacr;tika plants are one of them and their significance is paramount in the myth and ritual of the Head of Makha. The Pravargya sacrifice requires a special initiation over and above that of the Soma sacrifice and it must not be performed by one who for the first time offers a Soma sacrifice (&Sacute;B.14.2.2.44-46; &Amacr;p.&Sacute;S.15.20-21).

The Secret of the Cut-off Heads

The myth of the Mah&amacr;v&imacr;ra vessel is told in several versions, that of the &Sacute;atapatha Br&amacr;hmaṇa being the most exhaustive:

> The Gods, Agni, Indra, Soma, Makha, Viṣṇu, and the Vi&sacute;ve Dev&amacr;ḥ perform a sacrificial session in Kurukṣetra in order to win glory. They agree that whoever amongst them through austerity, fervour, faith, sacrifice and oblations would first encompass the end of the sacrifice would be the most excellent among them and the glory should then be common to them all. Viṣṇu obtained it (&Sacute;B.14.1.1-5).
>
> Viṣṇu is the sacrifice. But Viṣṇu was unable to contain the love of glory of his (&Sacute;B.14.1.6).
>
> Taking his bow with three arrows he stepped forth and rested his head on the bow. Then the termites of the Upad&imacr;ka kind gnawed the bowstring, it was cut, the ends of the bow springing asunder cut off Viṣṇu's head (&Sacute;B.14.1.1.7).
>
> It fell and became the Sun. The rest of the body lay stretched out with the top towards east (&Sacute;B.14.1.1.10).
>
> The gods said: Our all-encompassing hero (*mah&amacr;n-viraḥ*) has fallen. Therefrom the Mah&amacr;v&imacr;ra vessel was named, and the vital sap (that flowed from him) they wiped with their hands (*sam-mṛj*). Whence the Mah&amacr;v&imacr;ra is the Samr&amacr;j (the emperor) (&Sacute;B.14.1.1.11).
>
> The gods rushed forward to him, Indra applied himself to him, limb to limb, engulfed, encompassed him and became possessed of his glory [*ie* of that of the headless Viṣṇu] (&Sacute;B.14.1.1.12).
>
> The gods went on worshipping with that headless sacrifice (&Sacute;B.14.1.1.17).

---

1. The Philadelphia Museum of Art and The Institute of Fine Arts, New York University.

> Dadhyañc Atharvaṇa knew this pure essence (the Madhu, the sweet [and secret] knowledge of the Pravargya), how the head of the sacrifice is put on again; how the sacrifice becomes complete again (&Sacute;B.14.1.1.18 [*cf* 4.1.5.18]).
>
> Indra threatens to cut off the head of Dadhyañc if he divulges the secret to anyone else [for Indra had obtained only the glory of the headless body.] (&Sacute;B.14.1.1.19).
>
> The A&sacute;vins hear this and offer themselves as disciples to Dadhya&ncaron;c (&Sacute;B.14.1.1.20).
>
> Dadhyañc refuses them, fearing Indra would cut off his head (&Sacute;B.14.1.1.21).
>
> However the A&sacute;vins promise to protect Dadhyañc by the following scheme: when Dadhyañc would receive them as pupils they would cut off his head and replace it by a horse's head. Dadhyañc will teach them through a horse's head - which head Indra will cut off. Then they will replace Dadhyañc's own head (&Sacute;B.14.1.1.22-24).
>
> Dadhyañc &Amacr;tharvaṇa with a horse's head taught them the sweet [secret] (&Sacute;B.14.1.1.25).

The god who does not honour an agreement and arrogantly keeps to himself the glory he undertook to share with the other gods is beheaded by his own bow. The decapitated god is Viṣṇu, in the &Sacute;atapatha Br&amacr;hmaṇa. His name is Makha in the T&amacr;ṇḍya Br&amacr;hmaṇa while in the Taittir&imacr;ya &Amacr;raṇyaka he is called Makha Vaiṣṇava.[2] He is also called Makha Saumya (in &Sacute;B.14.1.2.17). Viṣṇu and Makha are equated, they are one person for Viṣṇu is the sacrifice (&Sacute;B.14.1.1.6) and Makha is the same as Viṣṇu (86.14.1.1.13). Viṣṇu is particularly the Soma sacrifice.

Except in the above story, Makha does not figure amongst the gods. Makha's head however is invoked in Taitt.S.1.1.8. and it is the very center of the Pravargya sacrifice. Makha's head means the Sun (&Sacute;B.14.1.1.10) and has for its symbol the Mah&amacr;v&imacr;ra vessel. Mah&amacr;v&imacr;ra is here being translated as 'all encompassing hero,' with reference to the sun,[3] but also with regard to Makha whose cutoff head is restored by the Pravargya ritual to the sacrifice.[4] Makha, in the &Sacute;B. is the deific name of the sacrifice.[5] The Sacrifice had its head cut off. Its headless body lies prostrate. This fallen hero is reconstituted by having his head sacrificially joined by the Pravargya ritual to the body, that is to the basic Soma sacrifice.

Who but Viṣṇu or Makha among the gods could encompass to its end the sacrifice? For Makha himself is the sacrifice and Viṣṇu is the sacrifice; subject and object are one. In its deific shape, as Makha or Viṣṇu, the sacrifice is the main figure in the myth. The myth is acted out in the form of the ritual. The meaning of the sacrificial myth, the staging and action of the sacrificial ritual, aim at the atonement of an initial wrong and at reintegration. In the present myth an arrogantly broken pledge is the initial wrong, the departure from integrity, a broken promise out of self-seeking niggardly pride. This initial disintegration that causes Viṣṇu-Makha, the sacrifice, to lose its head, wants to be undone by a reintegration, which is the purpose of the rites of the sacrifice.

The Pravargya sacrifice is added on to the beginning, or precedes the Soma sacrifice. The Pravargya is not known to the Ṛg Veda. It appears to have been a sacrifice originally independent of the Soma sacrifice. The two conjoint sacrifices have their mythical figure in Makha, the Pravargya being Makha's head. Its symbol is the Mah&amacr;v&imacr;ra pot.

---

2. T&amacr;ṇḍya B.7.5.6; Taitt. &Amacr;r.1.1-7; &Sacute;atapatha B.14.1.1-5; 14.1.2.17, a different version in Ait. B. 1.19; *cf* ṚV.10.171.2 'Indra severed Makha's head from the skin' (body; and Taitt.S.1.1.8.)

3. J. A. B. van Buitenen, *The Pravargya*, Poona 1968, 35, translates Mah&amacr;v&imacr;ra as 'Large Man.' The largeness being that of the sun, does not refer to its size, but to its all-encompassing power.
4. Pravargya is 'that which is to be put on the fire,' L. Renou, *Vocabulaire du Ritual Védique*, Paris, 1954, 111; *ie* the Mah&amacr;v&imacr;ra pot.
5. Makha has been variously translated; M. Mayrhofer, *A Concise Etymological Sanskrit Dictionary*, Heidelberg 1963, *s.v.* 'Sacrifice' and 'Hero,' both fit Makha in the present context.

The Soma sacrifice has Viṣṇu for its mythical figure. When the Pravargya sacrifice is added to the Soma sacrifice, they form as it were one sacrifice of which the Pravargya is the head, Makha's head. Forming one albeit extended sacrifice, Viṣṇu becomes equated with Makha. The Pravargya preceding the Soma sacrifice, being in front of the sacrifice, it is the 'Head of Makha'; nowhere is it spoken of as Viṣṇu's head.

In the &Sacute;B. version it was Viṣṇu who encompassed the entire sacrifice: this was his glory which identified him with the sacrifice. But in the elation of his triumph he literally lost his head. His bow cut it off. The head fell and became the sun. The rest of the body lay stretched out towards the east. In this calamitous situation, Indra encompassed the prostrate body, lay down on it; limb to limb he embraced it and its glory was absorbed by him. It was a truncated glory of a headless body. The gods went on worshipping with that headless sacrifice and gained nothing by it.

Truly, the gods were cheated by Viṣṇu of the glory of the sacrifice. Moreover the identities in the &Sacute;B. story do not work out squarely. Viṣṇu is the sacrifice and he who is the sacrifice is the Sun (&Sacute;B.14.1.1.6,32). In itself however, and not by synecdoche, the cut off head becomes the sun. It is Makha's head which is represented by the Mah&amacr;v&imacr;ra pot in the Pravargya sacrifice (V&amacr;j.S.37.8; &Sacute;B.14. 1.2.1). One who teaches and partakes of the Pravargya sacrifice enters the light of the Sun (&Sacute;B.14.1.1.26-32). By offering the Pravargya, the head of the sacrifice is replaced. (T&amacr;ṇḍya, 7.5.6, end)

Two equations hold good: Viṣṇu is the sacrifice; Makha is the Sun. The two conceptions are combined. They are linked in the &Sacute;B. by the role of Indra. It is as problematic as it is imitative. It is moreover futile, for the gods sacrificing with the headless sacrifice do not obtain blessings. (Taitt.&Amacr;r.1.6) Dadhyañc, the &Amacr;tharvaṇa, the firepriest, comes to their rescue by telling the Healers among the gods, the A&sacute;vins, the 'madhu-vidya,' the 'sweet' or secret magic knowledge how to replace the head of the sacrifice. The A&sacute;vins, in possession of the secret knowledge, ask the gods for a boon and receive it in the shape of a libation of hot milk (*gharma*) out of the Mah&amacr;v&imacr;ra pot (Taitt.&Amacr;r.1.7). They promptly replace the head of the sacrifice. Henceforward, Gharma, Mah&amacr;v&imacr;ra, Pravargya and 'Makha's head' refer to the same complex reality. The A&sacute;vins learned the Madhu Vidyā́, the 'sweet' secret knowledge straight from the 'horse's mouth,' for it was with a horse's head that Dadhyañc spoke to them (ṚV.1.119.9).

Now Indra had entered also this part of the story. He had cut off the head of Dadhyañc, that is the horse's head (ṚV.1.84.14). Indra had to cut off the head which had divulged the secret to the A&sacute;vins. In fact, Indra previously had threatened Dadhyañc that he would cut off his head should Dadhyañc ever betray the secret known only to Indra and Dadhyañc. By a ruse the A&sacute;vins made Dadhyañc part with the secret and keep his head. That is, they themselves cut off Dadhyañc's original head and put on Dadhyañc a horse's head which told the secret. When Indra fulfilled his threat, he did cut off Dadhyañc's head but that was the head of the horse which had told the secret. Finally the A&sacute;vins know how to restore the original head of Dadhyañc. This miraculous restoration these divine healers accomplished. Now, their knowledge further increased by the secret they had learned from the horse's head, they also knew how to restore the head of Makha. But did the 'sweet,' the Madhu, that only Indra and Dadhyañc[6] knew and that Dadhyañc announced to the A&sacute;vins through the horse's head remain unchanged from the Ṛg Veda to the Br&amacr;hmaṇas?

The Ṛg Veda speaks of the 'sweet' (*madhu*) of Tvaṣṭṛ, it also speaks of the fly that gave away the Madhu, the 'sweet' (ṚV.1.119.9). Tvaṣṭṛ's sweet is Soma. Indra once stole the Soma from Tvaṣṭṛ (ṚV.3.48.4), whereas the fly betrayed the secret to the A&sacute;vins. In the ancient story of the Ṛg Veda, the secret of Soma is betrayed to the A&sacute;vins, by Dadhyañc, or else it is betrayed to them by a fly.[7]

Was the 'sweet' that Dadhyañc knew the knowledge of Soma and where the Soma could be found? The horse's head of Dadhyañc was submerged in &Sacute;aryaṇ&amacr;vat.[8] &Sacute;aryaṇ&amacr;vat is a lake or river in the mountains of Kurukṣetra. It is rich in Soma.[9] With the bone of that cutoff horse's head Indra slew nine times ninety arch enemies

7. ṚV.1.119.9; R.Gordon Wasson, *SOMA: Divine Mushroom of Immortality*, The Hague, 1968, 61; K. F. Geldner, *Der Rig Veda*, 1, p. 162,n. on ṚV.1.119.9.9.
8. ṚV.1.84.14.
9. ṚV.9.65.22,23; S&amacr;y. on 1.84.14; *cf* 10.35.2.

(Vṛtras).[10] That bone served as Indra's Vajra, his unfailing weapon. It was the thunderbolt.[11] The Madhu in the Ṛg Veda has the secret of Soma for its content. This secret, the repository of Indra's strength, is revealed by Dadhyañc to the A&sacute;vins.

A later text[12] also tells us that Indra himself had imparted to Dadhyañc the magic secret (*brahma*) and had forbidden him to reveal it to anyone. This secret knowledge in post-Ṛg Vedic texts appears not to be the same pure essence, *viz* Soma, the innermost mystery and life elixir of the sacrifice, but another carrier of sacrificial transport, *viz* the secret of the Pravargya. This mystery is revealed to the A&sacute;vins by the horse's head which was cut off by Indra. Another cutoff head, that of Makha and the life elixir which flowed away from the decapitated head of the sacrifice itself, have their own initiatory power. Soma, the drink of immortality, sweetness itself (*madhu*), is the original mystery.

The mystery now however is centered in the restoration of the head of Makha. The horse's head told the A&sacute;vins the secret of how to restore the head of the sacrifice. The secret, however, shared originally by Indra and Dadhyañc is Soma. Secretly, by the horse's head, the sanctity of Soma was assigned to Makha's head in a duplicity of meaning, implying a transfer of significance from the Soma sacrifice to the Pravargya sacrifice. The Soma mystery is the primary secret. It is the 'sweet' of Tvaṣṭṛ, the maker of all form, the mystery of creativity itself, of which the Ṛg Veda sings.

The secret given away by Dadhyañc &Amacr;tharvaṇa, according to the &Sacute;atapatha Br&amacr;hmaṇa, is the knowledge of the restoration of the head of the sacrifice (&Sacute;B. 14.1.1.18; 4.1.5.18). It is the secret of the restitution of wholeness which had become fragmented. The cause of the fragmentation, the cause of the lost head, was the overweening pride of the god himself who thus 'lost his head.' While Soma is creativity itself - in a state untainted by egoity - the secret of regaining the lost head belongs to a state in the godhead fallen from primal innocence, when guilt had come to be. This latter mystery - enacted in the Pravargya ritual - slides into the place of the divine Soma transport. The horse's head divulged secrets of the gods. They were not the same, one supplanted the other.

Makha's head was cut off by a divine act of retribution - the termites hence were divinized. His sacrificial death is an immolation. Makha is the sacrifice by expiation. The slaying of Soma however fulfills his inner destiny. In order to be consumed Soma must be killed. The Soma sacrifice is a passion whereas Makha was felled by his overweening selfishness. The demon in Makha was liberated, the dark face of the cosmic giant was severed from the trunk, the cutoff head was purified in the Pravargya sacrifice. In its flames the head of Makha was made to glow with the radiance of the sun.

The secret knowledge by which the A&sacute;vins, the celestial Healers, restored the sacrifice is contained in the Mantras of the Hymn to the Light (ṚV.10.170.1-3). It is these incantations which are meant by the Div&amacr;kirtyas of which the &Sacute;atapatha Br&amacr;hmaṇa speaks (&Sacute;B.4.1.5.15; SV.2.803-805; &Umacr;hyag&amacr;na.2.2.9). By the power of these words addressed by the A&sacute;vins to the Light radiating from the Sun the head of Makha is restored to the body of the sacrifice.

Significantly, the hymn ṚV.10.171.2 immediately following this laud of the celestial Light, the Sun's radiance, praises Indra who severed the head of raging Makha from his body.[13] The beheading of Makha underlies the rite of the Pravargya. It is also one of Indra's heroic deeds. The slaying of demoniac darkness and thereby turning into Light is celebrated in more than one version. Makha, in the Ṛg Veda is raging darkness from

---

[10] ṚV.1.84.13-14.

[11] *Cf* A. A. Macdonell, *Vedic Mythology*, Strassburg 1897, 142. Wasson, 40.

[12] Bṛhad Devat&amacr;, 3.18-24.

[13] See note 1; ṚV.10.171.2. Makha as raging darkness thus figures as the primeval sacrificial 'animal.' The transformation of the demon into the sacrificial victim leads one step further. As sacrificial victim Makha supplants King Soma.
At a time when the Soma sacrifice was waning and Soma not readily obtainable, the Pravargya was added on to, supplemented, expanded, and reoriented the ancient rites.
When Indra had severed the raging head of Makha 'he came to the house of one who had prepared Soma' (somin; ṚV.10.171.2).

whose body Indra severs the head so that it may arise as sun.[14] No doubt the 'demon' Makha is cognate, *ab intra* with Makha, the sacrifice. The horse's head of Dadhyañc the fire priest, which the A&sacute;vins - whose name derives from *a&sacute;va*, 'horse,' - had put on his shoulders, reveals the secret. The horse's head is the sun, itself. It is at the same time the head of the sun-horse. Through the mouth of Dadhyañc, the sun-horse's secret knowledge, the Madhu Vidy&amacr; is revealed, or, it is said, the sun-horse 'sings together with the Soma-inspired singers in heaven.'[15]

In the Pravargya ritual, the head of Makha, the severed head, the Sun, represented as the 'all encompassing hero,' the Mah&amacr;v&imacr;ra pot, is hallowed by the horse even before the pot is made. A stallion leads those who go to collect the clay from a hole, significantly situated towards the sunrise, to the east of the &Amacr;havan&imacr;ya altar where the gods are invoked, the priest addressing the clay, 'Thou art the head of Makha,'[16] and the stallion is made to sniff at the clay.[17] When the Mah&amacr;v&imacr;ra vessel has been shaped, it is fumigated with horse-dung burnt on the G&amacr;rhapatya altar.[18] And the Mah&amacr;v&imacr;ra vessel glowing on the crackling fire is lauded: 'Loudly the tawny stallion neighed.'[19] Dadhyañc, through a horse's head that the A&sacute;vins - having beheaded him in order to save his human head - had given him, reveals to these horse-involved saviours, the cutoff head, the Mah&amacr;v&imacr;ra, the 'all encompassing hero,' the Sun. And thus its symbol is the earthen Mah&amacr;v&imacr;ra pot.

The Elixir of Life: Soma and P&umacr;tika

When Viṣṇu or Makha or the sacrifice - they are synonyms - had his head cut off, sap flowed away and entered the sky and the earth. 'Clay is this earth and water is the sky. Hence it is of clay and water that the Mah&amacr;v&imacr;ra vessel is made.'[20] The elements earth and water carry the sap of Makha's head into the substance of the Mah&amacr;v&imacr;ra pot. It will dry in the sun and be baked in fire. Earth or clay as it is dug from a pit east of the sacrificial hut is the major but not the only solid substance that goes into the making of the Mah&amacr;v&imacr;ra pot. Four other ingredients are added to the clay. Their importance is primarily symbolical, the relevant ingredient is a certain plant. &Sacute;B.14.1.2.12 speaks of this plant:[21] '&Amacr;d&amacr;ra plants are Indra's might[22] for when Indra encompassed (Viṣṇu) with might, the vital sap of Viṣṇu flowed away. And he lay there stinking as it were after bursting open (*&amacr;-dar*). The vital sap sang praises. The &Amacr;d&amacr;ra plants originated and because he lay there stinking (*p&umacr;y*) therefore [they are also called], *p&umacr;tika*. When laid on the fire as an offering they are fragrant for they originated from the vital sap of the sacrifice.' The vital sap that flowed from the head penetrated heaven and earth and mid-air, all that lies under the sun. The vital sap that flowed from the beheaded body was pressed out from it by Indra's might. Indra's might is sustained by Soma. In the transport caused by that drink of immortality the inspired poets sing about Indra's deeds. Does the &Amacr;d&amacr;ra plant here stand for Soma inasmuch as it is here called Indra's might? The &Amacr;d&amacr;ra plant is not otherwise identified except that it originated then and there and that it is also called P&umacr;tika. If the etymology of *&amacr;d&amacr;ra* is hermeneutic, that of *p&umacr;tika* is correct, not only philologically[23] but also factually as will be shown.

---

[14] Indra liberating the Sun is the subject not only of the Vala myth, but figures also in other images like that of raging Makha (ṚV.10.171.2), or also that of Indra striking down the chariot of Uṣas, the Dawn (ṚV.10.73.6) in her darkness aspect *cf* A. K. Coomaraswamy, 'The Darker Side of Dawn,' *Smithsonian Miscellaneous Collections*, 64.1. Washington, 1935,6. *cf* ṚV.9.73.5, the dark skin which Indra hates and which is magically blown away from heaven and earth.
Taitt.S.1.1.8 invokes the head of Makha as the wide extended vessel which contains all life. This vessel however is made of potsherds (*kap&amacr;ta*). The skin which is to be grasped by a god (not named), the victory over the demon appear in the same context, and Savitṛ, the Impeller or solar power is invoked to make ready (the vessel) in the highest firmament. The Pravargya ritual is adumbrated in the Yajur Veda.

[15] ṚV.1.6.8, *cf* A Bergaigne, *La Religion Vedique*, 11.380, fn. 2, or, the Sun is the hidden horse, ṚV.1.117.4-5, in its journey

through the night.

22. V&amacr;j.S.37.6; inspired and invigorated having drunk Soma, Indra performs his deeds.
23. Mayrhofer, *s.v.*

In Indra's close embrace of Viṣṇu's body - limb by limb, he covered him - was Indra's power carried by osmosis into the fallen body of Viṣṇu-Makha? Was it too much for that beheaded and disintegrating body and did it burst open and plants spring forth?[24] These plants called either '&Amacr;d&amacr;ra' or 'P&umacr;tika' are the most significant amongst the five ingredients that make up the clay of the Mah&amacr;v&imacr;ra pot. They represent the might (*oyas*) of Indra communicated to the body of Makha and transmuted into plants which will be ground and mixed with the clay out of which Makha's head, the Mah&amacr;v&imacr;ra pot, will be formed.[25]

The other ingredients of the Mah&amacr;v&imacr;ra pot are: earth from a termite hill[26] for these termites had been divinized and made 'first born of the world' in return for the part they played in the severance of Viṣṇu's head; earth turned up by a boar, for it was the boar Emuṣa-Praj&amacr;pati that raised the earth herself - she was quite small then - into existence.[27] These two additional kinds of earth establish mythically the consistency and existence of the substance of the Mah&amacr;v&imacr;ra vessel from the beginning of things. The P&umacr;tika plants are the third additional ingredient.[28] The sources do not reveal their identity. But the secrecy that surrounds them is not the only thing they share with Soma. The wrong identifications of the P&umacr;tika plant are proportionate to those of the Soma plant, which is fair as the former is only a substitute for Soma.[29] Yet its relevance is such that it confirms the drink of immortality to have been pressed from a mushroom. This mushroom has been identified as the fly-agaric, ie *Amanita muscaria*.[30]

The fourth ingredient added to the clay, making altogether five components of the Mahavlra pot, is goat's milk (&Sacute;B.14.1.2.13) or hairs from a she goat or black antelope (&Amacr;p.&Sacute;S.15.2.1), for the goat and antelope are sacrificial animals, 'born of fire,' symbols of heat.

King Soma was killed in that he in the shape of the Soma plant was pressed.[31] 'In the slaying of Soma the sacrifice is slain, with the sacrifice the sacrificer.'[32] In the Soma sacrifice the sacrificial significance of Soma was enhanced by his royal status. In the course of the Pravargya sacrifice, King Soma having been enthroned, that is a bundle of Soma plants having been placed on the seat of a high four-legged stool, the *r&amacr;j&amacr;and&imacr;*, which reaches to the navel of the sacrificer, a similar throne that may be higher, even shoulderhigh, is placed near

---

24. &Sacute;.B.4.5.10.4 speaks about the provenance of &Amacr;d&amacr;ra or P&umacr;tika. This passage does not treat of the Pravargya myth, but of substitutes for Soma. The &Amacr;d&amacr;ra plant in this context is one of the Soma substitutes, when Soma cannot be had. It is said to have sprung from the sap which spurted from the head of the sacrifice when the head was cut off. The implications of the myth are lost or overlooked when a part of it only is taken out of context. &Sacute;B.14.2.1.19 narrates somewhat vaguely 'when the sacrifice had its head cut off, its vital sap flowed away and therefrom those plants grew up'.
25. According to M&amacr;nava &Sacute;rauta S&umacr;tra, 4.1.9-10, the P&umacr;tika plants were ground. Another version of the origin of the P&umacr;tika plant, though lacking the coherence of the Br&amacr;hmaṇa of a Hundred Paths tells that the P&umacr;tika plant grew from a feather or leaf (*parṇa*) when Soma was carried through the air by the falcon (T&amacr;ṇḍ.B.9.5.1). This plant which properly is called &Sacute;yen&amacr;bhṛta, 'carried hither by the falcon,' is Soma (ṚV.1.80.2; 8.95.3; 9.87.6). &Sacute;B.4.5.10.2-6 however, enumerating the substitutes for Soma speaks of &Sacute;yen&amacr;bhṛta and &Amacr;d&amacr;ra as two different substitutes of Soma. Taitt.&Amacr;r.5.1.3.5 presents yet another name and story: 'Makha leaning on his bow smiled overbearingly and his warmth of life (*tejas*) left him. The gods wiped it on the plants. The plant &Sacute;y&amacr;maka originated therefrom. Also his manly power (*v&imacr;rya*) flowed out.' Makha here is not decapitated, Indra is absent from the story. The &Sacute;y&amacr;maka plant which may be a kind of grain or corn, does not otherwise figure in the story of Makha nor amongst the substitutes for Soma. Makha pays with his life for his hubris, his vitality goes to the plants.

26. &Sacute;B.14.1.2.10; V&amacr;j.S.37.4; Taitt.&Amacr;r.4.2.3; Ap.&Sacute;S.15.2.1.
27. *Cf* 25. These two earth admixtures are not always enumerated in the same sequence. Their proportionate amount is not indicated and seems to have not been relevant to the texture of the clay of which the pot was made. Like the ground P&umacr;tika plants these ingredients had more ritual-symbolical than technical importance similar to the presence of gold and silver in the metal alloy called aṣṭadh&amacr;tu (eight substances) of later day Indian bronze images.
28. V&amacr;j.S.37.6; &Sacute;B.14.1.2.12; &Amacr;p.&Sacute;S.15.2.2; van Buitenen, p. 57 quotes from Baudh&amacr;yana &Sacute;S., a variant of P&umacr;tika, namely B&amacr;d&amacr;ra [*&Amacr;d&amacr;ra*?] stalks. For references here given to &Amacr;p.&Sacute;S. *cf* van Buitenen, *passim*.
29. S&amacr;yana on T&amacr;ṇḍ.B.9.5.1 considers the P&umacr;tika plant to be a creeper; P&umacr;tika is explained as the flowers of the Rohiṣa plant by the commentary on K&amacr;ty&amacr;yana &Sacute;S. An impressive array of wrong identifications of the Soma plant is given by W. Doniger O'Flaherty in Wasson, 93-130. According to &Sacute;B.4.5.10.2, one of the Soma substitutes, the Ph&amacr;lguna plants, deserve mention. Of their two varieties, one with bright red flowers, the other with reddish brown flowers only the second was considered eligible. In this connection the observation in the Atharvapraya&sacute;citt&amacr;ni, J. von Negelein, *JAOS* 34, 254-256, is of interest. Red Soma is said to grow in the Himalayas and brown Soma on M&umacr;javant. If the fly-agaric, the mushroom identified by Wasson, has a red as well as a brown variety it would appear that in post-Vedic time the latter was in demand. P&umacr;tika is cited among the substitutes by W. Doniger O'Flaherty.
30. Wasson, *passim*.
31. Taitt.S.6.4.4.4; 6.6.7.1.
32. Taitt.S.6.6.9.2.

King Soma's throne. This is the Emperor's throne (*samr&amacr;ḍ&amacr;sand&imacr;*) on which the Emperor, the 'All-encompassing Hero,' the Mah&amacr;v&imacr;ra vessel will rest.[33]

The Emperor, the All-encompassing Hero, Mah&amacr;v&imacr;ra, the Sun, is the Great God of the Pravargya. His throne faces east, for nothing must come between Mah&amacr;v&imacr;ra and the sun.[34] Symbolically they are one, Makha's head is the Sun.[35] This is the meaning of the Mah&amacr;v&imacr;ra vessel. It has no other 'content.' Its fiery glowing shape encompasses its cavity, its vastness. Only after the pot has achieved its greatest heat and splendour is hot milk poured into it, the offering to the A&sacute;vins.[36] The All-encompassing Hero, the Sun, of the Pravargya, being joined to the Soma sacrifice, is the head of the sacrifice. 'The head of the sacrifice has become joined in the same manner in which the A&sacute;vins restored it.' (&Sacute;B.14.2.2.43) Just as the A&sacute;vins knew how to put the horse's head on the shoulders of Dadhyañc whose human head they had to cut off and then restored to Dadhyañc his human head, so they restored the head of the sacrifice. It was the horse's head that taught them this secret.

This is how the &Sacute;atapatha Br&amacr;hmaṇa presents the Madhu Vidy&amacr;, the sweet, secret knowledge that Dadhyañc's horse's head betrayed to them. In the Ṛg Veda however, it was another secret that Dadhyañc betrayed to the A&sacute;vins. This secret was 'Madhu,' the innermost 'sweetness,' Soma. (ṚV.1.116.12; 1.117.22)

More than half a millennium lies between the two meanings of the Madhu Vidy&amacr; in the Ṛg Veda and the Br&amacr;hmaṇas. The Sun cult of Mah&amacr;v&imacr;ra, the All-encompassing Hero, was combined with the Soma sacrifice. The meaning of this combined sacrifice revalued the ancient secret of the horse's head, of Dadhyañc and of the Sun.

The substitution of contents and the continuation of the original Soma sacrifices has a ritual analogy in the relation of the Soma plant, identified by Wasson as the fly-agaric, *Amanita muscaria*, and its substitute, P&umacr;tika. King Soma has not been dethroned, but his throne is further from the sun than that of Emperor Mah&amacr;v&imacr;ra. Into the making of Mah&amacr;v&imacr;ra went the P&umacr;tika plant. This symbolically essential ingredient of the Mah&amacr;v&imacr;ra pot has an unsavory connotation accounted for by the myth, told in the Br&amacr;hmaṇa of a Hundred Paths. However, its offensiveness is turned into fragrance when the plant is laid on the fire. This transfiguration in and by the ritual is similar to that of the juice of the Soma plant itself, which is made palatable ritually by an admixture of milk.

Mythically, however, the purification of Soma is effected by V&amacr;yu, the Wind. He blew with the gale of the spirit when Indra freed the cosmos from the Asura, the non-god, the Titan, Vṛtra the Serpent. Soma was in Vṛtra (ṚV.10.124-4) and Indra slew Vṛtra, the ophidian Asura. Slain Vṛtra stank to heaven, sour and putrid. V&amacr;yu blew away that foul smell - 'the smell of King Soma.' He was neither fit for offering, nor was he fit for drinking (&Sacute;B.4.1.3.5-8).

Agni, Soma and Varuṇa were in Vṛtra, the Asura. They were ensconced in the ambience of this ancient cosmic power. Indra slew this dragon, his antagonist. Agni, Soma and Varuṇa were liberated. They went over to the young conquerer god. The rule of the world had changed. But inasmuch as Soma was in Vṛtra he was slain with him who had contained him. However, he came out of the decomposing carcass. Its odor clung to him. V&amacr;yu blew on him and made him palatable (&Sacute;B.4.1.2.10).

The preoccupation of this account with the stench of the decomposition of the flesh of the World Serpent and of King Soma smells of guilt, the guilt of murder. The odor associated with the putrid smell of dead bodies was not unfamiliar it seems to the priests after animal sacrifices. The gods themselves dispelled some of the smell of King Soma and laid it into [dead] cattle. (&Sacute;B.4.1.3.8) In fact, the priests had chosen the plant P&umacr;tika and endowed it with a myth of its own (&Sacute;B.14.1.2.12) in the context of the sacrifice. In this myth stench as a symbol of evil is implicated in and purified by the sacrifice. The plant P&umacr;tika, however, when laid on the fire as an offering is said to become fragrant, it acquires the odour of sanctity.

Putka and the Santal of Eastern Bihar

In Eastern Bihar there live aboriginal people, the Santal, occupying a stretch of country called the Santal Parganas, and we find scattered villages of Santal also in the adjacent regions of Orissa and the western marches of West Bengal. The Santal number some millions. Until recently they were a hunting and food-foraging folk. Their language is not derived from Sanskrit nor is it Dravidian: it leads the third, smaller group, the Munda family. A trait of these languages is that their nouns are not classified into genders - masculine, feminine, neuter - but are either animate or inanimate, either possessing a soul or not possessing a soul. The whole vegetable kingdom is inanimate, soulless, except for one word that designates a certain mushroom. That noun is *putka*: it is animate, a soul possesses it.

P. O. Bodding in the preface to his *Santal Dictionary* (Oslo, 1929-1936, 1, XIV) draws atttention to a noteworthy fact: 'Strangely enough, the Santals use some pure Sanskrit words, which, so far as I know, are not heard in present day Hindi.' He might have added that, at least in the instance we are considering, the word has disappeared from all Sanskrit vernaculars. We may owe this survival to the mycophilia of the Santal, whose knowledge of the fungal world is reflected in a substantial fungal vocabulary. By contrast the Hindus are mycophobes: the twiceborn castes are expressly forbidden to eat mushrooms, whether growing on trees or from the earth (Manu 5.5.19; 6.11.156; &Amacr;p.&Sacute;S.1.5.14.28).

Among the Santal the *putka* is a mushroom and, alone in the whole vegetable kingdom, possesses a soul.[37] Did not *putka* inherit this sacred character from long ago when it was an ingredient of the Mah&amacr;v&imacr;ra pot, which was ritually 'animated,' endowed with sense organs, with a soul? Is not *putka* the Sanskrit *P&umacr;tika*?

The second peculiarity of *putka* is its revolting smell when gathered and left for a day or two exposed to the air.[38] In Dumka (Santal Parganas) a Santal woman in answer to questions put to her by Wasson said that she thought she might know why *putka* was animate; the Santal consume *putka* in their curry, but at the end of a day or two should any *putka* have been left over, the remains of the leftover *putka* stink with the stench of a cadaver.[39] She did not know the meaning of the word *putka* nor the myth of P&umacr;tika in the

---

33. &Sacute;B.14.1.3.10; 3.3.4.21; *cf* van Buitenen, p. 15; the three Mah&amacr;v&imacr;ra pots, two of them in reserve, - should the empty, red hot glowing pot crack during the sacrifice, - are placed on the Samr&amacr;ḍ&amacr;sandi, the emperor's throne.
34. The emperor's throne is placed south of the &Amacr;havan&imacr;ya fire where the gods are invoked and receive their offering and north of King Soma's throne, &Sacute;B.14.11.3.8,12. Notwithstanding these rites, raising Mah&amacr;v&imacr;ra above Soma, the &Sacute;atapatha Br&amacr;hmaṇa, ritually, though not logically, sums up its entire section on the Pravargya with the words 'The Pravargya indeed is Soma' (&Sacute;B.14.3.2.30). In this identification the P&umacr;tika plant plays the main role.
35. V&amacr;j.S.38.24; &Sacute;B.14.1.3.3-6.
36. &Amacr;p.&Sacute;S.5.9.10-12; 15.10.1-5. In the course of the sacrifice curds are offered to Indra and other gods. The curds offered to Soma should be curdled with P&umacr;tika plants (TS.2.5.3.5) in the first place, or with bark while other curdling agents such as rennet, curds, rice, or buckthorn should be used for the offering of the curds to other gods. - In more than one ritual context is P&umacr;tika linked with Soma.

Br&amacr;hmaṇas. Wasson himself did not link *putka* with P&umacr;tika though he supplied the evidence for the identity of this mushroom.

---

37. Roger Heim and R. Gordon Wasson: 'Les Putka des Santals, champignons doués d'une âme.' *Cahiers du Pacifique* 14, 1970, pp. 59-85. *Putka* appears to be a Santalized version of Sanskrit *P&umacr;tika*, the name in Sanskrit having a long or short 'i'. In the light of this discovery in Santal, one would like to inquire whether the same word with the same attributes is current in the sister language Ho, and in other languages of the northern group of Munda languages and, if so, whether it is present in the southern group.
38. Heim and Wasson, p. 65. The only other reason supplied by many Santal to justify the unique status of *putka* was that it was commonly found in the sacred village grove of *sarjom* trees (*ie &sacute;&amacr;l* in Hindi; *Shorea robusta*). But the *sarjom* itself is not animate; why therefore the *putka* around it, especially as the *putka* is not confined to *Shorea robusta*?
39. *Ibid* p. 85. The Santal distinguish three kinds of *putka*. (1) *hor putka* in which *hor* means 'man' or 'human being' or any Santal; (2) *seta putka*, *seta* meaning 'dog'; and (3) *rote putka*, *rote* being a 'toad' or 'frog.' It emerges from the Heim-Wasson paper that these authors consider the first as variations in usage and the terms are applied interchangeably, the usage varying in different villages and possibly with different stages of growth. The third is a puffball that appears suddenly after thunder storms. Many Santal have never heard of the *rote putka* and of those who had, few were able to identify it. The puffball does come in response to thunder, but the belief in thunder as the generative agent applies equally to the *hor putka* and *seta putka*. The *hor* and *seta putka* is an hypogean species, harvested when it finally breaks the surface of the ground. It has often been called a truffle, or 'truffle-like', which it is not. The Frog or *rote putka* calls to mind the Hymn to the Frogs (ṚV.7.10.3.8). There reference is made to the Gharma, the offering of hot milk and to the officiating priests, the Adhvaryus. In the &Sacute;B. the A&sacute;vins who had not been invited to the sacrifice became the Adhvaryu priests of the sacrifice after they had restored the head of the Sacrifice by the mantras of the Hymn to the Sun (ṚV.10.170.1-3).
    In the paper by Heim and Wasson, Professor Heim describes the *putka* mycologically and gives them their scientific names.

The third peculiarity of *putka* in Santal culture is the Santal belief that the *putka* are generated, not from seed, as are the generality of the vegetable world, but by the thunderbolt; in short, generated by divine intervention. Soma itself is generated by Parjanya (ṚV.9.82.3) apparently when his thunderbolt strikes the earth (*cf* ṚV.5.83.1,2,7).

P&umacr;tika, the foremost, and possibly the only direct surrogate for Soma, is a mushroom. When the fly-agaric no longer was available, another mushroom became its substitute. It had acquired a myth of its own. Nothing is known about any psychotropic virtue P&umacr;tika may have. However, no drink was made from it. Instead it was crushed, mixed with the clay of the pot. Its transubstantiation into the 'All-encompassing Hero' came about through fire, for it is said that the plants themselves strewn on fire become fragrant 'because they originated from the sap of the offering';[40] moreover, integrated into the substance of the fire-baked vessel, anointed with butter, they glow in glory in the fire of the Pravargya.

None of the other alleged substitutes for Soma has a myth of its own. P&umacr;tika sprung from the slain body of the sacrifice is a resurrection, as it were, of Soma. The other plants have no myth of their own except the &Sacute;yen&amacr;bhṛta plant which, as the name tells, is Soma itself. The name &Sacute;yen&amacr;bhṛta meaning 'carried by the falcon' conveys the myth of Soma having been brought from heaven by a falcon (ṚV.8.82.9; 10.144.5) when a feather or leaf, fell to earth[41] and the plant sprang from it. Regarding the other substitutes of Soma nothing but a similarity of colours connects certain flowers; or the fact that they were used in the sacrifice, certain varieties of grass, *viz* Ku&sacute;a and D&umacr;rv&amacr; grass.[42] A mushroom is foremost among the substitutes of Soma. Moreover, a mushroom is a significant ingredient in the sun-cult of Makha's head, added to the Soma sacrifice. P&umacr;tika though secondary in its role, being a surrogate for Soma, occupied a position of eminence in its own capacity as an essential ingredient of the substance of the Mah&amacr;v&imacr;ra pot. P&umacr;tika was raised into the region of the sacred as a surrogate for Soma, the most exalted plant in Vedic rites which indeed had Soma for their center. P&umacr;tika, however, did not succeed Soma, did not become hallowed by the same rites but was integrated into the substance of the Mah&amacr;v&imacr;ra vessel. Soma was meant to be drunk. The Mah&amacr;v&imacr;ra vessel was meant primarily to be made and seen. Its communion with the sacrifice was by a craft and ultimately by sight only.

The identification of P&umacr;tika, the Soma surrogate, supplies strong evidence that Soma indeed was a mushroom. P&umacr;tika integrated into the Mah&amacr;v&imacr;ra pot played its part in the mystery of the Pravargya sacrifice. That Putka-mushrooms should be known, to this day, as 'endowed with a soul' witnesses amongst the Santal of Eastern India a memory of the numinous emanating from the indigenous Indian Soma substitute.

Mixed with the clay and the other ingredients P&umacr;tika is part of the substance of which the Mah&amacr;v&imacr;ra vessel is made; it is dried in the heat of the sun, baked in the fire, placed on a silver dish and anointed with butter. The vessel is heated at the peak of the Pravargya to a red-hot glow, when the golden plate that had covered the mouth of the Mah&amacr;v&imacr;ra pot is removed. The 'All-encompassing Hero,' the 'Head of Makha,' the vessel that contains all life,[43] that is flame, glow, and heat, is the Sun.[44] Mah&amacr;v&imacr;ra, is 'Lord of all the worlds, Lord of all mind, Lord of all speech, Lord of all tapas [the fiery strength of asceticism], Lord of all brahman [the power of the sacred word], Lord of creatures, Spirit of poets.'[45]

---

40. &Sacute;B.14.1.2.12.
41. T&amacr;ṇḍya B.9.5.1 assigns to P&umacr;tika the myth of &Sacute;yen&amacr;bhṛta, saying that P&umacr;tika is the plant which grew from a feather (or leaf, *parṇa*) that fell to earth when Soma was carried through the air in contrast to the far more telling myth of &Sacute;B.14.1.2.12 about the origin of P&umacr;tika.
42. &Sacute;B.4.5.10; 14.1.2.12.
43. *Cf* TS.1.1.8.
44. &Sacute;B.14.1.3.17,26.
45. &Amacr;p.&Sacute;S.15.8.15-16; tr. van Buitenen, 92; matter in brackets added.

The Mah&amacr;v&imacr;ra Vessel

The Mah&amacr;v&imacr;ra vessel is prepared at the sacrifice itself. The making of the earthen vessel is itself part of the ritual.[46] The pot is shaped by hand; it is not thrown on a potter's wheel. Its height will be a span[47] and it is Makha's Head. Its shape however does not resemble any head or face, though part of it is called its mouth, but is also spoken of as opening[48] or outlet or as an outlet for pouring into.[49] The shape of the vessel resembles the V&amacr;yavya, the wooden vessel which held the libation for V&amacr;yu, the Wind.[50] The mouth or opening or top of the pot is also metaphorically called a nose for the Mah&amacr;v&imacr;ra pot. It is contracted in the middle and projects outward, widening toward the top.[51] These metaphors do not aim at conjuring up a physiognomy. They refer to a human face as much or as little as does the measure of a span.

The wooden V&amacr;yavya vessel is named after V&amacr;yu, the Wind. The gods rewarded V&amacr;yu with the first libation of Soma from this vessel because he was the first to tell them that Vṛtra had been slain &Sacute;B.4.1.3.4). Subsequently when V&amacr;yu had made Vṛtra-Soma fit for offering and fit for drinking the libation vessels belonging to other gods were also called V&amacr;yavya or V&amacr;yu's vessels (&Sacute;B. 4.1.3.10). V&amacr;yu, the Wind, had made Soma sweet. 'Therefore what becomes putrid they hang out in a windy place' (TS.6.4.7.1).

The Mah&amacr;v&imacr;ra vessel conforms with the libation vessels called V&amacr;yavya. While these are carved out of wood the Mah&amacr;v&imacr;ra pot is built up of clay.

The lump of clay for the pot is divided into three parts, one part to be the bottom. The clay, pressed down with the thumbs and flattened, is addressed with the words 'you are the two feet of the sacrifice.'[52] Obviously no similarity to any feet is intended here. The lowest part of the pot supports the vessel as the two feet support the human figure.

The second part of the clay is used for building the walls of the vessel up to the height of its collar (*parigr&imacr;v&amacr;*). The clay is laid on in three, five or an indefinite number of *uddhis* (elevations), that is, in coils or rings.[53] They seem to decrease in diameter towards the middle of the height of the vessel and increase towards its top. The contracted middle is referred to as *lagnam*. This is not to be understood to be a joint but denotes an intersection of planes.[54]

The third portion of the original lump of clay goes into the making of the top portion of the vessel which flares out to a height of two or four thumb widths above the collar (*parigr&imacr;v&amacr;*) or girdle (*mekhal&amacr;*)[55] laid on in high relief around the pot.[56] At the conclusion of the rites of Makha's Head, milk will be poured into the pot.[57]

Once the vessel is completed it must not be touched by hand.[58] It is held, raised, and transferred by tongs. The high relief of the collar or girdle would have prevented a slipping of the tongs.

54. Baudh&amacr;yana (van Buitenen, 10) gives a clear description, *cf* also &Amacr;pastamba (*ibid* p. 9). The number of *uddhis* or 'rings,' *ie* superimposed parts varies from three to four or more.
55. Taitt.&Amacr;r.5.3.5 *parigr&imacr;v&amacr;*, also *rasn&amacr;* or 'girdle' (&Amacr;p.&Sacute;S.15.2.17) are here synonymous.
56. Garbe, p. 329.
57. Van Buitenen, 10f; based on Baudh.&Sacute;S. [see also drawing on p. 11]. Van Buitenen under stands the three portions of the lump of clay to have been shaped as two small balls one on top of the other, and supported on a broad calotte shaped base, suggesting the shape of a man seated cross legged. This reconstruction is not according to the texts nor would it serve the purpose of the Mah&amacr;v&imacr;ra pot.
58. Van Buitenen, 15; &Amacr;p.&Sacute;S.15.4.6-8.

The shape of the Mah&amacr;v&imacr;ra pot is not anthropomorphic: it has neither the shape of a head, face, or figure of man. It is not an icon but a symbol in the shape of a vessel. To the officiating priest and to the sacrificer it means the Head of Makha, the Sun, and its mystery is experienced by them in the ritual. While they enact it, this mystery pervades their entire being, Mah&amacr;v&imacr;ra comes to life in them and they live in him. 'Like the two eyes, like the two ears, like the two nostrils thus he [the priest] places the senses in him.'[59] The Pravargya is a mystery rite, it requires a special initiation over and above the one for the Soma sacrifice.

The Pravargya is a complex ritual. Its first part, the Pravargya proper, is a sun ritual. Its main symbol is the red hot, glowing Mah&amacr;v&imacr;ra, 'the All-encompassing Hero,' who encompasses as sun the horizons of heaven,[60] unbounded space, all the world.

The second main part of the sacrifice begins when the vessel, having been made to blaze and having been hymned, is filled with milk. This part of the sacrifice belongs to the A&sacute;vins: it is the offering of hot milk due to them, the Gharma proper.[61] In this capacity, the Aitareya Br&amacr;hmaṇa lauds the Gharma as divine intercourse. The vessel is the member, milk is the semen, ejaculated - while boiling - into the fire as the divine womb, the birthplace of the gods, as generation.[62] Extending beyond the sacrifice, into the cosmos, Mah&amacr;v&imacr;ra, creator, procreator, by begetting extends from the bottom to the top, penetrates and supports heaven and earth.[63]

The coincidence within the same visual symbol, the Mah&amacr;v&imacr;ra vessel, of tropes taken from the shape of man is not to be seen as an overlapping of physical features. Each evocation conjured up an inner experience, valid in itself and not an image. The function of the lowest part of the pot is being felt as akin to that of feet; the top of the vessel, its opening, functions as mouth for liquid to be poured in and out. Or the entire pot is felt to function as the cosmic, procreative member, aggrandized as cosmic pillar. In another context, however, the Mukhalinga symbol of &Sacute;iva is a visually materialized form of such coinciding tropes. In this visualized symbol, the linga however had no procreative meaning. On the contrary, the concept of the ascending, not ejaculated but transubstantiated, semen as the substance of illumination is the motivating belief or experience that conjoins the shapes of phallus and head. The Mah&amacr;v&imacr;ra vessel is not anthropomorphic. It releases in the ritual the experience of the creative power of the Sun by the conception of 'Makha's Head' and again by an upsurge of procreative empathy of which the vessel becomes the liṅga-like symbol.

The allusion to the figure of man however is implied throughout the sacrifice. In the Pravargya, at the conclusion of the entire sacrifice the implements of the sacrifice are assembled around the Mah&amacr;v&imacr;ra pot either in the shape of man[64] or in that of the sun. This alternative implies the transfiguration of man, the sacrificer, which is the purpose of the sacrifice. The sacrificer has reached the sun, 'the radiant face of the gods, the eye of Mitra, Varuṇa and Agni.'[65] 'With the sun's eye I gaze upon thee.'[66] the priest had addressed the Mah&amacr;v&imacr;ra vessel when it had been baked in the fire and he had lifted the pot on the gravel kept ready for it. 'Were not the eye sun-like, never could it perceive the sun/ thus Goethe worded a knowledge expressed by the priest in the ritual sun-gaze of recognition of the completed Mah&amacr;v&imacr;ra vessel. This cosmic realization comprises all beings. Mah&amacr;v&imacr;ra, the sun, the All-encompassing Hero is addressed: 'Mah&amacr;v&imacr;ra, may all things regard me with the eye of a friend. May I regard all beings with the eye of a friend. With the eye of a friend do we regard one another.'[67] 'Long may I live to look on thee.'[68] 'Through a hundred autumns may we see that bright eye, god appointed, rise.'[69]

The Later and Separate Lives of Mah&amacr;v&imacr;ra and P&umacr;tika

Mah&amacr;v&imacr;ra, the All-encompassing Hero, is also the name of the last Jina or Conqueror of the twenty-four Jinas or Saviours (*t&imacr;rthaṅkara*) in the heterodox Jaina religion. His mythical life story is the exemplar for that of the other T&imacr;rthaṅkaras. Before his birth his mother had fourteen prognostic dreams. In one of them she beheld a vessel, a 'brimming vase.' This vessel of abundance is a symbol of ultimate knowledge.[70] In another frame of reference this vessel is also the Sun as vessel containing all time.[71] The brimming vase is common to the art of Buddhism and Hinduism. It is shown brimming with lotuses. They are particularly associated with the Lotus Goddess, Lakṣm&imacr;, Goddess of Plenty. The Mah&amacr;v&imacr;ra vessel, however, held no tangible contents. This sacred vessel as the All-encompassing Hero, the Sun, rules over space and time. In its Jain context it also holds that one supreme knowledge which has overcome the separateness of space and time, the manifoldness of the world.

The iconology of the prognostic dream vessel seen by the mother-to-be of the Saviour and which prefigures his life on earth, however, differs from all the other sacred vessels represented in Indian art. It is known to us in the Western Indian school of painting after the fourteenth century. There it is shown flanked, at the height of its neck, by wide open, far-seeing eyes. They are painted next to the vessel, whatever be its shape, not on it.

Together with it, they form an inseparable configuration showing with utmost clarity the vessel with the eyes that belong to it. Visually, this configuration combines, as a truly creative symbol, the presence of the sacred vessel and that of the all-seeing eyes which are its own. Floating on a monochrome coloured ground, they gaze, charged with the mystery of the sacred vessel, with the power of Mah&amacr;v&imacr;ra.[72]

The Mah&amacr;v&imacr;ra vessel and the P&umacr;tika mushroom are significant elements in the fabric of Indian tradition. P&umacr;tika starts with being a substitute for Soma, the drink of immortality, the elixir of life. P&umacr;tika qualifies for this part because P&umacr;tika is a mushroom reddish brown in colour. This mushroom amongst other reasons was chosen when the Soma plant, the fly-agaric, gradually became unavailable, in preference to other indigenous mushrooms for its being conspicuous or noticeable by the bad smell the cut mushroom develops. Hence also its name P&umacr;tika. Once chosen in lieu of Soma, P&umacr;tika usurped as its own the name '&Sacute;yen&amacr;bhṛta' and the myth of Soma's origin from on high. The substitute became authenticated as the original.

A gap of more than two and a half millennia, a transfer from Aryan priestly symbolism to tribal belief, the tribe adopting a Sanskrit name with but little change into its own language, the survival of this name in a Munda language, in a region at a considerable distance to the east from the ancient center of Brahmanical sacrifices, all this did not impair the ongoing myth of P&umacr;tika. This species is known to the Santal as 'endowed with a soul.' It is distinct from other mushrooms, from all the vegetable kingdom as being numinous. The odor of sanctity clings to this mushroom, however pejorative its telling name.

The sanctity of the Mah&amacr;v&imacr;ra vessel as artifact and symbol, judging by the pristine technique of shaping the earthen pot, would belong to an age far beyond the age of the Br&amacr;hmaṇas. Deified, the Mah&amacr;v&imacr;ra pot is the center of a ritual, entirely its own. The very making of it is part of the ritual. In this respect this pottery ritual may be grouped with the 'brick piling' ritual of the Vedic altar,[73] but also with the function of the potterpriest in South India today.[74] The Mah&amacr;v&imacr;ra pot is not in any way like a head urn, nor does it resemble a human figure: it refers to the sun, - not by virtue of its shape but by the process of making it. The vessel is dried by the heat of the sun and baked in a fiery pit. In the culminating ritual its validity is established in glowing glory wreathed in flames as symbol of the Sun or the Head of Makha, the cosmic giant.[75]

The worship and disposal - the whole ritual - of Mah&amacr;v&imacr;ra, though part only of the total Pravargya sacrifice are organised with the finality of perfection. The incongruity of an empty earthen vessel as symbol for Makha's head, the Sun, seems inexplicable. Yet a symbol is what one makes it to mean. The mouth or nose of the pot are as suggestive as are the implements in the final laying out of all the paraphernalia of the Pravargya, where they are understood to reconstruct the shape of man. Three pots (the original and the two reserve pots should the original crack) form the 'head,' the undipped broom that had been used in the ritual is placed above the head, so as to form a hair tuft, the tongs are the shoulders, and so on, the straws of the other broom are scattered over the configuration that embodies the essence of man, so as to form its muscles.[76] Whatever took part in the sacrifice, becomes part of the transfiguration of sacrificial man. The configuration of the paraphernalia of the sacrifice is vested with their composite magic. If the implements are arranged in a way so as to conjure up an image of the sun, the same purpose is fulfilled.

The head of sacrificial, transfigured man is represented by the three Mah&amacr;v&imacr;ra pots, each of them is the head of the sacrifice - even though only one played its role. Though there are three they mean one and the same only. In the sacrifice Makha's Head is the sun, the pot is Makha's head, the pot is the sun. The

72. In some of the paintings the vase and the flanking eyes are combined into a phantasmagoric 'face' (Coomaraswamy, Pl. 35,2.) comprising further subservient devices. On the other hand, the conception of the Suneye, as eye '*per se*' more or less independent of the face of the figure is one of the main factors in the style of the Western Indian school of painting, *cf* S. Kramrisch, 'Western Indian Painting,' under publication by Bhagaw&amacr;n Mah&amacr;v&imacr;r 2500th Nirv&amacr;ṇ Mahotsava Samiti, Bombay, 1974.
73. The square *ukh&amacr;* made of clay which held the heads of the five sacrificial victims was part of the sacrificial pile. It was neither the central cult object nor even a cult object in its own right.
74. S. Kramrisch, *Unknown India*, Philadelphia Museum of Art, 1968, 57.

pot is the head though it is unlike a head. The pot is made by the priest, the Adhvaryu, or he delegates this task to a potter (*kartṛ*, 'the maker'). The pot is the sun, is Makha's head, the head of the sacrifice not by a likeness of its shape but by that of another quality which has its maximum effect at the culmination of the sacrificial heating of the vessel. It is then that Mah&amacr;v&imacr;ra, anointed with butter and, heated to the highest degree, attains the fieriness of the sun. It had been covered with a golden dish so that it should protect heaven from its heat.[77] The 'All-encompassing Hero, glowing gold-colored, encompasses as sun, the horizons of heaven.'[78]

In South India of the present day, the cult of Aiyanar requires clay images of Aiyanar and his retinue. They are made by the village potter who is at the same time the officiating priest. He is a Kusavan by caste, son of a Br&amacr;hman father and a &Sacute;udra woman. Did clay, being baked in the fire and turning from earth to glowing splendor, effect in a potter-priest an initiation through the potter's craft, familar only with his sundried output? Did he behold the fiery sun glowing in his own work? Did the sun cult of the Mah&amacr;v&imacr;ra pot arise amongst potters and make them priests of their calling? Was it a cult indigenously Indian where the heat of the sun is as powerful as its splendor so that transposed into a rite the glow of the earthen pot and the vehemence of the flames are intensified by the anointing of the vessel? It was made by hand, the clay pressed into shape by the thumbs without a potter's wheel. This pristine technique was hallowed. It had arisen from direct contact, preserved the shape and the manner in which the vessel had been fashioned when the sediments of more than one myth were integrated in its substance and when the Sun vessel once-finished was not to be touched by human hands. It was not to be touched by human hands for its heat would have burnt them. The vessel was not to be touched because it was sacred. It was not to be touched so that the only contact with the sacred object was by sight, sight intensified to the exclusion of all other sensory perceptions, a rite of 'seeing' a communion by vision.

An indigenous sun cult celebrated by the ritual of its craft became the 'Head of the sacrifice' and Makha's head was joined to its body. Symbols live their own lives, draw to themselves their affinities, coalesce with them and emerge showing in various facets an identity of ambience of meaning. Mah&amacr;v&imacr;ra, in the Aitareya Br&amacr;hmaṇa, encompasses all creation, in the intensity of the climactic moment of procreation. The vessel now stands for the Liṅga. Head and procreative organ are coterminous yet do not overlap in the vision of the Br&amacr;hmaṇas.

Through long stretches of Indian thought and imagery, the symbolism of Liṅga and head combined in the creation of a visual whole. The Mukhaliṅga of &Sacute;iva, the phallus with a head or heads, is a concretely realised sculptural form perduring for two thousand years of Indian art, though with a total reversal of the implied meaning which here extols antithetically the power of creative heat as fervor of ascetic sublimation not as a spending into the fiery lap of all gods-to-be but as a self-contained rarification and ascent of this power.

On another facet of its meaning, Makha's head, the Sun, the All-encompassing, All-seeing eye of the world, fastens its steady gaze on all and everyone. The brimming vase sends forth this glance in eyes that are painted outside its shape, bestowing the power of sight and insight. Two vessels overlap in this Jain rendering of ancient themes. The one is the Mah&amacr;v&imacr;ra pot, which the 'Unbounded,' Aditi, is invoked to encompass.[79] It contains ultimate knowledge and all time. These are intangible contents. The other vessel is the 'full pot' (*p&umacr;rṇa ghaṭa*), the brimming vase of plenty, Laksnil herself.

The symbolism of the Mah&amacr;v&imacr;ra vessel is deeply ensconced and has manifold connections in Indian thought and art. P&umacr;tika, on the other hand, only contributes to the substance of the vessel. The mantle of King Soma had fallen on this notable mushroom, which inherits the glory of Soma for whom it is a surrogate. Its heyday is in the Pravargya ritual. Then the mushroom is lost to us in a millennial darkness from which, miraculously, it emerges 'endowed with a soul' amongst the aboriginal Santal of Eastern India in our own day.

While on one level the cow whose milk will fill the pot is Aditi, on the highest level Aditi remains Boundlessness itself.

CHAPTER FOUR

The Last Meal of the Buddha

by R. Gordon Wasson

What was *S&umacr;kara-Maddava?*

Upwards of a dozen scholars[1] in the past century have commented on what the Buddha ate at his Last Meal, *ca* B.C. 483, and the puzzling mystifications in the evidence. The meal was served to him and his suite of monks by his host the metal-worker Cunda at P&amacr;v&amacr;, a village that lay near Kusin&amacr;r&amacr; where the Mah&amacr;parinirv&amacr;ṇa - the "Great Decease" as the Rhys Davidses translated it - was scheduled to take place some hours later. The canonical P&amacr;li Text says that Cunda served his august guest *s&umacr;kara-maddava*, a hapax in P&amacr;li. Walpola R&amacr;hula, the Buddhist monk and scholar residing in the West, has assembled in a memorandum for us the relevant P&amacr;li texts with his translations and notes, and this document is appended to our paper.

The first part of that compound word, *s&umacr;kara-*, is simple: "pertaining to swine," *s&umacr;k-* being cognate with Latin *sus*. The second element is generally thought to mean tidbits, dainties, but whether as a specially delicate part of the pig's meat or as a food of which swine were specially fond, whether a subjective or objective genitive, no one can say. Rhys Davids noticing that in Bihar there was a common edible underground fungus, translated *s&umacr;kara-maddava* by "truffles."[2] This was a successful pitch, considering that by "truffles" he meant an underground fungus common thereabouts, although no truffle (= *Tuber*) has been discovered so far in Bihar. His underground fungus was a *Scleroderma*, a little snow-white ball that is gathered just as soon as it appears on the surface. There are a number of genera of underground fungi of which truffles are one, and each genus has many species.

The two canonical P&amacr;li Commentaries discuss but do not agree on the meaning to give to *s&umacr;kara-maddava*. One of them is the canonical P&amacr;li Commentary on the *D&imacr;gha Nik&amacr;ya*, *Sumaṅgalavil&amacr;sini*, and the other, the *Paramatthajotik&amacr;*, the canonical Commentary on the *Ud&amacr;na*. These Commentaries took their present form in P&amacr;li under the guidance of the celebrated monk Buddhaghoṣa early in the fifth century of our era, mostly from Sinhala sources available to him. Each of these commentaries suggests various dishes as possibilities. Both include pork and an 'elixir' (a chemical preparation) in the list of choices. The canonical P&amacr;li Commentary on the *D&imacr;gha Nik&amacr;ya* adds soft rice with the broth of the five products of the cow. The canonical P&amacr;li Commentary

on the *Ud&amacr;na*, deriving its authority from the Great Commentary (now lost) that dates from the third century B.C., offers two further choices: bamboo shoots (sprouts) trodden by pigs, and *mushrooms grown on a spot trodden by pigs*.

That the Buddha was eating his last meal was known to everyone thereabouts: nothing that happened there could have escaped those within eye-reach nor have been forgotten by them, not least because of the awesome event to take place a few hours later, the Buddha's translation to Nirvana that he had been predicting for that night since he was in Vai&sacute;ali three months before.

Dr. Stella Kramrisch, building on the work of the late Professor Roger Heim and me in eastern India, has identified with finality the *s&umacr;kara-maddava* as the *P&umacr;tika*,[3] a plant that figures conspicuously in the Br&amacr;hmaṇas and other early post-Vedic sacred Sanskrit texts. In this paper I will examine the Last Meal at P&amacr;v&amacr; and the death of Gautama the Buddha at Kusin&amacr;r&amacr; in what is today northern Bihar. I will focus attention on what he ate at his Last Meal - a matter of little theological importance to the Theravadin branch of Buddhism and none at all to the Buddhists of the Greater Vehicle, but pertinent to our mushroomic inquiries and notably, as I shall show, to the identity of Soma.

Of all the scholars who have dealt with the Last Meal of the Buddha, I believe only one, André Bareau, has addressed himself to the surprising anomaly offered by the possibility of either pork or mushrooms being served to the Buddha at this meal. Here is what Bareau has to say:

> En effet, la viande de porc et plus encore les champignons sont des choses pour lesquelles les Indiens impregnés de culture brahmanique, comme l'étaient le Buddha et une grande partie de ses disciples, éprouvent un profond, un insurmontable dégout et que ne consomment guère que certains tribus sauvages ou des gens de basse caste, rejetés par la bonne société et pressés par la faim. L'idée d'offrir au Bienheureux, pour l'honorer et le régaler, comme un mets de choix, ... de la viande de porc ou des champignons est aussi insolite que si, dans une légende occidentale, on offrait à quelque éminent personnage un festin dont le plat principal serait une cuisse de chien ou une purée de goémon, des sauterelles frites ou des chenilles grillées; cela paraîtrait à juste titre une plaisanterie ou ferait croire à une erreur de copie. [*Recherches sur la biographie du Buddha*. Tome 1, p 267. Paris. 1970. Publications de l'Ecole Française d'Extrême-Orient, Vol LXXVII]

Confirming what Bareau says, Chap V-5 of the laws of Manu, believed to have been committed to writing around the beginning of the Christian era, declares that:

> garlic, leeks and onions, mushrooms and (all plants) springing from impure (substances), are unfit to be eaten by twice-born men,

and this proscription is repeated in V-19:

> A twice-born man who knowingly eats mushrooms, a village-pig, garlic, a village-cock, onions, or leeks, will become an outcast.

Here the prohibition carries a dire penalty. Mushrooms are forbidden in two further clauses, VI-14 and XI-156. The repeated prohibition applies expressly to twice-born men, which embraced the three upper castes.

The ban on mushrooms was no dead letter. Sir William Jones quotes from a commentator on the laws of Manu named Yama:

> ... the ancient Hindus held the fungus in such detestation that Yama... declares 'those who eat mushrooms, whether springing from the ground or growing on a tree, fully equal in guilt to the slayers of Bráhmens, and the most despicable of all deadly sinners.' [*The Works of Sir William Jones*, Vol V, pp 160-161, London, 1807.]

---

3. Stella Kramrisch: 'The M&amacr;hav&imacr;ra Vessel and the Plant P&umacr;tika,' *supra*, 95.

This is the most extravagant outburst of mycophobia that we have found anywhere, surely the most extravagant to be found in the Indo-European world, which is saying a good deal. The learned Brahman tells us that the simple mushroom-eater is as bad as the murderers of Brahmans! Why such passionate, such exaggerated censure? Bareau, in comparing the Hindu eater of mushrooms to one among us who eats dog's flesh, was engaging in understatement.

Three months before the Last Meal at P&amacr;v&amacr; and before his Mah&amacr;parinirv&amacr;ṇa, the Buddha had been sojourning at Vai&sacute;ali and thereabouts. While in the vicinity of Vai&sacute;ali he had suffered a grave illness, attributed from ancient times to a chronic gastric upset, probably dysentery; had felt the weight of his years, had called himself an 'octogenarian,' and had announced his intention to go to Kusin&amacr;r&amacr; and there three months later to experience the Mah&amacr;parinirv&amacr;ṇa, the Final Extinction. He was predicting the time and place of his own end. He made his way to Kusin&amacr;r&amacr; with his followers on foot, teaching the doctrine as was his wont, and it took him three months to cover the 140 kilometers. To his disciples and the villagers he made freely known his purpose: he never wavered in his resolution, nor did he hide it from anyone.

The day before the Buddha reached Kusin&amacr;r&amacr; he arrived at the nearby village of P&amacr;v&amacr; and passed the night in the mango grove belonging to one Cunda, a metal-worker or blacksmith, and therefore a &sacute;&umacr;dra, the lowest of the four castes in Hindu society. Cunda, appearing almost immediately, inquired what the Buddha desired. According to one of the Chinese recensions of the Buddha's life, the Buddha explained that he was to undergo the Mah&amacr;parinirv&amacr;ṇa in Kusin&amacr;r&amacr;: lamentations followed. Cunda invited the Buddha and his many followers to take their single meal the next day with him, and by his silence the Buddha accepted. Cunda withdrew to assemble the food and prepare it. In the morning Cunda came to summon the Buddha and his followers to the meal that he had prepared.

Cunda, as we said before, was a &sacute;&umacr;dra, a man of the lowest caste. On the other hand, as the metal-worker of the region he was a technician, comfortably off, extending hospitality on a moment's notice to the Buddha and his numerous followers, one accustomed to meeting and mixing with travelers including individuals of what are today called the 'scheduled castes,' aboriginal tribesmen who were not Hindus and therefore not a part of the dominant Hindu society. His forge may well have been the *raison d'être* for P&amacr;v&amacr;. When the Buddha arrived at Cunda's dwelling-place and was seated in the place prepared for him, he (according to the *D&imacr;gha Nik&amacr;ya*) addressed Cunda saying,

> As to the *s&umacr;kara-maddava* you have made ready, serve me with them, Cunda, and as to the other food, sweet rice and cakes, serve the monks with them. [Chap. IV, §18, p. 138]

The Buddha then said to Cunda,

> Whatever *s&umacr;kara-maddava* are left over to thee, those bury in a hole. [§19]

In a hole, not just throw away, and we are told that the surplus *s&umacr;kara-maddava* Cunda buried in a hole. Apparently Cunda had brought *s&umacr;kara-maddava* for the whole company, as he had thought all would share in them, so there must have been an ample surplus.

Then the Buddha added these remarkable words,

> I see no one, Cunda, on earth nor in Mara's heaven, nor in Brahma's heaven, no one among the Samaṇas and Br&amacr;hmaṇas, among gods, and men, by whom, when he has eaten it, that food can be properly assimilated, save by a *Tath&amacr;gata*. [§19]

Obviously the Buddha had recognized at once what he was being offered, the *s&umacr;kara-maddava*, and he knew the mushrooms were of a species that would shortly smell bad ('stink') if they were not eaten or buried in a hole. (To this day the custom among some Santal seems to survive to bury any surplus *s&umacr;kara-maddava* in a hole.) Perhaps it was the first time in his life that the Buddha, of kṣatriya origin, was being offered mushrooms to eat. But these particular mushrooms were familiar to him because of their unique role in the Hindu religion in which he had been brought up.

André Bareau appreciates to the full the solemnity of this dish of *s&umacr;kara-maddava*, though he did not know what it was. He says:

> ... cette nourriture, la dernière que consomme le Bienheureux avant son Parinirv&amacr;ṇa, est une nourriture en quelque sorte sacrée, dont les riches qualités, la puissance essentielle, vont lui permettre d'accomplir cet exploit surhumain, la suprême Extinction. Cette richesse, cette puissance sont trop grandes pour être supportées par les autres êtres, hommes ou dieux, qui n'auront jamais, et de loin, à exécuter une action comparable. [*Recherches sur la biographie du Buddha*. Tome 1, p. 271. Paris. 1970. Publications de l'Ecole Française d'Extrême-Orient, Vol LXXVII]

Here was the Buddha, at one of the two supreme moments of his life, unexpectedly offered at his last meal a dish that Hindus of the upper castes were forbidden to eat, an edible mushroom, a dish that was the surrogate for Soma when formally sacrificed in an utterly different manner and setting. Buddhaghoṣa quotes the Great Commentary (*Mah&amacr;-aṭṭhakath&amacr;*) as saying of Cunda's motives in offering this dish to the Buddha and his monks:

> They say that Cunda, the smith, having heard that the Exalted One would attain *parinibb&amacr;na* that day, thought it would be good if he could live longer after eating this dish, and offered it wishing for the Master's longevity. [p. 138 *infra*]

Walpola R&amacr;hula's comment on the Great Commentary from which we have extracted this quotation is as follows:

> The *Mah&amacr;-aṭṭhakath&amacr;* (Great Commentary) is the most important of the ancient original Sinhala commentaries dating back at least to the 3rd century B.C., on which are based the present available P&amacr;li commentaries of the 5th century A.C., including the Commentaries on the *D&imacr;gha Nik&amacr;ya* and the *Ud&amacr;na* from which these two commentarial passages are taken.

The Great Commentary cites hearsay ('They say...') as the reason that Cunda served those particular mushrooms on that day. The hearsay may be right, but if indeed Cunda felt the dish of *P&umacr;tika* would extend the life of the Buddha, he must have confused the properties of *Soma* and of the *P&umacr;tika*. The *P&umacr;tika* enjoyed a unique status as the exalted surrogate for *Soma*, but, whereas *Soma* was consumed, the *P&umacr;tika*, as Kramrisch quotes the sources,[3] were mixed with the clay and then fired ritually in the making of the Mah&amacr;v&imacr;ra pot and there is no reason to think that the Hindus of the three upper castes or even the Brahman hierarchs ate these fungi. Does not the text of the Great Commentary permit another interpretation: Cunda, a &sacute;&umacr;dra accustomed to eating the *P&umacr;tika*, served them because it was the season of the rains (which had started when the Buddha and his suite were in Vai&sacute;ali) and the mushrooms, which he had known all his life, were fresh from picking? If so, it was the Buddha who at once recognized them because of their role in the Hindu religion and stopped Cunda from serving them to the others. The Buddha was certainly not accustomed to eating mushrooms of an kind, and here he was being invited to eat those slimy mucoid excrescences, as the twice-born Hindus with loathing would view them. May not this, combined with the emotional tension of his imminent extinction, have provoked a recrudescence of his intermittent attacks of dysentery?

I now interrupt our account of the Buddha's progress on his last day to set forth certain discoveries bearing on *s&umacr;kara-maddava*.

The Santal and the *Putka*

By an accident of fortune the Santal people living now in western Bihar and Orissa have preserved for us, as though in a time capsule, the identity of the Sanskrit *P&umacr;tika*, a plant until recently unidentified, an ingredient in the clay of the Mah&amacr;v&imacr;ra vessel that was fired in the course of the Pravargya sacrifice. The *P&umacr;tika* is known as having been the surrogate for Soma,[4] though probably today by no Santal, and it figures conspicuously in the Br&amacr;hmaṇas and other early sacred Sanskrit texts. As I said before, it was identified by Kramrisch on the strength of evidence produced by Heim and me.[5] (Roger Heim, outstanding French mycologist, had served as President of the Académie des Sciences and was Director of the Muséum National d'Histoire Naturelle: he accompanied me on many of my field trips.)

The late Georg Morgenstierne, the Norwegian linguist, specialist in the Kafir and Dardic languages, also a Sanskrit and Persian scholar, first called my attention to an oddity of the Santal language of special interest to me, as it affected their mushroom vocabulary. Santali was not a specialty of his but he was a vast reservoir of general linguistic knowledge.

The Santal, who number some millions, live in villages scattered in the area of eastern Bihar known as the Santal Parganas, in the western north-and-south strip of West Bengal, and in Orissa as far south as the Simlipal Hills. The Santal are slight in build, neat in dress, with sleek, black hair and dark almost black regular features, their houses of red earth ornamented with curious painted geometric patterns and neatly disposed within and without, in these respects contrasting with the Hindus. By tradition they are food gatherers, hunters, fishermen, but are now taking to agriculture.

From the Indo-European point of view, the Munda languages, of which Santali is the biggest member, are peculiar: in Santali there are no genders, - no masculine, feminine, neuter. Their nouns are either animate or inanimate endowed with a soul or without a soul. The entire animal kingdom is animate, has a soul. The whole of the mineral kingdom is inanimate, without a soul. There are oddities: *eg*, the sun, moon, stars are animate. Strangely, the vegetable kingdom - herbs, shrubs, trees, the fungal world - is inanimate, but *with a single exception*, one species of mushroom, the *putka*. The Santal do not know why the *putka* is animate, or so they say. The *putka* is an underground fungus that is gathered for eating just as it appears, a snow-white little ball, in mycology identified by Heim as a *Scleroderma*, well known in Europe. In season it is commonly highly prized as food by the Santal, and much sought for by women and children.

For the last century the Norwegian Lutherans have made a vigorous play to be helpful in India by missionary activity among the Santal. The Rev. P. O. Bodding, a resident of the Santal Parganas from 1890 to 1934, mastered their language and compiled an admirable Santal-English dictionary in five large volumes, pointing out among other things the oddity of *putka*, which enjoyed in the vegetable kingdom the unique attribute of a soul. He could not explain this anomaly, nor did he venture an etymology for *putka*. But in the preface to his dictionary Mr. Bodding observed a noteworthy fact:

> Strangely enough, the Santals use some pure Sanskrit words, which, so far as I know, are not heard in the present day Hindi.

I visited Dumka in the Santal Parganas for the first time in January 1965. The Rev. A. E. Strønstad, Mr. Bodding's successor, and Mrs. Strønstad put me up and Mrs. Strønstad graciously served as my interpreter. We asked elderly and knowledgeable Santal in Dumka and the surrounding villages why *putka* was animate. No one could tell us. Our best informant turned out to be Ludgi Marndi, the widow of a native Lutheran pastor. She told us that there was one entheogenic mushroom.[6] Was it the *putka*? No, not at all. It was merely *ot*', 'mushroom' of the soulless class. No one was able to find an example of this inebriating mushroom, but the description (big, growing only in dung mostly of cattle, and white reaching an intense cream color in the umbolate center) tallied with *Stropharia cubensis*. Neither were there any *putka* at the time of my visit: they would come after the monsoon broke. Ludgi Marndi and some other informants suggested that the *putka* was animate because it was found regularly in the sacred grove of *sarjom* trees near every village. (Santali *sarjom* = Hindi *s&amacr;l = Shorea robusta*.) But the sacred *sarjom* trees were not animate so why should a mushroom growing from their roots be? Furthermore, the *putka* grew also in mycorrhizal relationship with other species of trees. Ludgi Marndi seemed an especially good informant and just before we were leaving for New Delhi, defeated as we thought, I asked if I might talk with her again. We went over the same ground. Suddenly she leaned forward across the table to Mrs. Strønstad and in a whisper (as translated to me) said that she would tell her why she thought the *putka* were animate: 'You must eat them within hours of gathering *for they will soon stink like a cadaver*.' She spoke under considerable emotion. We knew not what this meant but at once I jotted down her translated words in my notebook and her remark appeared later, somewhat toned down, in the paper[7] that Heim and I published.

---

[4] See Manfred Mayrhofer: *A Concise Sanskrit Etymological Dictionary*, entry under *p&umacr;tikaḥ*, also Vol. 3, p. 761.

My 1965 visit was followed by another with Heim in July-August 1967, he flying from Paris to Calcutta and I from New York. We started our quest in the Simlipal Hills and the village of Bisoï in Orissa, where the Santal and their close linguistic kin the Ho intermix, as well as several other peoples. Again we questioned the natives about why the *putka* were animate. In Nawana in the Simlipal Hills I spent the evening with Ganesh Ram Ho, the chief of the village, and he, as Ludgi Marndi had done, volunteered the information that there was an entheogenic mushroom, and his description tallied with Ludgi's; his testimony confirmed that it was probably *Stropharia cubensis* or a close cousin. (That these two excellent informants volunteered to speak of an inebriating mushroom, doubtless *Stropharia cubensis*, is a lead not to be neglected: it may have played a part in the cultural past of the Santal and of Soma.) But, just as before, it was '*ud*' and soulless. '*Ud*' is 'mushroom' in Ho.

We published the account of our trips to the Santal country in *Les Cahiers du Pacifique*, #14, September 1970. Kramrisch in time saw our paper and she grasped immediately that the *putka* of the Santal was the *P&umacr;tika* of the Br&amacr;hmaṇas, of the Pravargya sacrifice and the Mah&amacr;v&imacr;ra pot. The *P&umacr;tika* had been the surrogate for Soma and naturally it would possess a soul! Kramrisch deserves a rich accolade for discovering that Santali *putka* was a loanword from the Sanskrit *P&umacr;tika*. When Soma was being abandoned, probably over a long period that ended shortly after B.C. 1000, the *P&umacr;tika* took its place, not as an entheogenic drink like Soma in the earlier sacrifice but as a component with the clay in the ceremonial firing of the Mah&amacr;v&imacr;ra vessel. Its stench (of which Ludgi Marndi had spoken) was turned into fragrance when the pot, held by tongs, was fired in the course of the rite. No one had ever known what plant it was. We now know that, like Soma, it was a mushroom, but a common mushroom, and it possessed divine qualities though less than Soma's.

In Santal culture not only is the *putka* animate, endowed with a soul: it possesses another of Soma's attributes. The belief is apparently universal among the Santal that the *putka* is generated by (mythological) thunderbolts.[8] Long after the Brahmans have lost any use for or knowledge of this mushroom, and have lost all special contact with the Santal, these humble, hardworking people, untouchables, still believe that the *putka* is procreated by the lightningbolt, as the Vedic Brahmans believed that Soma was procreated by the Vajra of Indra, or Parjanya, the god of lightning. Here is another manifestation, another proof, of the breathtaking cultural intensity millennia ago of the religion of the hierarchs of the Aryans. The lightningbolt was thought of as the sperm, the spunk, fecundating the soft mother earth with the entheogenic mushrooms.

The Santal believe there are two kinds of *putka*, the *hor putka* and the *seta putka*, one smooth and the other rough. Heim said the two kinds were merely different stages in the life cycle of the one species. The *hor putka* is the 'man *putka*,' not in the sense of male but of a human being, or of the 'Santal' whom they naturally regard as *par exellence* the human being. The *seta putka*, which is rough, is the 'dog *putka*,' the dog not being

---

5. *Cahiers du Pacifique* #14, September, 1970: 'Les putka des Santals, champignons doués d'une âme.' p. 77. For those interested, the mushroom was *Scleroderma hydrometrica* (Pers.) H. var. *maculata* (Pat.) H. In Europe it breaks out into an *Astraeus*, but in India remains closed, a *Scleroderma*.
6. 'Entheogen' is a word devised by some of us for those plant substances that inspired Early Man with awe and reverence for their effect on him. By 'Early Man' we mean mankind in prehistory or proto-history, before he could read and write, whether long long ago or since then or even living today in remote regions of the earth. 'Entheogen' (or its adjective 'entheogenic') has the advantage that it does not carry the odor of 'hallucinogen,' 'psychedelic,' 'drug,' *etc*., of the youth of the 1960s. See *Journal of Psychedelic Drugs*, Vol. 11 (1-2), Jan-June 1979, pp. 145-6.

despised as it is in Hindu culture. A few of the Santal spoke to us of a third *putka*, the *rote putka* or 'toad *putka*.' Most Santal did not recognize this term and of those who did, most could not say what kind of mushroom it meant. But when we were in Kathikund, a village in the Santal Parganas, we witnessed from our veranda a violent midday thunderstorm and within hours and then throughout the night a host of puffballs appeared on the plain before our bungalow. One of our Santal companions told us with assurance that these were indeed *rote putka*. In this instance the puffball was *Lycoperdon pusillum* but probably any other puffball coming in response to a thunder shower would be a *rote putka*. In short, the *rote putka*, which is not eaten

8. See p. 123, fn. 2; *SOMA: Divine Mushroom of Immortality*, pp. 39-40.

by the Santal, is a false *putka*. ... The entheogenic mushrooms of which Ludgi Marndi and Ganesh Ram Ho had told us, probably *Stropharia cubensis*, are not *putka*: they are merely *ot*', or *ud* in the Ho language, enjoy no grammatical distinction in the languages, and so far as I learned no distinction in folklore. But it is imperative that this be explored much further. Does its entheogenic virtue account for the colored geometrical designs, endlessly varied, that decorate the exteriors of many Santal houses?

Throughout our visits to the Santal country the people we spoke with said that pigs dug for the *putka*, thus confirming what the canonical P&amacr;li Commentary on the *Ud&amacr;na* says of *s&umacr;kara-maddava*. But I was seeking a quotation and after returning to New York the Rev. Johannes Gausdal, a retired missionary living in Oslo, put me in touch with Mr. Gora Tudu, principal of Kaerabani High School, and we asked Mr. Tudu through Mr. Gausdal whether swine sought out the *putka* in the forest. Here is what he replied:

> Whether the pigs eat *putka* or not? In this case also I got some *putka* from the forests. I tried them on a few pigs - the old *putka* were not liked, but the new ones seemed to be delicacies of the pigs. They ate them with relish. Also in the forest I found at several bushes where *putka* usually come up several marks of upturned earth, indicating that the pigs had been digging for the *putka*. [Letter in my *Munda* file]

I was careful not to divulge the reason this question was being asked. There are a number of genera of underground fungi divided among scores of species, and I should be surprised if they all drew pigs but perhaps they do.

Mr. Gausdal asked also about the smell of aging *putka*. Mr. Tudu replied, with unconscious humor:

> I collected some *putka*, both *hor putka* and *seta putka*, and put them in dishes in dry condition as well as wet, just to see what the smell would be like after decomposition. In both the smell emitted was that of decomposing wood material, not at all bad in the sense of any blooded being. The smell was never too strong or filthy. The worst I could compare, the smell was that of rotting jute in muddy water.

Kramrisch tells me that rotting jute in muddy water creates a fearful stench. Mr. Tudu possesses the endearing quality of dirt farmers everywhere: their fondness for the smell of dung heaps, for example, is powerfully colored by what dung means for the crops. The earthy smells of farm yards also possess a likeable integrit.

The Gausdal-Gora Tudu correspondence was conducted in Santali, but my questions and his answers to them were in English.

We know that the Santal have not always lived where they do now. Six hundred years ago they lived to the west of Benares on the Chot&amacr; N&amacr;gpur plateau, and tradition has it that long before then the Santal had lived much further to the West, just where no one knows, but possibly near the ancient center of Brahmanical sacrifices, where they could have had close relations with the Aryans, perhaps serving them before and through the shift from Soma to the *P&umacr;tika*. This would also explain the other Sanskrit words in Santali that Mr. Bodding notes. Indeed he remarks in his preface to his Santal Dictionary that 'the description of the Dasyus in the Vedas and the Mah&amacr;bh&amacr;rata seems to be adaptable to many a Santal.'

The death of the Buddha

Having completed the Santal interpolation, we will now revert to the text of the *D&imacr;gha Nik&amacr;ya* as translated by the Rhys Davidses.

After the discussion of the *s&umacr;kara-maddava*, the Rhys Davids translation continues with an astonishing development:

> §20. Now when the Exalted One had eaten the rice prepared by Cunda, the worker in metals, there fell upon him a dire sickness, the disease of dysentery, and sharp pain came upon him, even unto death. But the Exalted One, mindful and self-possessed, bore it without complaint. [Chap. IV]

This was a disconcerting turn of events, since the Omniscient One has but lately said that he sees no one, save a Tath&amacr;gata, who can properly assimilate the *s&umacr;kara-maddava*, which he has just eaten. If the circumstances were invented, as Bareau thinks, what a strange set of circumstances for utterly devoted followers of the Buddha to have invented! The mushrooms, now that we know precisely, were sound and there was never a risk: moreover, aged *P&umacr;tika* would declare their age by their stench! And Cunda was a responsible man to buy and cook them. However, let us remember that in the upper Hindu castes where the Buddha had been brought up and lived out all his early life, even though he was now free from food tabus and caste distinctions, all mushrooms would be shunned as inedible; but here, at a critical moment of his life, he was being offered *P&umacr;tika*. Did Cunda know the role of the *P&umacr;tika* in the religion of the twice-born castes? Did he perhaps know it by rumor, inaccurately? Or did he not know it at all and was he serving these mushrooms solely for the excellent reason that they were fresh and in season? It is clear from the testimony of the *D&imacr;gha Nik&amacr;ya* that the attack suffered by the Buddha was sudden; it was violent; it alarmed the whole company; it was virtually over quickly, for not long afterward the Buddha instructed the faithful &Amacr;nanda that they should walk on to Kusin&amacr;r&amacr; close by. But what could be more natural than a violent reaction in one brought up as a kṣatriya to consider mushrooms inedible? And with his large intestine being chronically inflamed with dysentery, his diarrhoea was a natural sequence. 'Dysentery' is a translation of the P&amacr;li *lohita-pakkhandika*, which means 'bloody flux' in old-fashioned English.

The account in the *D&imacr;gha Nik&amacr;ya* is as though written to order for this explanation. Two quatrains, apparently independent of each other, are inserted in the text of the *D&imacr;gha Nik&amacr;ya* (§20, p. 139) at this point. Buddhaghoṣa adds a note: 'It should be understood that these are the verses by the Theras [Elders] who held the Council' the Council that took place at R&amacr;jagṛha, at which some months later the initial plans were laid for mobilizing detailed recollections of the Buddha's teachings and for organizing the Buddhist religion. The first quatrain shows how those present murmured against Cunda, and, according to the second, there was also murmuring about the mushrooms. Here are the quatrains in the Rhys Davids translation:

> When he had eaten Cunda's food,
> The copper-smith's-thus have I heard
> the bore with fortitude the pain,
> The sharp pain even unto death.
>
> When he had eaten, from the mushrooms [=*s&umacr;kara-maddava*] in the food
> There fell upon the Teacher sickness dire,
> Then after nature was relieved the Exalted One announced and said:
> I now am going on to Kusin&amacr;r&amacr;

After the episode the Exalted One went out of his way to exonerate Cunda of blame, thus making even more tenable my explanation of his illness. For if Cunda had been guilty of negligence in choosing the mushrooms, why should the Omniscient One have exonerated him?

> 42. And the Exalted One addressed the venerable &Amacr;nanda, and said: - 'Now it may happen, &Amacr;nanda, that some one should stir up remorse in Cunda the smith, by saying: - "This is evil to thee, Cunda, and loss to thee in that when the Tath&amacr;gata had eaten his last meal from

> thy provision, then he died." Any such remorse, &Amacr;nanda, in Cunda the smith should be checked by saying: - "This is good to thee, Cunda, and gain to thee, in that when the Tath&amacr;gata had eaten his last meal from thy provision, then he died." From the very mouth of the Exalted One, Cunda, have I heard, from his own mouth have I received this saying: - "These two offerings of food are of equal fruit, and of equal profit and of much greater fruit and much greater profit than any other-and which are the two? The offering of food which, when a Tath&amacr;gata has eaten, he attains to supreme and perfect insight; and the offering of food which, when a Tath&amacr;gata has eaten, he passes away by that utter passing away in which nothing whatever remains behind these two offerings of food are of equal fruit and of equal profit, and of much greater fruit and much greater profit than any others. There has been laid up by Cunda the smith a karma redounding to length of life, redounding to good birth, redounding to good fortune, redounding to good fame, redounding to the inheritance of heaven, and of sovereign power." In this way, &Amacr;nanda, should be checked any remorse in Cunda the smith.' (p. 147-8)

Bareau concedes that Cunda and P&amacr;v&amacr; may be original elements but, if so, thinks that they are the sole original elements in the narrative of the Buddha's stay in P&amacr;v&amacr;:

> Deux siècles après le Parinirv&amacr;ṇa, ces deux noms, ici P&amacr;v&amacr; et Cunda, étaient les deux seuls éléments anciens, peut-être même historiques, de l'épisode du dernier repas du Buddha. Aucun souvenir n'avait donc été conservé ni des incidents qui avaient pu s'y produire ni de la nature précise des aliments qui avaient été servis alors au Bienheureux. [Tome I, p. 258 in his *Recherches sur la biographie du Buddha*, Ecole Française d'Extrême Orient]

Perhaps in the light of our discoveries Bareau may grant more to the history of the Buddha's Last Meal in P&amacr;v&amacr; as told in the *D&imacr;gha Nik&amacr;ya*. Too many had witnessed the episode with the mushrooms to permit the Theras to suppress it: his sudden illness had provoked too much talk.

Here is the account of the Buddha's death according to the *D&imacr;gha Nik&amacr;ya*, Chap. V,

> 1. Now the Exalted One addressed the venerable &Amacr;nanda, and said: - 'Come, &Amacr;nanda, let us go on to the S&amacr;la Grove of the Mallas, the Upavattana of Kusin&amacr;r&amacr;, on the further side of the river Hiranyavat&imacr;.'
> 'Even so, lord!' said the venerable &Amacr;nanda, in assent, to the Exalted One.
> And the Exalted One proceeded with a great company of brethren to the S&amacr;la Grove of the Mallas, the Upavattana of Kusin&amacr;r&amacr;, on the further side of the river Hiranyavat&imacr;: and when he had come there he addressed the venerable &Amacr;nanda, and said:
> 'Spread over for me, I pray you, &Amacr;nanda, the couch with its head to the north, between the twin S&amacr;la trees. I am weary, &Amacr;nanda, and would lie down.'
> 'Even so, lord!' said the venerable &Amacr;nanda, in assent, to the Exalted One. And he spread a covering over the couch with its head to the north, between the twin S&amacr;la trees. And the Exalted One laid himself down on his right side, with one leg resting on the other; and he was mindful and self-possessed.
>
> In a note on this passage the Sinhala commentator added an explanation:
>
> Tradition says that there was a row of S&amacr;la trees at the head of that couch, and another at its foot, one young S&amacr;la tree being close to its head, and another close to its foot. The twin S&amacr;la trees were so called because the two trees were equally grown in respect of the roots, trunks, branches, and leaves. There was a couch there in the park for the special use of the (periodically elected) chieftain of the Mallas, and it was this couch which the Exalted One asked &Amacr;nanda to make ready. (Ftnt. p. 149)

In the last watch of the night the Buddha died, precisely as he had been predicting for three months, since he was in Vai&sacute;ali.

There have been individuals in various parts of the world, and especially among the holy men of India, who have acquired by 'concentration' (*sam&amacr;dhi*) control over some of the muscles that ordinarily function in response to stimuli beyond the human will. A. L. Basham has remarked on this in *The Wonder That Was India*, p. 327:

> The ancient mystical physiology of India needs further study, not only by professional Indologists, but by open-minded biologists and psychologists, who may reveal the true secret of the yog&imacr;. For whatever we may think about his spiritual claims there is no doubt that the advanced yog&imacr; can hold his breath for very long periods without suffering injury, can control the rhythm of his own heartbeats, can withstand extremes of heat and cold, can remain healthy on a starvation diet, and, despite his austere and frugal life and his remarkable physical contortions, which would ruin the system of any ordinary man, can often survive to a very advanced age with full use of his faculties.

Basham fails to mention that occasionally death is the goal of this 'concentration,' but there is no reason to question that death can be the purpose of such an act of will. In recent years, when death has been the end result of this manifestation of will power, *mah&amacr;sam&amacr;dhi* has sometimes been the term used when speaking of it.

The Buddha predicted the day of his death three months before and thenceforward announced freely the time and place of his own extinction. After his Last Meal the narrative says that on his initiative he walked the short distance to Kusin&amacr;r&amacr;. Since the time of his death, no Hindu, no Buddhist, has ever suggested that he died of mushroom poisoning. His death has not provoked discussion among Buddhists. Knowing as we now do what the mushrooms were that Cunda served, they could have provoked a stomach upset in a Hindu mycophobe but they could not have caused his death. He died of his own will power, of his own *mah&amacr;sam&amacr;dhi*. Or, rather than provoking his own death, did he not use yogic power, under trying circumstances, to postpone his translation to *nirv&amacr;na* until he had reached his place of choice?

The surrogate for Soma explains and justifies the extraordinary words used by the Buddha in limiting to himself alone this dish. By consigning to a hole the surplus *P&umacr;tika*, he showed himself familiar with its everyday properties. Now that we know the precise properties of this mushroom, its etymology as cognate with 'putrid' is clarified, and its strong link with Soma is a good explanation for the Santal belief that it is generated by the divine lightningbolt.

Up to this point we have concentrated on only one source-the canonical P&amacr;li Text of the *D&imacr;gha Nik&amacr;ya* - for our details about the life of Buddha. It is the Holy Scripture of the Theravadin branch of Buddhism with its headquarters in &Sacute;r&imacr; Laṅka. There are, in addition, five other master recensions of his life, four in Chinese and one in Sanskrit. All five mention the stop in P&amacr;v&amacr; and name Cunda as the host there, but none of them mentions *s&umacr;kara-maddava*. An obvious explanation for this omission is that the Chinese are natural mycophiles: they eat with relish all kinds of edible mushrooms and they know their mushrooms. They would not understand why the Buddha honored the *P&umacr;tika*, saying he alone could digest it. For the Chinese all this would have been incomprehensible.

The Buddha and his followers were mostly Hindus of the upper castes who had withdrawn from obedience to the Hindu religion. When the Theras assembled at R&amacr;jagṛha, they were inevitably, even if they were rebels, heirs to the infinite complexity of habits, practices, subtle ways of thinking and feeling of the Brahmanic religion. When Buddhism became a world religion, it liberated itself from the Brahmanic religion and this included the mighty tradition of Soma and the Vedic hymns, and of course from the less powerful hold of the *P&umacr;tika*. In the early days of Christianity, before it became a world religion, the pull of Jewish ways such as circumcision and the ban on pig-meat exerted influence on Jewish converts to Christianity, and the early Church faced a parallel conflict.

The Buddha's last meal

The episode at P&amacr;v&amacr; lends itself to various explanations; the written record contains a number of anomalies. If we were to offer the solution that we think is most likely, here it is.

There is only the Commentary on the *Ud&amacr;na*, which Buddhaghoṣa presented as hearsay, to show that Cunda the &sacute;udra knew of the use made by the Brahmans of the *P&umacr;tika*. Cunda certainly knew this mushroom as a universal favorite among mushroom eaters when it was in season and it was in season right then: he was taken aback when the Buddha recognized the mushroom and asked him, in astonishing language unfamiliar to his ears, to serve them to the Buddha only. Cunda had done himself proud in assembling mushrooms for the whole company, and now he was forbidden to give them to the guests or even to himself.

Shortly after the Buddha had eaten his mushrooms with rice he fell violently ill. This must have caused Cunda consternation and chagrin. Alarm was felt, and there was murmuring against Cunda and the mushrooms in the assembly, for all or almost all were twice-born men and had been indoctrinated against mushrooms. We can imagine Cunda's embarrassment but we have no information: an opaque cloud of silence falls over him.

In the *D&imacr;gha Nik&amacr;ya* the Buddha exonerates Cunda, somewhat stiltedly under the circumstances. Perhaps everyone remembered that the Buddha had spoken up for Cunda and many had heard him but none could recall what precisely he had said. Someone seems to have drafted the paragraph much later. The fitting exoneration of Cunda demonstrated the thoughtfulness and the nobility of the Buddha under most trying circumstances.

Was not '*s&umacr;kara-maddava*' introduced in place of *P&umacr;tika* at R&amacr;jagṛha to avoid confusing people as to the Buddha's attitude toward the Old Religion? He showed an attitude toward the *P&umacr;tika*, and he reacted to them, in a way that we today, under the circumstances, can understand for the first time.

And as for the diverse explanations in the two canonical Commentaries for *s&umacr;kara-maddava*, they may have been introduced at R&amacr;jagṛha also, or perhaps more likely late in A&sacute;oka's reign when the need for an explanation became increasingly felt by the Buddhist community. No theological importance was ever given, then or later, to the P&amacr;v&amacr; episode because, after all, the Buddha was under acute stress at the time, what with his illness, his imminent extinction freely predicted since he was in Vai&sacute;ali three months before the episode at P&amacr;v&amacr;, and the unexpected dish of *P&umacr;tika* that suddenly confronted him. There had been far too much talk among those present to suppress the episode, but obviously the *P&umacr;tika* was not to be identified plainly. The *s&umacr;kara-maddava* was a way to tell the truth but still to interpose obstacles to its understanding. The word may have been a neologism invented *ad hoc*.

Now we see for the first time in how dramatic a predicament the Brahman proscription on mushrooms for the twice-born castes accidentally involved the Buddhist religion at the very moment of its birth. We still do not know we will probably never know when that proscription came into force, perhaps over centuries while the Vedic hymns were being composed, or possibly when the hierarchs among the Brahmans learned of the entheogenic virtues of *Stropharia cubensis* as known to the lower orders living in India, or when Soma was finally abandoned and the *P&umacr;tika* adopted as its surrogate. But we do know how effectively the Buddhist Theras fudged the facts in the *D&imacr;gha Nik&amacr;ya*, until an inquirer 2,500 years after the event appeared, assembled the evidence, and with the help of Georg Morgenstierne, Roger Heim, Stella Kramrisch, Wendy Doniger O'Flaherty, and above all of the Santal people, fitted together the jigsaw pieces.

The Indus Valley and Kashmir

When we published *SOMA Divine Mushroom of Immortality* in 1968 I pointed out in it that in the 1028 hymns of the *Rig Veda* there was never a mention of the blossoms, fruit, seed, leaves, branches, bark, or roots of the plant-a telling clue where to look for the divine herb. But there was another botanical fact that deserved full recognition, but I had not yet focussed on it.

Botanists divide plants between phanerogams and cryptogams. The phanerogams include all flower- and seed-bearing plants, whether trees, shrubs, creepers or climbers, herbs and grasses, whether cultivated or uncultivated. The cryptogams are lower orders of vegetation, less developed along the evolutionary trail, and the mushrooms are the cryptogams that interest us. Only in recent centuries have three or four species out of thousands lent themselves to commercial exploitation, and a meager handful also to expensive cultivation in laboratories. In Aryan times, in the Indus Valley and Kashmir, there was the widest variety of climate, owing to the variety of accidented terrain therein-lofty mountains, low lying plains, valleys, wetlands, arid stretches-and any needed phanerogam could probably have been grown in some part of that large country. *But only those mushrooms grew there that the country produced spontaneously*. Since we know that the supply of Soma was limited at best to the mountains and must have been further reduced when the monsoon failed, conforming to what we know about Soma in Vedic times, this points to the entheogenic mushroom *Amanita muscaria* for their Soma. That the birch and also the conifers act as hosts to *A. muscaria* was not realized by anyone among the Aryans, and therefore no one thought of planting the host trees to see whether by this means man could thus increase the yield of the holy plant.

Other fungal entheogens grow at the lower levels. They come in cattle dung, are easily identified and gathered, and are effective. But they fail to conform to Brahman practices: they are known to tribals and sudras. Soma on the other hand exacts self-discipline of the priests, a long initiation and training: it is, for proper exploitation, an affair of a priestly *élite*. But the possible role of *Stropharia cubensis* growing in the dung of cattle in the lives of the lower orders remains to this day wholly unexplored. Is *S. cubensis* responsible for the elevation of the cow to a sacred status? And for the inclusion of the urine and dung of cows in the *pañcagavya*? And was that a contributing reason for abandoning Soma? Given the ecological conditions prevailing in the Indus Valley and Kashmir, only a few of the Aryans could know by personal experience the secrets of the Divine Herb. The cult of Soma must have been shaped by the peculiar circumstances prevailing in the area, but ultimately those circumstances must have doomed that cult. Today it lives on in India only as an intense and glowing memory of an ancient rite.

Under the British Raj the rich and diverse vegetation of India was admirably studied, and George Watt's encyclopaedia *Dictionarv of the Economic Products of India*, 1889-1896, in eleven volumes, edited and partly written by him, is a major legacy of the British rule in India. However, the mycophobic British did little to advance knowledge of mycology, and the Hindus nothing. No one ever suggested a mushroom for Soma, let alone *A. muscaria*. Our *SOMA* came out in 1968 but no *A. muscaria* since then has yet been found in Pakistan or Kashmir: there have been numerous reports of finds but voucher specimens have not been deposited in herbaria. Dr. Roy Watling, mycologist of the Royal Botanic Garden of Edinburgh, spent three weeks in the field in 1978 on a general survey of the Kashmir area, in the vicinity of Srinagar. He collected in stands of birch in two areas but he arrived there late in the growing season and moreover the season was dry. In his printed report[9] he writes, 'The species *A. muscaria* is almost certainly native to the *Betula*-zone of northern India.' There he found *Betula utilis* from 9,000 feet up to the timber line at 10,500 feet but no *A. muscaria*. In the Northwestern Himalayas the birch grows intermixed with Rhododendron in scrub-vegetation up to 11,500 feet.

We may think we are feeling the frustrations of the Aryans but by comparison with them we are making only lackadaisical efforts to find a few voucher specimens, whereas the Brahmans must have developed urgent need for quantities of fruiting bodies to dry, and then to reflate, and bring to the pressing stones. Their needs must have been constantly increasing with the increasing population. Whatever may have been the case later, the relations at first with the natives were surely hostile. The natives seem to have come to occupy the intermediate mountain heights, precisely where *A. muscaria* grows and where the *Rig Veda* time and again says Soma grows. As we know from the *&Sacute;atapatha Br&amacr;hmaṇa*, the Brahmans depended for their Soma supplies, in large part at least, on the natives living in the mountains. The supply depended on the weather and the state of the relations with the natives, whereas the needs were swelling with every generation. The Brahmans must have found it in their interest to cultivate the Dasyus and the Dasyus would have found it advantageous to discover every spot where *A. muscaria* grew, above all the stands of birch but also other host trees. (*A. muscaria* has been reported lately from Tamilnadu, especially from the Nilgiri Hills, in Southern India, but its presence there has been attributed by mycologists to plantings of exotic conifers in the past century.) Most of the Soma sacrifices must have used make-do phanerogamic substitutes and in the post-Vedic Br&amacr;hmaṇas and other writings we learn how the priests from early times faced this scarcity with such make-do plants.

The Brahmans probably continued to trade with the mountains of Afghanistan seeking Soma, and with the Hindu Kush, but there is no knowing whether these tribesmen were friendly, perhaps intermittently. The *Afghanistan Journal* 6.2, 1979, announced the finding of *A. muscaria* in Nuristan, in the Shetul Valley high in the Hindu Kush in the extreme northeast of the country. The authors, Gholam Mochtar and Hartmut Geerken of Kabul, talked with three old codgers, ostensibly *habitués* of the "ravens' bread,"claimed to be *A. muscaria* from which an inebriating concoction is made. The episode is insufficiently documented to permit conclusions about its bearing on *Amanita muscaria* and the Soma question. Their report antedates the Russian invasion.

9. Watling, Roy and Norma M. Gregory: 'Larger Fungi from Kashmir,' *Nova Hedwigia*, Band XXXII, Brunswick, 1980, J. Cramer.

The use of substitutes by the Aryans must have been a reluctantly adopted practice from the start. They are mentioned for the first time in the last batch of hymns incorporated into the canon, Mandala X 85 through to the end, 191. In *SOMA* we failed to take into consideration these hymns of Mandala X, since they were admitted to the canon at a late stage, shortly before the Vedic age ended. But some years ago Professor Clifford Wright, in a lecture delivered at Cambridge University, took the position that many of those hymns, the last to be admitted to the canon, on strong stylistic grounds were by no means the last to be composed. There is a verse in these hymns that speaks of the substitutes. That hymn may well have been composed centuries earlier:

> *Rig Veda* X 85.3: One thinks one drinks Soma because a plant is crushed. The Soma that the Brahmans know - that no one drinks.

This conforms to our present thinking: the scarcity of Soma was not to be explained by the spread of the Aryans southward, then eastward down the Yamun&amacr; and beyond the confluence with the Ganges. The scarcity had always existed, and the make-do substitutes had been a chronic problem.

Memorandum by Walpola R&amacr;hula of the early sources for the meaning of *s&umacr;karamaddava*

The original Canonical P&amacr;li passage from the *Mah&amacr;parinibb&amacr;nasutta* of the *D&imacr;ghanik&amacr;ya*, P&amacr;li Text Society edition (London 1966), Vol. II, p. 127:

> *Atha kho Cundo kamm&amacr;raputto tass&amacr; rattiy&amacr; accayena sake nivesane paṇ&imacr;taṃ kh&amacr;daniyaṃ bhojaniyaṃ paṭiy&amacr;d&amacr;petv&amacr; pah&umacr;tañ ca s&umacr;karamaddavaṃ Bhagavato k&amacr;laṃ &amacr;roc&amacr;pesi: 'K&amacr;lo bhante, niṭṭhitaṃ bhattan'ti.*

Translation:

> Then at the end of that night, Cunda, the smith, having made ready in his house hard and soft delicious food, and also a big quantity of *s&umacr;karamaddava*, announced the time to the Exalted One, saying: 'The time, Lord, has come, the meal is ready.'

In explaining *s&umacr;karamaddava* in this passage the P&amacr;li Commentary of the *D&imacr;ghanik&amacr;ya*, *Sumaṅgalavil&amacr;sini*, P&amacr;li Text Society ed. (London, 1971), Vol. II, p. 568, gives three different opinions:

> *S&umacr;karamaddavan ti n'&amacr;titaruṇassa n'&amacr;tijiṇṇassa ekajeṭṭhakas&umacr;karassa pavattamaṃsaṃ. Taṃ kira muduñ c'eva siniddhañ ca hoti. Taṃ paṭiy&amacr;d&amacr;petv&amacr; s&amacr;dhukaṃ pac&amacr;petv&amacr;'ti attho.* (Colombo ed. of the *Sumaṅgalavil&amacr;sin&imacr;*, Part 1, (1918) p. 395 adds within brackets): [*Eke bhaṇanti: s&umacr;karamaddavaṃ pana muduodanassa pañcagorasa - y&umacr;sap&amacr;canavidh&amacr;nassa n&amacr;mam etan'ti yath&amacr; gavap&amacr;naṃ n&amacr;ma p&amacr;kan&amacr;maṃ. Keci bhaṅanti: s&umacr;karamaddavaṃ n&amacr;ma ras&amacr;yanavidhi, taṃ pana ras&amacr;yanasatthe &amacr;gacchati, taṃ Cundena Bhagavato parinibb&amacr;naṃ na bhaveyy&amacr;'ti ras&amacr;yaṃ paṭiyattan'ti.*]

Translation:

> *S&umacr;karamaddava* means meat available (in the market) of an excellent (first-rate) pig

> neither too young nor too old. This is soft and fatty. 'Having made it ready': having cooked it well is the sense. (Some say: *s&umacr;karamaddava* is the name for a culinary preparation of soft rice made into a broth with the five products of the cow,[10] just as *gavap&amacr;na* is the name of a culinary preparation. Others say: *s&umacr;karamaddava* is a chemical preparation [elixir]. It is found in the science of chemistry. That chemical preparation [elixir] was made by Cunda thinking that the *parinibb&amacr;na* of the Exalted One might not take place.)

The story of Cunda offering *s&umacr;karamaddava* to the Buddha occurs exactly in the same way in another canonical P&amacr;li text, *Ud&amacr;na*. The *Paramatthajotik&amacr;*, Commentary on the *Ud&amacr;na* (Colombo, 1920), p. 279, in explaining *s&umacr;karamaddava* gives four different opinions:

> *S&umacr;karamaddavan'ti s&umacr;karassa mudusiniddhaṃ pavattamaṃsan'ti Mah&amacr;aṭṭhakath&amacr;yaṃ vuttaṃ. Keci pana s&umacr;karamaddavan'ti na s&umacr;karamaṃsaṃ, s&umacr;karehi madditavaṃsakal&imacr;ro'ti vadanti. Aññe: s&umacr;karehi madditappadese j&amacr;taṃ ahicchattan'ti. Apare pana s&umacr;karamaddavaṃ n&amacr;ma ekaṃ ras&amacr;yanan'ti bhaṇimsu. Tañ hi Cundo kamm&amacr;raputto ajja Bhagav&amacr; parinibb&amacr;yissati't&imacr; sutv&amacr; 'appeva n&amacr;ma naṃ paribhuñjitv&amacr; cirataraṃ tiṭṭheyy&amacr;'ti Satthu ciraj&imacr;vitukamyat&amacr;ya ad&amacr;s&imacr;'ti ti vadanti.*

Translation:

> It is said in the Great Commentary (*Mah&amacr;aṭṭhakath&amacr;*)[11] that *s&umacr;karamaddava* is soft and fatty pork (flesh of pig) available (in the market). But some say: *s&umacr;karamaddava* does not mean pork (flesh of pig), but bamboo shoot (bamboo sprout) trodden by pigs; others say that it is mushroom grown on a spot trodden by pigs; still others have maintained that *s&umacr;karamaddava* is a certain elixir. They say that Cunda, the smith, having heard that the Exalted One would attain *parinibb&amacr;na* that day (lit., today) thought that it would be good if He could live longer after eating this (preparation), and offered it wishing the Master's longevity.

Epilogue

When I began working with Gordon Wasson on *SOMA*, almost twenty years ago, we had, at first, no suspicion that Soma might have been a mushroom: we just wished to collect the texts relating to Soma and look at them with a botanical as well as an Indological eye. It was only when I casually mentioned to RGW the urine-drinking, Soma-drinking episode in the *Mah&amacr;bh&amacr;rata* that he thought of *Amanita muscaria* as a possible identity for Soma, but from that moment on he became increasingly convinced that this was the case. I was certain that the evidence proved Soma was an entheogen (we called it an hallucinogen then), and that it was not a form of alcohol (as had been theretofore widely believed) but was a drug provoking an ecstasy of a very special kind. Here is a truth of great importance in the study of later Indian religion and this was the major contribution that RGW had made to Vedic studies.

I was, however, not yet convinced that Soma was a mushroom. I felt that the arguments rested primarily on the interpretation of adjectives, many of them words for colors, and mythological traits, many of which applied to other gods as well, permitting other interpretations as well as the interpretation that identified Soma with the fly-agaric. As an Indologist, rather than a botanist, I still feel that the broader hypothesis-that Soma was an entheogen-is more significant than the narrower one-that it was a mushroom. Over the years, however, the new evidence that RGW has brought to light, particularly the evidence linking the Buddha's last meal to Soma through the double links of the Vedic *P&umacr;tika* and the Santal *putka*, does in fact make it seem likely that Soma was a mushroom, as RGW believed from the first moment, and, when we recall the religious role of urine mentioned above, specifically the fly-agaric. But each of the three levels of the hypothesis-that Soma was an entheogen, a mushroom, and the fly-agaric-adds a valuable dimension to our understanding of both Vedic and post-Vedic religion.

CHAPTER FIVE

Carved 'Disembodied Eyes' of Teotihuacan

by Jonathan Ott[1]

Situated a few hours' drive northeast of Mexico City are the magnificent ruins of Teotihuacán, dating from the beginning of the first millennium AD. Best known for two large, stepped pyramids (Pyramids of the Sun and Moon) and the smaller, more ornate Pyramid of Quetzalcoatl, the ruins abound in numerous low, labyrinthine buildings which are decorated with beautiful and complex mural paintings. The comparatively well preserved Tepantitla murals are best known to scholars, a prominent segment having been restored and repainted in the Teotihuacán room of the Museo Nacional de Antropologia in Mexico City by Augustín Villagra Caleti. Portions of many other murals survive at Teotihuacán, while some, such as the important Zacuala murals, which are unprotected from the elements, are scarcely visible today.

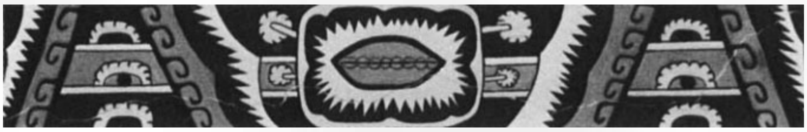

Fig. 1. 'Predella' from Zacuala, Teotihuacán, repainted by Abel Mendoza, who caught them before they disintegrated. Notice 'disembodied eyes' flanking central motif representing four mushrooms surrounding the radiant 'logos'.

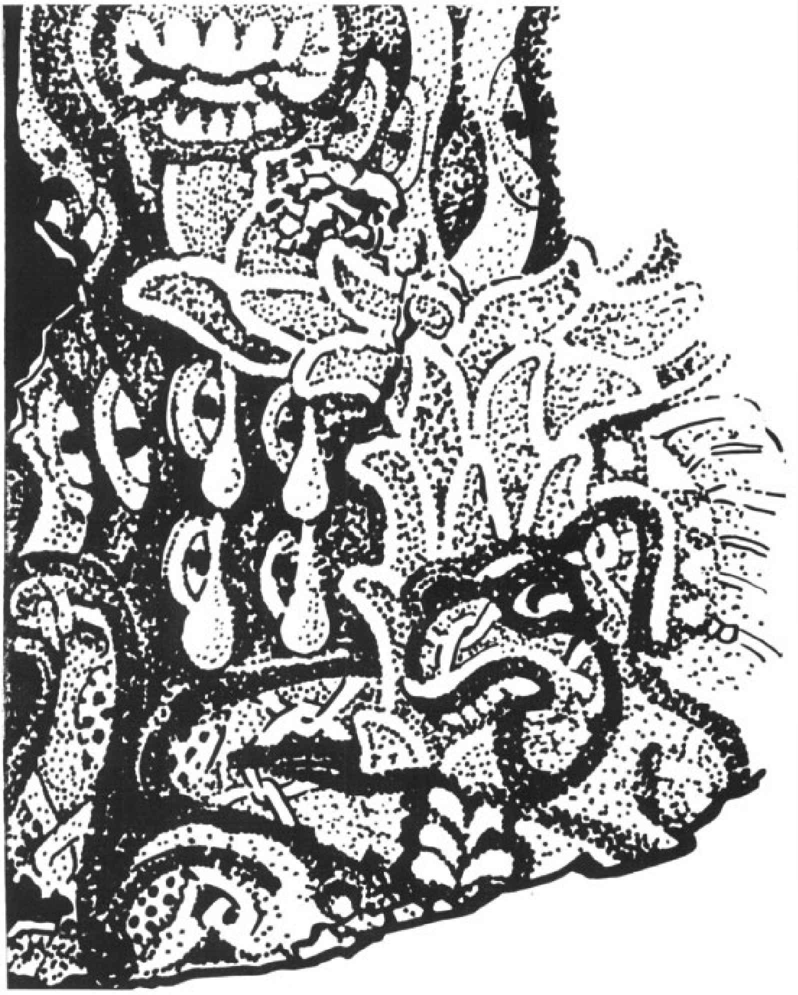

Fig. 2. Drops of entheogenic potion with appended 'disembodied eyes' from Teotihuacán murals. Reproduction by Margaret Seeler.

---

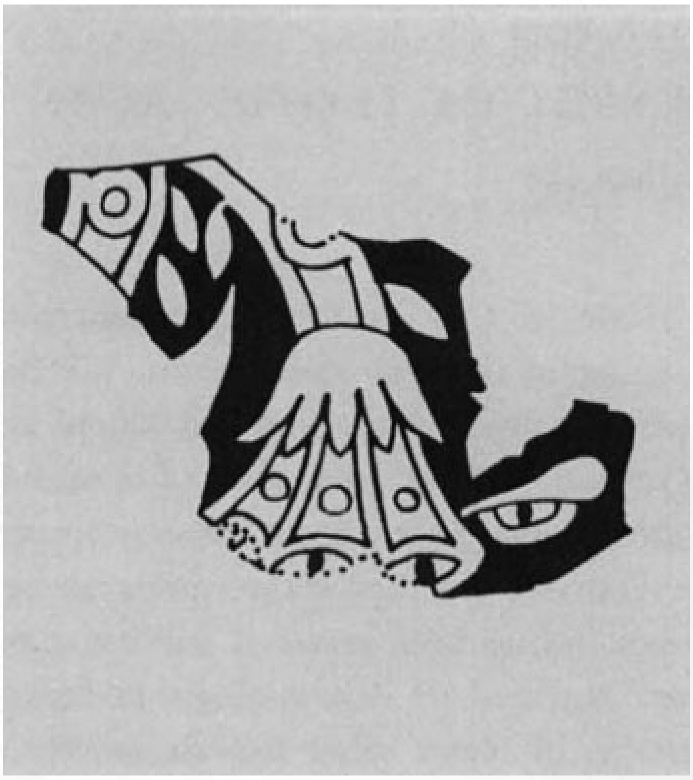

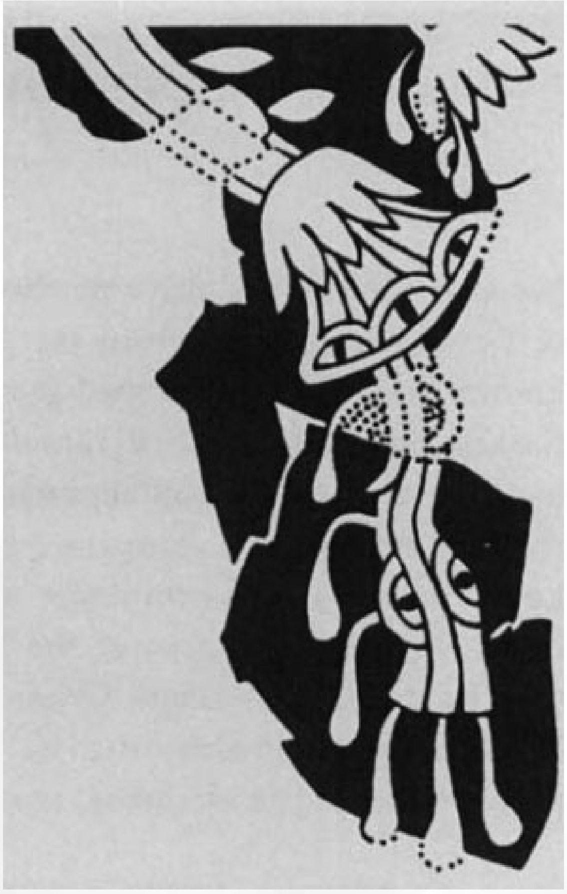

Fig. 3 & 4. Drops of entheogenic potion and appended 'disembodied eyes' issuing from entheogenic flowers. Reproduction of fragments of Tepantitla murals by Margaret Seeler.

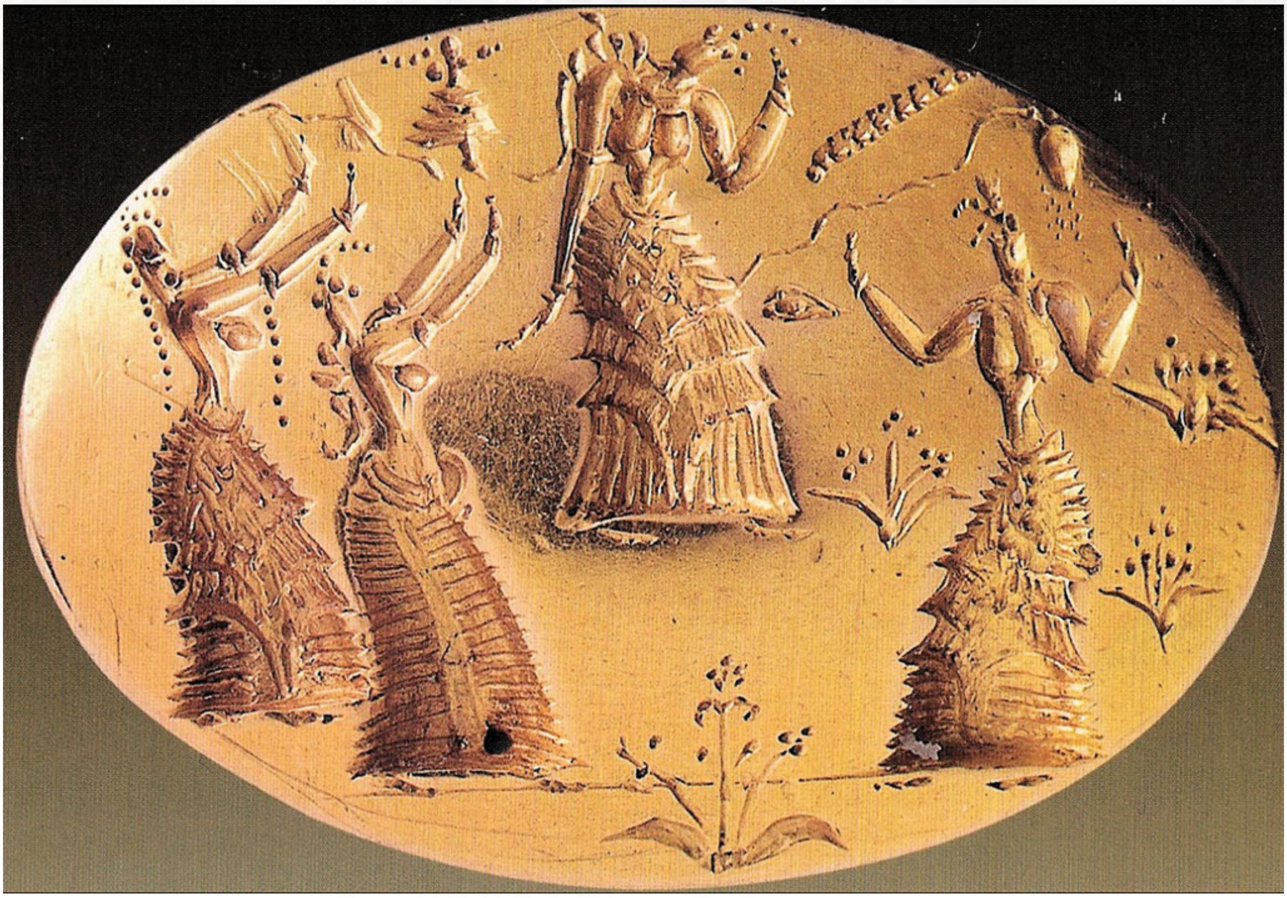

Fig. 5. Gold ring of Isopata near Knossos, greatly enlarged. Scene depicts epiphany of goddess (presumably Artemis) on the right, and four worshippers, all represented as anthropomorphic bees. Note 'disembodied eye' in center, and plants (presumably entheogenic) surrounding goddess.

In his 1973 book *The Mural Painting of Teotihuacán*, Arthur G. Miller[a] drew attention to the prominence of the 'disembodied eyes' that occur repeatedly in the mural paintings of Teotihuacán. Figures 1-4 illustrate some typical examples of the recurrent 'disembodied eyes' motif. During a recent visit to Teotihuacán, I was struck by the ubiquity of these 'disembodied eyes', indeed, it was difficult to escape the sensation of being watched constantly.

I here comment on the existence of 'disembodied eyes' in relief carvings at Teotihuacán. The carvings are found on columns in a courtyard of a structure known as the Palace of Quetzalpapálotl,[2] located at the west corner of the square adjacent to the Pyramid of the Moon (Fig. 6 & 7). The face of each column in the courtyard is adorned with two rows of four 'disembodied eyes' arrayed above and beneath a carving of a bird (Fig. 8). The carved eyes are realistic and are inlaid with obsidian 'pupils' (Fig. 9 & 10). The identification of the carvings as eyes is unequivocal - witness the corresponding inlay of obsidian to the eyes of the creature in the carvings, which represents a chimera called Quetzalpapálotl, 'quetzal bird/butterfly' (Fig. 8). It is perhaps significant that the eye of the bird is round, as in nature birds' eyes appear, whereas the 'disembodied eyes' are distinctly anthropomorphic, with upper and lower 'eyelids' giving the 'eyeballs' an ovoid shape. On the north, south, and east sides of the courtyard, the columns identically depict the avian chimera in profile (Fig. 8), whereas the columns on the west side show a frontal view, possibly of the same creature (Fig. 11).[3] The columns are surmounted by a broad lintel painted with a repeated motif, which in turn is crowned by a series of carved stone 'combs' (Fig. 12).

Fig, 6. Looking north at Teotihuacán, with Pyramid of the Moon at right and Palace of Quetzalpapálotl at left in foreground.

---

2. The Palace of Quetzalpapálotl was excavated in 1962 and summarily restored under the direction of Mexican archaeologist Jorge R. Acosta. The structure dates from the sixth century AD, belonging to the Teotihuacán III and IV eras. Details of the excavation and restoration can be found in Acosta's book *El Palacio del Quetzalpapálotl* (Institute Nacional de Antropología e Historia, México, 1964).
3. Scholars have differed on the question whether one or two birds are here depicted. In a recent paper (*Ethnos* 32: 5-17, 1967) Arthxir G. Miller summarizes the evidence and concludes that the bird depicted frontally represents an owl, whereas the bird depicted in profile represents the quetzal. Acosta, in his comments regarding his reconstruction of the columns, identified the profile birds as quetzal bird/but terfly chimeras, hence the name Quetzalpapálotl.

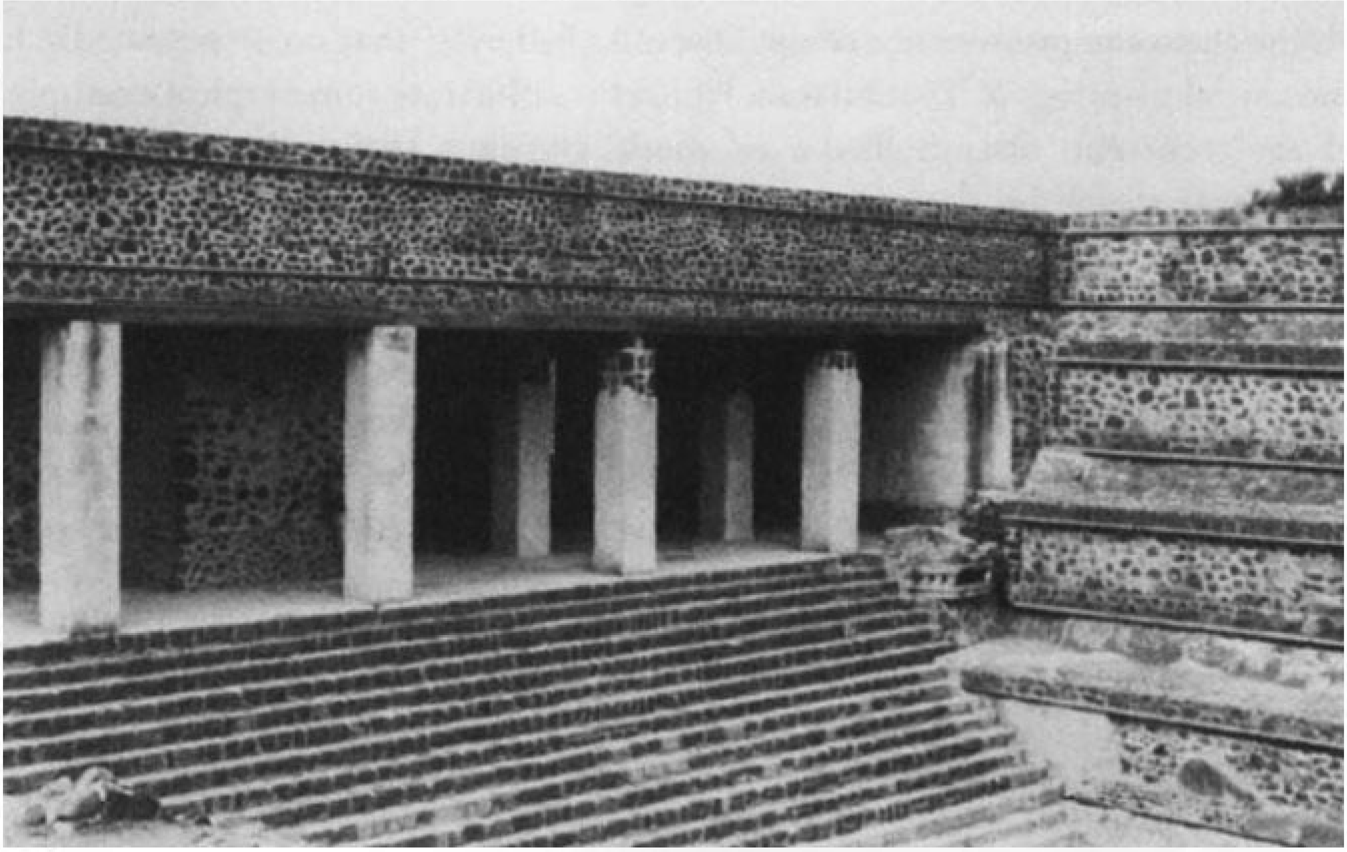

Fig. 7. Entrance to Palace of Quetzalpapálotl at Teotihuacán.

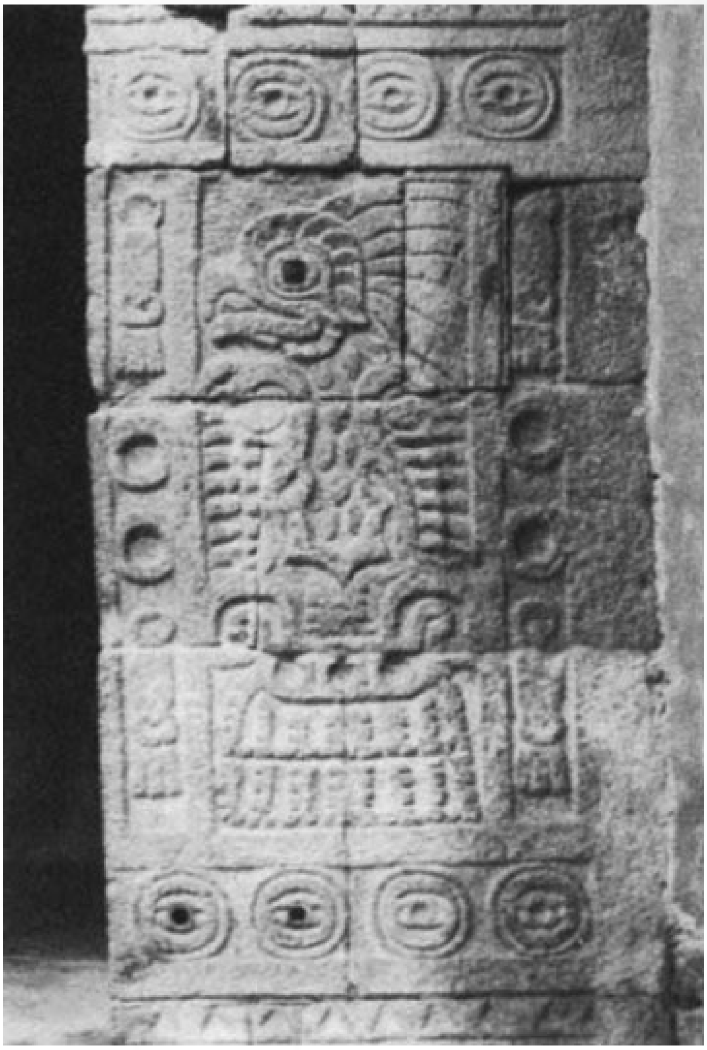

Fig. 8. Column showing Quetzalpapálotl chimera and 'disembodied eyes'.

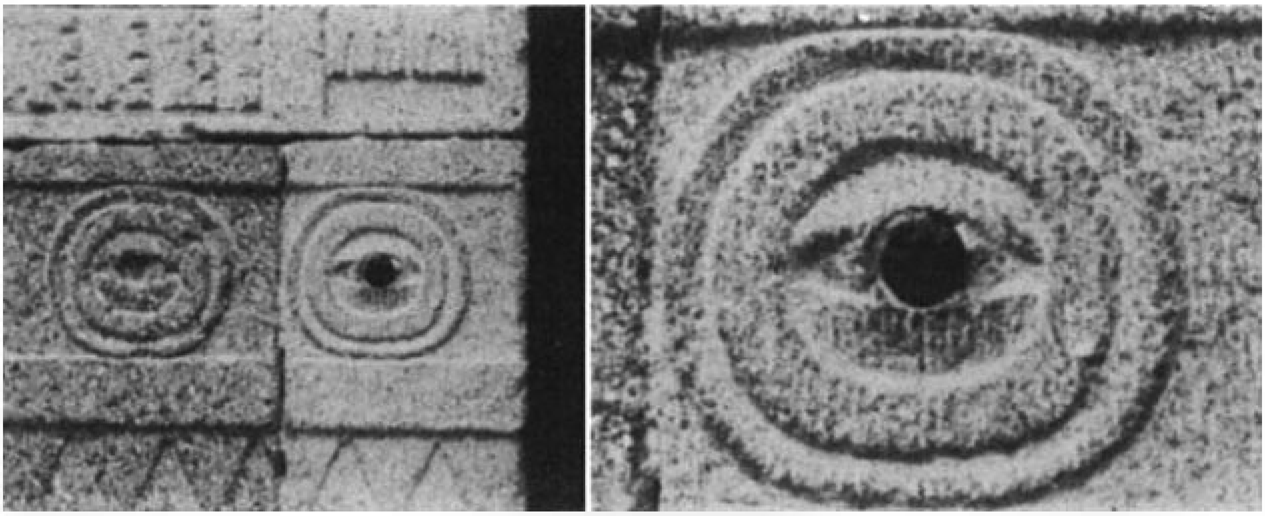

Fig. 9 & 10. Closeups of 'disembodied eye' from column. Note inlaid obsidian 'pupil' and anthropomorphic 'eyelids'.

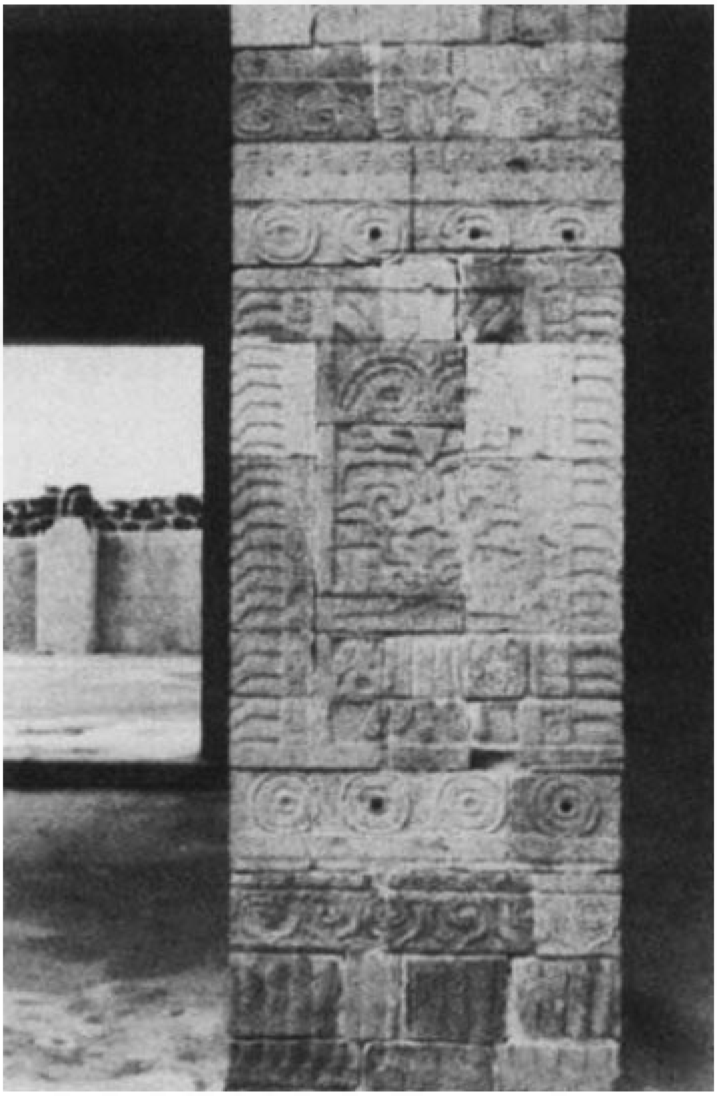

Fig. 11. West column with frontal view of avian creature and 'disembodied eyes'.

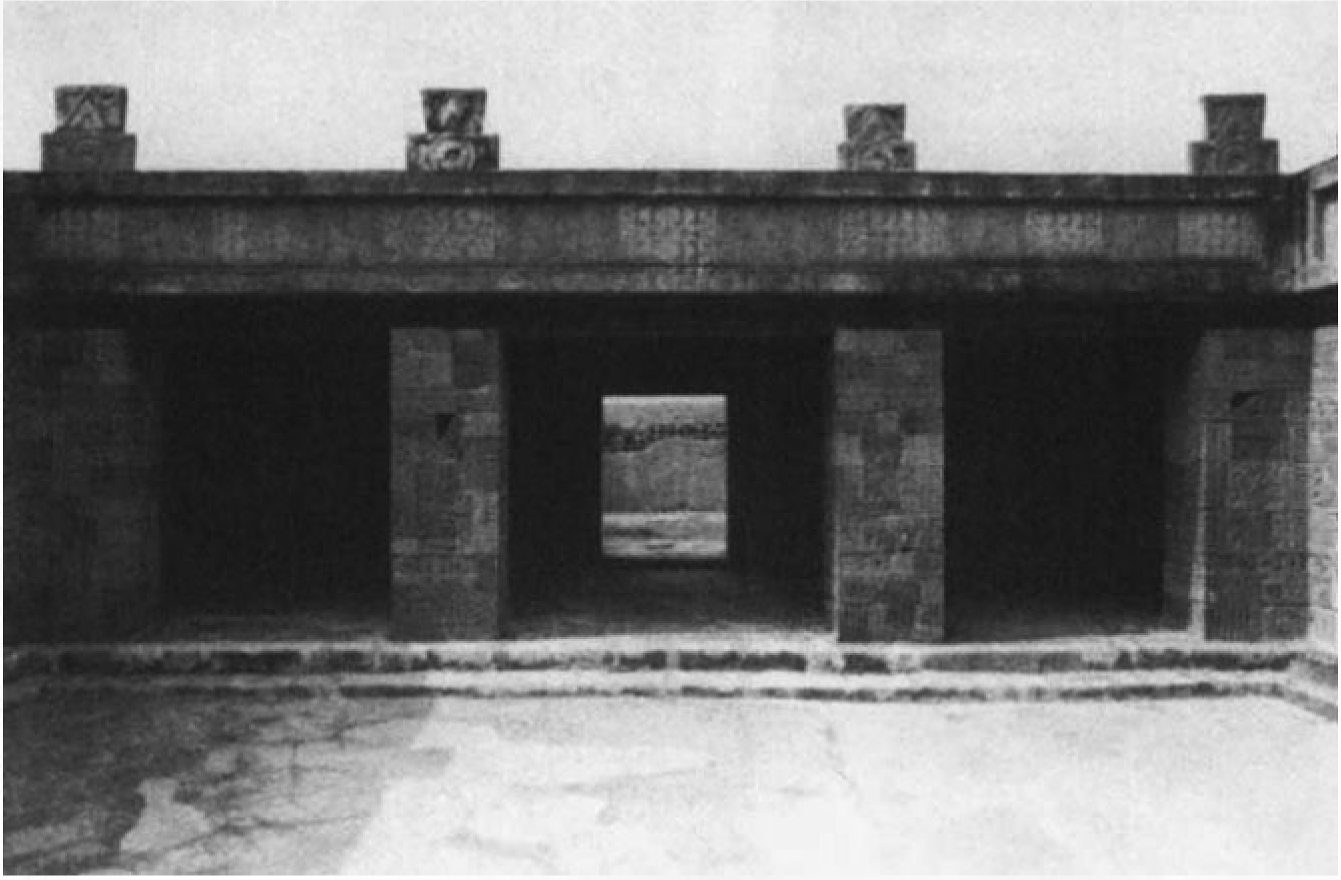

Fig. 12. West side of courtyard, showing columns surmounted by painted lintel and carved stone 'combs'.

In his book on the murals of Teotihuacán, Miller drew no conclusions as to the meaning of the 'disembodied eyes' or of the murals as a whole. R. Gordon Wasson has proposed that the 'disembodied eyes' represent the visionary sight of the shaman or participant in an agapé involving ingestion of a potion compounded of entheogenic mushrooms, morning glory seeds, or other plants with allied effects. This interpretation is based on the occurrence of mushrooms, flowers, and seeds in juxtaposition with the 'disembodied eyes' (*vide* Figures 1-4), and the association of the eyes with green drops issuing from the flowers (green, the color of jade, signifies religious value), drops which are symbolic of the entheogenic potion. This theory is laid out in detail in *The Wondrous Mushroom: Mycolatry in Mesoamerica*,[b] which further suggests that the labyrinthine buildings of Teotihuacán, decorated with these entheogenic motifs, were groups of cenacula in which sacramental ingestion of entheogens took place. The carved 'disembodied eyes' of the Palace of Quetzalpapálotl are further evidence confirming this hypothesis.

The 'disembodied eye' motif is not restricted to Mesoamerican art. Figure 5 illustrates the design on a gold ring, *circa* 1500 BC, from Crete. The scene probably depicts an epiphany of the Great Mother goddess Artemis (the figure on the right) in the form of an anthropomorphic bee.[c] The hierophants who attended the Ephesian Artemis were called *Essenes* or 'King Bees' and the later Greek mother goddesses, such as Rhea and Demeter, were attended by priestesses called *Melissae*, 'Bees'.d It would seem that the four figures on the left of the ring represent the *Melissae*, bee-priestesses worshipping the goddess. A 'disembodied eye' is clearly represented near the center of the composition, between the goddess and her devotees. Here we have a representation of a visionary scene, from an Old World culture and antedating by two millennia the murals of Teotihuacán, yet accompanied also by a 'disembodied eye'. We now know that the Greek culture practiced religious rites based on ingestion of entheogenic potions,[efg] and it is not unreasonable to assume that earlier cultures, such as the Minoans and Mycenaeans, had similar rituals. Does not the Minoan ring from Crete depict an entheogenic vision of the goddess and her devotees in their mythological forms, as human/bee chimeras? It is significant that the goddess on the ring is surrounded by plants, presumably the source of the entheogenic potion.

The carvings of 'disembodied eyes' in the Palace of Quetzalpapálotl echo a motif common in murals found throughout the ruins of Teotihuacán. What can the 'disembodied eyes' represent, other than the visionary eye of the seer under the influence of one or other of the well-known pre-Columbian entheogens? Indeed, the image of the 'disembodied eye' suggested itself to Wasson as a natural metaphor for the state produced by ingestion of entheogenic mushrooms. Written more than 25 years ago, in 1957,[h] long before the appearance of Miller's book and without his having seen the 'disembodied eyes' of the murals or columns, R.G.W.'s words are apposite:

> *There I was, poised in space, a disembodied eye, invisible, incorporeal, seeing but not seen.*

PART TWO

Poets, Philosophers, Priests: Entheogens in the Formation of the Classical Tradition

by Carl A. P. Ruck

CHAPTER SIX

Mushrooms and Philosophers

Toward the end of Aristophanes' comedy, the *Birds*, Prometheus, the mythical figure who stole fire from the gods, arrives on stage, shielding himself from the view of his arch-enemy Zeus, the god directly overhead in the heavens, by hiding himself beneath the shade of a parasol. This episode of the comedy is completed by a dance in which the chorus of birds describes the philosopher Socrates in a swamp, where he is summoning up spirits from the dead in the company of a strange race of people called the 'Shade-foots'.

> Amidst the Shade-foots, there is a certain swamp where Socrates, unwashed, summons up souls. Amongst his clients came Peisander, who begged to see a spirit that had foresaken him while he remained alive. He had a camel-lamb as victim for sacrifice, and, like Odysseus of old, he slit its throat, whereupon to him from the depths there came up toward the camel's trench a spirit, Chaerephon, the 'bat'.
>
> [lines 1553-1564]

Who were these Shade-foots amongst whom the famous Greek philosopher is supposed to be performing this rite of necromancy? They can be found still attending such rites in modern times and hence their identity may give us a key for understanding what Socrates was really doing.

Shade-foots

The Shade-foots were said to be a grotesque tribe of people who had only a single leg with a broad webbed foot like that of geese. They customarily lay on their backs, protecting themselves from the heat of the sun by resting in the shade cast by their single, up-raised, parasol-like feet. At other times, however, they displayed extraordinary vigor, leaping up and down with prodigious strength on their solitary legs. We first hear of them in the sixth century B.C. from a traveler named Scylax, who, according to Herodotus (4.44), wrote a description of a trip down the Indus and thence along the coast to Suez in the reign of the Persian king, Darius I. Nothing remains of Scylax's book, but a fragment of another work from the end of the next century is still extant, in which they and their bizarre characteristics are again mentioned. This is a book by Ctesias (60 Jacoby), a Greek physician from Cnidos who served at the Persian court and wrote an account of a similar voyage. Both of these early travelers claimed that India was the homeland of the Shade-foots.[1]

The tribe was called by other names as well. They appear to have been the same people that we hear of even earlier from the seventh-century poet Alcman, who knew them as 'Cover-foots' (148 Page). Another name, although Greek, is preserved only in Latin sources. The Shade-foots were also known as Monocoli or 'One-Legs' (Pliny, *Natural History* 7.2.23; Aulus Gellius 9.4.9).

This latter name is particularly interesting because when we find these people in modern times, they will be a particular plant involved in Asiatic shamanism. Monocoli in Greek was an epithet of plants (Theophrastus, *How Plants Grow* 2.25, *Enquiry into Plants* 9.18.8). In modern times, the prodigious strength of their single leg will also be remembered from ancient traditions.

The Scene of Necromancy

Before tracking them down today, however, we should look at the other details of the scene described by Aristophanes. Two other historical figures are also said to be present, Peisander and Chaerephon. The choice of these two is the point of the joke.

Chaerephon was the frequent and usually over-enthusiastic companion of Socrates. It was his impetuous consultation of the Delphic oracle that had elicited the famous response that Socrates was wiser than other men, an enigmatic reply that led to Socrates' life-long quest for someone wiser than himself, only at last to conclude that the oracle must have meant that all men are stupid, but that he alone knew it and thus, by that little bit, was wiser. We know of Chaerephon not only from the Platonic dialogues, but also from parodies of him in other comedies. He was an excitable and frenzied person (Plato, *Apology* 21a, *Charmides* 153b), a pederast (Aristophanes 377 Hall and Geldart) who could be called a 'child of Night' (Aristophanes 573), both characteristics that would make appropriate his metamorphosis into a bat as he impersonates the spirit that Socrates summons in the necromantic rite. He was also a pale person of notoriously slight and weak build, as dry and fragile as a moth's crysalis (Aristophanes 377; Anonymous 26 Edmonds), someone whom Aristophanes had described already as 'half-dead' years ago in his parody of Socrates' teaching in the *Clouds* (504).

It is this physical frailty that Aristophanes refers to as the culmination of the scene in the swamp, for Peisander, who was satirized as a coward in another comedy produced at this same festival of drama (Phrynichus, *Monotropos* frg. 20 Edmonds; cf. hypothesis for Aristophanes' *Birds*), apparently because of some otherwise unknown action in battle (Eupolis, *Exempt from Service* or *The Women Men* frg. 31 Edmonds), has come to Socrates' rite of necromancy in order to attempt to regain his own spirit that had failed him through cowardice. Instead of a miraculous return to bravery, however, he succeeds only in getting the squeaking bat-like weakling, Chaerephon.

---

[1] The real identity of the Shade-foots had become a futile topic for grammarians by the Christian era. Even as early as the fifth century, some people thought of them as African or Libyan (Antiphon 80 B 45 Diels; Archippus 53 Edmonds), and it was there that the scholars of the Hellenistic age placed them, for their parasol-like feet could be rationalized as a peculiar adaptation to the African heat, a bias that even endowed these poor suffering creatures eventually with the normal complement of limbs, the better to crawl about from exhaustion on all fours in the desert (scholia to Aristophanes' *Birds* 1553).
The valley of the Indus, however, must have been their original homeland, for that was the testimony of the earliest travelers, and even the fifth-century orator Antiphon, who thought they were Libyan, had apparently read of them in our earliest source, the Indian travels of Scylax (Antiphon 80 B 47 Diels). The confusion between an Indian and African homeland for the Shade-foots is understandable in view of the map made by the sixth-century Hecataeus, who placed the Ethiopians in the East along the entire region bordering the sea that separates Africa from India. By the Hellenistic age, however, these 'African' Shade-foots were reinterpreted as living in what was then considered to be Africa, the torrid regions to the west of Alexandria.
In identifying the Shade-foots' homeland as the Indus valley, I follow Roscher, *Ausführliches Lexicon der Griechischen und Römischen Mythologie*, and differ from the judgement recorded in Pauly-Wissova, *Real-encyclopädie der classischen Altertumswissenschaft* (see articles on 'Sciapodes').

Peisander and the Affair of the Profanations

More important than the joke for our purposes, however, is the veiled accusation that Aristophanes is making against Socrates by describing this imagined scene of necromancy. To understand this we must know something more about Peisander and about what was going on in Athens at this time. The *Birds* was produced at the City Dionysia in March of 414 B.C. Athens was engaged in fighting a great and lengthy war with Sparta and its allies, and just the previous year had sent its armada against the Sicilian city of Syracuse. Just prior to the sailing of the fleet on that expedition, an event had occurred that had thrown the city into confusion. It was discovered that some group of people had gone through the city, knocking off the phalluses on the stone representations of the god Hermes, the so-called herms, that were commonly placed before public and private buildings as magical guardian figures. This mutilation of the herms was not only an act of sacrilege, but it seemed to indicate that some political group had bound its members to secrecy through mutual complicity in the crime in order to prepare the way for an attempt to overthrow the democratic government. Peisander[2] was a leader in the official investigation into the whole affair, and it was he on the board of inquiry who had interpreted the crime of vandalism as just such an act of conspiracy (Andocides, *On the Mysteries* 36). The investigation, moreover, was broadened to include other instances of sacrilege, and it came to light that a number of prominent citizens had been illegally performing the initiation ceremony for the Eleusinian Mystery in their private homes with dinner guests. Amongst those implicated was Socrates' famous disciple, Alcibiades, who was accordingly recalled from his generalship on the Sicilian expedition, whereupon he fled into exile in Sparta, the city that headed the coalition of states opposed to Athens and its empire in the war. He was condemned *in absentia* and his property was confiscated and sold at public auction.

Prior to this scandal, Alcibiades had been one of the most promising younger leaders of the democracy, but his flight to Sparta revealed that his demagoguery had masked his underlying sympathies for his own aristocratic class. He supported the populace merely to advance his own career. Apparently Aristophanes thought the same was true of Peisander, for a few years later, he was to emerge as a leader of the oligarchic faction that attempted to arrange for the restoration of Alcibiades. Peisander was to be prominent amongst the so-called group of Four Hundred oligarchs who seized control of the city in an attempt to come to terms with Sparta, and he too was to flee to the enemy at the frontier fortress of Decelea when the regime fell in September of 411 (Thucydides 8.49, 98.1), whereupon his property was confiscated (Lysias 7.4) and he is not heard of again.

During his few months as one of the Four Hundred, Peisander arrested a fellow aristocrat, the orator Andocides, who originally had secured immunity in the earlier investigation into the mutilation of the herms and the profanation of the Mysteries by turning state's evidence and naming many of his associates (Andocides, *On his Return* 14). Although this informer was himself secure from prosecution at the time, a decree aimed specifically at him had later been passed, prohibiting anyone who had confessed to impiety from taking part in religious or commercial activities in the city, and he had accordingly been forced to withdraw into exile. While away from Athens, the informer had amassed a fortune as a merchant and had attempted to buy the good favor of what he thought was the rising political faction by an act of largesse to the fleet at Samos, only to find himself on the wrong side when he returned to an Athens controlled by the new group of Four Hundred oligarchs. Andocides' arrest and maltreatment by Peisander testifies to the degree of enmity that these wealthy citizens three years after the affair of the mutilation of the herms continued to direct toward someone who had caused themselves and their families so much trouble by his revelations and betrayal. Certainly Peisander, the former chief prosecutor in the investigation of the mutilations, would seem to have been acting out of character in supporting the guilty Alcibiades' restoration and, at the same time, persecuting the former star witness, unless, as is probable, the investigation into the mutilations had gotten out of hand by being linked to sacrileges in general, a broadening that went beyond the immediate problem of the suspected conspiracy and netted many who simply were discovered, like Alcibiades, to have been treating the forbidden Mystery ceremony as a private social event for the entertainment of their dinner guests.

---

[2] The Hellenistic scholars believed that there were two Peisanders, one who was slight and the other big (Eupolis, *Marikas* frg. 182 Edmonds; Plato Comicus, *Peisander* frg. 101 Edmonds). There can be no doubt that the one in the necromancy scene is the famous cowardly demagogue, but it is also probable that the other one was nothing but an invention of the scholarly tradition to explain the apparent distinction between a Peisander called the 'big one, the mule-driver' and another described as the 'twisted one'. The distinction is actually a misunderstood joke, comparing the penis of the offensive Peisander to that of someone of no account (see Aristophanes' *Thesmophoriazusae* 516); hence in Hermippus (*Artopolides* frg. 9 Edmonds), 'the big Peisander mounted in silence a pack-ass with olive-wood sinews, like the one for the wood at the Dionysia', with a pun on the sexual meaning of 'mount' and the action of mounting the speaker's platform. The 'bigness' of a politician, even though he be cowardly is an indication of the trouble he can cause the Demos (see *Birds* 1477, on the demagogue Cleonymus). See also Danny Staples, *Pea Pteroenta: Plot and Metaphor in Aristophanes* 78 (unpublished dissertation, Boston University, 1978).

As far as the comedian Aristophanes was concerned, Peisander was a hypocrite, both in persecuting the profaners and again at this very time that he was involved in making preparations for the transfer of the city to the oligarchic faction in 411 in order to facilitate the return of Alcibiades. As Aristophanes says in his *Lysistrata*, which was produced at this time, Peisander's changeable policy indicated that his demagoguery was for sale (489), an accusation he had first made fifteen years earlier in one of his first comedies, the *Babylonians* (81 Hall and Geldart). Moreover, again it appears that the Mystery profanations and political conspiracy are linked, for Peisander and his oligarchic associates are accused of performing the forbidden ceremony. The Eleusinian Mystery involved the drinking of a special drink, the so-called *kykeon* or 'mixed potion', and that is precisely what the hypocritical former prosecutor is accused of doing with Alcibiades and his aristocratic cronies, for, as Aristophanes claims, the whole politics of the city has become a 'mix-up' because these plotters are again 'mixing up' some 'up-set' for the stomach, an accusation that puns by these words upon the Eleusinian 'mixed' potion (489-491).

The Swamp of Dionysus

What Peisander was suspected of doing in 411 is merely a continuation of his earlier misdeeds in consulting the notorious Alcibiades' teacher Socrates at the necromantic seance in the swamp with the Shade-foots, for a number of considerations will lead us to conclude that the Shade-foot parody with which we began can only be a reference to the cowardly demagogue's suspected complicity in the very scandal that he found himself hypocritically investigating. The swamp, first of all, is a clear indication of what Socrates actually is said to have been doing. The place is not in some remote exotic land, for it is but one in a series of similar parodies in this section of the *Birds*, and like the others, it can be located nowhere else but in Athens itself. It can be none other than the one swamp in Athens of which we have knowledge, the sacred Swamp near the base of the Acropolis, the so-called Swamp of Dionysus. It was precisely there that one could expect to summon up spirits, as, in fact, another comedian, the poet Eupolis, appears to have done in a play produced about this same time, the *Demes*, which involved the resurrection of the departed localities or parishes of an ealier Athens (*cf*. Edmond's reconstruction, fr. 90-135). This Swamp was the Athenian entrance to Hades, for such noisome places suggested to the folk imagination the putrefaction that lay beyond the grave. The god Dionysus himself was shown in a later comedy of Aristophanes, the *Frogs*, rowing across this very place to get to the other world, where he is met by a chorus of initiates from the Eleusinian Mysteries. One might well expect to find them there, for this Swamp was also the scene for a secret annual event that apparently was part of the Eleusinian rituals. There was a temple in this Swamp of Dionysus that was opened just twenty-four hours each year, from the evening of the second day of the Anthesteria Festival until the evening of the third and final day, at which time the spirits of the city's dear departed, who had returned to visit their families, were lovingly reescorted back to their proper abode in the otherworld. These spirits had wandered abroad through the city for the three days of the festival, resurrected to celebrate a drunken revel with the living, who had summoned them at the start of the feast by drinking the intoxicating spirit of the new wine that had at last completed its subterranean fermentation. There was just one event that occurred in this temple in the Swamp of Dionysus during the Anthesteria. The so-called Queen of Athens, who was the wife of the king archon or inheritor of the sacral functions of kingship that went back to more ancient times before the secularization of the Athenian government, was prepared in this temple for her ritual union with the god Dionysus in an annual reenactment of the primal sacred marriage that magically reassured the yearly refounding of the city and reaffirmation of its fertile accord with the sources of life stemming from the other world (pseudo-Demosthenes 59.117).

This sacred marriage had some relation to the so-called Lesser Eleusinian Mystery,[3] a ceremony that was a preliminary to the Greater Mystery that would be performed in the autumn of the year at the neighboring village of Eleusis. Socrates' rite of necromancy, therefore, in this Swamp with a person like Peisander and at this particular date would seem somehow involved in the great scandal of the day, the profanation of the Mysteries.

Tongue-in-bellies and Revealers

Before proceeding in our investigation into what Socrates actually is supposed to have been doing, let us gain further assurance that, whatever it was, it was a profanation of the Mysteries. The Swamp parody is part of a choreographed two-part structure in the *Birds*, for which the second part is another parody involving fabulous peoples. This time the scene is a court of law conducted by 'Tongue-in-bellies' amidst a people called 'Revealers':

> Amongst the Revealers by the Hidden Water is a naughty race of Tongue-inbellies, who harvest and sow, gather fruit with their tongues and pick figs. Babbling like foreigners is this race, students of Gorgias and Philippus - and because of them, those Tongue-in-belies, these Philippuses, everywhere in Attica the tongue is a sacrificial victim cut apart.
>
> [lines 1694-1705]

In this parody, lawyers or orators are accused of aping their teachers in the quibbling play of words that make no sense in arguments proving the worse cause the better, as Aristophanes in the *Clouds* had said of Socrates, whom he considered chief amongst such teachers. There can be no doubt that this parody is meant as a companion piece for the Shade-foot verses, for structurally it would be expected since it is danced to the same choreographed rhythms and melody. Beyond that, however, it has a clear responsion in themes, with the Swamp matched by the Hidden Water and the sacrificed camel-lamb by the tongue, as well, of course, as with the matching fabulous peoples.

Here too the subject is the Mystery profanations, the great court event of the time. The Tongue-in-belly orators are hypocrites like Peisander, the prosecutor, for the fruit that their sowing and harvesting yields is bribe money, for 'picking figs' indicates people who give evidence in court against others for bounty, the so-called sycophants or 'fig-revealers'. The Tongue-in-bellies are themselves guilty of the case they try, for the lawyers are transformed into creatures with tongues in their greedy bellies, like the mysterious dwarfish woman who was supposed to have first served the Eleusinian potion to the goddess Demeter, and the Revealers amongst whom this trial takes place implicate the accusers in the crime they prosecute, since the official charge against the guilty was that they had 'revealed' the Mystery. The Hidden Water or *klepshydra* also has a double meaning, for it puns upon the 'water-stealer' or water clock that was used for timing speeches in the court and upon the so-named fountain near the cave beneath the Acropolis where the 'Queen' Creussa conceived and bore her son Ion while gathering flowers, an event that Euripides presents in his *Ion* tragedy as a mythical version of the sacred marriage.[4] A further pun on the Revealers or *Phanai* also suggests Eleusinian connotations, for the 'revealers' are verbally indistinguishable from the 'torch processions' (*cf*. Euripides, *Rhesus* 943), such as those that took place in the cults of Dionysus; Aristophanes in the *Frogs* has Dionysus greeted by just such a torch procession of Eleusinian initiates in the Swamp when he arrives there in the otherworld (340 ff.). Even the sacrificed tongue has similar connotations, for the orators' butchering of speech recalls the prohibition of secrecy imposed upon the central events of the Eleusinian initiation.

---

[3] A fragment of a bas-relief, now in the National Archaeological Museum, Athens, originally from the sanctuary on the Ilissos River where the Lesser Mystery was celebrated, shows Heracles, holding the pitcher-shaped cup that is characteristic of the Anthesteria Festival, as he arrives for his initiation into the Lesser Mystery.
For a compilation of sources relevant to the Anthesteria, see Sir Arthur Pickard-Cambridge, *The Dramatic Festivals at Athens*, second edition revised by J. Gould and D. Lewis (Oxford, 1968). The interpretation of the 'sacred marriage' as a shamanic ritual is presented in R. Gordon Wasson, Albert Hoffmann and Carl A. P. Ruck, *The Road to Eleusis: Unveiling the Secret of the Mysteries* (Harcourt Brace Jovanovich, New York, 1978) 38ff., 85ff.

[4] Carl A. P. Ruck, On the sacred names of lamos and Ion: Ethnobotanical referents in the hero's parentage. *The Classical Journal*, 71/3 (1976) 235-252.

Socrates as Profaner of the Mysteries

Actually, now that we recognize the Shade-foot parody and the corresponding parody of Revealers and Tongue-in-bellies as a reference to the contemporary scandal of the Mystery profanations, we might have expected that Socrates' rite of necromancy at this particular time could have been nothing else. The main political implication of the affair of the herms and the profanations was the anticipated pro-Spartan coup d'état, and it is not surprising that Socrates would have fallen under suspicion in the common mind. He was always associated with pro-Spartan sympathies and just the kind of aristocratic patrons and friends who might have been implicated in such a political coup.[5] These suspicions must have particularly centered upon him now that his disciple Alcibiades had not only been convicted of sacrilege, but was actually now living with the enemy in Sparta. It was commonly thought, moreover, that Socrates' involvement with Alcibiades was pederastic on the Laconian model (*cf* Plato, *Symposium* 215a ff.). It is, in fact precisely as a phillaconian that Socrates is labeled in the scene of necromancy in the Swamp, for he is given the epithet of 'unwashed', a characteristic of those young friends and disciples of his who earlier in the comedy had been said to ape him or 'Socratize' in a pro-Spartan mania, imitating his long hair and the hunger and filth that marked the rigorous indoctrination of young Spartans into their homoerotic warrior society (1281-1282). Already in the *Clouds*, Aristophanes had portrayed the filth of Socrates' disciples, a parody that supposedly was the beginning of the prejudice that would culminate two decades later in his own trial and execution for the crime of impiety in 399 B.C. (Plato, *Apology* 18b).

Not only were Socrates and his friends notorious Spartan sympathizers, but even before the great scandal of the profanations, he was suspected of profaning the Mysteries. In the *Clouds*, he had been shown teaching his students to disdain conventional theology in a parody of a mystery initiation, as they probed the lower world for the bulbous plants that in the Eleusinian myth were associated with Persephone's abduction to Hades (188 ff.). He had, in fact, even been labeled a Melian in that comedy (830), on the model either of Diagoras of Melos or Aristagoras of that same island, both of whom had profaned the Mysteries on some occasion before the great scandal of 415 (scholia to *Clouds* 830 and *Birds* 1072). If one could accuse Socrates of profaning the Mysteries in 422, the date of the *Clouds*, certainly the proven guilt of Alcibiades seven years later would have implicated his unconventional and pro-Spartan teacher as well, and, in fact, the infamy of Diagoras is recalled in the *Birds* when the chorus of birds cites the reward that had been posted for the capture and death of that earlier profaner of the Lesser Mystery (1072-1073). It would have been inevitable, in any case, that suspicion would fall upon Socrates since it was apparently well known that he was subject to mystical trances that were so similar to the experience of the Eleusinian vision that Plato adapts the language of the Mystery to describe them (Plato, *Symposium* 174d ff., 220b ff., *Phaedrus* 250c).

Mushrooms

To return, then, to our original question about what Socrates was really doing in the Swamp, it would appear that he was profaning the Mysteries. The scene of necromancy, therefore, is vital evidence about what was involved in the Eleusinian Mysteries, and evidence that hitherto has not been detected.[6] It remains to see whether the identity of the Shade-foots will allow us to be more precise about what happened at the Mysteries and about what Socrates is accused of doing in the company of that fabulous tribe of one-legged people from India.

---

[5] In addition to the documentation from Aristophanes cited in the text, note also that Socrates is portrayed by both Plato and Xenophon, himself an ardent admirer of Sparta, as praising the Dorian institutions of Crete and Lacedaemon (Plato, *Crito* 52e, *Republic* 544c, *Laws* 634; Xenophon, *Memorabilia* 3.5,4.4).

[6] It is surprising that this reference to the recent profanations has apparently gone unnoticed, despite the fact that Socrates is labelled as a pro-Spartan in this very comedy. Previous readers of the Shade-foot ode have been misled into thinking that the Swamp must be a foreign place since the fabulous one-footed creatures are in it, although so are three Athenians; it has also not been noticed that the Tongue-in-bellies are equally fabulous, but this ode, which is clearly a complement to the former, describes an Athenian court of law.

I should like to show that the Shade-foot parody confirms a suggestion I made about the nature of the Eleusinian Mysteries in *The Road to Eleusis*. In that book, I and my colleagues interpreted the Eleusinian Mysteries as communal shamanic ceremonies involving the ingestion of drugs. The Shade-foots will confirm what we suspected to have been the drug involved at the Lesser Mystery.

It is appropriate first to give some background about the studies from which our theory evolved. The collaboration was organized by R. Gordon Wasson, an amateur mycologist, who brought me together with the Swiss chemist, Dr. Albert Hofmann, to investigate the subject of the Eleusinian Mysteries.

In 1968, Wasson first proposed the cautious supposition that nothing in the Ṛg Veda, a collection of religious hymns assembled in definitive form about 1000 B.C. or a little later, after a previous long tradition of oral transmission, was inconsistent with the idea that the plant and god Soma and his reputedly inebriating drink, the focus of a very ancient ritual, were to be identified as being originally a particular species of psychotropic mushroom or entheogen, *Amanita muscaria* or, as it has sometimes been called in English, the 'fly-agaric', a mushroom that has been employed until lately both in shamanic rites and as an inebriant in the forest belt of Siberia.[7] Since the initial publication of that hypothesis, Wasson's theory has received significant acceptance and corroboration.

Various surrogates, usually not psychoactive, replaced the original inebriant in the later performances of the ancient ritual, perhaps because the true Soma was no longer easily obtainable in the lands to which the Indo-Iranian peoples migrated and had perhaps even been forgotten with the passage of time. These substitutes perpetuated certain symbolic or physical attributes of the original as remembered in the ancient poetic phrases that went back to a time before the poems were recorded in writing. It has recently been shown that the earliest surrogate for Soma in India was fungoid, hence adding strong confirmation for Wasson's theory.[8]

This emergence of the lowly and often despised mushroom at the center of one of the major ancient religions validates what Wasson and his wife Valentina Pavlovna had first surmised during the years they spent together investigating the rich European folklore about fungi, for the widely dichotomous attitudes of the Indo-European peoples today seemed to suggest derivation from a still living and powerful taboo protecting the usage of a sacred plant.[9] It was just such a religious usage that Wasson was to discover and elaborately document amongst Amerindian shamans in his study of the Mazatec María Sabina.[10]

If, however, the Soma theory were justified, one should also expect to detect analogues to the shamanic rite amongst other Indo-European peoples. Recently, Wasson has discovered an Ojibway shaman and herbalist, Keewaydinoquay, who belongs to one of the tribes of the Algonkian Nation and who has confided to him her people's traditions about the ritual usage of *Amanita muscaria*.[11] The likelihood of continuity with the Siberian rites presents itself forcibly, and doubly so now if the language of the Wintun tribe of California has a close genetic relationship to the Ob-Ugrian languages of north-western Siberia.[12]

Could the rite be detected not only in the ancient Aryan traditions, but also, as Wasson suspected, amongst the classical cultures of Greece and Rome? It was this question that Wasson proposed to me at the beginning of our collaboration on the ancient mystery religions, which he had long suspected of centering upon

drug-induced visions.[13] There could be no doubt that the drinking of a specific potion was part of the ceremony at Eleusis, where the culmination of the Mystery was consistently described as an overwhelming vision of spiritual presences demonstrating the relationship of the living to the dead. Drinking or drunkenness, moreover, seems to have been an element in the other, less known mysteries, such as those of the Kabeiroi at Thebes or the one celebrated at Samothrace. That the Eleusinian ceremony had been illegally performed for the enjoyment of dinner guests in private homes toward the end of the fifth century, moreover, suggested obvious parallels to the profane use of entheogens in modern times.

The ingredients of the Eleusinian potion are given as water, mint, and barley in the Homeric hymn to Demeter, our earliest literary source about the Mystery. Since the mint or *blechon* (*Mentha pulegium*) is hardly (or not at all) psychoactive,[14] our attention was directed to the barley. Here our third collaborator, Dr. Albert Hofmann, the discoverer of LSD, was able to supply us with the information that ergot or 'rust', a common fungal parasite on grain, contains a powerful water-soluble drug. Ergot, moreover, like other higher fungi, produces fruiting bodies of the characteristic mushroom shape. Did ergot figure in Greek botanic traditions in a way that might suggest its involvement in the Eleusinian Mystery?

The Greeks believed, as is to some extent actually true, that edible plants were evolved forms of more primitive, wild, and in some cases actually inedible avatars, and that agriculture, as opposed to the mere gathering of plants, was a triumph of civilization or culture. In particular, *aira* or *Lolium temukntum*, commonly called 'darnel', 'cockle', or 'tares' in English, an inedible grass that grows as a weed in fields of grain and is usually (like grain itself) infested with ergot, seems to have been thought to be a primitive form of barley, which would revert to the weedy growth if not properly tended. A similar opposition between gathered and cultivated plants involved the god Dionysus: poisonous and intoxicating wild ivy with its diminutive clusters of berries was apparently related to a cultivated plant that it resembled, the vine with its bunches of juicy grapes. This opposition is often depicted in vase paintings, where the elder Dionysus is shown confronting the younger manifestation of himself in a new generation as his own son, the boy named 'Bunch of Grapes', who carries the vine plant, while his father holds the wild ivy.[15] It is clear, moreover, that the wintertime mountain ceremonies of the maenads, the ecstatic female devotees of the god, involved the gathering of wild botanic versions of Dionysus, for their common implement, as shown in art and literature, was the so-called *thyrsos*, a hollow stalk stuffed with ivy leaves, a procedure that was the custom for preserving the freshness of herbs as they were gathered.[16] The fact that maenadic ceremonies did not occur in any relationship to the timing of the events involved in viticulture can now be understood, for these mountain rites centered not upon wine but upon the wild and intoxicating herbs gathered while the more civilized god was absent in the otherworld, undergoing the cultivation that would convert the juice of crushed grapes into an inebriant. Even wine, however, was felt to have an affinity to the toxins of wild plants, for, as we have shown, wine itself was flavored with various herbs that intensified its intoxicating qualities, hence requiring that it be diluted with several parts of water to tame it for civilized purposes.

In this opposition between wild and cultivated plants, the fungi played an important role, for they are seedless growths that defy cultivation and are thus paradigmatic of wildness. (The spores of mushrooms require a microscope to be seen distinctly.) Characteristic of all plants, of course, is the way they feed upon dead and putrefying matter. Here too the fungi had a special importance, for the tomb and the whole underworld were thought to be covered with mouldering growths that consumed the flesh of mortality. But even these wildest of plants could be made to function in the evolutionary botanical scheme. The Greeks realized that fermentation was a fungal process. The making of wine involved procedures and symbolism that suggested the tending of the dead and the hope for resurrection, for the blood of the harvested grape was entrusted, like any corpse, to subterranean, tomb-like containers, where the surrounding earth maintained the proper temperature for fermentation; when the process was completed, the containers were opened to release the new god, who returned together with the other spirits from the grave to celebrate a drunken revel on his birthday.

[14] C. Kerenyi, working with Dr. Albert Hofmann, suggested that *Mentha pulegium* may have been responsible for the Eleusinian vision: *Eleusis: Archetypal Image of Mother and Daughter* (Pantheon, New York, 1967, translated from the German manuscript revised by the author from publications in 1960 and 1962) appendix 1. Dr. Hofmann, however, now claims that Kerenyi overstated the psychoactive properties of *Mentha pulegium*, and, in any case, this mint is clearly not strong enough to have warranted those instances of profane use and attendant severe penalties that were occasioned during the great scandal of 415 B.C. The inclusion of *blechon* in the Eleusinian potion had a symbolic significance, as explained below.

[15] Attic black-figured vase in the British Museum, storage-jar by Exekias, B 210, about 540 B.C., the elder Dionysus holding ivy sprigs confronts his son. Krater by the Altamura painter in the Museo Archaeologico Nazionale, Ferrara, the elder Dionysus, attended by flower-bearing maenads, seated and holding the *thyrsos*, confronts his smaller self in the form of his son standing on his lap and bearing sprigs of vine and a cup of wine. *Etc*.

[16] Theophrastus, *History of Plants* 9.16.2.

The goat also was symbolic of the more primitive god, and in the form of ithyphallic goat men, the so-called satyrs, he would lasciviously cavort and possess his ecstatic brides in the winter ceremonies on the mountains. The goat's grazing habits, however, were a danger to the cultivated vine, and the hircine representative of the god became his special surrogate, whose sacrifice was necessary to assure the continuance of more civilized manifestations of Dionysus. Amongst the religious observances of Dionysus were the great festivals of drama, where the phallic exuberance of the satyrs suggested the humorous antics of comedy, while tragedy, the song sung for the sacrificed goat, centered on the necessary fall that would reconcile man to the deeper implications of his own mortality and the healthy accord of his society with the forces of the dead.

Parallel to the Dionysian gift of liquid nature was the dry food of Demeter's grain, upon which also could be grown a transmutation of a wild fungus. The vision that resulted from the carefully programmed ingestion of the ergot potion demonstrated the continuity of life and death and reaffirmed the forward progress of Hellenic civilization. The inclusion of mint in the Eleusinian potion had a similar symbolism with regard to this evolutionary theme, for the fragrant herb had connotations of illicit sexuality; the wild herb, therefore, was appropriately bruised and crushed for the barley drink that signified the transition of Persephone from sterile concubinage to a wifedom that mediated the chthonic realm of Hades and the Olympian of Demeter and Zeus. This joining of the house of the Olympians to that of the netherworld through Persephone's matrimony is another instance of the evolutionary paradigm. The Mysteries were sacred to what was called a 'holy duo of goddesses', who need not be named specifically as Demeter and her daughter Persephone, for there was a singularity in their twoness that made their roles interchangeable.The original single Earth Mother Goddess of pre-Olympian times has become a duo at Eleusis to signify the reconciliation of more primitive traditions to the new era of gods headed by a father in the heavens: Persephone has become a daughter of Zeus entrusted to the house of Hades in the earth and barred from Olympian status, but in the form of Demeter, her mother, the Great Goddess resides on Olympus with her brother Zeus. The sacred Eleusinian reconciliation, moreover, gave mankind, who in some traditions was not deemed essential to the world order as ruled over by Zeus, an intermediary role, communicating with the chthonic powers for the fertility that would yield the continuing cycles of rebirth upon which the Olympians themselves depended for nourishment in the form of sacrifice.

Just as the goddesses, so too were the Mysteries double. Whereas the emphasis of the Greater Mystery was redemption from death by the incorporation of the underworld's putrefaction into a larger scheme where it would function as a source of fertility, or, in agrarian terms, as manure instead of pollution, the Lesser Mystery, which preceded it by half a year, occurred in the wild and involved the preliminary to reintegration, the Dionysian theme of Persephone's illegal abduction by death while gathering intoxicating uncultivated flowers. In view of the role played by cultivated fungal parasites in the fermentation process and in the Eleusinian potion, we suggested in *The Road to Eleusis* that a wild mushroom may have figured in the Lesser Mystery, for such a fungus would both complete the pattern and explain certain aspects of Dionysian symbolism, such as, for example, the fact that a mushroom itself could be viewed as a miniature *thyrsos*, with the intoxicating cap replacing the ivy leaves stuffed into the stalk-like stipe.[17]

Aja Ekap&amacr;d

The Shade-foots, in whose company, as we have seen, Socrates appears to have communed with spirits in profanation of the Lesser Mystery, can be found also in Vedic traditions. The Hellenic migration into the Greek lands in the second millennium before Christ was only one branch of widespread migrations of Indo-European peoples, another group of which moved down from the northwest into what is now Afghanistan and the valley of the Indus. This latter group was the so-called Aryans, whose language was Vedic, a parent of classical

---

[17] Apicius 7.15.6.

Sanskrit. The canonical collection of 1028 hymns called the Ṛg Veda preserves the ancient oral traditions of these people dating back to a time before the migrations when presumably they shared a common homeland with the other IndoEuropeans. We should expect to detect common elements and parallels between the Greek-speaking Indo-Europeans and the Vedic Aryans, as, in fact, we can in their languages, poetic metaphors, and customs.

In the Ṛg Veda, amidst a complex pantheon, headed by Indra, appears the god Soma, a plant that was pounded to extract a divine inebriant. This drink is described with symbolic components that, as has been recently shown,[18] are traceable back to an Indo-European original from which it apparently derived, for similar components occur also in the descriptions of magical drinks or potions in Greek traditions. Soma is often accompanied by Agni, the god of fire, and is richly described with formulaic epithets that note his color and metaphorically associate him with the bellowing of bulls, the pillar of the sky, the single eye, the navel, and so forth, although (remarkable for a plant) no mention is ever made of roots, leaves, blossoms, or seeds. It was this omission that attracted Wasson's notice. He demonstrated that a mushroom was the only botanic specimen that would fit such a description and that similar metaphors could be traced in later traditions about fungi.

Through oversight, however, Wasson did not mention '*Aja Ekap&amacr;d*' in the original edition of Soma, an omission that is repaired in his new introduction to the French edition.[19] *Aja Ekap&amacr;d*, as his name implies, is the 'Not-born Singlefoot', a deity mentioned six times in the Ṛg Veda and apparently an archaic name for Soma himself, for he shares epithets with him, is often accompanied by the chthonic serpent who invariably is the guardian of the holy plant, and once even has only the first of his names linked to a common epithet of Soma as Aja N&amacr;bhi, the 'not-born Navel'. As Wasson observes, '*Aja Ekap&amacr;d*' is the perfect binomial nomenclature for a mushroom, for mushrooms are 'not-born' since, as already mentioned, their seedless propagation by microscopic spores was not understood in antiquity, for which reason in India as in Greece (as well as elsewhere) they were thought to be engendered by the fire of the lightning bolt as they burst suddenly through the soil, expanding with the absorbed water of the rainfall, a manner of conception that the Greeks, in fact, gave to Dionysus. Similarly, although the 'single-foot' attribute is, of course, common to all plants, it appears to be particularly apposite for mushrooms, which occur in folklore as the little men with only one foot, as in the following German riddle quoted by Wasson:[20]

Sag' wer mag das Männlein sein
Das da steht auf einem Bein?
Glückpilz! Fliegenpilz!

The Shade-foots, who were also known to the Greeks with the botanical epithet of 'One-legs', and who came originally from the Indus valley, would seem, therefore, to be a Hellenic version of the deity Soma with the epithet *Aja Ekap&amacr;d*. They survive into modern times amongst the Chukokta tribesmen in the region to the far north-east of Siberia. There, the spirits that reside in *Amanita muscaria* are said to materialize to those who become inebriated on the mushrooms as little people with a single leg; these leaping single-footed creatures, as numerous as the mushrooms that each has ingested, lead the intoxicated tribesmen on intricate and marvellous journeys to the land of the dead.[21] These tribesmen, moreover, are so impressed with the prodigious strength of the mushrooms' single leg that they often attempt to imitate them by thrusting their heads through some restraining membrane or by vigorously leaping about like the ancient jumping Shade-foots, amongst whom Socrates also communed with spirits in profanation of the Lesser Mystery.

The aptness of such a metamorphosis of mushrooms into little one-legged creatures is apparently something that suggests itself repeatedly to folk imagination, for it is thus also that they appear in the perhaps unrelated

shamanic traditions of Meso-America.[22] Our ancient leaping Shade-foots are, furthermore, actually recognized as red-capped mushrooms in the fabulous journey to the end of the world described in C. S. Lewis's fictional *Voyage of the* '*Dawn Treader*'.[23]

In antiquity we may surmise that the Shade-foots were present by and large throughout Siberia. Although the Greeks learned of them from the Indus valley sometime after the middle of the first millennium before Christ, they were probably present for millennia earlier in the forest belt, and other versions of them no doubt also came into the Greek lands with the arrival of the Indo-Europeans at the beginning of the Mycenaean Age. We perhaps catch a glimpse of them with another attribute of Soma as the Monophthalmoi or 'One-eyes', a fabulous people who lived on the frontier with the netherworld in the steppes north of the Black Sea and were called Arimaspeans in Scythian (Herodotus 3.116, 4.13,27; Aeschylus, *Prometheus* 803 ff.). These One-eyes engaged in combat with the monstrous guardian beasts of the otherworld and were the center of religious rites of shamanism proselytized in Greece by the priest and poet Aristeas of Proconnesus, who was said to be able to metamorphose into a raven and to travel as a spirit separate from his body (Herodotus 4.14-15). Other Monophthalmoi appear in Greek traditions as the 'Orb-eyes' or Cyclopes. They are named individually with epithets of the lightning bolt (Hesiod, *Theogony* 139) and were reputed to be workmen of Hephaestus (Callimachus, *Hymn to Artemis* 46 ff.), the god of fire in the volcanic forge. It is in this form that they may have come with the Dorians, for they figure in the epic traditions of the *Odyssey* and were said to have built the fortifications of several cities in the Argolid (scholia to Euripides' *Orestes* 965), including Mycenae, which was supposedly so-named because its founder, a son of Zeus, had picked a mushroom there (Pausanias 2.16.3).

Analogues to their name as 'Shade-foots' and 'Cover-foots' can also be found in ancient India. In classical Sanskrit, 'mushroom' is *chattra*. It is formed from the root *chad*, 'to cover' and has 'parasol' as its primary meaning. This could not have been its name before the Indo-European migrations. Since parasols were not called for in northern climes, and indeed, were unknown until recently in the regions north of India, it is probable that the Aryan invaders found the utensil in use and named it with the Indo-European root when they came south, later extending the meaning by metaphor to include mushrooms.

The metaphor, moreover, is particularly apt in Greek. The Greek parasol, like ours today, was round and ribbed with toe-like spokes that resemble the webbed foot of water fowl, which had the epithet of'cover-footed' (*steganopodes*, Aristotle, *History of Animals* 504a7, *etc*.), as well as the gills of a mushroom. It was called the *skiadeion* (Aristophanes, *Birds* 1508), which is simply to say, the 'little shade', and was thus an appropriate term for the little *skia*, the spirit or ghost that was the 'shade' of former life to be summoned from the grave in a rite of necromancy.

Prometheus as Shade-foot and the Theft of Fire

It remains for us to consider whether Aristophanes had any special reason for choosing Prometheus to bear the parasol as his standard. In the *Birds* each of the two parodies that we have been examining, that of the Shade-foots and the matching one of the Revealers and the Tongue-in-bellies, is introduced by a scene appropriately related to it. Thus, the Tongue-in-bellies at court are introduced by a scene in which Heracles humorously discovers that as a bastard son of Zeus he does not have a clear right of inheritance to his father's Olympian estate. In the same manner, the preceding scene with Prometheus carrying the parasol to shade himself from the view of Zeus overhead is a thematic introduction to the parody of Socrates' necromancy with the Shade-foots, for Prometheus clearly is himself being presented as an impersonation of a Shade-foot, and his exit, furthermore, just before the parody, even imitates the carrying of the sacred basket beneath a parasol in a religious procession (1550 ff.).

Although Prometheus's quarrel with Zeus goes back to the time he stole fire from the gods, the traditions about that primordial theft suggest that the fire had connotations of herbalism. Prometheus was said to have hidden the stolen fire in a hollow fennel stalk or *narthex* (Hesiod, *Works and Days* 52; Aeschylus, *Prometheus*

---

[22] For documentation, see R. Gordon Wasson, *The Wondrous Mushroom: Mycolatry in Meso-America* (McGraw-Hill, New York, 1980).

[23] C. S. Lewis, *The Voyage of the* '*Dawn Treader*' (Macmillan, New York, 1952) 141 ff.

109), thus treating fire like an herb gathered and stuffed into the Dionysian *thyrsos*; *narthex* itself, in fact, became a term for a casket of drugs, apparently because of such traditional usage in the gathering of magical and medicinal plants.[24] It is significant, therefore, that Aeschylus in his *Prometheus* tragedy refers to the stolen fire as a 'flower' or *anthos* (7) that was given to mankind as the source of that same intelligence and clairvoyance for which Prometheus or 'Forethought' is himself named, including, in particular, knowledge of drugs and the mantic art (476 ff.).

This gift of the stolen fire was involved in the mystery traditions of the Kabeiroi, for the theft took place on the island of Lemnos (Cicero, *Tusculan Disputations* 2.10.23) and had its source in the volcano there that was thought to be the forge of Hephaestus (Aeschylus, *Prometheus* 7).[25] It was to the primordial men of that island that Prometheus gave the fire. These men were called the Kabeiroi, the eldest of whom was supposed to have been born there from the earth itself.[26] In art, the Kabeiroi were portrayed as dwarfish black caricatures of mythical figures. Their leader was called Kadmillos, apparently a diminutive version of Cadmus, who came from Phoenicia and founded Thebes, where there also was a mystery cult of the Kabeiroi. These traditions perhaps facilitated the transposition of the Shade-foots to a supposed homeland in the African deserts in later antiquity.

These aboriginal Kabeiroi to whom Prometheus entrusted the divine spark of intellect were in all probability originally a primitive race of botanic creatures, for autochthonous births such as theirs are suggestive of plants. Thus at Corinth, for example, the first men actually were said to have come into being by metamorphosis from mushrooms (Ovid, *Metamorphoses* 7.312-313; *cf*. Apollodorus 1.9.3); and at Thebes, Pentheus, who plays the role of the sacrificial surrogate for Dionysus in Euripides' *Bacchae*, was the son of the apparently 'serpentine' Echion, one of the autochthonous Spartoi, the men who were said to have been 'sown' by Cadmus from what is usually called in English the 'teeth' of the primordial serpent. If we translate the term more exactly for its context, it is clear that such 'teeth' must obviously be 'fangs' and hence we are dealing here with a mythical tradition about toxic botanic forms. At Athens too, we can note a similar complex of metaphors suggesting that botanic drugs were involved in the symbolism of primordial autochthony, for Erichthonius, the 'Very Chthonic' son who was born from earth out of the seed either of Hephaestus or Prometheus, was said to have bitten the nurses (Apollodorus 3.187) to whom Athena entrusted him and to have caused thereby their death in the ensuing fit of madness (Pausanias 1.38.3; Euripides, *Ion* 12 ff.).

The traditions about Hephaestus also suggest botanic paradigms for the fire that set the aboriginal creatures on the track of evolution to a higher state of being. It is no happenstance that both Prometheus and Hephaestus, as we have just seen, were said to have fathered the primordial Athenian, for they often double for each other in myth and hence it is likely that they were originally simply different aspects of the same figure, with Prometheus's so clearly transparent name merely an epithet for the other.[27]

It is Hephaestus, the god of volcanic fire, who is responsible for tormenting Prometheus and his brother Titans for their opposition to Zeus and the tyranny of his newly established rulership that at first was not reconciled to the existence of man, Prometheus's own creation. Such fiery torment that is a burden of selfinflicted sacrifice recalls the close association of Soma and the fire god Agni and is suggestive of the pattern of shamanic initiation or *askesis*.

To trace this idea, let us look first at the traditions involving the lame Hephaestus with magical plants and intoxication in his tormenting of the Titans. For example, as punishment for the giant or 'Earth-born' Typhon, Zeus was said to have confined him in the volcano of Aetna (Aeschylus, *Prometheus* 351 ff.), which, like the volcano on Lemnos, was thought to be a forge of Hephaestus (*Prometheus* 366 ff.). This punishment parallels that of Prometheus's brother Atlas, who stood as 'the pillar between heaven and earth' in the Garden of the Daughters of the West, the so-called Hesperides (*Prometheus* 347 ff.). The mountain with the core of fire and the special garden where magical plants grow are probably to be recognized as analogous versions of the

---

[24] Thus *Narthex* was used as the title for medical works by Heras, Cratippus, and Soranus (Galen 12.398, 959; Aätius 8.45).

[27] Kerenyi, *Prometheus* 57-62.

World Axis or *axis mundi*, the place where the Tree of Life grows, allowing the shaman to ascend or descend to other realms in the torment of his *askesis*. This place is at the ends of the earth, hence, as with the Hesperides, in the place where the sun goes down. Analogous to it is the place of the dawn. Thus Hephaestus bound Prometheus in the far east, a topographical counterpoise to the torment of his brother in the land of the evening, and like the latter, it too is a place where special herbs grow. On his quest for the so-called 'apples of the Hesperides', Heracles will visit Prometheus as well as Atlas, for the two distant locales are bound by the daily journey of the sun through the darkness of the night, a trip that Heracles, who also will experience the shamanic *askesis*, was said to have taken by sailing in the fiery sun's own *depas* or 'drinking cup' (Stesichorus 8.1; Pherecydes 18a), a utensil that suggests that the voyage is one of intoxication,[28] and that Hephaestus, who fashions such metal cups in his forge (Aeschylus, fr. 69), may again be involved.

Other traditions also associate both the eastern and western locales with the shaman's fiery plant, for the word in Greek for the 'apple' that was to be found growing in the Garden of the Hesperides is verbally indistinguishable from the golden fleece of the 'sheep' (*melon*) that was hung on the tree in Medea's land in the far east. It was that fleece that had transported the children of the 'hallucinatory' Nephele to that otherworld environment. The equivalence of the two topographical extremes can also be sensed from the fact that the socalled 'Queen' Medusa, the Gorgon, was located in both places (Hesiod, *Theogony* 2,74 ff.; Aeschylus, *Prometheus* 790 ff.). On a vase painting from southern Italy, we glimpse a remembrance that the fruit of the Medusa's special tree was a mushroom.[29]

Prometheus himself, in some traditions, was apparently the magical plant. A miraculous herb, parasitic on a tree and in color like the crocus, was said to grow from the blood of Prometheus in his torment. Medea picked it to anoint Jason (or Iason, in Greek, apparently so named for this anointing with the drug[30] that will protect him from the fire-breathing bulls guarding the tree with the golden fleece); when the plant was thus harvested, Prometheus himself groaned, according to the way that Apollonius Rhodius told the story, for the plant is said to grow from a double stem. In picking the Promethean herb, Medea is also in contact with the suffering Titan bound to his mountain, for which reason the root of the plant when it is plucked was said to resemble the flesh of a corpse that has just been cut (*Argonautica* 3.845 ff.).

The fiery Titanic drug found at the tree on the mountain in the lands where the sun is kindled and extinguished appears, as Wasson has shown,[31] to have had a fungal prototype in the homeland of the Indo-Europeans. In Siberia, the paradigmatic shaman's Tree is the shining white birch that is host not only to the mycorrhizal parasitic *Amanita muscaria* growing at its base, but also to the steps of shelf fungus ascending its trunk. The latter, 'punk' or *Fomes fomentarius*, provides the tinder for making fire with a fire drill, thus associating the gift of fire with the shaman's ascent to the fiery realm of his visions.

The torment of *askesis* passes from sufferer to sufferer, a labor like the sun's, forever renewed. It is upon the basis of this primitive experience in primordial times that culture is founded and continually renewed. The myth of Heracles, for example, is a case in point. He was said to have fought many poisonous monsters in order to tame the earth for mankind and to establish the reign of his divine father Zeus. His burning torment came upon him when his wife Dejanira anointed his robe with the drops of poison that came originally from one of the monstrous beasts he had killed (Sophocles, *Women of Trachis* 831 ff., 1140 ff.). In another tragedy, he was shown in a mad state, poisoned by this same primordial source (Euripides, *Heracles* 1189 ff.). This intoxication represents his regression to a primitive state, to a time before the world was civilized, when he,

29. Amphora from the third quarter of the fourth century B.C., now in the Pergamon Museum, East Berlin (Staatliche Museen zu Berlin, Antiken-Sammlung, inv. no. F 3022), See Wasson *et al*, *The Road to Eleusis* plate 8.
30. The name lason contains the same *ia-* root that occurs in words such as *iatros* ('healer' or 'doctor') and *iasthai* ('to heal'). In addition to the anointment by Medea, lason is associated with drugs through his education in his youth in the wilds with the centaur Chiron. See Ruck, On the sacred names of lamos and Ion.
31. Wasson, *Soma* 2.16 ff. In Siberia, birch-bark containers were stuffed with punk, which deprived of air by tight packing would harbor the smouldering fire for upwards of two days. This custom invites comparison with the tradition of Prometheus's theft of fire hidden in the *thyrsos* or *narthex*, for the marrow of the giant fennel was used as tinder and even in modern times on some of the Greek islands is still the means of preserving the glowing embers or of carrying them from place to place (for references see Kerenyi, *Prometheus* 80).

who would eventually pacify the earth and show the way to reconciliation with the heavens, was still a dwarfish creature called a Daktyl or 'finger man'.[32] The dichotomy between primitivism and culture at the Eleusinian Mysteries can be detected in the tradition that claimed that this poisoned and primitive Heracles underwent purification at the Lesser Mystery (Apollodorus 2.5.12; Diodorus Siculus 4.14; Scholia to Aristophanes' *Plutus* 1013) in order to prepare him for his initiation into the Greater. Heracles, however, can be freed from his poisoned state and restored to his Olympian destiny only by passing the venom to another who will play the role of the primitive sufferer. Thus, on the pyre that was eventually lit on the mountaintop of Oeta, Heracles escaped from his mad torment, giving his venomed arrows and bow to a member of the family of Poeas, whose name suggests that he had a botanic identity.[33] The words for 'poison' and 'arrow' (*ios*) are identical in Greek, and the transference of the bow apparently entails also the contamination by its metaphoric complex of primitivism and toxicity. Thus when we hear of this bow again, it is in the hands of Philoctetes, a son of Poeas. He was shown in Sophocles' tragedy yearning to be burnt in the Lemnian volcano of Hephaestus (*Philoctetes* 800, 986 ff.), a release from torment analogous, as he claims, to the fiery consummation that he once afforded Heracles on Oeta (801 ff.). Instead, cursed by his inheritance, he must live a primitive existence, dragging his poisoned foot in a track like the primordial serpent's (163, 291) and hunting for food that necessarily is tainted with the arrow's toxin (105,166). Periodically he falls into fits of madness that are described as a wild kind of intoxication, ungraced by the evolution of the custom of communal drinking of tempered wine (213, 712 ff.). Eventually, he too, it was said, passed the role of sufferer to another, when he shot Paris at Troy on his foot with an arrow, while he himself was reintegrated with society and his own foot healed with curative herbs and wine (Apollodorus, *Epitome* 8; Tzetzes, *On Lycophron* 911).

Prometheus too could be freed from his torment on the mountain to which Hephaestus unwillingly had bound him only by passing his role to another. Thus it was said that the centaur Chiron was poisoned when Heracles accidentally shot him on his foot as the other centaurs fought in their typically uncivilized way to drink from a newly opened jar of wine. Despite Chiron's vast knowledge of drugs and herbs, a lore he was said to have taught many heroes in their youth spent with him in the wilderness, he was unable to heal himself. Heracles at last freed Prometheus by offering Chiron as a substitute (Apollodorus 2.5.11).

We cannot expect that Aristophanes reacted consciously to the full implication of presenting Prometheus as a Shade-foot, although it is perhaps possible that in the Kabeiric mystery traditions something was known that is now lost. Much, however, of what we have been discussing in the patterns of myth probably represents the inheritance of traditions from very ancient times whose meaning the classical writers did not question. Embedded in those traditions was a special value placed on lameness, like that of Hephaestus, Oedipus, and Philoctetes, or on single-footedness, as in the case of the 'one-shoed' (Apollodorus 1.9.16) Jason. The obvious psychological aptness of such an attribute of heroism no doubt facilitated its perpetuation, but the consistent way that it is incorporated as a detail in a larger complex involving the young hero's exposure to a mountainous wilderness of toxic plants as a preliminary to his reintegration with the civilized world suggests that the 'one-leg' paradigm, with its botanic manifestations, derives from the same ancient metaphor that in a more bizarre form was preserved as the Shade-foots.

Part of that ancient inheritance of heroic paradigms clearly derives from tales of shamans in primordial times. The torment of Prometheus and his brother Titans represents the toil imposed upon them by the new race of gods ruled by Zeus. The eagle that once was symbolic of Prometheus's flight toward the celestial realm has been expropriated as an emblem for Zeus. Prometheus no longer flies. Instead, chained to the eastern mountains that in the Iranian traditions were the home of the magical herb, he is tormented by the eagle who feasts repeatedly on the liver that was the seat of the Titan's power of divination.[34] The mountain itself, with its volcanic core, provides a passageway down to the netherworld (Aeschylus, *Prometheus* 1080 ff.), just as the holy plant found on its slopes afforded transport to the fiery heavens. His eventual release is symptomatic of the great reconciliation that reapportioned the world amongst the earlier and later races of gods and found room as well for the humans that were his creation. With the stolen fire, at a place called Mekone, apparently named for the 'Poppy' and sacred to Demeter and Persephone,[35] he taught mankind how to sacrifice, cooking the edible parts of the butchered victim and burning the rest for the gods. In doing this, his.shamanism, for so the name of the place would suggest, set man in his vital.role in the cosmos and began the arduous evolution toward the civilized arts, for in every repetition of such sacrificial eating, the Greeks retraced, in culinary symbolism, the steps of their long progress toward culture.[36] Without the ritual, -mankind could not come to terms with the horrible realization that life is nourished, just like plants, by what is dead, and that primitivism, as in the maenadic ceremonies, must be tended as the fertile foundations of civilization.

---

[32] For a discussion of the tragic hero as reversion from Olympian to chthonic or Dionysian symbolism, see Ruck, Duality and the madness of Herakles. *Arethusa*, 9/1 (1976) 53-75.

[33] Poeas (or more exactly Poias) is perhaps to be related to the word for 'herb', *poie*.

[34] On hepatoscopy and the wounding of Prometheus, see Kerenyi, *Prometheus* 39-40. For an interpretation of Prometheus's torment by the eagle as shamanic *askesis*, see E. A. S. Butterworth, *The Tree at the Navel of the Earth* (Walter de Gruyter, Berlin, 1970) 201 ff.

In addition to the common Indo-European heritage of traditional metaphors and religious ideas, however, the close proximity of the Greeks to their eastern neighbors no doubt also added to the storehouse of myth. Thus, the hero's Promethean flight with the eagle in search of Soma or the magical potion can be found in the traditions of the Indo-Iranian peoples.[37] Its earliest written account appears in Ṛg Veda 4.26 and 27, with parallels in the *Avesta* and later texts, as well as in the literature and art of Mesopotamia. In addition to the similarity to the Prometheus myth, the same story seems to underlie the traditions about the eagle who brings nectar to Zeus[38] and the myth of Ganymedes' abduction from a mountain by Zeus in the guise of an eagle so that the handsome youth might serve nectar on Olympus as cupbearer to the gods (Homer, *Iliad* 20.133-335; Vergil, *Aeneid* 5.252 ff.; Ovid, *Metamorphoses* 10.155-161). The eagle traditionally sits in the branches of the shaman's tree. Perhaps this image too is detected in Greek, in Nonnus's description of a blazing olive tree off the coast of Tyre with an eagle at its top holding a libation cup (*Dionysiaca* 40.467 ff.).[39]

Of particular interest for our interpretation of Prometheus's impersonation of a Shade-foot in the *Birds* are three reliefs from the temples at Sanchi and Amar&amacr;vati in India built in the first and third centuries A.D., but employing traditional symbolism that is certainly much older and which is essentially not different from that found in the eastern Mediterranean.[40] On these reliefs, the Tree of Life is shown as a pillar between earth and sky, resting on an *omphalos* or Navel Stone and surmounted by sunshades, apparently as indication of the fiery brilliance of the higher realm.

Philosophers

Aristophanes' parody of Socrates' necromancy in the Swamp makes clear that the symbolism of the Aryan fungus played an essential role in the Lesser Eleusinian Mystery. As with Soma, of course, it is possible that surrogates or substitutes were actually employed by the classical period, although the attributes of the original were in some form retained. Thus, the color of Medea's Prometheus herb is roughly consistent with the Vedic traditions, as is that also of the ergot fungus of the Greater Mystery. A similar spectrum of sacred color is described in Pindar's *Sixth Olympian Ode* as characteristic of the magical herb that was responsible for the primordial source of inspiration for the mythical ancestor of the lamidai, the prophets who continued to practice divination at the sanctuary of Zeus at Olympia.[41] We should not conclude, moreover, that the *Amanitas* were not to be found in ancient Attica, for it was doubtless a deadly species of that genus that was responsible for the accidental deaths commemorated by Euripides in a famous epigram (Eparchides, quoted in Athenaeus 2.61a-b). And in the forested regions of modern-day Greece, the country people retain a knowledge of edible and inedible species.

By sending Peisander into the Swamp to consult Socrates amongst the Shadefoots, Aristophanes was cutting through appearances and showing up the vigorous prosecutor of the investigation into the scandal of the recent profanations as basically no other than he would soon turn out to be, an aristocrat like the now infamous Alcibiades, whose democratic demagoguery would last only so long as it suited his own political ascendency. Like the other students at what Aristophanes in the *Clouds* had called Socrates' *phrontisterion* or 'thinkshop', Alcibiades and Peisander both could be expected to have learned from the philosopher to despise convention and speak with the deceitful rhetoric of the Tongue-in-bellies.

It would appear, therefore, from our discussion of the scene of necromancy that the common suspicion about people like Socrates was that they were apt to have derived their ideas about other realities and about the relativity of everything to be found in this present world from drug-induced visions. In rehabilitating the reputation of his teacher, a man who had been put to death for impiety, Plato chose precisely a time just before the scandal of the profanations to portray Socrates at Agathon's symposium as a person subject to spontaneously generated periods of mystical trance and to emphasize the non-erotic involvement and growing separation between the philosopher and his drunken disciple Alcibiades. That, however, was not what was commonly believed by Socrates' contemporaries. To them, he seemed to speak of experiences that resembled those of a shaman, and his unconventional manner of life and his novel deities made it likely that he acted as a mystagogue for the young men devoted to him.

He was, in fact, not unlike other early philosophers whose lives and ideas have been recognized as shamanistic.[42] Amongst them, let us recall only Empedocles, who was said to have attempted to prove his divinity by jumping into a volcano, leaving behind only a single sandal (Heraclides 77 Voss). In his life he had a great reputation as a healer and, as he himself says, he was sought in his native Sicily by many who-wanted prophecies or drugs (111,112 Diels). He died when Socrates was in middle age, but the characteristic life of such men, as the necromancy parody shows, still set the expected pattern for wise men in Athens at the end of the century. Even Plato in the following decades would describe his master's devotion to wisdom by the metaphor of the inspiring god of Love, the child of ragged poverty, who spent his whole life in philosophic quest, an enchanter and herbalist and sophist (*Symposium* 203d).

CHAPTER SEVEN

The Wild and the Cultivated: Wine in Euripides' *Bacchae*

In the *Bacchae*, the cultivation of grapes for the making of wine is presented as a novel advance in the science of agriculture. The prophet Teiresias compares it to the cultivation of grain as mankind's basic food. The latter is the dry nourishment that Demeter offers, whereas wine is its liquid complement, the new gift that the god Dionysus 'discovered and introduced' (ηὗρε κεἰσηνέγκατο 279). It is something as yet unknown in Thebes. Hence, he explains that it is a potion prepared from the clusters of grapes from the vine. As a 'drug', it is the supreme anodyne (οὐδ᾽ ἔστ᾽ ἄλλο φάρμακον πόνων 283), granting sleep and surcease from pain and daily cares (280-283), and it is a divine inspirative of wisdom and courage (298 ff.).

Others also have heard about wine in Thebes. The herdsman too claims that the vine is apparently an anodyne (παυσίλυπον ἄμπελον 772), without which there can be no love or pleasure for mankind (773-774). If such are the characteristics of this new drug, however, his praise of wine would seem an inappropriate conclusion to his narrative of the wild events he has just witnessed on Mount Cithaeron, for he barely escaped with his life from the god's maddened devotees. Clearly, we are not to assume that the revel on the mountain was caused by this new gift of the vine's potion. In fact, he had begun his narrative by stressing that there was no amorous dalliance amongst the women, nor were they drunk on wine, as the king who opposes this new god has suspected (686-688).

Pentheus, as will be shown, is king of a pre-viticultural city, and his persona in the drama is characterized by the antithetical properties to the wine whose introduction he opposes. In such a city, it cannot be the fermented juice from the cultivated vine that is responsible for the maenadic revels on the mountain, but wild and hunted growths instead, more primitive versions of the god, predating his Asian journey of discovery. This contrast of the wild and the cultivated will establish the basis for a new understanding of Euripides' meaning in this drama and of the tragic genre in general as a religious celebration of Dionysus.

The Discovery of Wine

At the beginning of the *Bacchae*, Dionysus announces that he has come to Thebes from Asia Minor bringing with him the cult of his new religion and that he has planted what must be the first grape-bearing vine in this land where he was born (11 ff.), for Thebes is a country that has yet to learn the art of viticulture and experience the blessings of wine. The herdsman, for example, can praise wine later only from hearsay evidence (ὡς ἐγὼ κλύω 771), and Teiresias introduces his explanation about the parallel advances in agriculture by predicting the god's future greatness in Greece. Pentheus too knows of wine only by rumour (λέγουσι δ᾽ ὥς τις εἰσελήλυθε ξένος 233 ff.) and he suspects that the experience that the god is introducing from Asia is merely a 'fiction' (πλασταῖσι βακχείαισιν 218) that the women use as a 'pretext' (πρόφασιν 224) for illicit love-making in the wilderness.

The situation in Thebes at the beginning of the play corresponds with other Greek traditions about the importation of viticulture, as well as with historical fact, for the growing of grapes for the production of wine apparently did originate in Asia Minor as a parallel development to other advances there in the cultivation of human foods. The art of viticulture spread westward from there via Crete and the Aegean islands to Thrace and mainland Greece.[1] With wine came also the cult of its ecstatic religion, undergoing accretions and developments, notably from Egyptian and Minoan influences. Dionysus himself traditionally landed in Attica around the fifteenth century before the Christian era,[2] and the names of his first proselytizing priests suggest

2. Hieronymus's Latin translation of Eusebius records 1497 B.C. as the date of the god's arrival in Attica and 1387 B.C. as the date of his birth from Semele at Thebes. The date of arrival derives from Athenian traditions preserved in the Atthidographers. See Kerenyi 143, note 32.

Semitic, eastern Mediterranean and Egyptian origins.[3] His name has been read in Mycenaean-Minoan documents, as well as the name of his arch-opponent Pentheus, indicating that the antagonism between the two belongs to a very early stratum of the religion as it developed in the Greek lands.[4]

As would be expected, the name for the newly cultivated plant, the Vine' or *ampelos* (ἄμπελος), appears to be a word assimilated into Greek from a non-Indo-European language of the Mediterranean substratum, like other words for things that were novel to the experience of the immigrating Indo-Europeans.[5] The same is probably the case for the intoxicant fermented from the vine's grapes, 'wine' or *oenos* (οἶνος), and for the 'cluster of grapes' or *botrys* (βότρυς).[6] It is also possible, however, that *oenos* is derived from a very ancient Indo-European word, ultimately related to the Latin word for 'grape-vine' (*vitis*) and the Greek *itys* (ἴτυς), 'circular rim', as of a wheel supported by its spokes.[7] If the latter is the case, *oenos* presumably referred originally to some intoxicant other than wine, perhaps to a plant appropriately designated with the metaphor of *itys*. In Greek mythical traditions, Itys appears with Dionysian connotations as the butchered son of the maenadic sisters, Procne and Philomela, whose story involves the pattern of possession and abduction by a chthonic spirit, as in the myth of Persephone.[8]

The name of Dionysus himself contains the Indo-Europeans' word for their chief god, Zetis/Dios, and testifies to an attempt to incorporate the alien deity into Indo-European mythology as a son of Zeus, the so-called 'Nysian Zeus'. A similar assimilation occurs in the traditions about Zeus's birth on Crete, which clearly must be a rebirth since the god existed before the Indo-Europeans made contact with the Minoan culture of Crete. This Minoan 'Zeus' was one of the so-called 'divine-child' deities of botanic nature.[9] One of the names for him may have been retained in classical Greek as Bacchus, another name for Dionysus and for a 'sacred branch' or *bakkhos* (βάκχος), which, according to Hesychius, is a Phoenician word for 'lamentation', such as might be expected to attend the death of such divine children, as in the classical rites of Adonis.

The myths recounting the story of the god's arrival in Greece attest to the pattern involved in the assimilation of his cult. Traditionally, he is met by a king and his daughters, who are initiated into his new religion.[10] This initiation, as we shall see, was apparently some form of 'sacred marriage' between the princess and the god, a shamanic rite of spiritual possession whereby the alien deity was reborn in his Hellenic form, for, as the poet of the Homeric hymn to Dionysus claimed, the god's mother was said to have borne him in many places along his route to Thebes, although actually the true account was that he was born far off in Phoenicia near the streams of Egypt on a mountain called Nysa (1.1-9), the sacred place after which he is named as the 'Nysian Zeus'. The paradox of a foreign as well as native births was reconciled in later traditions by assuming that the Dionysus who arrived in Greece as the bringer of his cult was different from the one born at Thebes, but the two must originally have been the same god,[11] and, in the *Bacchae*, Euripides is closer to the truth in disguising the Theban-born Dionysus as the prophet arriving from the East with the rites of his foreign religion of viticulture, which his mother's people do not yet know.

---

[3] Dionysus was first received as a guest in Attica by Semachus, the founding hero of the deme of Semachidae, whose name appears to be West-Semitic, meaning 'made to rejoice'. Another tradition placed the god's landfall similarly on the west coast of Attica at Ikarion where he was received by Icarius, whose name suggests that he came originally from Icaria, the island off the coast of Asia Minor, where the god was supposed to have been born. Icarius can be related to Caria and to the 'light-bearer' names of Ikar (the star Sirius) and lacchus (a name of Dionysus at the Eleusinian Mysteries), as well as the Egyptian lachim, a man who was supposed to have lived in the time of the otherwise unknown King Senes. A third route of arrival was through the mountain village of Eleutherae on the Boeotian border, a place assodated with Eleuther and an apparition of the chthonic aspect of the god under the name of Melanaigis, the 'black goatskin', and with the proselytizing seers Pegasus and Melampous, the latter being the one who supposedly introduced the phallic worship of Dionysus from Egypt by way of the Peloponnesus. See Kerenyi 73 ff., 146 ff., 160 ff.

[11] Kerenyi, *Ibid*. 143-144.

As the god was repeatedly born anew as Zeus's son, the sacred place of his birth also was multiplied, so that there were many places called Nysa, and women other than Semele who were his mother. Even in antiquity it was recognized that the supposedly Theban Semele, whose family had migrated from Phoenicia, was no other than the Earth Mother (*F. Gr. H.* 244 F 131 Jacoby) imported from Anatolia. Thus Persephone, the great queen of the netherworld, was his mother too, and she also experienced the sacred marriage at Nysa, according to the Homeric hymn to Demeter (2.17).

The latter tradition gives us valuable insight into what was involved in these sacred marriages, for Persephone was said to have been gathering wild flowers with a group of maiden women when she was possessed by the spirit of death, the lord of the otherworld, who was synonymous in such experiences of spiritual possession with Dionysus himself (Heraclitus 15 Diels). By that abduction, she eventually gave birth to a new form of Dionysus.[12] The ecstatic devotees in the cults of Dionysus similarly performed some secret ritual that apparently symbolized the gathering of wild plants, for the recurrent indication of their maenadic occupation is a strange implement, the so-called *thyrsos* (θύρσος), apparently another non-Indo-European loan-word in Greek that designated a stylized 'sacred branch' or 'wand' in the form of a hollow giant fennel stalk crowned with leaves of wild ivy. As I have shown in a recent study of the Eleusinian Mysteries,[13] this sceptre of Dionysus takes on particular meaning when we consider that such hollow stalks were customarily employed by herbalists in Greece to preserve the freshness of the wild plants they gathered (Theophrastus, *H. P.* 9.16.2) and that 'ivy' or *kissos* (κίσσος), a plant sacred to Dionysus, was the sort of magical wild plant that would have been gathered in this manner, for it was reputed to be poisonous, with a deranging effect upon the mind (Pliny, *H. N.* 24.75; Dioscorides, *Alex*. 2.176). The plant that Persephone gathered was also reputed to be a drug, for the flower that she picked was the *narkissos* (νάρκισσος), like *kissos*, another loan-word in Greek from a non-Indo-European language,[14] but a plant that was thought in classical times to have been so named because of the 'narcotic' stupor that it induced (Plutarch 2.647b; Dioscorides 4.161). A further similarity between Persephone's Nysian abduction and the activities of the Dionysian maenads in the sacred places called Nysa is indicated by the generic titles of the god's devotees in their mountain rites, for they too, like Persephone, were his nymphs or 'brides', as well as the women who 'nursed' him in his infancy (Homeric hymn 26). These women who nursed another's child are, more exactly, 'wet-nurses', and their affinity with Persephone's realm was symbolized by their patronage by Hecate (Hesiod, *Theogony* 450-452), another manifestation of Persephone as the chthonic queen.

Other traditions confirm that the Dionysian sacred marriage and ecstatic madness are to be understood as symbolic of what, originally at least, was a drug-induced shamanic possession, for Semele was sometimes said to have conceived Dionysus, not by means of the destroying thunderbolt of Zeus, but actually by ingesting a potion containing the heart of Dionysus himself (Hyginus, *F.* 167), and, in addition to the *thyrsos*, maenads are sometimes depicted wielding gigantic pestles, an obvious implement for herbalist activities.[15] In the *Bacchae*, moreover, *narthex*, the word for the 'giant fennel', is apparently synonymous with the *thyrsos*; metaphorically, *narthex* could be used to describe a container for drugs and was thus employed as the title for medical treatises by several ancient doctors (Galen 12.398, 959; Aëtius 8.45), and in Euripides' play it seems to contain Syrian frankincense (144), an incense that was reputed to affect the mind (Dioscorides 1.81).

Even more explicit, however, is the tradition about the abduction of Oreithyia, which Plato rationalizes in the *Phaedrus* (229c). She was said to have been ravished by the wind Boreas. Her name describes her as an ecstatic woman on a mountain, and in the rationalized version of her myth, she was playing on the mountain with her friend Pharmakeia, the 'use of drugs', when she fell to her death in a gust of wind. Oreithyia, furthermore, was one of the Hyakinthidai or Daughters of Hyakinthos, a vegetative deity who changed upon his death into the *hyakinthos*, another pre-Indo-European plant name assimilated into Greek. Like Itys, whose name is supposed to be the nightingale's eternal lament (Sophocles, *Electra* 148), and perhaps also like the Phoenician Bakkhos, Hyakinthos has connotations of mourning, for his flower was supposed to imitate the letters that spelled the sound of lamentation (Moschus 3.6-7; Euphorion, frg. 36M Powell; Ovid, *Metamorphoses* 10.215). Hyakinthos appears to have been an aboriginal deity at Sparta, later supplanted by Apollo,[16] who, like Dionysus, as a son of Zeus represents another assimilation of a pre-Greek god into Indo-European traditions. Oreithyia's abduction by the wind, moreover, is a rather transparent metaphor for 'inspiration' and chthonic possession, especially in view of the wind's direction from the wintry north.[17] Hyakinthos himself was destroyed by the equally sinister wind from the west, the lands where the sun goes down. The abduction of Oreithyia by Boreas is depicted on a fifth-century Attic *hydria* in the Vatican Museum; she is shown with Pharmakeia and holds the wild flower that she has apparently just picked, as the winged Boreas abducts her.

---

[12] Kerenyi, *Ibid*. 83, 110 ff. The birth of Dionysus by Zeus from Persephone was specifically a Cretan tradition (Diodorus Siculus 5.75.4) and is parallel to the traditions of the Cretan assimilation of Zeus by a similar rebirth.

[14] Words ending in *-issos*, like those in *-inthos*, are not Indo-European.

[15] *Hydria* from Nola, *Archäologische Zeitung* 2,6 (1888) 3-5, pl. 3 (= illustration 5 in W.H.Roscher, *Ausführliches Lexicon der griechischen und römischen Mythologie* (Olms, Hildesheim 1884-1937, 1965^2) *s. v.* Orpheus): Orpheus attacked by a Thracian maenad with a mortar in the presence of a satyr.

It would be expected that with the advent of viticulture, the wine god would be assimilated to the prevailing patterns of shamanic religions, for the fermented juice of the cultivated grape, as well as the pre-viticultural magical plants, induces a kind of spiritual communion with deity. Some aspects of this assimilation must have occurred before Dionysus arrived in the Greek lands with his gift of the vine, and still others after the coming of the Indo-Europeans. There is, however, a basic pattern to be discerned in these assimilations. Dionysus is represented both by the grape-bearing vine and by wild plants reputed to be intoxicating or poisonous. The mountain revels did not occur in the vineyards or during the time of year suitable for agriculture, but in the winter months, when the Greek mountains bloom with untended flowers, and in the wilderness. They are characterized by the symbolism, not of the harvest, but of the hunt, a search both for wild plants and for animals, that were wrenched brutally to pieces and eaten raw in a primitive manner, predating the civilizing advent of the arts of cooking. The brutality of this primitive experience was clearly meant as regression to a primordial existence. The women were said on occasion actually to have eaten their own children (Plutarch 299e; Aelian, *Varia Historia* 3.42; Apollodorus 2.2.2, 3.4.3, 3.5.2; Nonnus 9.49 ff., 47.484 ff., 48.917 ff.). In the *Bacchae*, they attack village agricultural settlements and their tilled fields of grain (748 ff.) and invert the normal order of society, for they are females performing the hunt, an occupation more appropriate for males,[18] and, thereby, they regress to the role of male-dominating women who seemed to prevail in the mythical traditions about primordial times.

The prime botanic symbol of this Dionysian inversion of the civilized order was the ivy or *kissos*, by one account, the actual meaning of Nysa (Pseudo-Dioscorides, *de Mat. Med.* 2.179). Its leaves and manner of growth bear an uncanny resemblance to the vine, but it is a wild plant and its diminutive berries are like primitive versions of the clustered grape. The ivy, moreover, reputedly is intoxicating in itself, whereas the grape must be harvested and tended through the long fermentation process. In the winter when the vine is leafless and dormant, the ivy grows like the vine on upright stems, blooming at the time of the autumn grape

---

16. J. D. Mikalson, Erectheus and the Panathenaia. *American Journal of Philology*, 97 (1976) 141-153.
17. 'To blow or breathe upon' (ἐμπνέω, καταπνέω) is the Greek equivalent of the Latin *inspirare* and commonly means 'inspire': for example, Hesiod, *Theogony* 31; *Plutarch* 2.421b; Homeric hymn to Demeter 238; Aristophanes, *Lysistrata* 552; *etc*. All winds were thought to blow to and from caverns within the earth: Elmer G. Suhr, *Before Olympus: A Study of the Aniconic Origins of Poseidon, Hermes and Eros* (Helios, New York 1967) 30 ff. The destructive Boreas was an apt figure for a deadly ravisher of vegetation.
    Oreithyia was a daughter of the primordial Athenian king Erechtheus. Her sister Creusa was similarly ravished in a sacred marriage while picking flowers (Euripides, *Ion* 889) in a spot exposed to the north wind (11). Creusa herself was married later to a son of Aeolus, the lord of the winds (63). Since it was apparently Erechtheus himself who originally enacted such deadly abductions upon his own daughters (260 ff.), these unions with foreigners are probably to be understood as displacements of his role upon outside forces, who are merely aspects of his own persona, as in the traditions about the immigrant and indigenous Cadmus, on which see 'The Regression of Cadmean Thebes', below. By such sacred unions, moreover, the sinister alien forces become incorporated into the sustaining beneficent metaphysical alliances of the city, on which see 'The Reconciliation with Primitivism', below. In actual fact, the Athemans believed that their marital alliance with Boreas was responsible for the destruction of Xerxes' fleet off Mount Athos as he came against Greece, and they commemorated the natural disaster by building a temple to Boreas on the supposed site of his union with Oreithyia (Herodotus 7.189).
18. Marcel Detienne, *Dionysas Slain* (Johns Hopkins University Press, Baltimore 1979, translated from the French edition of 1977) 20-52.

harvest and producing its fruit in the spring as the vine comes back to life, a return that seems markedly reluctant, compared to the spring-time growth of other plants. During the summer, while the vine grows upright, the ivy now enters into a second stage of growth, with trailing tendrils of leaves of the more familiar shape. It is a plant of dual nature, like the twice-born god it represents, and was thought capable of hybridizing from one variety to another. As Walter Otto has observed, 'The vine and the ivy are like siblings who have developed in opposite directions and yet cannot deny the relationship.'[19] Ivy, moreover, was thought to be parasitic, wildly sending out roots all along its stem and capable of sustaining its own life from the nourishment extracted from the host trees upon which it climbs, eventually destroying them, and even continuing to grow when its contact with the ground is severed (Theophrastus, *H. P.* 3.18.9). Ivy was related to the vine apparently as the weed to the cultivated hybrid.

Ivy was the vine's avatar. It belonged mythologically to a previous generation. Dionysus himself was called Kissos (Pausanias 1.31.6), but never Ampelos or 'vine'. It was only after his own sacred marriage with his maenadic bride Ariadne that he produces sons named Staphylos or the 'clustered grape' and Oinopion, 'vinous', whom Dionysus first taught how to make wine (schol. in Apollonium Rhodium 3.997). This evolution is often a theme in vase paintings, as, for example, on the *krater* by the Altamura painter, where Dionysus is shown confronting the younger image of himself standing on his lap: Staphylos holds a wine cup and sprigs of vine, while his seated father, attended by flower-bearing maenads, holds the ivy-crowned *thyrsos*.[20]

Other pre-viticultural magical plants are also associated with Dionysus as his primordial avatar. Amongst these are to be counted the opium poppy,[21] whose role in Minoan religion is attested by the female 'sleeping' idol from Isopata in the Iraklion Museum, who wears a diadem of the plant's seed capsules, each painted with the slit that would be cut to extract the drug. Dionysus himself is seen wearing such a crown on a volute *krater* in the National Archaeological Museum of Taranto: he is depicted as a youthful hunter amidst ecstatic maenads, one of whom holds the *thyrsos*. In a similar manner, Dionysus assimilated the role of honey and its ferment, mead, from the Minoan culture.[22] The latter intoxicant involves the symbolism of the bee, who, like the herb-gathering maenadic women in the wilds, goes from flower to flower, extracting their essence, which is a drug related to the venom of serpents, but its beneficial antithesis, instead of a poison.[23] Such a ritual is apparently depicted on a gold signet ring from a tomb near Knossos, now in the Iraklion Museum: women with the heads of insects are seen dancing amidst flowers as they experience the mystical apotheosis of a deity.

The association of Dionysus with certain trees, in particular the resin-bearing firs and pines, is also testimony to such an assimilation of pre-viticultural intoxicants into Dionysian religion. Primitive man cut the bark of such trees to extract the sap, which would ferment to produce an intoxicant (Pliny, *N. H.* 12.2).[24] Thus Dionysus maintains several 'arboreal' epithets, such as Dendreus, Endendros, and Dendrites, and he is called Phleus as the god of the 'abounding sap'.[25] Thus too, the maenads carried sacral branches or *bakkhoi* for the mountain revels (*Bacchae* 109-110), and, as we shall see, the final consecration of Pentheus as the Dionysian sacrifice will take place in the god's sacred tree. Greek wine, moreover, assimilated the taste of such more primitive intoxicants, for it was resinated (Aristophanes, *Acharnians* 190 *cum schol.*) in the manner of modern retsina.

We should expect that whatever pre-viticultural intoxicant figured in the shamanic religions of the Indo-

Europeans would similarly be assimilated to the cult of wine as an avatar of the evolved and cultivated god. The Aryan branch of the migrations of these northern peoples into Iran and India in the second millennium before Christ preserved a shamanic cult from their homeland. This religion is recorded in the collection of Sanskrit hymns known as the Ṛg Veda, which is the written form of what was originally oral and formulaic material dating back to a period before the migrations. Amongst the deities of a complex pantheon appears the god Sonia, a god who was a plant that was sacrificed to extract its inebriating drug for a sacred potion. The physical properties of this plant are recorded in its formulaic epithets and descriptions in the hymns. Although Soma is a plant, surprisingly no mention is ever made of its flower, leaves, or roots. R. Gordon Wasson has demonstrated, to the satisfaction now of most Indo-Iranologists, that the original Soma, for which substitutions were made in the later performances of the rite, was a particular mushroom, the *Amanita muscaria* or 'fly-agaric', a plant that still figures in Siberian shamanism today. This mushroom grows in northern latitudes only in association with the roots of certain trees, in particular, pines, firs, and birches. The birch, because of this association, figures symbolically as the shaman's Tree of Life, the axis by which he ascends to the realm of the gods.

The Hellenic branch of these Indo-European peoples can be expected to have brought some knowledge of the traditions of this shamanic cult with them on their migrations into the Greek lands. This indeed seems to be indicated by the fact that Greek epic preserves a pattern for the mixing of magical potions that has formulaic analogues in the Vedic material. Working with Wasson and the Swiss chemist, Dr. Albert Hofmann, I have attempted to show that the Eleusinian Mysteries, and probably the other mystery religions of classical Greece, can be interpreted as communal shamanic seances, in which mystical visionary experience was induced by the ingestion of drugs. For the Greater Eleusinian Mystery, the drug was a water-soluble extract of ergot, either expressly cultivated on barley or gathered from other, weedy grasses, such as *Lolium temulentum*. This fungus, which produces fruiting bodies of the characteristic mushroom shape, is a natural source of psychoactive alkaloids commonly referred to as LSD.

The paired Eleusinian Mysteries, which centered upon the art of cultivating grain, were, like the Dionysian art of viticulture, an assimilation of the religious traditions of the pre-Greek agrarian peoples into Indo-European mythology. Thus the original solitary Mother Goddess becomes split into the sacred duo of the Mysteries, Demeter, an Olympian as sister of Zeus, and the chthonic Persephone, who, like Dionysus, has been reborn as a child of Zeus. *Lolium*, which in Greek was called *aira* (αἶρα), was thought to be the inedible avatar from which the cultivated barley had been evolved by the agricultural arts and into which it would again revert if not properly tended. The Greater Mystery celebrated this successful hybridization and reconfirmed the forward evolutionary progress of Hellenic culture, a civilization nourished like the barley itself by its healthy accord with its roots in the chthonic realm.

The cultivation of grain is the culmination of an event that began in more primitive times, namely, the abduction of Persephone while gathering wild flowers. This illicit stealing of her as a concubine eventually is legitimized in a more civilized age as she becomes a wife related by law to the powers of death. The primitive precedent for the Greater Mystery was imitated as the Lesser Mystery. By investigating the traditions about a fabulous Indian tribe of single-footed, parasol-like creatures who were supposedly implicated in a profane performance of the Lesser Mystery, I have demonstrated that the symbolism of the Indo-European wild mushroom, with analogues to the Vedic material, was preserved at this rite that was considered the prelude to the revelation of the Greater Mystery. In view of the parasol metaphor, moreover, it seems possible that if *oenos* and *itys* did indeed refer originally to a pre-viticultural intoxicant of the Indo-European people before their migration into Greece, the identity of that intoxicant was fungal, for the metaphor of a 'circular rim' is singularly apposite for a mushroom. Apparently by coincidence, it is actually as such that the sacred mushroom of Mesoamerica is indicated pictographically.[26]

---

[26] R. Gordon Wasson, *The Wondrous Mushroom: Mycolatry in Mesoamerica* (McGraw Hill, New York 1980) 64. Wasson identifies the flower glyphs that decorate the effigy of the Aztec deity know as Xochipilli or the 'Prince of Flowers' as all indicating various magical plants or 'entheogens' that figured in shamanism. By another amazing coincidence of iconography, the butterfly in both Mesoamerican and Hellenic cultures indicates the soul. A common word in Greek for 'butterfly' is *psyche* or 'soul', and Psyche is actually depicted as a butterfly on a neo-Attic marble pedestal in the Vatican, probably copied from an original work of the second century B.C.: the soul is being burnt by two weeping Erotes as a Dionysian sacrifice, a parallel event to the visit of the drunken god to a poet, and the preparations for the dismemberment of a sacrificial animal and its boiling in milk. See Kerenyi, *Dionysos* plate 64 B.

It is appropriate that the fungi should have figured in the symbolism of the hunt, as opposed to cultivation, for they are the prototypic wild plant. Their propagation by microscopic spores instead of seeds made their manner of growth a mystery in antiquity, and, even today, certain species resist cultivation. For this reason, in Greece, as well as in India, they were thought to be planted by the lightning bolt, as they burst suddenly from the ground, swollen with the water absorbed from the rainfall. Dionysus, himself, had such an engendering by his Indo-European father, whose bolt of lightning can be traced as a symbol of enlightenment in Asiatic shamanism.[27] The assimilation of the fungi to the Dionysian complex of symbolism as the wild avatar of the cultivated god can be noted in the metaphoric description of a mushroom as a miniature *thyrsos* (Apicius 7.15.6), with the intoxicating cap atop its stipe substituting for the crown of gathered ivy leaves.

Other characteristics of fungi would have facilitated the assimilation of the viticultural deity to Indo-European traditions. Each year in Greece, the three winter months belonged to a primitive, maenadic aspect of Dionysus. These were the months that the harvested and presumably dead viticultural deity spent in the otherworld, and, even at Delphi, the Olympian sanctuary regressed to more primitive Dionysian rites in honor of chthonic powers. In the absence of his cultured self, Dionysus was represented by the *phallos*.[28] The phalloid shape of mushrooms, which fruit in the non-viticultural season, made them an apposite metaphor for the male organ (Archilochus, frg. 34 Diehl). The *phallos* itself, as a symbol of Dionysus, was an importation from Egypt by the seer Melampous (Herodotus 2.49) in the Mycenaean age,[29] although it was a Greek innovation to represent the god by the *phallos* alone, instead of a movable one, in the Egyptian manner, attached to the god's effigy. Melampous belongs to a tradition similar to that of the confrontation between Pentheus and the Dionysian prophet, for it was he who cured the daughters of Proetus of the madness that afflicted them when their brother Megapenthes opposed the rites of Dionysus. Since their madness took the form of bovine rutting, the Egyptian import suggests that their cure comprised sexual gratification.

The metaphor of the bovine oestrual madness also involves the pre-viticultural aspect of Dionysus in taurine symbolism. Amongst the Indo-Aryans, the bull was the commonest metaphor for Soma,[30] and the sacral function of the bull amongst the Minoans obviously reinforced Indo-European traditions. It was apparently as a bull that Dionysus united with the sacral queen of Athens in her annual, ancient, winter rite of marriage, which took place in what was called the 'bull stable' (Aristotle, *Ath. Pol.* 3.5). The 'bellowing' or *mykema* of a bull seems to have been a metaphor for the imagined cry of the fruiting bodies of the mushroom as they burst from the earth or are harvested.[31] The metaphor perhaps derives from a pun on *mykema* and *mykes* or 'mushroom', words whose initial sounds would both have been written in the Mycenaean syllabary with the pictogram of a bull's head.

In addition to the supposed successful hybridization of the vine from primitive avatars, the art of viticulture also was symbolic of the taming and cultivation of the wild mushroom. The Greeks suspected that there was a similarity between the growth of mushrooms and the fermentation that transformed the juice of the vine's grapes into wine, a process that actually is caused by the growth of microscopic lower fungi, the yeast. Thus a mushroom itself could be called metaphorically a 'ferment' or *zumoma* of the earth (ζύμωμα χθονός, Nicander, *Alexipharmaca* 521), a word that implies an effervescing or boiling of corrupting digested matter. A similar corruption occurred in the tomb, which traditionally in Greek, as in modern languages, was a mouldy place (Homeric hymn 2.482; Sophocles, *Ajax* 1167). 'Mushroom', in fact, was apparently a metaphor for the 'burial coffin' or 'tomb' itself (Suidas *s.v.* μύκη). Thus, upon the body of the harvested grape could be grown the regeneration of the primitive god into his evolved form as the cultivated and refined intoxicant of civilized times, a rebirth that was clearly observable in the effervescing movement of the rotting ferment, as well as in the perceptible warmth generated by the process.

Here too, the art of viticulture was parallel to Demeter's gift of edible grains. Fungi are also responsible for 'leavened bread' or *zumites artos* (ζυμίτης ἄρτος), which in Greek is designated by the same metaphor of fermentation. The harvested grain similarly was host for the wild corruption. The association with the tomb would have been particularly obvious since the ancient method of cultivating the leaven would have corresponded to modern 'sourdough', a process of apparent rotting marked by a distinctive unpleasant smell. By comparison to the reddening corruption that overspreads iron, the dry grain too was host to a fungal 'rust' or ergot, *erysibe* (ἐρυσίβη), from which Demeter's analogue to wine was extracted for the Greater Eleusinian Mystery.

The Reconciliation with Primitivism

For the Greeks, evolution was not a stable process. Civilization and the arts of cultivation were continually in need of renewal, to found them again upon the healthy accord and reconciliation with their more primitive origins, the fertilizing source in the chthonic realm from which they grew into the Olympian age. If the primitive were not given its proper role in the evolving order of the world, there would be no place for mankind, which, by virtue of its mortality, participates in the non-Olympian contamination of the tomb. The dishonored earth, instead of supporting the foods of life, would yield only poisons and sterility from the rotting dead, whose angry spirits would hound the living with wild delusions. Such is the threat made by the loathsome and despised Erinyes of Aeschylus's *Oresteia*, the maddening, female Hell-hounds, whose presence pollutes Apollo's Delphic temple. The priestess likens them to the Harpies who defiled Phineus's food with their rotting excrement (*Eumenides* 50 ff.). When at first they are dishonored in the civilized institution of the court at Athens, they threaten to drip tears of poison from their wounded hearts, polluting the earth with a stoppage of growth of both crops and mankind (780 ff.). Athena, however, cajoles them into accepting an honored place beneath the earth, and the threatened curse becomes a joyous benediction of fertility for the city.

Even the Olympians, moreover, would starve if mankind were not to fulfill its essential role of mediation between the two realms, converting the foods of the earth into the pure fragrance of burnt sacrifice rising to the heavens. Zeus himself, as in Aeschylus's *Prometheus*, would fall into mortality if he were not to cooperate with mankind's earth-born creator. Similarly it was a conspiracy of Zeus and earth, as announced in the Homeric hymn to Demeter, that led to the separation of the Olympian mother from her chthonic daughter and the eventual institution of the Mystery, whereby death itself was transmuted into a friendly visitor amongst mortals, the lord of riches, personified in his subterranean temple at Eleusis as the handsome youth who represented that very conspiracy, the primordial plan of Zeus.[32] Thus Demeter's first two reactions to her daughter's loss are to feed a child, not with food, but by anointing him with ambrosia and by inspiration, keeping him from the grievous witchcraft of worms burrowing in his flesh, and when that attempt to purify from mortality fails, similarly to deny all growth of mortal foods from the earth, until at last her own mother, who bore her into the Olympian realm, induces her to save the Olympians from starvation and accept back a chthonic Persephone, now pregnant and contaminated with the seminal foods of earth eaten in the tomb.

Reconciliation between the gods of the older and newer orders is, in fact, a common theme in Greek mythology, and the iconography of the deities themselves, as well as the rites of their worship, testifies to the conservative retention of very ancient, pre-Olympian aspects preserved and honored in their classical cults. Thus, for example, the pre-Indo-European goddess Athena, although reborn as an Olympian daughter of Zeus, still was associated with the transmuted symbols of her primordial identity. The Gorgon's head has been displaced, but is still worn, as indication of her role in triumphing over the chthonic queen, and the owl, her predatory night bird, has lost its meaning as the spirit responsible for her ecstatic possession, but persists as indication of the rational wisdom of the cultivated arts that she inspires. Amongst these was that of weaving, whose sinister, fateful symbolism was displaced upon the spider in the myth of her contest with Arachne, and ritually placated in the quadrennial presentation of a tapestry at the Panathenaic Festival, specially woven by a group of pre-nubile girls. Even the serpent, symbolic of the toxins of the earth, persists, but as her foster-child, responsible for the maddened deaths of others, maidens of the autochthonous dynasty at Athens.[33] In a similar manner, Demeter had non-Olympian manifestations, more akin to Persephone, as an Erinys, the Black One, and, like the Gorgon Medusa, a centauress.[34] Often the pre-Olympian identity persists and is assimilated as an epithet, supposedly indicative of a beloved companion whom the deity inadvertently destroyed. Thus Athena murdered Pallas when distracted at play by a sign from her Olympian father, the aegis or serpent-fringed goatskin, which is part of Athena's attire. Similarly, Apollo was once Hyakinthos, the beloved pre-Olympian plant-god whom he displaced.

Such reconciliation indicates the essential participation of primitivism in an evolving world where humans are to have a role. In terms of agrarian realities, mankind, by virtue of its mortality, is contaminated with the rotting dead matter it must slaughter or harvest for food, a putrefaction that is both the potential cause of pestilence and yet the honored, stinking nutriment that sustains the generations rooted upon the earth. The affinity of the dead and their living counterpart can also be sensed in the culinary arts, another evolutionary sign of civilized mankind's progress from primitivism. The 'ripening' of fruits, by which they softened toward rottenness, was a kind of 'digestion', a process that was hastened, in its refined way, by 'cooking' or 'baking' (πέσσω). The meat of the sacrificial animal, moreover, was prepared in a manner that recapitulated the supposed ontogeny of both the beast and the cultivated arts, the primordial organs grilled first, in primitive fashion, before the parts that grew later were boiled as stew. In Orphic doctrine, mankind inherited original sin from the Titans, who opposed the evolution of Dionysus into the assimilated son of Zeus and feasted atavistically upon his flesh, cooked in perversion of the culinary arts. Zeus rescued the primordial organs and regenerated his son in an Olympian identity.

The Making of Wine

In the making of wine, the god's experience was analogous to mankind's journey toward redemption through the mouldering tomb. As in the scene depicted on Homer's shield of Achilles (*Iliad* 18.561-572), the cultivated fruit of the vine was harvested to the music of lamentation, for the god had died. His slaughtered body was then dismembered in the wine press, a crime that the harvesters sought to ascribe to agents other than themselves. In art, it was traditionally satyrs who trod upon the grapes, and, in actual practice, the treaders seem to have worn masks.[35] The juice, that was the god's blood, flowed into urns placed like burial chambers beneath the earth, where the subterranean environment maintained the proper temperature for the fungal growth of fermentation.

While the spirit of the god was being cultivated in the otherworld, he was absent from the living. The months of his sojourn in the tomb are marked in the Greek lands by a winter-time profusion of wild flowers upon the mountains, although the cold is too intense to favor the growth of garden varieties or vegetables. This was the time when the atavistic Dionysus prevailed. It was the time for the phallic processions of the rural Dionysia celebrated in the villages, primitive rites dating back to the period before the incorporation of the god's worship in the civic calendar under the popular tyrant Peisistratus. This was the time too for the enactment of the primordial sacred marriage and for the ecstatic ceremonies of the 'maenadic' *lenai* at Athens, when the women urged the god through his winter sleep, worshipping him at his effigy composed of the empty robes and mask that awaited his return.[36] Comedy, the 'revel song', originally was the only drama performed at this period, and appropriately so, for the phallic dancers described an inverted world, given over to libidinous desires that satirized the mighty and reshaped society according to the whims of baser fantasies.

When the wine was at last ready at the February festival of the Anthesteria, the urns were opened, and the god's spirit was reborn as an infant. The graves of the dead released their spirits as well at this time, and for the three days of the festival, ghosts roamed abroad in Athens. The Anthesteria was the time of reconciliation between the two realms of the living and the dead. It was then that the maddened Orestes was supposed to have arrived at Athens and been offered hospitality, despite his polluted condition. That event was recalled in the special arrangements at the festival for drinking from separate pitchers and eating at small private tables,

36. Kerenyi, *Dionysos* 281 ff.

so that the hospitality that was extended to the visiting ghosts thereafter would not contaminate the food of the living by the putrefaction that clings to those who come from the grave. This was the time too when the hounding Erinyes were placated and honored as the Eumenides, the Blessed Ones. In preparation for the encounter with the dead at this festival, the Athenians purified themselves symbolically of the contamination they shared with the other realm by chewing upon pieces of *rhamnos*, a shrub whose laxative properties purged their bodies of chthonic pollutants.

This was a time also for honoring an earlier age of mankind, for the Anthesteria commemorated those who died in the Great Flood that Zeus sent against the evil primitive race, after which the sole surviving couple, descendants of the first creator, repopulated the world with its present people by throwing the stones of earth behind them. Amongst the sons of that couple was Orestheus, who discovered and planted the first vine, and Amphictyon, who first received Dionysus and learned from him how to tame the toxins of wine, and Hellen, the eldest, after whom the Hellenic race took its name. The primordial race that the Hellenes replaced was the Pelasgian, a pre-Indo-European people of whom remnants survived into classical times. Their sin, for which Zeus sent the Flood, was to have attempted to contaminate the Olympian by feeding him the flesh of a boy, Nyctimus, a creature of the night, as though Zeus were the lord of the other world. Zeus changed them all into wolves and assimilated that more sinister identity, as in the case of the other deities we have mentioned, by assuming the epithet *Lykaios*, the 'wolfish'.

An earlier age at Athens itself was also placated at the Anthesteria by a curious rite of swinging in swings, supposedly in commemoration of Erigone. It was her father who first received Dionysus and his gift of wine in Attica, but when he shared it with his fellow men, they saw double and thought themselves poisoned, for which they killed and buried him beneath a pine tree. Erigone found his body and hanged herself from the tree in grief. The swinging thereafter at the festival recalled that initial misunderstanding about the civilized nature of wine.

Reconciliation with the dead and the past at the Anthesteria also took the form of an initiation into the experience of wine for the very young, the children of three or four years of age. They were the personification of the young god, and as they cavorted among the revellers and the ghosts, the continuity of mortal lineage through the transformations of the tomb was sensed as analogous to the god's fermenting gestation and rebirth out of death.

The birth of the wine, moreover, was symbolic of the god's triumph over his own more primitive identity. The satyrs, who had presided at the treading of the harvested grapes and who had inverted the norms of civilized behaviour in the maenadic revels of the winter, were the natural enemies of the cultivated god, for goats, whose hircine nature they shared,[37] were thought to be particularly invidious to the vine because of their dangerous tendency to graze on its young shoots (Vergil, *Georgics* 2.380).[38] Now the goat yielded to Dionysus. The goatskin was filled with wine, and as a test of the triumph of sobriety over drunkenness, the revellers at the Anthesteria competed in a contest, attempting to balance themselves upon a greased wineskin (Pollux 9.21). There was also a contest of drinking, for which the prize was a goatskin (Aristophanes, *Acharnians* 1224 *cum schol*). It was the goat too that was the special sacrificial victim for Dionysus. The song for its slaughter, the *tragoidia*, was perhaps the origin of tragedy.[39] In the next month the Athenians would celebrate the Great Dionysia, a drama festival that originally involved only the tragic poets, without the comedy later imported from the Lenaea. The Dionysia was a great celebration of Athens as a center of culture in the Greek world, and it revealed the higher inspiration of Dionysus in his civilized form.

---

[37] Satyrs are often confused or joined with Sileni, from whom they sometimes appear to have acquired equine characteristics, in addition to the goat-like nature that they share with Pan. All of these figures represent primitive spirits of the woodland. Like the centaurs, the Sileni were also inspired sources of knowledge and their leader was entrusted with the teaching of the child Dionysus in the wilderness of Nysa, just as Chiron was said to have educated heroes. The satyrs, on the other hand, share the centaurs' inclination toward the uninhibited satisfaction of libidinous drives, especially under the influence of wine.

[39] Walter Burkert, Greek Tragedy and Sacrificial Ritual, *Greek, Roman, and Byzantine Studies*, 7 (1966) 92 ff. See also Kerenyi, *Dionysos* 333.

Just as in the making of wine the two natures of Dionysus were reconciled, so too in the wine itself was the primordial deity still honored. To understand this incorporation of the pre-viticultural deity in wine, we must summarize evidence that I have presented more fully elsewhere.[40] The Greeks, as well as the Romans (Pliny *N. H.* 14.29), had the peculiar custom of diluting their wine with several parts of water before drinking it. Since they could not have fortified their wines with pure alcohol from distillation (a process not known until the alchemists discovered 'aqua vitae' around 1100 A.D.), the alcoholic content of their wines could have been derived only from natural fermentation, which is limited to about fourteen percent by the pickling effect of the alcohol itself upon the growing yeast which produces it as a by-product of the fungal activity upon the sugars of the juice. Greek wine, therefore, should have had only very mild intoxicating properties after the customary three- or fourfold dilution with water. Such, however, was not the case. We even hear of a wine that could stand eightfold dilution (Pliny, *H. N.* 14.53), an actual historical survival of a wine that in the mythical tradition required twenty parts of water (Homer, *Odyssey* 9.208-211) and was associated with the story of the Cyclops, a primitive one-eyed creature who figured in mystery traditions and Asiatic shamanism.[41] Undiluted wine was supposed to cause permanent brain damage. Nor should we assume that the Greeks diluted their wines so that they might safely drink excessive quantities, for just four 'little cups' of diluted wine are said to have been sufficient to induce a deep intoxication (Eubulus, fr. 94). The frequent depictions of revellers in art and literature, furthermore, should leave no doubt that the Greeks did indeed get drunk and that the purpose of drinking was, in fact, to become inebriated. Obviously, the alcoholic content of their diluted drink could not have been the sole cause.

As we have seen, the Greeks recapitulated the evolutionary history of Dionysus by incorporating the resinous taste of one of the god's pre-viticultural antecedents in their wine. It is only to be expected that they would also have assimilated other atavistic versions of the cultivated god into the fermented drink. Alcohol itself was unknown as a substance, and the affinity of the ferment to other intoxicants would have suggested itself by their similar effects upon the mind, although wine had the mark of civilization, as opposed to the wild, natural growths, and was gentler, for Dionysus had taught mankind how to tame it through dilution. Spices, unguents, and herbs were, in fact, added to Greek wines, either in the fermentation or at the ceremony of dilution before drinking. It is these additives that must account for the special inebriating properties of Greek wines, which in some cases were actually more hallucinogens than alcoholic intoxicants (Aristophanes, *Wasps* 12 ff., 213).

As sign of such an assimilation of wilder versions of the god, the quality of wine was referred to as its 'flower' or *anthos*, a metaphor that persists today, without the same meaning, in our speaking of a wine's 'bouquet'. Dionysus himself was called the Flower God, Antheus and Euanthes, epithets that gave his name to the Anthesteria festival. The tradition of wine as a vinous potion persists in modern Greek, where the demotic word for wine is *krasi*, literally the 'mixture'.

The Mad King and the God

Pentheus, as the king of the pre-viticultural kingdom in the *Bacchae*, has a peculiar characteristic which perhaps we now can begin to understand. He is mad. Cadmus first notices it as Pentheus makes his entrance, rushing on stage to interrupt the old men's plan to join the mountain revel. He is 'all aflutter' or distraught with passion (ὡς ἐπτόηται 214), and throughout the play his violent emotions and stage presence are a visual contrast to the calm of the Asiatic deity of the vine. As the prophet Teiresias tells him, he is 'witless' (ἐν τοῖς λόγοισι δ᾽ οὐκ ἔνεισί σοι φρένες 269), and his meaningless words have only the semblance of sense. At the close of their violent controversy, the seer sums it up: Pentheus is a babbling idiot (μῶρα γὰρ μῶρος λέγει 369); all along, he has been 'out of his mind' and now he has become 'raving mad' (ὡς οὐκ οἶσθα ποῦ ποτ᾽ εἶ λόγων. μέμηνας ἤδη: καὶ πρὶν ἐξέστης φρενῶν 358-359).

---

[40] Wasson, Ruck, and Hofmann 89 ff.

[41] The Cyclopes were apparently a Greek version of the fabulous people known as Arimaspeans, a name that designates them as Monophthalmoi or 'One-eyes' in Scythian. The Arimaspeans were involved in shamanic rites that were proselytized in Greece by the priest and poet Aristeas of Proconnesus. See E. R. Dodds, *The Greeks and the Irrational* (University of California, Berkeley 1951) 141.

In the context of the play, this madness is presented as a pre-viticultural state of mind. Whereas Pentheus is senseless, the mentality that wine induces, as Teiresias explains, is inspired with divine knowledge, a mania that underlies the appropriately so-called 'mantic' arts (τὸ γὰρ ... μανιῶδες μαντικὴν πολλὴν ἔχει, 298-299), as well as the panic 'fear that sets an army aflutter' (φόβος διεπτόησε ... μανία δὲ καὶ τοῦτ᾽ ἐστὶ Διονύσου πάρα 304-305) and embraves them for the conflict, whereas Pentheus's bravura as the play develops will merely demonstrate his witless state. Wine, moreover, is the superlative anodyne, as we have already noted, whereas Pentheus is the 'Sufferer' and is so lacking in the mania of clairvoyance that he cannot even see what his name so clearly warns him will be his role in his intended conflict with Dionysus (367 ff.). 'You are mad in the most painful way', Teiresias tells him (μαίνῃ γὰρ ὡς ἄλγιστα 326).

Not only, however, does Pentheus have a mentality contrary to the effects of wine, but his pain is incurable and his suffering was apparently induced by ingesting some other 'drug' (κοὔτε φαρμάκοις ἄκη λάβοις ἂν οὔτ᾽ ἄνευ τούτων νοσεῖς 326-327). It was traditional to believe that ill humour could be traced to a maddening drug,[42] but in this context there is certainly more than convention involved.

This ill-humoured opponent of the vine, moreover, has no less a botanic identity than the god. It is repeatedly mentioned in the drama that Pentheus is the son of the 'serpent man' Echion (213, 265, *etc*.), a creature 'sown' and 'harvested' (ὃς τὸ γηγενὲς δράκοντος ἔσπειρ᾽ Ὄφεος ἐν γαίᾳ θέρος 1025-1026; ὃς τὸ Θηβαίων γένος ἔσπειρα κἀξήμησα κάλλιστον θέρος 1314-1315) from the primordial crop that Cadmus had planted in founding the city of Thebes. The seeds for that first sowing of the Theban plain were the fangs of the deadly serpent who was the previous inhabitant of the site for the city, and the crop that sprouted from them fought amongst themselves until only five remained, the so-called Sown Men or Spartoi, of whom Echion was one. Like his grandson Pentheus, the aboriginal serpent can be expected to have derived his ill temper from toxic plants, for it was by eating evil drugs that serpents were thought to acquire their grievous bile (Homer, *Iliad* 22.94; Vergil, *Aeneid* 2.741; Pliny, *N. H.* 22.95). Serpents also contaminated other plants by their presence. Thus mushrooms were said to suck up the venom of serpents in the ground beneath them (Nicander, *Alexipharmaca* 521-525), and only after serpents had gone into hibernation was it safe to gather them (Pliny, *N. H.* 22.95). By one account, Dionysus discovered wine when he noticed a serpent eating grapes and in accordance with a prophecy improvised the first wine press (Nonnus, *Dionysiaca* 12.293-362).[43] Snakes, moreover, resemble the trailing growth of the vine and ivy. Because of their cold-blooded nature, they had a particular affinity with the latter and were twined into the ivy wreaths of the maenads (Plutarch, *Alexander* 2.6), who tore them to pieces in their winter revels.[44]

The role of the serpent in pre-Indo-European religion is well attested by the so-called snake goddesses of the Minoan culture, where it probably figured, like the predatory bird and magical plants, as representative of the possessing chthonic spirit in shamanic rites of sacred marriage. The serpentine form of Echion associates him with the symbolism of the autochthonous dynasties at other Greek cities and with the earth-born creatures whom Zeus eventually subdued in establishing his Olympian realm. The myth of Cadmus's coming to Thebes, sowing the Spartoi, and betrothal of Pentheus's mother Agave to Echion is analogous to the traditions about the advent of viticulture, involving a sacred marriage and mediation with toxic primitivism in the establishment of culture and civilization. Matrilocality and matrilineality, which are indicative of primordial times, have been replaced by Pentheus's patrilineality and patrilocality, and the successful evolution toward the Olympian age is symbolized by Cadmus's marriage to Harmonia, the offspring of Aphrodite and Ares, who was also the parent of the primordial serpent whom Cadmus destroyed. The success of this assimilation of cultures and transmutation of symbolic forms was indicated by the attendance of the Olympians themselves at the marriage feast of the city's founder.

It is perhaps significant, however, that Cadmus in the *Bacchae* is now old, and the rejuvenation that would have come with the acceptance of Dionysus's new rites of cultivation is denied him in the play. Instead, as we shall see, the city becomes unfounded and reverts to primitivism as the pre-Olympian nature of Pentheus asserts itself.

Double Birth and the God's Surrogate

In this pre-viticultural kingdom, Dionysus has not yet been assimilated, and thus the fundamental dualism of his nature is misunderstood by everyone except the Asiatic devotees, who have come with him from the lands that have already accepted his gift of wine. The essence of this dualism involves the mystery of his double birth, by which death becomes a gestation for regeneration and evolution. The chorus of Asiatic women describes how the infant was taken from the womb of his dead mother and washed in the Theban spring of the maenadic Dirce. Zeus then took him for his thigh, calling, 'Come, Dithyrambus, enter this male womb of mine' (Ἴθι, Διθύραμβ᾽, ἐμὰν ἄρσενα τάνδε βᾶθι νηδύν 526-527). thus giving him the sacred name which the Greeks interpreted as meaning that Dionysus had come twice to the gates of birth.[45] It is by means of this second birth that Dionysus is assimilated into Indo-European traditions, and the Asiatic wine cult became incorporated into the civilized era over which Zeus reigns. The myth is paralleled in one of the oldest of the Vedic upanishads, which states that the gods took Soma and put him into the right thigh of the supreme sky-god Indra.[46]

For the Thebans, however, only the primordial half of the dualism is accepted. Pentheus, like his mother and sisters (26 ff.), ridicules Dionysus's supposed Olympian birth. They all claim that Semele's infant perished in her womb, destroyed by the thunderbolt that was her punishment for lying about an imaginary affair with Zeus in order to cover her shame for an illicit pregnancy from a mortal (242 ff.). Even Teiresias does not understand the second birth, for although he stresses that Dionysus is indeed a god and the son of Zeus, he attempts to rationalize the mystery by explaining that Dionysus was actually born only once. It was simply a confusion of words that gave rise to the idea that he was sown into the 'thigh' (*meros*) of Zeus. Instead Zeus made an illusory double of the infant out of the layer of upper air and gave it as a 'surety' (*homeros*) to the care of his jealous wife as assurance of his future fidelity, while the real Dionysus was apparently entrusted to the nurture of others (286 ff.).[47] Teiresias's explanation, however, misses the point and deprives the god of his transmutation into his civilized aspect. Instead, Hera, like a primordial great goddess, tends her delusion and seems to dominate Zeus, and the real infant, who was born only once, has yet to evolve from primitivism, for the creatures to whom he was entrusted are traditionally the satyrs and maenadic nurses and brides of Nysa, the wild place of his youth, before the discovery of wine. Even Cadmus shares the Theban doubt about the mystery, but he urges that they at least appear to accept it, for it is a noble lie that will benefit the dynasty and his dead daughter's reputation (332 ff.).

It is by means of the second birth, however, that the god acquires his special role in alleviating the sufferings of mankind, while nourishing the spirit with the superior mania of inspiration. The death of his primitive self is the essential precedent for his evolution into Olympian times, and by being born both of the mother in the earth and of the heavenly father, he is the appropriate mediator between the Olympian gods and mortals, who, like him, experience the contamination of the chthonic realm.

Teiresias attempts to explain this role of mediator in mankind's sufferings as an act of sacrifice, whereby Dionysus, although a god, offers himself in libation to the other gods so that humans, through him, can experience the blessings of wine, its ability to end pain and cause sleep and forgetfulness of daily troubles (οὗτος θεοῖσι σπένδεται θεὸς γεγώς, ὥστε διὰ τοῦτον τἀγάθ᾽ ἀνθρώπους ἔχειν 284-285). Dionysus is identical with the 'liquid potion of the clustered grape' which he 'discovered' (279), and it is only by sacrifice of himself that he can offer his gift of wine.

Just as Dionysus came twice to the gates of birth, his act of sacrifice, therefore, must bring him doubly into death, both in the abandonment of his own atavistic precedents and in the form of his cultivated self. As we have seen, such a double sacrifice was ritualized in the actual tending of the vine's harvest through its winter fermentation. It is the mystery of this sacrifice that the god will reveal to the doubting Thebans in the *Bacchae*. The play enacts the consecration of Pentheus via a repetition of the double birth as the god's surrogate, in whose person Dionysus must, as always, die in order to free himself from his darker antithesis and grant the blessings of madness through his gift of wine.

---

[45] This derivation of Dithyrambus, although well attested in antiquity and obviously implied by this passage in the *Bacchae*, is apparently false. The name may be another non-Indo-European word assimilated into Greek and can be compared to a Phrygian word for the 'tomb', thus an epithet of Dionysus as the Lord of the Tomb. See Sir Arthur Pickard-Cambridge, *Dithyramb, Tragedy, and Comedy* (Oxford 1962, second edition revised by T. B. L. Webster) 7-9.

[46] See Dodds, *Bacchae* 78.

[47] Unfortunately a lacuna in the text appears to occur after line 293. Gilbert Murray suggests the indicated completion on the basis of the myth as recorded in Apollodorus 3.4.3.

The musical accompaniment for the dancing of the choral women in the play is a constant reminder that the story does, in fact, enact this pattern of assimilation and sacrifice, for the instrument they play is the tympanum, whose connotations they identify at the beginning of the drama in their first dance, the parodos ode. There, they describe accurately and in detail the double birth of Dionysus and present it as analogous to the Cretan birth of Zeus himself, the event whereby the Indo-European god, in like manner, assimilated the pre-existent male deity of Minoan religion (89 ff.). The sound of the tympanum indicates that the evolutionary rebirth is taking place and that Dionysus brings redemption from the primitivism of the kingdom where he was first born, for it was at the Cretan birth of Zeus that the ecstatic Corybantes invented the tympanum to cover the cries of the newly born infant, and the same drum was used in Corybantic rites to cure madness (Aristophanes, Wasps 119 *cum schol*.). There was also a tradition, of which Euripides was apparently aware (*Cyclops* 3), that the same sound cured Dionysus himself of a madness sent upon him by Hera in his primordial state.[48]

The First Birth

The first birth is from the earth. It will be marked by thunder and earthquake, and symbolized by the simultaneous burst of fire upon Semele's tomb, which from the beginning of the play has been seen still smoking from the time that Dionysus was wrenched from his mother's womb. It is this birth that will ratify Pentheus as the primitive aspect of the Dionysian duality.

Characteristic of that role, Pentheus is first introduced as a hunter, symbolic of the pre-agrarian gathering rites of the winter revels. It was as a hunter that Dionysus manifested himself then, as Zagreus, the 'one who catches his prey alive', a chthonic child of the queen in the otherworld. In these rites, Dionysus was both the hunter and the hunted, for the maenadic women sought the wild plants and animals whose spirit would possess them in ecstatic rapture.

Thus, when Pentheus first enters on stage, he announces that he intends to 'hunt' (228) the Theban maenads on the mountain. In the ensuing choral stasimon, the Asiatic devotees of the god identify the kingdom of such a mad and senseless hunter as a land that does not know the joyous and pain-relieving festivities of the Dionysian vine and they pray to return to their eastern homelands. The next episode begins with the presentation of Pentheus's captured prey (434 ff.), and Pentheus, as hunter, taunts Dionysus, whom he has 'netted' (451) alive, as an effeminate weakling who 'hunts' (459) only those same Aphrodisian joys that the Asiatics have just extolled.

As the two opponents size each other up for the coming conflict, their uncanny similarity begins to emerge, for Pentheus, as well as the disguised god, is a Dionysus. Thus the prophet, who actually was first born in Thebes, identifies Asia as his homeland, from which place he has brought the rites of Dionysus, the son of Zeus. When Pentheus facetiously asks if they have a Zeus there who makes new gods, Dionysus replies that it was here in Thebes that the union with Semele took place. The different appearances of the prophet and Pentheus also cannot distinguish between the two, for Pentheus seeks to know what the god looks like, only to find that Dionysus apparently can look like whatever he wishes (477). He is in fact standing right there, although Pentheus cannot see him, for Dionysus is sane, and the other mad (500 ff.). Just as Pentheus had begun the episode by inquiring into the mysterious prophet's identity, Dionysus now, in structural responsion as the scene closes, claims that Pentheus himself does not know his own identity, to which the mad king unwittingly demonstrates the truth by stupidly citing his chthonic lineage from Echion and his name, whose meaning as 'Sufferer' he clearly does not comprehend.

---

[48] See Dodds, *Bacchae* 83-84.

With the two thus joined by the uncanny opposition of their dissimilar temperaments, the play proceeds to enact the consecration of the Dionysian surrogate. The first stage is the confirmation of his earth-born nature by apparently simultaneous miracles within the palace and amongst the Theban women on the mountain.

The choral dance that introduces this episode contrasts the redeeming second birth of Dionysus with the mad earth-begetting of Pentheus. The Asiatic women describe how Zeus took the infant from the flaming lightning that had blasted Semele and then quenched the fire in the Theban spring of Dirce before receiving the embryonic child into his thigh to gestate for the second birth (519 ff.). Thebes, however, refuses the 'grape-clustered joy of Dionysus' wine-vine' (τὰν βοτρυώδη Διονύσου χάριν οἴνας 534-535). and, instead, Pentheus is demonstrating the madness we have already seen - Pentheus, of chthonic lineage and begot of a serpent, the offspring that earth-born Echion once planted, no mortal child, but a wild monster, a deadly earthy creature that is the god's antagonist (537 ff.). They pray to Dionysus to come, significantly, from Olympus to rescue them from this primitive madness, and the god complies, calling to them from within the palace, where the hunter had taken his prey. The god manifests himself as Bromius, the 'Thunderer'. He shatters the foundations of the building and sets the palace afire with lightning, while, as in his own first begetting, the tomb of Semele bursts into flames.

This event has the unmistakable indications of a birth from the earth. Like the sacred marriage of the queen at Athens to the primordial Dionysus, the place where the miracle is enacted is the bull stables of the royal palace, and the thundering earthquake traditionally marks the emergence of autochthonous creatures from the ground.[49] In the theater, it would have been staged to the striking of the 'thunder gong', the same instrument that in the Mystery at Eleusis announced the birth of the divine child Brimos from the nether realm in the midst of a blinding flash of light.[50]

At the beginning of the ensuing episode, Dionysus, still disguised as the prophet, emerges from the palace to detail what has happened within. The mad Pentheus, with deluded sight, mistook a bull in the stables for the prophet, whom he thought he was roping and confining. It was at this moment that the earthquake and the fire on Semele's tomb had occurred (622. ff.). Ironically, Pentheus thinks that the house itself has caught fire and he calls for his servants to quench the flames with the same water from the spring of Dirce that had doused the burning infant Dionysus. Then, thinking that the prophet had taken advantage of the confusion to escape, he rushed into the house, where he mistook a hallucination for the prophet and entered into combat with thin air. Through all of this, the prophet emphasizes that he himself maintained his calm composure (622, 636), while Pentheus vainly struggled and rushed about. It is also clear that for the prophet too the events within the palace were only the appearance of what they seemed (ὡς ἔμοιγε φαίνεται, δόξαν λέγω 629), but unlike Pentheus, he could correctly interpret what was happening as manifestations of Bromius, whom he identifies by the primordial epithets of Bacchus and Bacchius. When Pentheus finally emerges from the palace to find the prophet still quietly waiting for him, his first words are that he has 'suffered terribly' (πέπονθα δεινά, 642), the confirmation of the role that he is too mad to understand. In contrast, the prophet claims that he himself was freed from the suffering that Pentheus had intended to inflict upon him by the 'somebody... who makes grow the clustered vine' (649 ff.).

The chthonic birth had been sensed also on Cithaeron. The herdsman who has just returned from there tells how Pentheus's mother Agave had heard the bellowing of bulls and waked the other Theban women. There too, as in the bull stable of the palace, the connotations are of a primordial sacred marriage, for Euripides repeatedly describes the madness that has driven them to the mountain as the oestrual heat, the poisoning sting of the 'gadfly' or *oistros* (32, 119, 665, 1229) that inflames the womb, the organ, as it was thought, that made women in particular prone to hysteria and uncontrollable longings.[51] This association of the gadfly's sting with sexual madness is a traditional metaphor in Greek. In Apollonius Rhodius (3.276 ff.), Eros himself is

---

49. Thus a bellowing, as of a bull, and a shaking of the ground occur when Medea cuts the magical root with which she will anoint Jason (Apollonius Rhodius 3.864-865). The same bellowing sound occurs when Perseus 'harvested' the Medusa's head (Eustathius, on Homer, *Iliad* 2.498). The autochthonous Erichthonius/Erectheus was named the 'bellower' (cf. *erechtho*, *orechtho*).
50. See Kerenyi, *Eleusis* 84. The instrument was called the *echeion*.
51. Bennett Simon, *Mind and Madness in Ancient Greece: The Classical Roots of Modern Psychiatry* (Cornell University Press, Ithaca 1978) 238 ff.

likened to a gadfly amidst a herd of heifers as he enters a room filled with women and shoots Medea with an arrow whose poison, like a flame, drives her madly into love for Jason. The myth of the gadfly itself involves Zeus's affair with a primordial version of Hera in the person of lo, whom Hera transformed into a cow, like her own pre-Olympian self (Ovid, *Metamorphoses* 5.330) as indicated by her ancient epithet, Boopis, the 'Bovine', still retained on Olympus. The gadfly was supposedly the ghost of the 'all-seeing' (Panoptes) herdsman who tended the cow, goading it, as in Aeschylus's *Prometheus*, into ecstatic wanderings until a Zeus of the Olympian age calmed her madness with the touch of his hand, to beget the later race of heroes. The gadfly was also known by a name that apparently is the opposite of the primordial herdsman's epithet, for it was called *muops*, the 'close-eyed', by which name it was identified with a plant (Pseudo-Plutarch, *de Fluviis* 22.5) said to grow in a river, that itself figured as another chthonic lover of a heifer-like maiden in the myth of Deianeira (Sophocles, *Trachiniae*).

The sexual nature of the women's madness is, of course, what Pentheus has all along suspected, but, as in the case of Semele, he has mistaken the spiritual aspect of the maenadic rapture. The numerous depictions of Dionysian revels in vase paintings can leave no doubt that the Greeks of Euripides' audience were well aware that the women cavorting on the mountains were indeed engaged in sexual experience, but that Pentheus was a fool to think that it could be seen, for the eroticism was metaphysical and the lovers spiritual. Thus on vases we see the women wakened by ithyphallic satyrs and romping with them, or dancing, often nude, before the thyrsos-bearing god, or presenting hares, symbolic of sexuality, as their catch in the hunt.

What the herdsman saw, as he tells Pentheus, was not the suspected drunken orgy, but a model of decorum. The maenads had fallen asleep in three groups, apparently exhausted from their ecstatic dancing. The trifold grouping was traditional,[52] and apparently corresponded to differences in their ages, 'the young, the old, and maidens still unwed' (694), each of which is led by one of the sisters of the dead Semele (681-682). Since children do not appear in depictions of maenads on vases, and indeed would be unlikely to have experienced the oestrual madness, the age distinctions must refer to their stages of female maturity, and the 'young' are mentioned as contrast to the 'old' and would include women well into the age of child-bearing,[53] as distinct from those beyond that stage of life. Presumably, the trifold grouping pertained to the generic roles enacted by the maenads as the god's 'brides' and 'nurses' and 'hunters'.

The regressive symbolism of these women, who have been goaded into the wilderness, away from their civilized task at the loom (118), is apparent in their clothing, for they are wearing the traditional maenadic attire of animal skins, girded with serpents, a form of dress that symbolically imbues them with the animal's spirit. In this bestial transformation, they were seen cuddling animals like children or actually suckling them, apparently having abandoned in the city their own newly born babies (702).

They have evidently been gathering wild plants, for they crown themselves with wreaths of ivy, *smilax* or 'bryony', and leaves of oak (702-703). The latter two plants, like the ivy, have regressive symbolism. *Smilax* is an evergreen creeper that resembles ivy, with clusters of scarlet grape-like berries, which are said to be similar to the fruit of plants called the 'wild grape' and the 'wild vine', as well as nightshade (Theophrastus, *H. P.* 3.18.11). Like ivy, it was a wild plant, not cultivated, and thought to be parasitic, clinging even more than ivy to its host (*ibid*. 7.8.1). It was a common substitute for ivy in maenadic rites, but in some way deficient (Pliny, *N. H.* 16.155), probably because it lacked ivy's reputed effect upon the mind. The oak had similar connotations of primitivism. It was associated with a primordial Zeus, whose sacred grove at Dodona was tended by a barefooted priesthood of prophets who slept upon the ground (Homer, *Iliad* 16.233). Before the arts of agriculture evolved, mankind was supposed to have fed upon acorns, the fruit of this sacred grove (Vergil, *Georgics* 1.147-149). Acorns were also thought to be the ancient food of the Pelasgian, pre-Indo-European people of Arcadia (Adespota, fr. 67 Page; Herodotus 1.67; Hippolytus, *Refutatio Omnium Haeresium*

---

[52] Tripart grouping is associated with Theban maenadism. See Albert Henrichs, Greek Maenadism from Olympias to Messalina, *Harvard Studies in Classical Philology*, 82 (1978) 137-138.

[53] Dodds, who follows Bruhn, interprets the grouping thus as only twofold: 'young and old - and unmarried girls among them', *Bacchae* 163. Maenads, of course, are depicted with the Dionysian child, but not with their own. The traditions, mentioned above, about maenads who ate their children during the revels probably are not to be understood literally, but in terms of ritual impersonations, with the child either the gathered Dionysian infant or, as in the scene described by the herdsman the wild animals and serpents that the women 'mothered' before rending limb from limb for the ritual raw meal.

5.17), and the homilitic phrase, 'to be born from the legendary oak or stone' (Homer, *Odyssey* 19.163 *cum schol*.; Plato, *Apology* 34d, *Republic* 544d), seems to have implied primordial origin in pre-civilized times.

What the herdsman next saw was an apotheosis of the pre-agricultural age, a reversion to the fabled Golden Age, when the earth yielded up nourishment without mankind's toil of cultivation. Someone struck the rock with her *thyrsos*, and water flowed from the ground. Another placed the *narthex* upon the earth, and the god sent up a natural spring of 'wine', while others scratched the ground and found 'milk'. After the miraculous appearance of these three natural springs, the *thyrsoi* themselves are transfigured, with streams of honey dripping from the leaves of ivy. Thus it was in primitive times, as Vergil claims, before the streams of wine were stopped and the honey shaken from the leaves, so that mankind henceforth would have to work for his livelihood (*Georgics* 131 ff.).

The central role of the *thyrsos*/*narthex* in this apotheosis suggests, as one would expect, that the women in this wild place are gathering foods, instead of tending crops or herds. In the context of this play, where the gift of Dionysus is consistently designated by phrases descriptive of the clustered grape that is fruit of the tended vine, it is significant that here it is simply 'wine' that flows naturally from the earth, without the need of fermentation. *Oinos*, in fact, can be generic in Greek for any intoxicant. Thus Herodotus, for example, can speak of beer as a 'wine made from barley', as distinguished from Vine wine' (2.77). 'Milk' too is easily metaphoric and can designate the milky sap of plants (Theophrastus, *H. P.* 6.3.4), or even wine, as the 'milk of Aphrodite' (Aristophanes, fr. 596). It is perhaps also significant that Euripides, in this description of the women's activity, speaks of 'swarms of milk' (γάλακτος ἑσμοὺς 710), a strange metaphor,[54] suggestive of bees, as if what the women actually were doing was gathering the essence of flowers. Bees, moreover, have a special significance in this ethnobotanic context, for, like the gadfly, they are stinging insects and therefore poisonous, but they seem to be able to transform the poisons, which they must have derived from flowers, into honey, a nourishment akin to serpent's venom, but sweet and non-toxic.[55] Thus, in this Golden Age, even the poisonous ivy leaves gathered into the *thyrsos* yield honey. Honey, moreover, seems to have been associated with the Minoan predecessor of the viticultural Dionysus, and it is related to the common word in Greek for 'intoxicate', probably indicating the role of mead as a precedent for wine.[56]

In Pentheus's kingdom, however, the blessed age of primitivism is not allowed to express itself as a function of evolution, and thus, instead of renewing civilization, it pollutes and destroys it. The women, after the gathering ceremony, had entered into the maenadic madness, calling upon Dionysus with his mystery name as the chthonic lacchus and as Bromius, the 'Thunderer', and the whole mountain, thereupon, had become transformed, together with its beasts, into constant motion. This is the blessed madness that the Asiatic maenads had extolled at the conclusion of their parados dance (135-169). There, they had described the god's epiphany amongst them, in the midst of the primal land flowing with milk and wine and honey, as Bromius, leading the hunt for the goat to be eaten raw and possessing their leader with a shamanic frenzy. When the repressive Pentheus intrudes upon the idyllic scene through the presence of his spying herdsmen, it is clear, to all but him, that the corollary of the blessing is the danger of dishonored primitivism, and that he and his kingdom will have a role as the tragic surrogate. When the herdsmen decide to 'hunt' (719) the maenads to please their master, they discover that there is another leader for the chase, and the women, like hounds (731), attack the hunters, using their *thyrsoi* as weapons.

Instead of the miraculous age that predated civilization, this same primordial time now is maddened to vengeance against the later agrarian age. The herdsmen themselves barely escape dismemberment, and the women fall upon their cattle instead, brutally rending them limb from limb with their hands. Then, like predatory birds, they swoop down upon the Theban farming villages beneath them, plundering and destroying them like enemies and kidnapping children, until finally they return to the miraculous springs on the mountain to cleanse their bodies of the blood.

---

[54] Dodds, following Elmsley, calls the metaphor absurd and derives ἑσμός from ἵημι (instead of ἕζομαι) so that the phrase means 'springing jets' of milk: *Bacchae* 164. Thusalso Liddell, Scott/Jones. In compounds, however, the word has connotations of bees and I suspect that a melissaean metaphor is appropriate to this context.

[55] See Ruck, *Sacred Names*.

[56] Kerenyi, *Dionysos* 36.

The cultivated vine with its ferment of wine is the symbol of the world restored to balanced accord with its primitive origins, and for it to exist, its enemy must be destroyed. The primordial god must yield to Dionysus, the son of Zeus. Now that Pentheus has been ratified in his chthonic birth, both by the events within the palace and the twofold manifestation upon the mountain, the episode concludes with the presentation of Pentheus, confirmed in his coming role as victim. Once more, the dual aspects of the god are divided between him and his surrogate. Pentheus cannot, as he says, endure to 'suffer what he suffers' at the hands of women (786). Clearly, he is the sufferer, even though he had tried to make the other 'suffer' (788). In temperament, his every action demonstrates that he is the passionate one, despite the prophet's advice to calm himself (790). He is the prey for whom the net is cast (848), and the senseless confusion of his thinking is more than ever apparent. He will take pleasure in his pain (814-815). To avoid being detected in going to the mountain in stealth, he will instead go openly (816-817). And as final proof of their inverted roles, Pentheus, who had derided the prophet's effeminacy, will put on the female attire of a maenad, a stratagem that demonstrates, as Pentheus now admits, that the prophet inspired by Dionysus has been the sensible one all along (824-825). The last words of the prophet as the episode closes foretell the victim's death, which will show that the terrible god born of Zeus is most gentle to mankind.

The Second Birth

When we next see the two, they both have a different appearance. The god no longer disguises himself as his own prophet, but he has assumed the taurine manifestation that came into being at the chthonic birth, while the passionate Pentheus is now calm, dressed in the effeminate attire that he had despised in the prophet and the maenadic Cadmus and Teiresias. From now until the completion of the sacrifice, the world apparently appears double, with two suns and two cities of Thebes.

On the mountain, Pentheus will experience the final consecration for his tragic role. Like the god himself, the primordial chthonic being will be entrusted to the celestial realm before being offered as the Dionysian victim, confirmed in his total dual identity by a second birth that mediates the schism between earth and sky, primitivism and cultivation.

The messenger who returns from the revel describes this second 'miracle' (1063). Apparently gesturing as he speaks to emphasize the symbolic nature of the event as a mediation, he says that the foreign prophet took the 'celestial, topmost branch of a pine tree and brought it, brought it, brought it down to the black earth. It curved like a bow, or like the circumference traced on a rounded wheel as it is inscribed by a compass. That's how the foreigner brought that mountain branch in his two hands and bent it to the ground, an act that no mortal could have done' (1064-1069). Then Pentheus sat on the pine bough, and the stranger let it go straight up. 'Straight up into the high up air it stood fast' (ὀρθὴ δ᾽ ἐς ὀρθὸν αἰθέρ᾽ ἐστηρίζετο 1073), an image again emphasized by gesture and repeated phrase.

When he is seen there by the maenads, the prophet disappears and a voice, 'apparently' (ὡς μὲν εἰκάσαι 1078) that of Dionysus himself, calls to them from the upper air, where, of course, Pentheus now is, announcing that the victim is at hand. At this moment, the lightning flash that had marked the first birth is repeated, and the earth and heavens are joined, transfixed by a light of holy fire (καὶ πρὸς οὐρανὸν καὶ γαῖαν ἐστήριξε φῶς σεμνοῦ πυρός, 1882-1883).

The Paradigm of Actaeon

The death of Pentheus at the hands of the maenads involves the metaphor of the inverted hunt, in which the hunter is mistaken for the beast of prey by the pack of hounds, who revert from the domesticated state to the wild and turn upon their master. It is a story told also about Actaeon, a cousin of Pentheus, and Euripides apparently considered Actaeon's fate as paradigmatic of Pentheus's death in the *Bacchae*, for he mentions Actaeon several times (230, 337, 1227) and specifies that the dismemberment of Pentheus occurred in exactly the same place on Cithaeron where the dogs had earlier torn Actaeon to pieces (οὗπερ πρὶν Ἀκτέωνα διέλαχον κύνες. 1291). Actaeon was the son of Autonoe (230, 681) and Aristaeus, a son of Gyrene and Apollo who was associated with advances in horticulture, namely the tending of bees and the making of cheese and the hybridizing of cultivated olives from oleasters. Aristaeus also had a more sinister aspect, for he was responsible for Eurydice's abduction to Hades, and it is apparently this regressionary trait that surfaced also in the figure of his son. In the earliest accounts, Actaeon incurred his death by rivaling Zeus as suitor of Semele (Stesichorus, fr. 68; Acusilaos, fr. 33 Jacoby), and hence as a potential mortal sire for the Dionysian child. In terms of the *Bacchae*, we may surmise that it was someone like Actaeon who had the illicit affair with Semele that Pentheus and his aunts suspect. It is appropriate, therefore, that both Pentheus and he should meet the same end, since both represent regressionary primitivism with regard to the transmutation and evolution of Dionysus into Olympian times.

Traditionally, such regression is effected by Lyssa, a goddess of madness whose name means literally 'rabies'. Lyssa is a feminine formation of the word for 'wolf (*lykos*), and the goddess represents the rabid madness that converts the domestic dog into its wild avatar, the wolf. A fifth-century vase from Attica in the collection of the Boston Museum of Fine Arts actually depicts Lyssa as a woman with a wolf's head as she maddens Actaeon's hounds against him, while Zeus and Artemis look on.[57] It may be that such a costume was traditional for Lyssa. Euripides used her as a character in his *Heracles* tragedy, where her lupine symbolism is an integral part of the plot. In that play, she maddens the hero into slaughtering his own wife and children, whom he had intended to rescue from the same fate at the hands of the 'wolf Lykos, a primordial king of Thebes. Instead, he does what the 'wolf intended, because Lyssa leads a pack of hounds against him (860, 898) and drives him into rabidity, infected with the primitive poisons of the monstruous beasts he had himself once hunted. The most recent of these conquests in the play is the netherworld's dog Cerberus and the poison of its rabid foam (Pliny, *N. H.* 27.22), aconite, which significantly for the pattern of the tragedy was called 'wolf-bane'.[58]

In the *Xantriae*, Aeschylus had also brought Lyssa on the stage as a character, inspiring the Theban maenads into madness against Pentheus (fr. 169), but in the *Bacchae*, Euripides seems to have intended Pentheus himself to be in some sense a Lyssa. Thus the prophet, as he prepares to dress Pentheus in female attire, prays to Dionysus to knock Pentheus out of his senses and insert a 'giddy Lyssa' (ἐλαφρὰν λύσσαν, 851), explaining that otherwise Pentheus will not accept his new costume. While he is off-stage dressing as a maenad, the choral women imagine the joy of the mountain revel, comparing themselves to a fleeing fawn that escapes the hunter's pack of hounds, and they approve of the good sense that the god displays in hunting down his impious enemy (862 ff.). Their own joy in escaping the hunter is apparently the reciprocal complement to the fate warranted by the lawless, mad prey that the god hunts. After the ensuing episode, in which Pentheus is presented in his maenadic costume, they too identify this female attire as indicative of Pentheus's Lyssa-like appearance (ἐν γυναικομίμῳ στολᾷ λυσσώδη κατάσκοπον, 980-981), and they summon Lyssa's hounds to rouse the Theban women on the mountain in oestrual madness against this senseless, chthonic creature, while they imagine themselves rejoicing as they join in the hunt, led now by Justice herself and the god.

Since, as we have seen, Pentheus has the temperament of a poisonous herb and apparently, in his maenadic dress, is actually the rabid goddess of madness, his presence in the revel maddens his mother's pack of hounds (cf. 731) and they mistake him for the prey of the hunt. In view of the botanical ramifications of his identity, it is perhaps significant that the Theban women capture him as though he were a plant, uprooting the entire pine tree, which is itself a primordial version of Dionysus. There may be similar botanic implications in their use of the *thyrsos* as a weapon (733, 1099).

The lupine and serpentine connotations of Pentheus's identity mark him both as the enemy intruding upon the Golden Age and as the primitivism that cultivation must overcome, for the end of the Golden Age was issued in when serpents acquired their deadly poisons and the wolves began to plunder (Vergil, *Georgics* 1.129-130).

The Regression of Cadmean Thebes

The *Bacchae* concludes with a curious prophecy delivered by Dionysus. Cadmus and his wife Harmonia will be transformed into serpents and ride away in a carriage or chariot drawn by calves. Cadmus will become the leader of a barbarian host, presumably the Encheleis or 'Eel-people' of northern Epirus, amongst whom in historical times the earlier sovereignty of Cadmus was commemorated by the carrying of serpent ornaments as standards, in the same manner as the similar ornaments of the supposedly autochthonous Erechtheid lineage at Athens. With these people, Cadmus will eventually attack many cities, until finally he will be defeated in an assault upon Apollo's oracular sanctuary at Delphi. There at last, his barbaric horde will be routed and he and Harmonia alone will be rescued and transported to the Islands of the Blest by Ares, the god of war, who was Harmonia's father (1330 ff., 1352 ff.). In actual fact, such an oracle was current at the time of the Persian Wars, when Mardonius used it to justify his attack on Delphi, although it was well known that its true reference was to the Illyrians and the Encheleis (Herodotus 9.42 ff.).

In its context in the *Bacchae*, the prophecy is final proof of Dionysus's now vindicated Olympian lineage, for, as he says, he knows these things from no mortal father, but from Zeus (1340-1344,1349). The corollary of that ascendancy is the destruction of his darker self in the victory he has just enacted over Pentheus. The fall of Pentheus and his pre-viticultural kingdom entails the demise of the entire civilization that Cadmus once had founded at Thebes, and the city, according to the prophecy, must now revert to its primitive state.

The fall of the house of Cadmus had been dramatized in the earthquake that shook the palace, and it was announced explicitly at the beginning of the messenger's account of the death of Pentheus. Cadmus, as the messenger says, was the one 'who sowed the earth-born harvest of the serpent snake in the land' (1025-1026). The failure of that primordial cultivation is lamented by Cadmus himself at the end of the play. He will be cast out of his house, 'he, Cadmus the Great, who sowed and reaped that superb harvest, the race of Thebans' (1314-1315). He and Teiresias had set out for the mountain revel at the beginning of the drama as two old men in hope of rejuvenation (187-188, 190), but now he returns from there unfulfilled, reproached by Agave for what she perceives as the ill temper of old age (1251 ff.), and bearing the mangled pieces of the young man (1218 ff.) who had inherited the culture he had once founded and who should have been his protection from the indignities of time (1303 ff.).

The founding of Thebes involved the mediation of indigenous and immigrant peoples, together with their dichotomous religious systems. Thus Cadmus, like another Apollo, whose directions he was following, destroyed the primordial serpent at Thebes and then planted its fangs, the so-called dragon's teeth, in the ground, from which grew the first crop of autochthonous creatures. To one, he gave his daughter Agave, thus mingling the blood lines and establishing the Indo-European traditions of patrilineality and patrilocality. Still another daughter brought an Olympian connection and the potential for dominance over the transmuted toxins of the earth. The success of Cadmus's foundation, as we have seen, was symbolized by his own patrilocal marriage to an Olympian female, Harmonia, whose name indicates the harmony between the realms, that was symbolized also by the attendance of the Olympians themselves at her marriage feast at Thebes. Since Harmonia was a half-sister to the primordial serpent (Sophocles, *Antigone* 126 *cum schol*.), she functions as an Olympian replacement for the autochthonous female originally associated with the serpent's spring.

A similar mediation can be seen in Apollo's victory over the serpent at Delphi. By destroying the serpent, Apollo established Olympian dominance over the sanctuary, that earlier had belonged to chthonic forces. It is ironic that Cadmus and Harmonia, as indication of their regression from Olympian harmony, will become 'dragon and dragonness' (1358) at the head of a host of serpentine 'Eel-people' and will finally themselves be routed in their attack upon this same Delphic sanctuary.

Their cow-drawn cart is similarly indicative of the reversion to the pre-foundational condition, for Cadmus had been advised at the Delphic shrine to follow a cow into Boeotia, the land that would be named after it, and to found a city on the site where it lay down. He was descended from a line that twice had experienced a union with Zeus that involved taurine symbolism and migratory wanderings, first with lo, and again four generations later with Europa, the sister whom Cadmus was seeking when Apollo directed him into Boeotia. In the *Bacchae*, a taurine Dionysus has disrupted the city by sending its women rutting on the mountain, and again wandering cows will lead the Cadmean dynasty away from settled life.

At Thebes, the royal lineage will pass to the house of Oedipus, whose founder Labdacus was supposedly related to Cadmus via the latter's only son, Polydorus, a shadowy figure whose name as the 'one of many gifts' suggests chthonic associations with Hades and Plutus or 'wealth'. Labdacus is clearly a repetition of Cadmus, for Cadmus, as civilizer, was supposed to have introduced the Phoenician alphabet to Thebes, an event that also involves Labdacus, since another name for Cadmus's son was Pinakos, the 'writing tablet', and Labdacus seems to be named for *lambda*, the letter that follows the initial letter of Cadmus's name.[59] While Labdacus's son Laius is in his minority, the kingship will be exercised by the sinister ancestor and namesake of Heracles' opponent, the wolfish Lykos, like Pentheus, a son of one of the original Spartoi, Chthonius, a 'man of the earth'. His wife will be the maenadic Dirce, a woman associated with the Theban spring. Only after his death is Thebes again founded, this time by the dissimilar brothers who were his nephews, Amphion and Zethus, the latter of whom married the Theban spring that gave the city its new name of Thebes.

Under Laius, the city will again suffer from the failure to mediate with the chthonic realm. He himself is supposed to have incurred a curse upon his house by the abduction of Chrysippus, an homoerotic affair that demonstrates his disregard for the fertile power of the earth, which in outrage will eventually manifest itself in the predations of the maenadic Sphinx, again on Cithaeron. Ms son Oedipus, at whose hands he will die, will have been inadvertently begotten in drunkenness upon a descendant of the serpentine Echion, and although he will at first rescue the city from the mountain madness, the sinister implications of his conception, against the advice of Apollo, and of his exposure to the mountain wilderness in his infancy, as well as his nurture by the wife of the cattle-tending Polybus, will eventually surface, uncovering his darker, pre-Olympian identity as the consort in the queen's matrilineal and matrilocal kingdom.[60] The city will return to fertility only when the pollution of this darker identity is recognized, in compensation for the previous, mistaken disregard of the Labdacids for chthonic primitivism. While the sons of Oedipus quarrel for control of the city in the great battle at the seven gates, a battle that pitched descendants of the autochthonous Spartoi against a host of foreign immigrants, the city will again be saved by an attempted mediation with the spirit of the slain primordial serpent, by offering a sacrifice of the last unwed descendant of the crop that Cadmus planted, so that the earth might take back a harvest for its harvest and mortal blood for its blood (Euripides, *Phoenician Women* 931 ff.). Even that pacification, however, will prove unstable, for the new regent, again the brother of the great queen, will demonstrate his lack of accord with the chthonic realm upon which his city rests, by burying the living and unburying the dead. And even in the next generation, the sons of the seven who came against Thebes will repeat their fathers' war.

This summary of the familiar mythical traditions about Thebes cannot, of course, do justice to the complexity of the subject, but is intended as an outline of what could be documented by a fuller analysis of the way Thebes figures in tragic literature. As the city where Dionysus was born and initially rejected, Thebes was an important theme for Athenian tragedians. The story of Pentheus deserves to be viewed within the context of the entire body of Theban traditions, which seem to present the city as repeatedly unstable in its foundation because of a basic failure to maintain accord with the fertile sources of primitivism.

In the metamorphosis of Cadmus into a serpent, we can probably sense the regression of the supposed foreigner, the great civilizer and founder of an Olympian realm, to his own more primitive identity as an autochthonous chthonic figure, the form in which he was known in the mysteries of the Kabeiroi at Thebes and elsewhere. Thus Cadmus was said to be a son of a native, primal man, Ogygos, the child of Earth (Pausanias 9.5.1), in which case, the foreign realm from which he came was distant from Thebes only in the vertical plane, and the serpent whom he killed was his own primitive nature. In a similar way, the foreigner Medea was also aboriginal at Corinth. In the mysteries, Cadmus was apparently the father of a divine child, called Cadmilus or 'little Cadmus', another Hermes and, like him, represented by an ithyphallic herm. The foreign 'Eel-people' over whom Cadmus will rule suggest his own more primitive kingship over the eels of the lake in his native

[59] Kerenyi, *The Heroes of the Greeks* (Thames and Hudson, London 1959, translated from the German) 88. Since I follow Kerenyi's interpreration of the traditions about Cadmus, I have not cited original sources, which are documented in *Heroes of the Greeks*.

[60] Kerenyi, *Heroes* 88 ff. The Oedipean duality is indicated, as is common in the traditions about heroes, by the riddle of his own name. The pre-Olympian aspect of his identity has him gathered in the wilderness like a Dionysian child, a creature like a plant with a single foot. In Sophocles' *Oedipus*, he discovers his Dionysian primitivism vis-à-vis Apollo, whose Olympian nature is confirmed when Oedipus, like another Pentheus, becomes the polluted scapegoat.

Boeotia, and the complex traditions about his journeys toward Thebes involve the story of his own taurine abduction of a bovine Harmonia, who was actually his sister, a Persephone-like figure who was mourned by the mother, in whose company Cadmus and his brothers were said to have wandered, searching for her at the ends of the earth.[61]

From Pollution to Fertility

The *Bacchae*, as the work of an Athenian poet, presents a typically Athenian bias toward Thebes and Dionysian symbolism. Athens is a stable and eternal city, in the divine keeping of Athena, a primordial mother goddess, reborn as a virgin daughter of Zeus and successfully transmuted into the primarily masculine orientation of Olympian times.[62] Thus, for example, she wears male attire and was said to have helped the various sons of Zeus in conquering primitivism, including manifestations of her own primordial identity. Unlike Thebes, the traditions about Athens' autochthonous dynasties demonstrate that the city has successfully mediated the dichotomy of primitivism and culture.[63] In actual fact, the incorporation of rural Dionysian celebrations into the city's calendar of religious observances under the populist tyrant Peisistratus is living proof, enacted again each year, of Athens' acceptance of Dionysus. By the time of Euripides, the festivals of drama had become an important indication of the city's cultured life and a demonstration that the elsewhere dangerous god was a son of Zeus at Athens and a founder of civilization.

Typically, the regressive tendencies of Thebes cannot be solved there, but, in the Athenian view, can only be pacified through the intermediary of Athens, which, with its more stable foundation, will be able to provide the appropriate mediation to incorporate the rejected Theban primitivism into its own grand alliance of beneficent atavistic powers that sustain the civilized city. Thus, at the end of the *Heracles*, the former Olympian hero, polluted with the wolf-man's madness, is offered a tomb in Athens, to replace the altar to his father Zeus that at the beginning of the play had supposedly indicated his Olympian identity and his successful rout of the primitive forces threatening Thebes. In offering the tomb, Theseus, one of the mythical founders of Athens, is enacting the brighter version of his name as the 'placer', as opposed to his more sinister aspect as the one whose identity was indicated by the tokens 'placed' beneath the stone at Troezen, the city where he too was conceived, against the advice of Apollo, in irrational drunkenness. Ironically, Theseus in the *Heracles* had just been freed himself from the stone that had merged with his backside in Persephone's realm, and thus his entombment of the fallen Heracles is the counterpoise to his own ascendency, and the stone tomb in Athens supplants the stone of the now meaningless altar in Thebes.

As in the case of Heracles, there were also traditions about the reversion of Theseus to a darker persona. Thus it was sometimes claimed that he never returned from Persephone's realm, or that he died away from his native land in a controversy with a wolf-man named Lykomedes, while the kingship at Athens was regained for a time by the autochthonous dynasty. In a curious historical enactment of the basic mythical idea, here too the value of primitivism was recognized and reincorporated into Athenian traditions. What were supposed to be the bones of Theseus were recovered and returned to Athens for burial in 473 B.C., after his spirit had appeared to many in the recent battle against the Persians at Marathon (Plutarch, *Theseus* 35-36).

The burial of pollution at Athens is, in fact, the common theme of Theseus as the mythical Athenian king. In Sophocles' *Oedipus at Colonus*, another contaminated hero from Thebes is buried by Theseus at Athens. He enters into a covenant with Oedipus, whose rotting old body will be placed in Athenian land in the grove of the Eumenides, an alliance with the netherworld that will be an additional source of fertility and eternal stability amidst the vicissitudes of time, while the controversies at Thebes continue to rage in the warring of Oedipus's sons. Theseus also champions the cause of burying what Thebes refuses to place into its own ground in Euripides' *Suppliants*, where he espouses the supplication of the mothers of the Seven who fell in the war at the gates of Thebes, and retrieves their bodies for interment at Eleusis, thus again striking an alliance that will fortify his own city. His son Demophon, in Euripides' *Sons of Heracles*, will similarly strengthen Athens by

providing burial even for Eurystheus, the archenemy and sinister double of Heracles who was defeated in a battle at Marathon. The theme can be noted even in Euripides' *Hippolytus*, where Theseus is reconciled with his own chthonic aspect in the person of his damned bastard son whom he mistakenly suspected of a Persephone-like abduction. Hippolytus too will be buried at Athens and incorporated into the city's religious foundations.

These burials at Athens demonstrate the same reconciliation with primitivism that we have already noted with regard to the conversion of the Erinyes into the beneficent Eumenides. These daughters of Night and sisters of Lyssa, who track down the prey they madden with wild delusions and contaminate with their excremental nature, could pollute the land with a 'lichenous' (λιχὴν, 785) plague of fungal-like parasitic sterility, until Athena in Aeschylus's *Eumenides*, caring for her city like a gardener (911), cajoles them into friendship by burying them in the earth, where their rotting poisons can function, not atavistically, but as a source of fertile growth for the Olympian institutions of the cultivated city.

The agrarian significance of such an incorporation of pestilential putrefaction as a benefit to the city was actually ritualized in Athens at the Skira and Thesmophoria festivals. Sacrificial pigs, animals akin to the netherworld deities, probably because of the characteristically obnoxious smell of their excrement, were tossed into subterranean caverns and allowed to rot, and, four months later, their putrefied remains were exhumed and spread upon the fields as fertilizer.[64]

Beyond the theme of actual burial at Athens, we can trace the similar theme of the reintegration of pollution into society in a number of other tragedies. In Sophocles' *Philoctetes*, the diseased and fit-prone hero is induced to abandon his exile and bring the contamination of his poisoned body and envenomed arrows to Troy, where his presence will allow his fellow Greeks at last to take the citadel. Reintegration seems also to have been essential to the theme of Sophocles' *Ajax*. Here too, the hero, who has regressed to a pre-Olympian identity, is finally reconciled with his enemies. Denied the inheritance of Achilles' armour, Ajax becomes a maddened cattle thief, and although he was supposedly named for the *aietos* or 'eagle' of Zeus, his darker persona will surface, the primordial Ajax, named for *Aia* or 'Earth' and the lamentation (*aiai*) of his tragic fate. Once he is dead, however, Odysseus, the new bearer of Achilles' armour and the particular enemy of Ajax, will side with the hero's surviving brother and convince the Atreidae to allow him burial.

In the context, therefore, of similar tragedies on the theme of primitivism and culture, the *Bacchae* is somewhat unique in not expressly enacting the reconciliation and reintegration. Although the chorus of Asiatic devotees joyously welcomes the deluded Agave as a fellow member of their revel band (1172), she will vow never to be a bacchant again as she goes into exile from her native Thebes (1384 ff.). A lacuna in the text of the *Bacchae* before the final prophecy of Dionysus obliterates a section of the play, that can, however be reconstructed from other sources.[65] The body of Pentheus was apparently reassembled onstage and prepared with lamentation for burial, but the truer reconciliation is probably the condemnation of the regressive Thebes and the vindication of the viticultural aspect of the god, who, as is implicit in the performance of the play at a Dionysian festival, has been integrated into the religion of another, more cultivated city.

Toward an Understanding of Tragedy

Sometime in the early history of the drama festivals at Athens, it apparently became a stock criticism of a particular play that it had 'nothing to do with Dionysus'.[66] The phrase would seem to imply that a good tragedy was expected to concern itself with Dionysian themes, although the *Bacchae* is the only extant tragedy actually about Dionysus, and only a few of the lost plays appear to have been written on the actual subject of Semele, the bacchants, or the god's traditional enemies. The satyr plays and the comedies that were also part of the festivals could more easily maintain a Dionysian relevance, if for no other reason than their obvious phallic exuberance, but actually, given the great number of tragedies included at each performance, it is difficult to see how constant, simple repetition of the Dionysus myth would not have become unbearably tedious. The demand for Dionysian relevance in the tragedies must be understood as indicating something less literal than continuous reiteration of the god's myth. We have already seen that Dionysian themes can underlie the telling of apparently quite unrelated myths, and this argument could be expanded to encompass all the extant tragedies, if we were to consider themes other than the one germane to our discussion of the *Bacchae*. As conclusion, however, I should like to place the experience of ancient drama in its Dionysian context in order to demonstrate its relevance to the god as a religious celebration, since this too is an enactment of the transmutation of primitivism to culture.

Drama itself was a kind of madness. Actors are frequently portrayed in vase paintings and terra-cotta figurines contemplating the mask of the character they will impersonate on the stage. It is a commonly observed phenomenon that actors become quite literally obsessed by the personae of their roles, and ancient actors, in particular, by wearing the masks of the mythical figures they impersonated, can be expected to have experienced a kind of possession by the spirit of these dead heroes who returned, in the dramas, from the past. One of the early occasions for drama was, in fact, the performance of a hero's story at his tomb,[67] and in Athens, the earliest masking techniques of Thespis, the first tragic poet, suggest that the performers were intended to represent spirits of primordial times. Thespis disguised their faces with gypsum (Plutarch, *de Proverbiis Alexandrinorum* 30) or white lead (Suidas, *s. v.* Thespis), apparently to imitate the bloodless color of ghosts.[68] A similar disguise was associated with the primordial Titans who were said to have slaughtered and cooked the infant Dionysus (*Orphica Fragmenta* 209 Kern) in a regressive manner, contrary to the evolution of the culinary arts. Thespis apparently also used wine lees (*Anthologia Graeca*, Dioscorides, 7.411; Horace, *Ars Poetica* 275-277), the unfermented residue from the god's harvest as the grape. Perhaps even more significant was his use of wreaths of strawberry-tree (Suidas, *loc. cit.*), supposedly a primitive food of the Golden Age (Vergil, *Georgics* 147-149) and a fruit that today is used, as in the ancient manner, to fortify wine in some regions of Greece.[69] The aged Athenian lawgiver Solon was said to have disapproved of Thespis's performances of tragedy as a lie (Plutarch, *Solon* 29; Diogenes Laertius 1.59), perhaps because these early dramatic impersonations, unlike simply choral poetry, seemed to evoke the dead from the underworld.[70]

The enthusiasm of the actors who brought such figures to life in the service of the god was, moreover, a contagious experience for the spectators as well. The people of the ancient audience, if they could read at all, were more accustomed to witnessing the performance of literature than to deciphering the written word in private.[71] In order to recapture the enthusiasm of the original audience, we must consider what manner of mentality would have been involved in witnessing drama, as opposed to reading it. The reader tends to stand apart from the communication and judge it rationally. This is less true when what is read is already familiar or to some extent even memorized, as was the more common case in classical times, for then the words serve merely to remind the memory of things already known and stored away as part of the cultural heritage of given truths. In performance, however, the words tend to capture the mind and imagination with a greater vividness. The judgmental processes recede to the dominance of emotional responses, especially when the performance, like classical drama, is musical and rhythmic, with imposing spectacle and dance. To an audience not accustomed to the detachment of reading and not yet desensitized, as in modern times, by too frequent an exposure to dramatic enactments, such emotionality would be even more pronounced. The whole audience might fall to weeping or be possessed by the contagion of laughter, enraptured by the impersonated spirits.

Wine itself seemed to have played a role in intensifying such a dominance of emotion over rationality in the ancient theater. We must imagine an audience in somewhat less than a perfectly rational state pharmacologically, for, as Philochorus, the fourth-century historian of Attica and its religious practices, records (fr. 171 Jacoby), the spectators prepared themselves by drinking throughout the days of dramatic performance, in addition to whatever drinking, presumably of a deeper nature, took place during the evenings of revelry. The wine drunk was called *trimma* (τρίμμα), like the one drunk at marriages, apparently so named

from the fortifying additives that were 'ground' into it (Hesychius, *s. v. trimma*).[72] There were traditions also that claimed that the poets themselves were possessed by the spirit of the wine when they performed their dramas (Athenaeus 1.2.2, 10.429).

Such drinking in the theater should not be taken to imply a boisterous or ill-attentive audience, but one irrationally enraptured by the music and the dance and the age-old stories of what was supposed to be history, now again come alive. Actually, we have an eloquent eye-witness description of the mesmerizing effect of dramatic poetry on both the actors and the audience in Plato's *Ion* dialogue. Plato had himself been a tragic poet before he turned to philosophy, and although he may exaggerate a little to make his argument against the irrationality of the poetic experience, his description must be accepted as authentic evidence about the general nature, at least, of what happened in the theater of the classical age.

The description purports to be Socrates' rebuttal to the claims of a renowned poetic expert, the rhapsodist Ion, who had made the conventional assertion that poetry is knowledge. It appears, however, that poets do not really understand their own poetry in any rational sense (533d ff.). All poets compose not by art or scientific skill, but because they become possessed and filled with divinity. Music and rhythm lead them into a condition where they are no longer in control of their own wits, but are actually possessed by the subject or figure they are impersonating. They are, in fact, like people entranced or bewitched. The god has removed their minds and substituted his own, using them as his servants, the vehicles for a communication that simply seems to pass through them, although it is not their own. They are like prophets and oracles, who speak for the god, but do not comprehend or at times even remember what words they spoke when the possessing spirit came upon them.

This enchantment, moreover, is a contagion that spreads to the audience as well. The god, according to Plato, is like a magnet drawing the poet or performer into bondage with its attractive force, and through his inspired servants, the binding attraction passes on to the spectators, uniting them all like so many iron rings drawn ineluctably into a continuous chain.

Both poet and audience, in fact, are drunk, but on a potion superior even to that of wine, for the god, in this celebration of his evolution to culture, transports and reunites his people with primordial times of the Golden Age. The drama itself is a drink that the poets have fetched from the magical springs that flow in the gardens of the Muses, a potion composed of the commingled nectars of flowers that are tended not by human agents, but simply found in a metaphysical wilderness by the ecstatic poets, as they go, like bees, from each to each. It is this special drink that the poets offer, and through it, the whole world seems metamorphosed, with rivers, as on Cithaeron, that flow with milk and honey. In the throes of this intoxication, the whole theater will fall to weeping along with the actor although they are celebrating a joyous festival, or their hair will stand on end for fear although they sit amidst their closest friends.

In a deeper sense, it is not the reanimated dead who have so captivated and enthralled the actors and their audience, but rather the culture's heritage of myth, the ancient patterns of story and metaphor that have accompanied the people in the long course of their history from primordial times. The meanings of these stories are elusive, for they have been told over centuries and have had a multiplicity of referents and they seem always to suggest subtleties receding beyond the frontiers of conscious knowledge. The ancient poets were trained in the skill of telling these stories, molding them in accordance with criteria of balance and harmony, but, as Socrates testifies in the *Apology* (22b ff.), not themselves really capable of explaining what they intended as meaning. Traditionally, these inspired transmitters of myth ascribed the source outside their own conscious control to the Muses, who were the daughters of Memory, the repository of the cultural heritage. In performance, these poets and their actors led the audience back into the world of myth, imparting to it their own sense of its deep, although elusive, worth and relevance for the present.

This confrontation with myth not only brought the people back to its historical past, but, as ontogenesis as well, it reunited the individual with the primordial and darker versions of the self that underlay the persona of civilized life, the infant in the adult and the wild in the cultured. What Aristotle was to call the tragic flaw had not only such a reference to the personal psyche, however, but to the whole of society as well, which was reconfirmed in its civilized state by experiencing this journey back to primitive origins.

---

[72] The citation of Hesychius in Liddell, Scott/Jones omits the mention of the drinking of *trimma* in the theater.

Such a journey is basically Dionysian and does not require the story specifically of Dionysus to be told. From the viewpoint of the tragic poets, there were particular ways of telling a story that pertained to their god and his area of symbolism, different, for example, from the ways of the epinician poets. The latter celebrated the masculine virtues of Olympian heroes and of the victorious athletes who surpassed for a time the limits of their own mortality, reasserting their families' aristocratic claim to divine lineage. But the tragic poets told instead of the hero's fall from Olympian grace into the dominance of women and the foredestined tomb. When freed from the personalism of the Aristotlean bias, the mythopoeia of the tragic poets can be shown to represent a consistent pattern or design, in which the hero's fall repeatedly involves Dionysian symbolism, the regression to a more primordial identity, and the restitution of fertility to the civilized world, or some favored part of it, by the incorporation of the polluted, non-Olympian persona. In this manner, the inspired enthrallment of the theater experience was itself an analogue to the stories enacted in the dramas that celebrated the god who himself submitted to death in order to be reborn with his gift of wine.

CHAPTER EIGHT

The Offerings from the Hyperboreans

Introduction

The Hyperboreans were a mythical people, living beyond the frontier of the world known to the classical Greeks, in what was reputed to be the original homeland of the god Apollo. Each year, however, these supposedly imaginary people joined the real cities of Greece in sending actual offerings to the god at his sanctuary on the sacred island of Delos. The other cities all sent envoys with sheaves of grain, the so-called first fruits of the year's crop, harvested before they had completely ripened, but the sheaf of wheat from the Hyperboreans was special for it was supposed to conceal some other plant, a secret offering bound within it.[1] Whoever actually sent this special gift from the lands of myth, the plant itself, we may assume, would have to have been something that was considered particularly appropriate to the supposed Hyperboreans,[2] as well as to the pre-Hellenic identity of their original god and to the meaning of such ritual presentations of first fruits.

The Route for the Offerings

The Hyperborean offering was transmitted from its origin indirectly along its way to Delos through a succession of intervening peoples. Somewhere along this route, the actual sheaf with its secret contents must have materialized out of the land of myth.

The route for the transmission is recorded in three ancient authors,[3] who are in essential agreement that the offerings traveled a strangely indirect, zigzag course, up the Danube, then south along the shore of the Adriatic, and eastward through Dodona and across the Thessalian plain, before finally going south through Euboea and the adjacent islands to Delos. This was obviously not the easiest nor most direct route from

---

[1] Herodotus (4.33) mentioned 'sacred things bound in wheat-straw' and Pausanias (1.31.2) called them 'first fruits hidden in wheat-straw,' adding that their identity 'was known by no one.' Callimachus, however, in his *Hymn to Delos* (4.275 ff.), seems to identify these Hyperborean offerings as nothing more than 'a stalk and sacred sheaves of grain' (thus, M. Gary, *Oxford Classical Dictionary*, Oxford 1970, s. v. Hyperboreans), but a closer examination of the context reconciles his account with the other two. Callimachus is describing the general convergence of first fruits upon Delos, sent from all the cities of the Greek world, amongst which the land of the Hyperboreans is mentioned as the most distant. He then goes on to give the aetiological myth that explained the special manner in which the Hyperborean offerings were conveyed to Delos, not in person by the Hyperborean emissaries, as in the case of the other cities, but indirectly through a series of intermediaries. In this context, there was no reason to distinguish the special contents of the Hyperborean offerings from the general tribute of first fruits. Callimachus's point is simply to illustrate the glory of Delos in receiving tribute from even the most distant of the Greek lands. If the 'sacred things' or 'first fruits' were still a secret in the second century A.D., when Pausanias gathered his information, it is unlikely that Callimachus, three centuries earlier, would have known that the whole tradition was merely a pious hoax, nor would such a revelation suit the context of a hymn, in the Homeric manner, in praise of Delos. As an antiquarian poet, it is just such traditions that he would have wanted to perpetuate.
Nor is it clear that the Hyperborean offering was actually a sheaf of grain, for 'wheat-straw,' 'stubble,' or 'stalk' (*kalame*) is not the same thing as 'sheaf (*dragma*, literally, a 'handful' or 'as many stalks or *kalamai* as the reaper can grasp in his left hand'). Since the Hyperborean offering, as we shall see, had a longer distance to travel, it is unlikely that it could have been cut at the same time as the other offerings of first fruits. That it was a 'first fruit' is documented by Pausanias, but the 'straw' may have been intended merely to hide it or preserve it over the journey.

[2] Tithes and first fruits were often of a kind particularly identified with the traditions of the donor and could even on occasion be represented by a model, as, for example, a head of celery from Selinus or a head of the precious drug plant silphium from the people of its native Libya. In the same manner, we hear of a golden radish, a silver beet, and a turnip of lead, apparently from private donors, as well as a silver duck from a poulterer, and so on. See William H. D. Rouse, *Greek Votive Offerings* (University Press, Cambridge, U. K. 1902, reprinted by Arno Press, New York 1975) 60-94. We can expect that the secret offering was considered to be the special Hyperborean plant.

[3] For the ancient testimony, see p 225 note 1. The three documents cover the same route, but mention different places along the way. The one divergence is the insertion of an Athenian role in the final delivery of the offerings, according to Pausanias's account. This apparently reflects Athenian dominance over the sacred island, dating from sometime after the writing of Herodotus, and the innovation may have coincided with the Athenian reorganization of the Delian festival around the year 418 B.C., when Athens dedicated the new temple to Apollo.

Scythia, through which the offerings had initially passed on their way from the Hyperboreans. They could more simply have been sent through the Hellespont and along the northern shore of the Aegean. The careful preservation of this Danube and Adriatic route must have had symbolic significance, and it may retrace the historical route of a tribal migration of Indo-Europeans into the Greek lands from central Asia.

At the other end of the journey, beyond the Scythians, we hear of only one further people before we enter the lands of myth. These are the Issedonians (Pausanias 1.31.2), a nomadic Indo-European tribe living along the forested south-western slopes of the Altai Mountains, which form the western fringe of the central Asiatic massif.[4]

Beyond them were the Hyperboreans, who either transmitted the offerings through the intermediary of the Arimaspeans (Pausanias, loc. cit.) or perhaps were themselves identical with these Arimaspeans (Callimachus, *Hymn* 4.291 *cum scholia*; Antimachus, frg. 118). The name of these Arimaspeans is supposed to be descriptive of them in the Scythian language. They were a people who had only a single eye (Herodotus 4.27). They lived near the Gorgons (Aeschylus, *Prometheus* 790 ff.; Pindar, *Pythia* 10.45)[5] amongst monstrous griffins, whose gold they were said to steal.

Hyperboreans

These Hyperboreans, as the Greeks understood their name (Herodotus 4.36; *Pindar*, Olympia 3.31; Callimachus, *Hymn* 4.281; etc.),[6] lived in a paradise 'beyond the North Wind,1 who was personified as Boreas. Although north of the Greek lands, the Hyperboreans appear to have been imagined as living also considerably toward the east, for Boreas, in early Greek cartography, did not stand for the cardinal point until later advances in astronomy, and Boreas could shift around from place to place to indicate the direction from which the north wind would appear to blow at different locations. In the region of the Hyperboreans, beyond the Issedonians on the slopes of the Altai Mountains, the bitter prevailing winds sweep westward down through the Dzungian Gate. On the other side of the mountain pass, the Hyperboreans lived. Boreas himself was supposed to have had his home in a cave, which can perhaps be still identified with an actual Cave of the Winds that is located there within the mountain pass in Asiatic lore.[7]

The journey to the mythical land of the Hyperboreans was to be accomplished only through inspiration and mystical transport, as would be expected, for there is no other way to find the long pathway to another world. There was a poem, entitled the *Arimaspea*, about such a journey to the Hyperboreans. It was ascribed to a certain Aristeas of Proconnesus, an island in the sea of Marmara. Since Aristeas is supposed to have reappeared in Italy amongst the Metapontines in the fifth century, some two and a half centuries after his death (Herodotus 4.15), he is probably not so much a real person as the traditional persona that was assumed by a poet in reciting that type of poem. Such poems, like the songs of Hesiod, were originally oral in composition and were perpetuated by a religious society of similarly inspired poets, who could all speak in the biographical persona of their supposed founder.[8] Just as Hesiod appears to have been a Boeotian farmer with

---

4. J. D. P. Bolton *Aristeas of Proconnesus* (Oxford 1962) 104-118.
5. The placement of the Gorgons in the east (instead of the more customary west) seems to have derived from the *Arimaspea* of Aristeas. See Bolton 61 ff. It is probable, however, that the Gorgons were traditionally placed near each of the Greek versions of paradise or the otherworld. Thus they are found also to the south amongst the Ethiopeans, as well as with the Hesperides in the west. See Joseph Fontenrose, *Python: A Study of Delphic Myth and its Origins* (University of California Press, Berkeley and Los Angeles 1959) 288.
6. The ancient etymology has been questioned in the modern era. Ahrens suggested that the name was actually derived from a supposed variant, Hyperphoroi, and thus the Hyperboreans were simply the same as the 'Perpherees,' the name that Herodotus records for the emissaries or 'conveyers' who delivered the offerings to Delos. Schroeder, on the other hand, assumed that'Boris'was a variant of the word for'mountain' (*oros*) and interpreted the Hyperboreans as the people who lived 'beyond the mountain.' See Lewis Richard Farnell, The Cults of the Greek States (Oxford 1896-1909) 4.102 ff. Further references are found in Pierre Chantraine, *Dictionnaire Etymologique de la Langue Grecque* (Klincksieck, Paris 1968) 1157-1158. Farnell enthusiastically endorsed Ahren's interpretation, but there is probably nothing wrong with the etymology current in antiquity. It is accepted as correct by E. R. Dodds, *The Greeks and the Irrational* (Berkeley 1951) 162, and Bolton 195.

an evil and greedy brother, the Aristean persona is characterised by his experiences of shamanic rapture. He was said to have journeyed to the Hyperboreans while 'possessed by Apollo' (*Phoibolamptos*, Herodotus 4.13),[9] an experience that was thought to have happened to him first in a fuller's shop in Proconnesus, but which was repeated, according to some sources (Apollonius, *Mirabilia* 2), over a long period of time. During these seizures, he had the appearance of being dead, while his soul would leave his body (Suidas, s. v. Aristeas; Maximus of Tyre 10.2 ff.) in the form of a raven (Pliny, *Natural History* 7.174), a bird sacred to Apollo and associated, in particular, with the god as his spiritually possessed 'bride' or mate and devotee.[10] As this animal familiar of the god, Aristeas would travel far and wide. He was also thought to have the gift of prognostication and was closely identified with Apollo in certain of his cults.

It was not only Aristeas, however, who experienced such Hyperborean rapture. The shamanic nature of the journey was a traditional theme. Abaris, who, like Aristeas, was the assumed author of another collection of verses, was himself supposed to have been a Hyperborean and was said to have traveled about the earth on an arrow from Apollo's temple amongst those imaginary people (Herodotus 4.36; Suidas, s. v. Abaris).[11] Pindar thought that Abaris was a contemporary of Croesus (frg. 283 Bowra), although, like Aristeas, he too seems to have reappeared at a later date, both in Athens (Suidas, s. v. Abaris) and amongst the Spartans, whom he directed in the performance of sacrifices to avert plagues (Apollonius, *Mirabilia* 4), a ritual that, as we shall see, had definite Hyperborean connotations.

Another of these Hyperborean travellers was Olen, the reputed composer of certain very ancient hymns that were sung at Delos on the subject of the first Hyperborean offerings and a similar purificatory ritual (Herodotus 4.35; Callimachus, *Hymn* 4.304-305), He was claimed as the founder and first prophet of the oracle of Apollo at Delphi (Pausanias 10.5.7), and hence, he too, like Aristeas and Abaris, was presumably the traditional persona of a shamanic poet possessed by the god. He was either a Lycian who came from the Hyperboreans (Pausanias 5.7.8) or was actually himself a member of the Hyperborean race (Pausanias 1.18.5, 8.21.3; Hesychius, s. v. Olen).[12]

It was the wind Boreas himself who took such ecstatic poets to the Hyperborean world that lay just beyond the wintry passage through his cave in the Dzungian Gate. The wind is traditionally an abductor to the otherworld, for the metaphor of 'inspiration,' which in Latin literally implies 'blowing upon' (*inspirare*), existed also in Greek as *empnein*. Thus, for example, the Muses, according to Hesiod, 'breathed song into' him at the moment of his inspiration upon Mount Helicon (*Theogony* 31). So too, 'breath' was soul or *psyche*, just as in Latin it was *spiritus*.[13]

---

9. K. Meuli (1935) Scythica, *Hermes* 70, 121-176. Bolton, 125 ff., disputes what has become the common acceptance of Aristeas as a shaman. He argues that Aristeas was simply someone who was somewhat of a religious fanatic about Apollo and that because of his love for the god, he set out on an actual trip to what he believed to be the topographical homeland of the god, going only so far as the Issedones and hearing from them of a civilized race beyond the central Asiatic massif, who in reality were probably the Chinese. Although Herodotus does claim that Aristeas did not go so far as the Hyperboreans - a strange shortfall for a shaman's journey, as Bolton points out - we should note that not all the sources, who presumably also had access to the *Arimaspea*, agree that he failed to reach the goal of his travels, Bolton further argues that the reappearance of Aristeas amongst the Metapontines was a resuscitation of his memory by the Pythagoreans as a justification for their own vegetarianism, a trait that they shared, as we shall see, with the Hyperboreans
   The diverse traditions about Aristeas, however, are probably not to be reconciled with reality, but indicate, as I have suggested, the persona of an oral tradition of poetry about the journey to the Hyperboreans, nor should we assume that the so-called *Arimaspea* was a fixed text without variants
   For a refutation of Bolton's view, see Ken Dowden (1980) Deux notes sur les Scythes et les Arimaspes, *Revue des Etudes Grecques* 93, 486-492.
10. C. Kerenyi, Asklepios: *Archetypal Image of the Physician's Existence* (Pantheon, New York 1957, translated from the German of 1947) 87-100.
11. Herodotus differs from the later sources in saying that Abaris traveled carrying the arrow, unless the text is to be emended to reconcile it to the other traditions. See Reginald Walter Macan, Herodotus (MacMillan, New York 1895, Arno Press reprint 1973) note on 4.36.3.
   The idea of traveling on a sacred arrow may imply shamanic rapture, for the word in Greek for 'arrow' (*ios*) is homonymous with 'toxin,' and the arrow traditionally was drugged or poisoned and conveyed the metaphor of intoxication.
12. On the confusion of Lycia with the land of the Hyperboreans, see my discussion below under Lycians.
13. Bruno Snell, *The Discovery of the Mind* (Harvard University Press, Cambridge, MA 1953, translated from the German of 1948, 2nd edn.) 8 ff.

The myth of Oreithyia suggests, as we might expect, that the inspired journey to the Hyperborean paradise beyond the North Wind had connotations of shamanic herbalism, for it was the 'breath' or *pneuma* of Boreas (Plato, *Phaedrus* 229c) that carried her to the otherworld while she was playing with her maiden companion, named Pharmakeia or the 'use of drugs'. The spirit thus brought Oreithyia to what was called the 'ancient garden' of Apollo amongst the Hyperboreans (Sophocles, frg. 956 Pearson). It was in that garden that the Hyperboreans would have harvested their special offering to the Delian god. What magical plants grew there in paradise?

The Garden of Apollo

One of those plants was the olive (Pindar, *Olympia* 3.13 ff.). Heracles was supposed to have seen it growing in the land of the Hyperboreans when he went there in pursuit of the so-called golden-antlered hind of Apollo's sister Artemis, an animal that must originally have been the reindeer, for only in that species does the female deer bear horns.[14] Up until then, it was said, the olive was unknown in our world. Heracles was supposed to have transplanted it to the sanctuary that he founded in honor of his divine father Zeus at Olympia, which previously had been completely treeless. Henceforth, the Hyperborean olives provided the wreathes that crowned the victorious athletes who competed in the games at Olympia.

In Delian traditions also, the olive had a sacred association with the Hyperboreans. The grave of the maidens who were the first Hyperborean ambassadors to Delos with the secret offerings was marked by an olive tree that grew upon it, in the area of the sanctuary that was set aside for the goddess Artemis (Herodotus 4.34). It was believed to be one of the oldest trees in existence (Pausanias 8.23.5), and was the object of a bizarre ritual, that dated back to the visit of Theseus upon his return trip toward Athens, after slaying the Cretan Minotaur (Hesychius, s. v. *Deliakos bomos*). Apparently, it was the custom to dance around the altar with whips, while boys, with their hands bound behind their backs placed themselves in symbolic contact with the divinity resident within the tree by biting its trunk (Callimachus, *Hymn* 4.316-324).

From these traditions, it would appear that the Hyperborean plant had connotations of the grave and ritual sacrifice, that it was, moreover, an entheogen capable of effecting the ecstatic journey to the otherworld, and that it was symbolic of the advent of the Olympian strain of religion that came to the Greek lands with the arrival of the Indo-Europeans. It was this triumph of Olympianism over the previous indigenous religions that was commemorated by the tradition that Olympia was purified and refounded by Heracles in honor of Zeus, and the athletic games that were celebrated there were thought to prove the victor's continuance in that divine heritage. Theseus's visit to Delos similarly symbolized the triumph over the primitive chthonic implications of the Cretan labyrinth.

The olive itself, however, can only be a symbolic substitute for the original Hyperborean plant, as it was before being transplanted to this world, for the olive is not native to the northern latitude of the Hyperborean homeland.[15] Before its transplantation, the Hyperborean plant, with the full magical character of the original entheogen, was known metaphorically as the tree upon which grew the golden apples. Although the route for the Delian offerings preserved the remembrance of an Asiatic homeland for the Hyperboreans, that land lay beyond this world, and the various entrances to the otherworld all led to the same place. Thus the Hyperboreans could also be found in the garden of the Hesperides, in the far west beyond Gibraltar, at the frontier of life and death, where the sun went down (Alcman, frg. 10 Page; Apollodorus 2 5.11), and the same Heracles who discovered the olive was said to have brought the apples back as well, from the journey that had taken him north into Hyperborean territory in quest of the magical reindeer.

---

[14] W. Ridgeway (1894) The Legend of Herakles and the Hind with the Golden Horns (Pindar, Ol. III 31), *Proceedings of the Cambridge Philological Society* 37-39, 14-15.

[15] For Greece, the olive does not grow north of the plains of Thessaly. Pindar (*Olympia* 3.13 ff.) claims that Heracles found it growing at the head-waters of the Danube, a region that was considered to lie within the territory of the Hyperboreans.

There was, however, another Hyperborean plant that, like the olive, could be found in this world. This was the *daphne* (*Laurus nobilis*), a laurel or bay. Although the plant itself contains no psychoactive drug,[16] the Greeks considered it a symbolic entheogen. The eating of its leaves was thought to induce the mantic possession of Apollo's Delphic priestess, who, like Aristeas, became *Phoibolamptos* (Lycophron, *Alexandra* 6, 1640). Olen, with the two Hyperboreans, Pagasus and Agyieus, was supposed to have constructed the first temple of Apollo at Delphi out of branches of *daphne* that he brought with him from the valley of Tempe, the narrow passage north into the Thessalian plain (Pausanias 5.7.8; 10, 5, 7). That origin for the plant was commemorated by continuing to gather from there the leaves that were used, like those of the olive at Olympia, to weave the crowns for the athletes and musicians who were victorious in the Pythian contests (Aelian, *Varia Historia* 3.1; Argument 3 to Pindar's *Pythia*).

It was said that Apollo himself had sought refuge in Tempe with a suppliant branch of *daphne* after having slain the serpent monster Python and that he had been purified there before his return to Delphi. The *daphne* leaves for the victor's crowns were gathered in Tempe in a ritual that recalled the god's polluted sojourn there. Every ninth year, the Septerion (or Stepterion) Festival was celebrated at Delphi, coinciding originally with the performance of the Pythian contests, which were said to commemorate Apollo's victory over the Python. In the Delphic sanctuary, opposite the Portico of the Athenians, there was a level area called the threshing floor. Here a temporary structure representing a royal habitation was set up, with a table beside it. A band of youths, escorting a boy, who apparently was thought to impersonate the god, silently attacked this hut and set it afire with torches, overturning the table. They then fled immediately all the way to Tempe, where they were purified of their crime which was no less, as it was imagined, than the ritual slaughter of some kingly person, an impersonation, that is to say, of Apollo's own murder of the Python. The youths then gathered the boughs of *daphne* and carried them triumphantly back to Delphi, accompanied by the music of flutes and pipes (Plutarch, *Moralia* 293c, 418ab, 1136a; Aelian, *Varia Historia* 3.1; Pausanias 2.7.7).

Tempe was apparently considered a nearer version of the Hyperborean world, an analogue to the northern land, like the entrance to the otherworld beyond Gibraltar, and the boughs of *daphne* are a Delphic version of the Delian ritual of the secret offerings. Thus the slaughter of the Python, followed by the expiatory sojourn in Tempe, is comparable to the tradition that Apollo was banished to the Hyperboreans for a period of servitude and absolution after his murder of the one-eyed Cyclopes (Apollonius Rhodius 4.612-616). This same murder of the Cyclopes was also given as a reason for Apollo's sojourn in the service of Admetus, whose kingdom lay in the nearer Hyperborean otherworld in the region of Tempe (Euripides, *Alcestis* 1-7). The Cyclopes and the Python were both more primitive identities of Apollo himself, and thus the murders quite naturally required his own descent for a stay in the underworld.

Both the *daphne* and the olive were trees that marked the transition to the otherworld and had connotations of a death that occurred at puberty. The maiden Daphne, for example, died in the region of Tempe as she attempted to escape the courtship of Apollo and was transformed into the plant that bears her name (Ovid, *Metamorphoses* 1.452 ff.). Similarly, Hippolytus, the virgin youth who was devoted to Artemis, was said to have died when the reins of his maddened horses became entangled in the crooked branches of an olive (Pausanias 2.32.10).

The basic identity of Tempe as a Hyperborean land can also be sensed in the traditions involving both places with Apollo and wolves. Apollo himself bore the epithet Lykegenes, meaning 'born from the she-wolf',[17] and it was said that his mother Leto had been escorted from the Hyperboreans by wolves, herself as a she-wolf, at the time of her labor (Aristotle 580 a 17), and that after the death of Python, it was a wolf that first brought Apollo the *daphne* from Tempe (Servius, on Vergil's *Aeneid* 4.377).

---

16. Dr. Albert Hofmann, in personal correspondence, assures me that, despite the common knowledge that the Delphic priestess chewed the leaves of *Laurus nobilis*, the plant contains no chemically active principles that could induce her prophetic ability, nor is he aware of any other laurel with such properties.
17. Thus, Farnell 4.114. Even in antiquity, there was an attempt to derive Lykegenes from a supposed *lyke*, meaning 'light,' and thus Apollo was associated with solar symbolism, but this is a result of the attempt to obliterate Apollo's pre-Indo-European identity. The same pattern can be seen in the explanation of his epithet of Phoibos as meaning the 'shining one,' whereas its original significance apparently designated him as the consort, named with the name, in matrilineal fashion, of his Great Goddess, Phoibe, who was assodated, not with the masculine sun, but with its feminine counterpart, the moon. See Kerenyi, *Asklepios* 90 ff. Phoibos is thus a primordial name and identity retained as an epithet of the Hellenic god, in the same manner as the epithet of Bacchus (Bakkhos) for the Hellenic Dionysus.

The wolf was a metaphoric version of the god in his polluted state, and thus Apollo was also called Lykoktonos, as the 'one who slew the wolf (Sophocles, *Electra* 6). The stories of Apollo's murdered victims really mask the god's sacrifice of his own primitive precedents in order to supplant them with his evolving Hellenic persona as a deity of more civilized times.[18] In this manner, the primitive Apollo could himself be represented as a wolf or, like Python, as a serpent (Bode, *Scriptores Rerum Mythologicorum* - Farnell 4.359 R 7n). It was as a wolf that he abducted the maiden Gyrene, like Daphne, from the region of Tempe (Servius, on Vergil's *Aeneid* 4.377), and the wolf was his special animal and a fitting sacrificial victim in his worship (Pausanias 10.14.7, scholia to Sophocles' *Electra* 6).

Lycians

Amongst the god's primordial victims was a race of evil wizards called the Telchines. Originally associated primarily with the island of Rhodes, they also inhabited Argos and Crete and migrated to Lycia under the leadership of Lykos or 'wolf and founded a temple of Apollo Lykios by the river Xanthus in south-western Asia Minor (Diodorus Siculus 5.56). Others claimed that it was actually wolves themselves who met Apollo's mother Leto when she was in labor and that it was they who brought her to the same site by the river, where she was delivered of the divine twins (Antoninus Liberalis 35). These wolves were apparently nothing other than the Telchines themselves, for one version of their origin had them metamorphosed out of Actaeon's hounds (Bergk, *Poetae Lyrici Graeci*, Leipzig 1882, 3.232). Traditionally, these hounds represented the recidivism of the domestic dog into its wild avatar, the wolf, a transformation that was effected through the agency of rabies, which was called the 'wolf-madness' or Lyssa. The Telchines, therefore, were the 'mad' or inspired ministers of the primitive Apollo. The classical god, who was supposedly born on Delos, was ritually insulated from his own recidivous tendency by prohibiting all dogs from landing or living upon the island (Strabo 2.8.6). The homeland of the god's lupine predecessor, who was born instead in Asia Minor, was named for the Telchines' deity. It was called Lycia, from the epithet of their god, Apollo Lykios, for Lycia is a Greek word and not the country's ethnic name in the native language of its inhabitants. For the Greeks, Lycia was known as the 'wolf-land.'

This wolf-land of Lycia, it would appear, was another version of the Hyperborean world, for it too was claimed as the paradisiacal garden where Apollo spent his annual sojourn (Vergil, *Aeneid* 4.143-144; Suidas *omega* 71). Thus, the Olen who brought the first *daphne* to Delphi came, as we have seen, with two Hyperborean companions, but was himself a Lycian (Pausanias 5.7.8). Apollo's name in fact, appears to be derived from that of a Hittite deity of entrances, and hence of weather and the seasons.[19] Moreover, the cave of the Python at Delphi, which was the original site of the oracle on Parnassus, is a Hellenic importation of a religious cult from Cilicia, on the southern coast of Asia Minor, eastward beyond Lycia.[20]

This Corycian Cave, as it was called at Delphi, seems in fact, to have had the same name in Cilicia, as well as at its various other Anatolian locations. These caves were all considered to be entrances to the otherworld. The Delphic Corycian Cave was administered by a tribe that lived in the nearby town of Lykoreia, high on the Parnassian plateau, before they later moved further down the mountain to occupy the site of the classical Delphic sanctuary, sometime before the year 800 B.C. (Strabo 9.3.3). Lykoreia is etymologically the 'mountain city of the wolves,' and its original location was supposedly chosen by wolves, who led the Lykoreians there to save them from the waters of the great flood (Pausanias 10.6.2 ff.). Its founder was a certain Lykoros, the 'wolf-warder,' or, by some accounts, simply Lykos himself. Here too, we can discern the wolf as a primitive version of the god and hence the primordial enemy of the classical deity who evolved from him, for it was a Lykos who was said to have desecrated the god's temple by attempting to steal the sacred tripod upon which the oracle sat. For this reason, Lykos was stoned to death (Hippocratic Corpus 9.412 Littré; Pausanias 10.14.7; Aelian, *De Natura Animalium* 10.26).

The cave on Parnassus was apparently another passageway to the god's primordial realm amongst the Hyperboreans. The oracle there was spoken by three winged sisters who were said to become inspired by eating honeycomb (Homeric hymn 4.533-567). They were called 'bees,' a title that persisted into the classical era for the priestess of the oracle, even after the transposition of the rite to the Delphic sanctuary. This cave of the bee-maidens was said to have been the second Delphic temple, replacing the first of *daphne*, and it was reputed to have been constructed out of honeycomb and feathers by bees (Pausanias 10.5.9 ff.). Like the *daphne* temple, it too would appear to be a metaphoric substitute for the golden fruit of the otherworld, for Apollo, on usurping the site from the Python and claiming it for his own Hellenic persona, was supposed to have dispatched the honeycomb temple to the land of the Hyperboreans (Pausanias, loc. cit.; cf. Strabo 9.3.9). Whereas the classical Apollo transmitted oracles from his Olympian father, this Corycian version of the god sent up dream phantoms from the dead in the service of the Great Mother, who was Earth (Euripides, *Iphigenia in Tauris* 1259-1269; Aeschylus, *Eumenides* 1-8).

Since the Corycian Cave could be viewed as an entrance to the Hyperborean world that lay beyond its depths, the Delphians themselves were called Hyperboreans (Mnaseas, frg. 24 Müller). The cave was the way to the golden fruit. Hence, the cave itself was said to have had its chambers lined with gold, and its maiden priestesses were clothed in golden raiment (Philoxenos, frg. 14 Bergk).

It is not surprising, therefore, that the Telchines, who served the primitive god in his Lycian temple, were notorious metalsmiths, working the precious ores extracted from the chthonic depths. Their name was etymologically derived from the words for 'melting' (*texis*) and 'enchantment' (*thelxis*) (Hesychius, s. v. Telchines),[21] and they were apparently the Lycian version of the Cyclopes, who were similarly subterranean smiths, as well as of the Hyperborean griffins, who dug the gold that the one-eyed Arimaspeans stole from them (Herodotus 3.116). Like the bee-maidens, the Telchines were ecstatic creatures (Nonnus, *Dionysiaca* 14.42) with a reputation for sorcery and drugs (Callimachus, frg. 6.64, Diodorus Siculus 5.55; Hesychius, s. v. Telchines). They were also herbalists, for their so-called metallurgic arts involved the making of special potions with the roots they dug from the earth (Eustathius p. 771, 60 ff.), and the single eye that characterized the Cyclopes and the Arimaspeans was known for them as the power of their evil eye (Ovid, *Metamorphoses* 7.366). The classical god in killing these ancient ministers of his religion, redeemed mankind from their supposed wickedness, for, like the bee-maidens, their shamanism was chthonic. They stood accused of having sprinkled the islands of Rhodes and Cos with the waters of the underworld, thereby annihilating all life (Strabo 6.4.5).

Apollo

Apollo, it would appear, had two homelands, one amongst the Hyperboreans on the slopes of the Altai Mountains, and the other amongst the Lycians who tended the Corycian caves of Anatolia. This is not surprising, for in his classical form, Apollo, like the other Olympians, was actually an assimilation and reconciliation of deities from two basically different religious traditions.[22] One was that of the Indo-Europeans, in which male deities dominated over females and were associated with the heavens and spiritual immortality. The other was the Anatolian tradition, where there was a Great Mother goddess, associated with the earth, agriculture, the tomb, and an eternity of corporeal resurrections and deaths. In Lycia, Apollo would have been originally the lesser consort of a superior goddess, amongst a people who still in classical times alone of all men known to the Greeks reckoned lineage by matrilineal descent (Herodotus 1.173). The myth of his birth as a son of Zeus is more exactly, like that of the other children of Zeus, the story of his assimilative rebirth into his new identity as one of the Olympians, along with his former Goddess, who has been transformed into his twin sister, Artemis.

The basis for the assimilation of the 'northern' and Anatolian Apollos seems to have been that both gods were involved with oracular activity, in which they functioned as intermediaries with another world, a role that probably developed from their supposed control over seasonal change and hence over the entrances to life and

death. The shamanism of the Hyperborean Apollo, however, would have differed from that of the Lycian with regard to its orientation. To judge from Orphism, which was a classical evolution of northern Apolline traditions, the shamanism of the Indo-European Apollo was directed toward the celestial realm and strove to liberate the spirit from the body, whereas the Lycian god, through death and rebirth in the embrace of the Earth, showed the way to the body's renewal in its passage through the tomb.

It would, however, be an oversimplification to assume that the assimilation of the two religious traditions occurred solely in the Hellenic context. The Anatolian peoples may well have been influenced by their eastern and northern Indo-European neighbors before their Lycian deity confronted the Hyperborean after the migration of the Indo-Europeans into the Greek lands. So too, the myths cannot be separated clearly at all times into two distinct traditions.

The typical mythical pattern for this assimilation presents the gods of a newer Olympian generation asserting their dominance over their own avatars. Since the Indo-European immigrants were to dominate politically and impose their language, which was to become Greek, upon the indigenous peoples, the gods of this new order are characterized by the Indo-European cultural ideals of male dominance and celestial orientation, but versions of their avatars persisted into the classical period, particularly in agrarian and funereal rites, and, in various ways, the Olympians, like the people who worshipped them, had to strike an accord both with their own particular precedents and with a whole class of deposed chthonic deities, who were the children of an earlier race.

In this manner, although Apollo's predecessors were supplanted and often discredited as his evil antithesis, it was nevertheless felt necessary to appease their angered spirit by some semblance of accord and reconciliation. Thus at Delphi, the Python, who was the original deity of the Corycian Cave, continued to be honored in biennial nocturnal rites that were an atavistic regression to the times of the Hyperborean bee-maidens and their Lycian god. During these rites, the whole sanctuary fell under the dominance of Dionysus, who often functioned as the chthonic opposite of his celestial brother, while Apollo himself withdrew to his primordial home amongst his chosen people in the otherworld.

Sacrifice

Such acts of expiated slaughter, by which the god supplanted his predecessors, are paradigmatic of the accord with the past and its primitivism that was repeatedly renewed through the ritual of sacrifice. The victim for the offering had a role of special honor, for typically it was an animal that was felt to have some particular kinship with the deity, often being associated with the god's sinister persona.[23]

Although some sacrificial ceremonies required that the victim be given over totally to the deity or spirits, either through holocaust or by being simply left to rot, the sacrifice was usually a communion meal that the worshipers shared with the gods. Even in the former case, the sacrifice was meant as food that was offered to the deity whose appeasement was sought. In feeding the deity, the worshipers nourished and bound it to the persona elicited though their invocation and ritual, seeking to avert its regression to less beneficent manifestations. The sacrifice itself was a cultivated and civilized art, usually involving the act of cooking, although certain ceremonies in honor of primitive personae required the eating of the flesh raw. Ordinarily, however, the manner in which the victim was butchered and prepared for consumption was intended symbolically to reassert and strengthen the progress of evolution, for the ceremony recapitulated the supposed ontogeny of the animal itself, as well as the imagined history of the culinary arts since primitive times.[24]

---

[23] Thus, a dog could be sacrificed to the nether goddess Hecate, a horse to Poseidon or the Winds, a goat to Dionysus, a sow to Persephone and Demeter, etc. The animal was thought to represent the form in which the deity formerly appeared and the victim was thus chosen to intensify the resemblance, as, for example, a red dog to the Latin Robigus, who was the spirit of the reddish fungus or ergot that attacks grain. So too were virgin animals appropriate to the virgin goddesses Artemis and Athena, and black ones for the chthonic gods, but white for the celestial. The bull was a typical sacrifice to Zeus, and we can sense the god's sinister persona in the myth of his abduction of Europa, whom he possessed in the form of a bull that breathed the fragrance of the magical herb it had grazed upon.

[24] Marcel Detienne, *Dionysos Slain* (Johns Hopkins University Press, Baltimore 1979, translated from the French of 1977) 68 ff.

In addition to ritualizing the manner in which mankind of necessity partakes of death in order to nourish life, the ceremony of sacrifice signified man's essential role in the reconciliation between the primitive and civilized deities and between the chthonic and Olympian realms. The chthonic gods, who presided over the tomb, were accustomed to eating the corruptible matter of life, but the Olympians ordinarily avoided pollution with the blood and flesh of mortality and were nourished instead upon their own special food and drink, their ambrosia and nectar,[25] which had the power to confer immortality even upon mortals (Pindar, *Olympia* 1.61-64) and were the reason that the Olympians were a race apart, with serum-like ichor instead of blood in their veins (Homer, *Iliad* 5.339-342). Because of this basic difference, the pure Olympians at first had little use for humans, who were created out of clay (Pausanias 10.4.4) and were closer by nature to the chthonic gods, who shared with them the traumas of birth and death. Through the communion meal of sacrifice, even the Olympians, however, were incorporated into the universal interdependency of life and death in the sources of nourishment.

Before Zeus's great reconciliation with humans and the creatures of Earth, he had originally intended to destroy mankind and he and his new hierarchy of gods were cruel and tyrannical. Pursuant of his plan, he took fire away from the volcanic forge of the subterranean smiths and hid it from humans (Hesiod, *Theogony* 561 ff.; Aeschylus, *Prometheus* 7). This fire was the magical plant of chthonic shamanism, and without it, mankind was no better than the beasts of the wilderness, eating their foods raw and lacking in all the civilizing arts (Aeschylus, *Prometheus* 436 ff.). Before Zeus could complete their destruction, however, Prometheus championed the cause of men, who were beings of his own creation, and retrieved fire for them back from the heavens so that they would not remain utterly at the disposal of the tyrannical god. Although himself born of Earth, Prometheus had at first sided with Zeus in the battle that subdued the chthonic creatures, but since Zeus would not rule with justice, it was the role of Prometheus to endure shamanic torment until he could manage to reconcile the two opposing realms and demonstrate the interdependency of both upon the intermediary lot of mankind.

In this reconciliation, chthonic fire became identified with the fire from heaven, for the chthonic smiths are also the Cyclopes who make the celestial thunderbolts of the supreme Father (Hesiod, *Theogony* 149), and thus, the magical plants of the two traditions of shamanism merge. In effecting this reconciliation, Prometheus showed Zeus the way toward justice and the evolution of a better world. In return for his own freedom, Prometheus showed Zeus that the new order of Olympians would be eternal only if the supreme god avoided his own demise by passing on to a human the allotment of mortality that would have been his.[26]

In this manner, it became a human who was to bear the darker persona of the supreme Olympian, and it fell to the lot of mankind continually to reinstate the terms of the accord upon which the new order of the world depended. To the most sinister aspects of the chthonic deities, the sacrifice was typically performed at night in a pit in the ground, and the victim was often not considered an edible species and was simply left to rot. The Olympians, in contrast, were characteristically worshiped in the light of the sun, and, according to the procedure established by Prometheus, the inedible parts were burnt upon an altar for the gods, while humankind cooked and consumed the rest (Hesiod, *Theogony* 535 ff.).[27] In such sacrificial rituals, the magical power of fire transmuted the gods' portion into fragrant smoke, that would ascend to the heavens, where the Olympians, or the brighter aspects of the evolving chthonic gods, fed upon the destruction of their own

---

25. *Ambrosia* is etymologically a negative formation of *brotos* or 'mortal,' and hence a designation of the nourishment of immortals. *Nektar*, which often indicates the gods' drink, may be derived similarly from *nekus* or 'corpse,' plus a second element indicating 'against.' The word has also been interpreted as composed of an initial negative (*ne*-), plus *ktar*, which may be related to *kteres*, a synonym for *nekroi* or 'corpses' (thus, Hesychius). There is, however, no generally accepted etymology for *nektar*. See Chantraine.
26. Thus, the nymph Thetis, by whom Zeus would have begot his own successor, was given in marriage to Peleus, and Zeus avoided that chthonic union, for Thetis is another of the abducted Persephone-like females, and Peleus is named for 'clay' or 'mud' (*pelos*). Achilles, who is born of the union, therefore, is the bearer of Zeus's mortal potential, a mortal son of an immortal father.
27. The verb for sacrifice when directed to a celestial god was typically *thuo* (or *thyo*) and meant basically 'to make smoke.' A different verb was used for chthonic sacrifice, *enagizo*, which implies involvement with 'pollution' and 'curse' by association with the dead. These distinctions in nomenclature and ritual for celestial and chthonic deities were not universally observed, but that is probably because it was possible to invoke the celestial aspect of a chthonic deity, like the paired Demeter and Persephone, or the more sinister persona of an Olympian.

primitive avatars. Thus they were strengthened in their separate estates, with humans as intermediaries to reinforce the advance of the Olympian age.

Thargelia

The offerings of first fruits were presented to Apollo toward the beginning of June, on the seventh of the month Thargelion, which was so named after these *thargela*, the still unripe samples of the coming harvest. It is at this time that we may infer that the Hyperborean offering must have also arrived at Delos, amidst the offerings of sheaves from the other Greek cities. Because of the greater distance that it had traveled, however, it is improbable that the secret offering could have been cut at its supposed Hyperborean origin that spring. The sheaf may have been added later along the route, but the special Hyperborean plant would have to have been available earlier in the year. The arrival of all these *thargela* was the occasion for the great gathering of Ionian Greeks on Delos to celebrate their Apollo as an Olympian god with music and dance, these highest manifestations of the Hellenic culture inspired by him (Callimachus, *Hymn* 4.300 ff.; Homeric hymn 3.146 ff.).[28]

During the entire period of this festival, the Greek cities were considered to be in a state of ritual purity, as befitted the god they were honoring at this Thargelia Festival. To maintain this purity, they had to avoid all contamination with blood pollution, for that would have involved them with the chthonic realm and endangered the persona of the deity they intended to invoke and nourish. Thus it was, for example, that Socrates remained so long in prison before his execution, for the Athenian ambassadors with the first fruits had already set sail for the sacred island just the day before the trial and condemnation, and during the state of purity, no public execution or blood offering could be made (Plato, *Phaedo* 58a ff.).

On the day before the Thargelia, however, as it appears to have been celebrated in the various Greek cities, the ultimate sacrifice to a chthonic deity had been made, a piacular victim 'upon whose flesh no one could feast' (Aeschylus, *Agamennon* 151). This was the offering of a human sacrifice, or, at least, the tradition of such an unspeakable offering. It is not clear from our evidence whether in the classical period this sacrifice was still enacted regularly, although both myth and archaeological finds testify to its occurrence in Minoan and later times. The human sacrificial offering may have been reserved by the classical Greeks for times of extraordinary peril, such as pestilence or war, when the more sinister aspect of the healing Apollo would need special appeasement. It is also possible that by the classical period the actual immolation had become a symbolic or token imitation. Despite our modern repugnance,[29] however, the ritual was known even in classical Athens and perhaps practiced there (Aristophanes, *Knights* 1405; Lysias 6.53).

The victim was called the *pharmakós*, a scapegoat or atonement, but a word that in Greek is derived from the same root as 'drug' or *phármakon*.[30] A mythical tradition preserved an awareness of the obvious relationship between the two words, for a figure, personified as Pharmakos, was remembered as an ancient enemy of Apollo, another of the god's supplanted predecessors. Pharmakos was said to have incited the god's wrath by stealing his sacred drinking cups, for which reason the deity had him stoned to death (Istros, frg. 33 Jacoby; Suidas, s. v. Pharmakos). The myth is clearly aetiological for the *pharmakos* ritual, but it suggests an original controversy about the two traditions of shamanism and the magical plant.

---

[28] It is unlikely that the great assembling of peoples at Delos (Homeric hymn 3.147 ff.) was separate from the Thargelia, for that would have required the mounting of two annual ambassades to the sacred island. See Farnell 4.289 ff.

[29] S. Eitrem and J. Fontenrose in the *Oxford Classical Dictionary* (s. v. Sacrifice) discount the evidence as untrustworthy, probably arising from strangers' misunderstandings of hearsay reports of rites, and they cite the piacular killing of a criminal at Marseilles and the occasional slaughter of captives of war as hardly evidence for human sacrifice amongst the Greeks and Romans. It is true that a spurious work attributed to Plato (*Minos* 315 ff.) unequivocally states that human sacrifice was not the custom amongst Greeks, although it was amongst other peoples, but it is now clear that human sacrifice was once enacted amongst the Greeks also and that they maintained a remembrance of it in their mythical traditions and continued to enact various transmutations of the rite in classical times, although actual immolation may, in most cases, have been avoided, or the victim chosen as being, for some reason, justifiably expendable.
The repugnance of modern scholarship to human sacrifice amongst the Greeks can be sensed from Wilamowitz-Möllendorff's attempt to emend Harpocration's testimony to read two 'rams' (*arnas*) for the two 'men' (*andras*) indicated as the sacrificial victims. See Paul Stengel (1887) 'Thusiai Aspondoi,' *Hermes* 22, 647.

[30] Although the etymology of *pharmakon* is not clearly established, its relationship to *pharmakos* seems assured. See H. Frisk, *Griechisches etymologisches Wörterbuch* (Winter, Heidelberg 1954-1970).

Our earliest source for the manner of performance of this ritual at Athens is the third-century B.C. historian Istros (or Ister, as he is sometimes called), an Alexandrine pupil of Callimachus who collected information about cults and festivals in Athens during the early, mythological period. According to him two men were chosen as victims, one on behalf of the men, and the other on behalf of the women of the city (loc. cit.). We do not get further details until the third century A.D., but the similarity of the wording of the quoted material suggests that the original source was again Istros. The victim for the males, we are told, was draped with black figs, the other with white, and the two were called *subakkhoi*, a word whose etymology is unknown, probably assimilated from a pre-Hellenic language (Helladios, in Photius, *Bibliotheca* 534 Bekker). Apparently, moreover, the use of a male victim on behalf of the female populace was not always the custom, for we also hear of a pair of victims, a man and a woman (Hesychius, s. v. *pharmakoi*).

The occasion for the first offering of such *pharmakoi* was supposed to have dated back to Minoan times, when the Athenians were compelled by a plague to send seven males and seven females to die in the labyrinth at Knossos. Every year thereafter, the Athenians had sent the same tribute of human victims until they were finally released from this bloody obligation of appeasement when Theseus sailed as a victim to Crete and managed to slay the Minotaur. This tradition, like that of Pharmakos, similarly implies the transition from primordial to more civilized times, and Apollo, in his Delian purity as an Olympian again figures in a redemptive role, for Theseus, on his way back to Athens, transmuted the sinister and chthonic implications of the labyrinth into higher culture on the island of Delos as the intricate windings of a line-dance by the troop of victims he had rescued from the Minotaur. This was the aetiology of the first Thargelia, and the tradition was commemorated, as it was believed, by employing the very ship of Theseus, which had been preserved and perpetually restored as a precious antique, to convey the Athenian contingent to the Delian Thargelia with the city's first fruits in classical times (Plato, *Phaedo* 58a ff.).

Although the *pharmakoi* were human offerings, the manner of their immolation suggests that they were symbolic, in a broader sense, of the whole regenerative agrarian cycle. The victims, holding cheese and breads, were beaten seven times on their genitals with branches of the wild fig, squills, and other wild plants (Hipponax, frg. 7, 11 Diehl, quoted with amplification by Tzetzes, *Chiliades* 5.726; scholia to Aristophanes' *Knights* 1133). This symbolic seven-fold flagellation is reminiscent of the whipping of adolescents at the Delian olive and identifies the victim's sexuality and its relationship to primitivism and the otherworld as the particular aspect of them that was offered in piacular sacrifice. The victims themselves were apparently selected for the same symbolism, for they were social and physical miscreants, chosen because of their extraordinary ugliness or low birth.

In preparation for their ordeal, they were glorified (Hipponax, frg. 13 Diehl, quoted with amplification by the scholiast to Lycophron's *Alexandra* 436), as befitted their sanctified role as the god's avatar. They were fed at public expense (Suidas, s. v. *pharmakous*) and purified by a vegetarian diet of bloodless foods, the cheese and breads that they were made to hold for the flagellation, as well as the wild fruits of the branches that were used as whips (Hipponax, frg. 9 Diehl). This appears to have been the custom also in the Greek colony of Marseilles, where the same ritual was still known in the fourth century A.D. (Servius, on Vergil's *Aeneid* 3.57). There, we are told, the victims were sumptuously maintained on such foods and luxuriously dressed.

Then, like the mythical Pharmakos, they were stoned to death, a form of execution that avoided incurring individual blood guilt. Their bodies were burnt with the wood of wild fruit trees, and their ashes were scattered to the winds, which took their spirits to the otherworld and spread their mortal remains upon the earth to enrich and fertilize it for the new growth of cultivated plants that they, as impersonations of the wild and primitive, liberated through their deaths (Tzetzes, *Chiliades* 5.736; scholia to Aristophanes' *Knights* 1133).

The Hyperborean offerings to the Delian Thargelia appear to be a transmutation or substitution for such *pharmakos* victims. It is for this reason, no doubt, that the Hyperborean maidens who were the first ambassadors to arrive in person with the secret offerings never returned to their far-off land, but were buried on Delos within the area of the sanctuary that was sacred to Artemis (Herodotus 4.34), a signal honor that was accorded them, despite the general prohibition against all contamination with funerary custom that prevailed otherwise at the sanctuary. The myth of their simple death glosses over the tradition of what was originally their sacrifice on the sacred island and thus protects the classical god from the sinister connotations of his more primitive persona as a chthonic deity.

According to Herodotus, however, these two maidens, with their male escorts, were actually not the first visitors from the Hyperboreans. They were said to have been preceded by two other girls, a doublet variant of the other myth.[31] They came from the Hyperboreans by the same route and at the same time as the pregnant Leto and brought with them thank-offerings for her easy delivery of the twins, the rebirth that gave them their classical personae. They too apparently died, or were sacrificed, on Delos and were buried and honored within the sanctuary. These Hyperboreans, according to another variant, were none other than the goddess of travail herself, who came to aid Leto in her labor, and the two traditions of primitive Apolline worship are transparent in the confusion about whether this goddess of travail actually came from the 'northern' Hyperboreans or, as some claimed, from Minoan Crete and the labyrinth that had claimed the Athenian victims up until the time of Theseus's triumphant visit to the sacred island after the death of the Minotaur (Pausanias 1.18.5).

The two commemorative graves of these two groups of Hyperborean visitors to Delos were ritually honored in classical times by rites of passage, for the maiden Hyperboreans were themselves symbolically the first fruits of pubes cence, originally offered to the chthonic persona of the god. Thus it was the custom for Delian maidens in classical times to make a substitute offering at pubescence, a lock of hair, wrapped about a spindle and placed upon the grave of the Hyperborean maidens when they themselves prepared for marriage. Similarly, pubescent males on the island would make a 'first fruit offering' of their facial hair, wrapping it about the shoot of some young plant (Callimachus, *Hymn* 4.296 ff.).

The other of these two graves on Delos, that of the Hyperboreans who aided Leto's delivery, was also honored ritually. Delian women, who, like the goddess, had given birth and passed beyond the threshold of maidenhood into matrimony, would collect the ashes from the sacrificial animals burnt upon the classical god's altar and scatter them upon the tomb of these Hyperboreans who had died so that the god could be born.

Apollo and Artemis, moreover, are frequently associated with rituals of human sacrifice in a Hyperborean context. The most interesting of these victims is Orion, who was associated with a pre-classical intoxicant, a predecessor of the Dionysian wine. Orion was the son-in-law of Oinopion, a primitive 'wine king',[32] who made him drunk and blinded him. Orion himself was said to have been born out of an oxhide upon which the gods Zeus, Poseidon, and Hermes had urinated, and his name was etymologically derived from this act of urination, *ourein* (Ovid, *Fasti* 5.495 ff.; Nonnos, *Dionysiaca* 13.96 ff.; Servius, on Vergil's *Aeneid* 1.535). He seems to have regained his sight through the aid of one of Hephaesrus's Cyclopes and to have died at Artemis's hands when he tried to violate one of the maiden Hyperborean visitors to Delos at the time that the classical twins were born (Apollodorus 1.25-27).

Like all victims, the *pharmakos* ideally had to accept its fate. The Hyperboreans, themselves, were supposed to have enjoyed a blessed, long life, during which they too abstained from eating meat, living instead upon the fruits of trees (Hellanikos, frg. 96 Jacoby). At the end of their lives, they voluntarily offered themselves to death by jumping off a cliff (Pliny, *Natural History* 4.89; Mela 3.37). Such a leap off a cliff to one's voluntary death is well attested in Apolline ritual and mythical traditions.[33] Symbolically, it enacts the descent to the netherworld in the wind's embrace,[34] and Apollo himself was called Kataibasics, as the god of the descent, although the epithet could also be interpreted in a less sinister manner as the god who oversaw the return to one's country and homeland (scholia to Euripides' *Phoenician Women* 1408).

The most famous Apolline leap was the one from the Leucadian rock, the sheer limestone cliffs on the west coast of the island of Leukas in the Ionian Sea, off the coast of Acarnania. By one account, the priests of the god threw either themselves or some sacrificial victims off the rock into the sea (Photius, s. v. *Leukates*).[35] This so-called 'White Rock' was a particular topographical localization of another cliff, found only in the lands of myth, at the edge of the world and reputed to be an entrance to the country of dreams, sleep, and death, the gateway where the sun went down or rose again from its repeated passage through the abyss of night (Homer, *Odyssey* 24.9 ff.).[36] Typically, it was a wind that snatched its victims from that rock, and the mythical leap was located elsewhere as well, wherever the boundary between consciousness and unconsciousness was felt to lie. At Cape Leukas, however, the traditional concept was defined by the purificatory ritual of an annual sacrificial leap in honor of Apollo. The leap from the Leucadian cliffs was reputed to be a cure for intoxication and madness (Anacreon, frg. 31 Page) and even the poetess Sappho was supposed to have plunged there into the sea for love of Phaon (Menander, frg. 258 Koch), who is a doublet of Phaethon and hence a mortal son of his divine father, the sun-god Helius. In the case of Euripides' Silenos, who was the leader of the satyrs or primitive Dionysian spirits, this madness was a joyous affliction caused by drinking a potent drugged wine that came originally from a northern priest of Apollo (Euripides, *Cyclops* 412; Homer, *Odyssey* 9.196 ff.),[37] so that, as he says, he would gladly leave his life amongst the race of Cyclopes and leap from the Leucadian rock (Euripides, *Cyclops* 264 ff.). Since Aphrodite herself was supposed to have been the first to find this famous leap as a cure for her love of Adonis (Ptolemaios Chennos, in Photius's *Bibliotheca* 152f Bekker), it is clear that the tradition of the Leucadian rock implies not only the magical herb and the shaman's rapture to the otherworld, but also the transition from primitivism to the Olympian age, for the love-goddess Aphrodite was one of the forms in which the Earth Mother was assimilated as an Olympian, and Adonis, whose name appears to be related to Semitic Adon or 'lord', was her dying consort, whose fate was symbolized in classical times in the withering pots of seedlings, the so-called Gardens of Adonis, that were mourned as a commemorative ritual by Greek women.[38]

---

[31] The names of all the girls are recorded, but there are variations concerning who was in which group, probably indicating that the two separate groups are doublet variants of the same tradition. The first visitors were Arge and Opis. The second ambassadors were either a group of three, named Oupis (a variant of Opis), Loxo and Hekaerge, or a group of two, like the first visitors, but named Hyperoche and Laodice. The names appear to be bynames or epithets of Artemis.

[32] On the connotations of these mythical kings with names constructed upon the word for 'wine' (*oinos*), see C. Kerenyi, *The Heroes of the Greeks* (Thames and Hudson, London 1959) 113.

[33] Farnell 4.274 ff.

[34] Thus Oreithyia (see p. 222) was blown to her death off a mountaintop, in the rationalized version of the myth of her abduction by Boreas to the Hyperborean garden of Apollo.

In actual custom, each year at Leukas, it was an ancestral rite to throw some convicted criminal off the cliffs as a purificatory sacrifice to Apollo. The substitution of a criminal for the *pharmakos* victim in classical times was an appropriate transmutation of the original symbolism, for the adjudged criminality of the victim certified him as an antisocial and recidivous force within the civilized group. The god, however, was supposed to have been lenient to the sacrificial offering, who was said to sprout feathers during the descent and to be uplifted by birds, so that he would land safely in the shallow waters at the base of the cliffs (Strabo 4.5.2). We are reminded of the god's similar kindness to one of his own avatars, Kyknos, like the wolf and the Python, a primordial enemy, who used to slay pilgrims on their way to the Delphic sanctuary. Apollo turned him into the 'swan,' after which he was named, the god's own prophetic bird (Palaiphatos, *De Incredibilia* 12; Antoninus Liberalis, *Transformationes* 12.12). As part of the Leucadian rite, moreover, an ox was slaughtered and, like the human victim, not feasted upon, but left to rot and attract flies, which, after drinking the blood, were said to disappear (Aelian *De Natura Animalium* 11.8).

The White Rock, as a mythical idea, is probably just one of several attempts to locate in reality the 'White Island' of Leuke. Other topographical placements found it somewhere in the Black Sea (Pindar, *Nemea* 4.49; Euripides, *Andromache* 1262), and thus it was sometimes identified with an island lying before the estuary of the Danube, a place that became confused with the so-called Islands of the Blessed, where the gods of an earlier age presided over the souls of the departed. It was there that Kronos, the father and deposed predecessor of Zeus, was king, and like the other versions of the Hyperborean land, it was a magical garden where golden flowers grew upon resplendant trees and in the offshore shoals (Pindar, *Olympia* 2.68 ff.). The western gateway of the Hesperidean garden and the analogous Leucadian Rock thus had its antipodal counterpart in the blessed island glowing white in the light of the rising sun. It was to this eastern entrance that Orion was transported upon his death after his attempted violation of the Hyperborean maidens (Homer, *Odyssey* 5.121-124). The sacred island of Delos itself was so-called because of the way its barren coasts shone from a distance amidst the Cyclades in the light of the sun.

---

35. Farnell 4.431 emends 'them' (*autous*) to 'themselves' (*hautous*), an easy emendation (requiringonly a change of breathing from smooth to rough or aspirate) that supplies an otherwise absent appropriate object for the verb in a this context.

In Vedic traditions, the White Island can also be found. There it is called Suetadvlpa, and the paradise beyond the wind appears as Uttarakurus.[39] This is what would be expected, for the Indo-European tradition of shamanism can be traced in the other lands to which these peoples migrated. The ambrosia and nectar upon which the Olympians feasted is a Hellenic version of what in the Aryan or Indo-Iranian context was called Soma or haoma.[40] This is the original identity, or at least Sanskrit name, of the magical plant that grew in the gardens of paradise and marked the gateway to the 'northern' otherworld. It is this that is the object of the hero's quest, not only in Hellenic traditions, but also hi the lore of their Anatolian neighbours, and Soma is an aspect of the atavistic personae of the classical gods. The concept of this magical food reached Greece not only, as in the Hyperborean traditions, along with the tribal migrations from central Asia, but also indirectly through dissemination and assimilation amongst the different peoples and cultures of Anatolia, where it was equated to their own versions of the shaman's plant.

Although the intoxicating properties of Soma were recalled in the oral poetry of the Indo-Iranians, numerous symbolic substitutes, which were not entheogenic, were commonly employed in the ritual that centered upon the preparation and drinking of the ceremonial potion. The reason for these substitutions seems to have been that the original plant, which was to be found in the homeland of the Indo-Europeans before their various migrations and whose attributes were preserved and perpetuated in the formulaic phrases of their oral poetic traditions, was no longer easily available in their new environments and had, with the course of time, lived on chiefly in the memory of the Brahmans and priests.

So too, the magical plant of the Hyperboreans became identified in Hellenic traditions with various substances that were, in one way or another, appropriate to the religious and symbolic context, but which did not share the original's physical properties for inducing mantic inspiration. Such was the case, as we have seen, with the *daphne* at Delphi and the olive at Olympia and Delos. Both are clearly not the plant actually recalled in the traditions of the Hyperborean entheogen, which more poetically could also be metamorphosed into the golden fruit or flowers, subterranean honey, the Gorgon's head, or the creatures with a single eye.

It became, above all, the god's victim, to be appeased and offered in sacrifice, for the plant belonged to the wilderness that had preceded the growth and evolution of the superior Olympian age of assimilated and reconciled divinites who presided over the perfection of Hellenic culture. Thus it became also the *pharmakos* offering, either the actual giving of human lives or, as became increasingly appropriate to the god's own civilized persona, the token offering of the same. In this way, criminals were used for the annual leap at Leukas, or, as in Thessaly, the people promised each year to sacrifice 100 men, a full hecatomb, to Apollo Kataibasios and each year postponed the offering until the next (scholia to Euripides *Phoenissae* 1408). At Delphi, as we have seen, the Python was murdered again in sham. On Delos, the Hyperborean visitors were replaced by the symbolic flagellation at the sacred olive and, as elsewhere, by rites of passage at puberty, for the youthful and virgin persona has to die at adolescence to liberate the fertile adult, just as the god himself and his sister had grown to maturity only in the Hellenic age. As with their human devotees, so also in the agrarian cycle could the same token offering be made in the form of the botanic first fruits, given as piacular victims to assuage the honor of the primitive spirits who are again and again deposed in the arts of cultivation but whose chthonic beneficence is required if the crop is to grow to fruition.

Daphnephoria

The olive and the daphne were coupled in the Apolline ritual of the Daphnephoria or the 'bearing of the *daphne*.' Like the ritual of the *pharmakos*, it appears to have been an annual purificatory ceremony. It was performed in Boeotia each year (Pausanias 9.10.4), with a more elaborate performance of the ceremony every ninth year, like the Delphic Septeria (Proclus, *Chrestomathia* C. 26 = Photius, *Bibliotheca* p. 321 Bekker). In this ceremony, a log of olive wood was wreathed with *daphne* and various flowers. At its top was attached a bronze sphere, from which were suspended smaller balls, arranged around 365 purple garlands that encircled the middle of the log. The bottom of the log was clothed in a saffron *krokotos*, which was an effeminate robe

39. Ken Dowden (1979) Apollon et l'esprit dans la machine: Origines, *Revue des études Grecques*, 92, 293-318.
40. Fontenrose, 430, 549, conies to this conclusion on the basis of an extensive examination of the myth of the god or hero's combat with the primordial serpent monster in Mediterranean and Near-eastern cultures.

commonly worn by Dionysus or by his devotees at his festivals. The *krokos* blossom, from which the saffron dye was prepared, itself had associations with the *pharmakos* offering to the pre-Olympian Apollo,[41] and the entire Daphnephoria effigy seems to have been intended as a token representation of the primordial god or his scapegoat.

Consistant, however, with his newer, assimilated identity, as indicated by the botanic transmutations of the *daphne* and the olive, the bronze spheres did not represent the golden fruit of the Hyperborean tree, but were interpreted instead as symbolic of the celestial universe, the sun, moon and stars, with the garlands as an enumeration of the days of their annual course.

In place of the royal victim, who seems to have been the original sacrifice,[42] a handsome boy of noble ancestry, touching the effigy, was led in procession by his nearest male relative, who himself carried the decorated log. The boy followed like the god, wearing a golden crown and resplendant clothing that reached to his feet. Behind him came the rest of the procession, composed of maidens, holding suppliant branches and singing hymns. In this manner, they brought the sacred *daphne* to the god's temples.

The Secret Offering

Although, as we have seen, there were several plants associated symbolically with Apollo, the secret offering enclosed in the sheaf of wheat from the Hyperboreans was probably none of these commonly known, yet it would have had to display certain characteristics to suit the meaning of the Thargelia and the *pharmakos* offerings. Since two strains of shamanism were assimilated in the evolution of the classical god, a plant not known to the Indo-Europeans before they found it amongst the earlier Mediterranean peoples would not be a likely possibility, for although the Hyperboreans, as a metaphor, could be encountered wherever there was an entrance to the otherworld, the careful preservation of the route for the supposed transmission of the secret offering to Delos would indicate a pre-Hellenic plant originating on the forested slopes of the Altai Mountains, the 'northern' homeland of the Hyperboreans. For this reason, the olive is an unlikely candidate.

The token offerings of first fruits, moreover, were meant to liberate the coming harvest from the contamination of its own primitivism, and thus the secret offering should be characterized as the god's pre-classical avatar. The *daphne*, therefore, like the olive, would have the wrong symbolism, for they both signify the god's completed transmutation to Olympian status.

The most striking characteristic of the Hyperborean original, of course, is its properties as an entheogen. It should be a wild, northern plant, associated with Indo-European traditions, and since it was sent as a secret offering, we should expect that knowledge of its identity was restricted.

R. Gordon Wasson, working with the Sanskrit tradition of the Ṛg Veda, has postulated that the original identity of Soma in the homeland of the Indo-Europeans before their migrations into the Indus valley and the plateau of presentday Iran was a particular species of mushroom, *Amanita muscaria*, sometimes called the 'fly-agaric' in English. As would be expected, the Hellenic branch of these same peoples brought with them into the Greek lands a remembrance of a special symbolism for the fungi in religious contexts. Wasson and his colleagues have detected it in the religion of the Eleusinian Mysteries, as well as in the rituals of viticulture and its god Dionysus. We should expect, as well, to find this same fungal symbolism in the traditions of the secret Hyperborean offering, especially since that carefully perpetuated ritual, more than any other, preserved a mythical idea of the original Indo-European homeland and its native entheogen.

A mushroom, first of all, would have the perfect symbolism for its piacular role as a *pharmakos* offering. It was a wild plant, uncultivatable and belonging to the pre-agrarian, primordial world of hunter-gatherers. In the form of ergot, a fungus with fruiting bodies of the characteristic mushroom shape that is parasitic on various wild and cultivated grasses and grains, the mushroom actually blighted and poisoned the ripening harvest and was thought to pose a threat of regression for the whole evolutionary process that had yielded the edible foods and the progress of higher culture and civilization. Ergot was apparently felt to represent some aspect of Apollo's supplanted avatar, for he bore the epithet Erysibios (Strabo 13.1.64), literally the metaphor of the fungus as the reddening corruption or 'rust' (*erysibe*) upon the grain.[43]

---

[41] In Euripides' *Ion*, the queen of Athens, in pre-Olympian times, conceives a child by the god in decidedly chthonic circumstances while gathering *krokos* blossoms.

[42] Farnell 4.274 ff.

This rust appears as the ingredient of a magical potion derived from a sacred tree with connotations of a fertility sacrifice and rite of pubescent passage in the mythical traditions about the seer Melampous, or 'blackfoot,' as his name implies. Melampous was the first prophet of Dionysian religion in Greece and was supposed to have learned divination from none other than Apollo himself. On the mainland near the Malaic Gulf, there was said to have been a king whose son was impotent. Melampous discerned that the boy's problem had been caused by the fact that he had witnessed a traumatic incident. He had seen his father gelding rams, and when the knife by chance had fallen close to him, he fled in terror, as well he might, for as the king's son, he was a likely candidate for the role of victim himself. The furious father, in his frustration, had thrust the knife into a sacred tree, where it had 'rusted/ the same metaphor in Greek, as in English, for the reddening corruption that also destroys iron through oxidation. Melampous was said to have cured the youth's impotency by administering a potion composed of the rust scraped from the blade (Apollodorus 1.9.12; scholia to Homer's *Odyssey* 281).

Ergot, moreover, is an entheogen, containing water-soluble alkaloids that are closely related to LSD. The Indo-European migrants would have first encountered the entheogenic ergot amongst the grain-growing peoples through whom they passed, and thus in the Greek branch as well as the Indian, one of the first surrogates for Soma would appear to have been fungal. It was used as a Hellenic substitute for Soma in the potion that was drunk by the initiates at the Greater Eleusinian Mystery in order to induce the communal shamanic experience of a descent and return from the otherworld. Its entheogenic properties, furthermore, were apparently responsible, according to mythical tradition, for the Apolline art of divination. Apollo himself was supposed to have been taught clairvoyance by a certain Glaucus (Nicander, frg. 2 Schneider), who seems to have acquired the ability when he discovered the magical properties of a wild grass, *Paspalum distichum*, a plant commonly infested with a species of ergot that, unlike the others, contains pure, uncontaminated entheogenic alkaloids.[44] It was supposed to grow on the Islands of the Blest, that Hyperborean paradise, where the deposed Kronos was said to have planted it, and it was responsible for the daily flight of the horses of the Sun from the White Island to the White Island (Alexander Aetolus, p. 465 Rose, quoted in Athenaeus 7.296 ff.). Glaucus was also said to have been the father of the Cumaean Sibyl (Vergil, *Aeneid* 6.36), an Apolline prophetess, like the Delphic Pythoness, who was abducted and cursed by the god, like another Cassandra or Daphne (Ovid, *Metamorphoses* 14.130 ff.).

Ergot, however, would tend to be associated primarily with an agrarian, grain-growing people, and hence with the Lycian version of Apollo. At the Eleusinian Mystery, it had such a connotation, for it represented the domestication of the wilder fungi, just as wine, too, is a fungal cultivation yielding an entheogenic potion. At the Greater Mystery, it was the culmination of an initiation that had begun with a ceremony involving the hunt for a wild fungus or its surrogates at the Lesser Mystery, and symbolically it reconciled the Indo-European shamanic heritage with what were originally pre-Hellenic agrarian rites. Thus, it is interesting that amongst the several mythical figures who bore the name of Glaucus, there was one who was a brother of the Minotaur on Crete. He too was prophetic, and was resuscitated by a magical herb after he drowned in a vat of honey (Apollodorus 1.96 ff.). Another Glaucus was actually a Lycian in the war at Troy.

The fungus of the Hyperborean homeland, in contrast, would have come, at least so it was supposed, from the wooded slopes of the Altai Mountains, where conifers and birch abound, an environment, therefore, where *Amanita muscaria* is commonly found. Presumably, it would have fruited in the autumn and been preserved, as is usual for Amanita, by drying so that it could be conveyed over the long journey, wrapped in straw, to arrive on Delos in late spring along with the other offerings of first fruits. Is there anything, we must now ask, in the Apolline traditions that might suggest that this was the identity of the secret plant?

---

[43] It was an epithet that he shared with Demeter, who could be called Erysibe (*Etymologicum Gudianum* 210.25). She was the Mother Goddess in her Hellenic manifestation, assimilated to Olympian traditions as a sister of Zeus and the overseer of the cultivated grains. The same epithet also appears for Apollo in dialectal forms as Erethimios (*Sylloge Inscriptionum Graecarum* 724) and Erythibios (Strabo 13.1.64).
If Erithios, a Cypriote epithet of the god, is also a dialectal variant (and not to be related instead to *erithos* or 'hired-servant'), there is an intriguing tradition that it was this Apollo Erithios who counseled Aphrodite to take the first sacrificial leap off the Leucadian Rock in order to assuage her yearning for Adonis (Ptolemaios Chennos, in Photios, *Bibliotheca* 152f Bekker).

[44] Hofmann, *Road to Eleusis*.

The one-eyed Arimaspeans, who, as we have seen, were either just another name for the Hyperboreans or, as a separate people, were the first intermediaries in the transmission of the subterranean gold that was mined by the griffins, are a personification of one of the attributes of Soma as the 'single eye'. So too, therefore, are the Cyclopes, whose murder as primitive surrogate occasioned Apollo's expiatory sojourn amongst the people of his 'northern' homeland. There were two versions of these Cyclopes, and the Anatolian ones probably arose from a separate dissemination of the metaphor through Asia Minor, where the later discredited Lycian Telchines display the same attribute as their evil eye. These one-eyed creatures are a variant of another attribute of Soma as the figure with a single foot, a characteristic of a supposed race of people called the Shade-foots, who came from the Indus valley and were fancifully implicated, according to the comedian Aristophanes (*Birds* 1553 ff.), in a profane celebration of the Lesser Eleusinian Mystery. It appears that the Arimaspeans may have come from the same general region, for Herodotus's supposed Scythian etymology of their name is probably not correct, but they were really an Iranian tribe, called the Argempaioi or Argimpasoi.[45] All these fabulous creatures can be traced to fungal manifestations and testify strongly that it was some kind of mushroom, if not actually Amanita, that was originally the Hyperborean plant. In its Hesperidean version, the plant bears still another attribute of Soma as the 'mainstay of the sky',[46] which is the role that Atlas plays as 'pillar of heaven' in the west (Aeschylus, *Prometheus* 351), just as his Titanic brother in the east, Prometheus, when presented as a Shade-foot, impersonates the sacred plant as a 'parasol/ which is the Sanskrit word for 'mushroom.' The single-footed trait can also be seen in certain Greek heroes who, like Oedipus, have mythical roles as Apolline surrogates.[47]

It is also significant that only three mythical figures were said actually to have gone to the land of the Hyperboreans, and all three came from the region of Mycenae. These were Perseus, Heracles, and the ecstatic, fly-bitten heifermaiden, lo, although she, unlike the other two, got only to the edge of the Hyperborean land. Melampous, who devised the rust potion, also was involved in the lore of Mycenae, and the Lycian Glaucus was a grandson of another figure, probably a doublet of Perseus,[48] who played a role in the same traditions. The ancient foundations of that city were supposedly built by the Cyclopes, and it was named, as it was claimed, after the 'mushroom' or *mykes* that Perseus picked at the site (Pausanias 2.16.3). The name of the city is a feminine plural, like Athens (Athenai) and Thebes (Thebai), perhaps indicating that, in fact, the word is not Indo-European, but from one of the pre-Hellenic languages. The same conclusion seems indicated by the naming of these cities in a matrilineal fashion after the patron goddesses, represented presumably by the priestesses or women of the city. It is equally significant, however, that the Indo-Europeans, in imposing their rule upon the pre-existent city, interpreted its name in terms of their own sacred plant, and probably equated the chthonic Cyclopes with their Hyperborean doubles.

Still more explicit is the depiction of Perseus's journey that we see on a fourth-century B.C. *amphora* from southern Italy.[49] The artist followed the tradition that confused the Hesperides and their golden fruit with the

---

[45] Dowden, Deux Notes 492.

[46] Wasson, *Soma* 47-48. Prometheus, Atlas's brother, is also involved with the attributes of Soma, for the divine plant is metaphorically 'fire' and is often identified with Agni, the god of fire (*Ibid*. 39 ff.). Soma is also the 'sun,' which travels repeatedly between the two tormented Titanic brothers (*Ibid*. 37-39). It is also described with the same adjective as the Sun's horses, which in Greek traditions, as we have seen, graze upon *Paspalum*, the Mediterranean transmutation of the entheogen.

[47] On the botanical nature of the single-footed figure in Greek myth, see Lowell Edmunds (1981) The Cults and the Legend of Oedipus, *Harvard Studies in Classical Philology* 85, 221-238.

[48] This was Bellerophon, who was sent to Lycia by king Proems to be killed by the father of Proetus's Lycian wife. On Bellerophon as a doublet of Perseus, see Kerenyi, *Heroes* 79 ff., who points out that Bellerophon's name is a transparent epithet for the 'killer of the monster' and that only Bellerophon and Perseus rode on Perseus's magical horse Pegasus. It was Bellerophon who brought seven Lycian Cyclopes to build the fortress of Tiryns in the Mycenaean kingdom, whereas Perseus picked a mushroom at Mycenae, which was also a Cyclopean fortress.
Bellerophon, like so many other heroes, was a single-footed figure. When, like another Phaethon, he tried to ascend the heavens on his flying horse, it was driven mad by the gadfly and he fell into a thorn-bush and was thereby inflicted with his botanic stigma of lameness.

[49] Pergamonmuseum, East Berlin, Staatliche Museen zu Berlin, Antiken-Sammlung, inv. no. F 3022. Published as plate 8 in Wasson et al., *Road to Eleusis*.

Hyperborean garden. He shows us Perseus in the far-off land as he beheads the Medusa, the primordial queen who is a manifestation of the Great Goddess to whom the Lycian god was consort. In displacing her from her former role, Perseus, as a son of the Olympian Zeus, founded the Indo-European dynasty at Mycenae. Clearly identified as the fruit of the Medusa's magical tree on the vase painting is the mushroom.

If the Hyperborean plant, then, was, by tradition at least, a mushroom, was it Amanita? Specific traits of *Amanita muscaria* are retained in the traditions of the Apolline surrogates. Thus, Orion had a bizarre begetting out of urine. It is perhaps significant that one of the properties of the *Amanita* entheogen is its ability to pass through the body without being entirely metabolized, a fact that was utilized in Siberian rites in modern times and that seems to persist amongst the Brahmans of India in the special healthful properties they accord to the drinking of urine. This property of *Amanita* may first have been observed, as Wasson has suggested, in the northern forests and tundra, where it is commonly known that reindeer exhibit a profound addiction for *Amanita muscaria* and for human urine, particularly if impregnated with the entheogen. Both, as the folk know, drive the herds of reindeer mad, and, in actual fact, the mushroom affects the animals in the same way as humans. Did this tradition persist in the association of the Hyperborean plant with the golden reindeer of Artemis, an animal that the classical Greeks could never have seen in their Mediterranean environment? So too, we should consider Mycenae's traditions of maddened heifers, both lo and the daughters of Proetus. It has not been determined whether *Amanita* affects cattle as it does reindeer, although the animals do eat the mushrooms.[50] In the Mediterranean lands, where *Amanita* cannot be expected to be found, cattle do, however, become profoundly inebriated upon the ergot of *Paspalum distichum*, the plant that Kronos sowed in the Islands of the Blessed and fed to the horses of the Sun.

The entheogen of *Amanita* also exerts a strong attraction for flies, hence the mushroom's common name of 'fly-agaric'. Flies are attracted by the mushroom's juice and rendered senseless and immobile, so that in European lore, the plant has been sometimes considered an effective means of controlling the insect. This characteristic of the plant may have determined the belief that the sacrificed victim at the Leucadian Rock was supposed to rid the populace of flies. Like the agaric, Apollo too was a 'flycatcher,' for he bore the epithet of Muiagros (Aelianus, *De Natura Animalium* 11.8).[51]

The color of the sacred plant in Greek traditions, moreover, appears to have fallen within the 'yellow-orange crimson-purple' part of the spectrum (Pindar, *Olympia* 6.55), a range represented botanically by the tawny juice of *Amanita* and the purple of *Claviceps purpurea* or ergot.

---

[50] Wasson, *Soma* 74-75. Metaphors of cattle are also attributes of Soma, which can be described as an 'udder' that yields the entheogenic milk and as a 'bellowing bull,' the latter being apparently also a characteristic of the mushroom that Perseus picked at Mycenae. The bull is the commonest metaphor for Soma, and this manifestation of the sacred plant may underlie the tradition that Zeus, in establishing European civilization, abducted the Anatolian Europa by appearing to her in the form of a bull that breathed upon her the inspiration of the flower he had grazed upon.

[51] Farnell, 4, reference 275b, suggests that the epithet may indicate Apollo. Muiagros is also attested for an otherwise unknown Elean god (Pliny, *Natural History* 10.75) and a 'hero' in Arcadia (Pausanias 8.26.7). It is not certain that it is, in fact, an epithet of Apollo, himself, but that is only to be expected if it indicates one of the most secret aspects of his displaced primitive persona.

References

Citations of ancient authors mentioned in the text and notes refer to the works in the original languages. The numerical references indicate the traditional subdivisions (such as book, chapter, paragraph, verse, *etc*) as established by the first printed edition. It is customary for all subsequent editions and translations to preserve the same numbering, and thus, except where otherwise indicated (as in the case of fragments of lost works), any edition or translation should contain the citation. Editions of fragments usually include a concordance for previous numberings.

Chapter 1 appears here for the first time. All the other essays have been published elsewhere, as follows:

Chapter 2, also written by me, first appeared as 'Lightning-bolt and Mushrooms: an essay in early cultural exploration', a contribution to a volume entitled, '*For Roman Jakobson: Essays on the occasion of his sixtieth birthday*', published 11 October 1956, by Mouton, in The Hague. This was my first publication in ethnomycology. It now appears in revised form.

Chapter 3, by Professor Stella Kramrisch, 'The Mah&amacr;v&imacr;ra Vessel and the Plant *P&umacr;tika*, was published in the *Journal of the American Oriental Society*, Vol. 95, Number 2, April-June 1975.

Chapter 4, 'The Last Meal of the Buddha', written by me, also appeared in the *Journal of the American Oriental Society*, Vol. 102, Number 4, October-December 1982.

Chapter 5, by Jonathan Ott, appeared first in the Harvard *Botanical Museum Leaflets* in the fall of 1983, Vol. 29, No. 4.

The oldest Representations of Hallucinogenic Mushrooms in the World

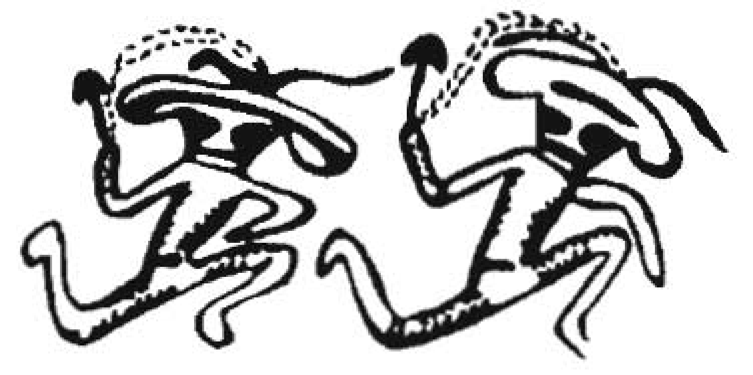
(Sahara Desert, 9000-7000 B.P.)

by

Giorgio Samorini

original source: http://www.samorini.it/doc1/sam/sam-1992-sahara.pdf
backup source: http://www.psilosophy.info/resources/sam-1992-sahara.pdf

Abstract -The idea that the use of hallucinogens should be a source of inspiration for some forms of prehistoric rack art is not a new one. After a brief examination of instances of such art, this article intends to focus its attention on a group of rock paintings in the Sahara Desert, the works of pre-neolithic Early Gatherers, in which mushrooms effigies are represented repeatedly. The polychromic scenes of harvest, adoration and the offering of mushrooms, and large masked "gods" covered with mushrooms, not to mention other significant details, lead us to suppose we are dealing with an ancient hallucinogenic mushroom cult. What is remarkable about these ethnomycologicol works, produced 7,000-9,000 years ago, is that they could indeed reflect the most ancient human culture as yet documented in which the ritual use of hallucinogenic mushrooms is explicitly represented. (As the fathers of modern ethno-mycology and in particular R. Gordon Wasson) imagined, this Saharian testimony shows that the use of hallucinogens goes back to the Paleolithic Period and that their use always takes place within contexts and rituals of a mystico-religious nature.



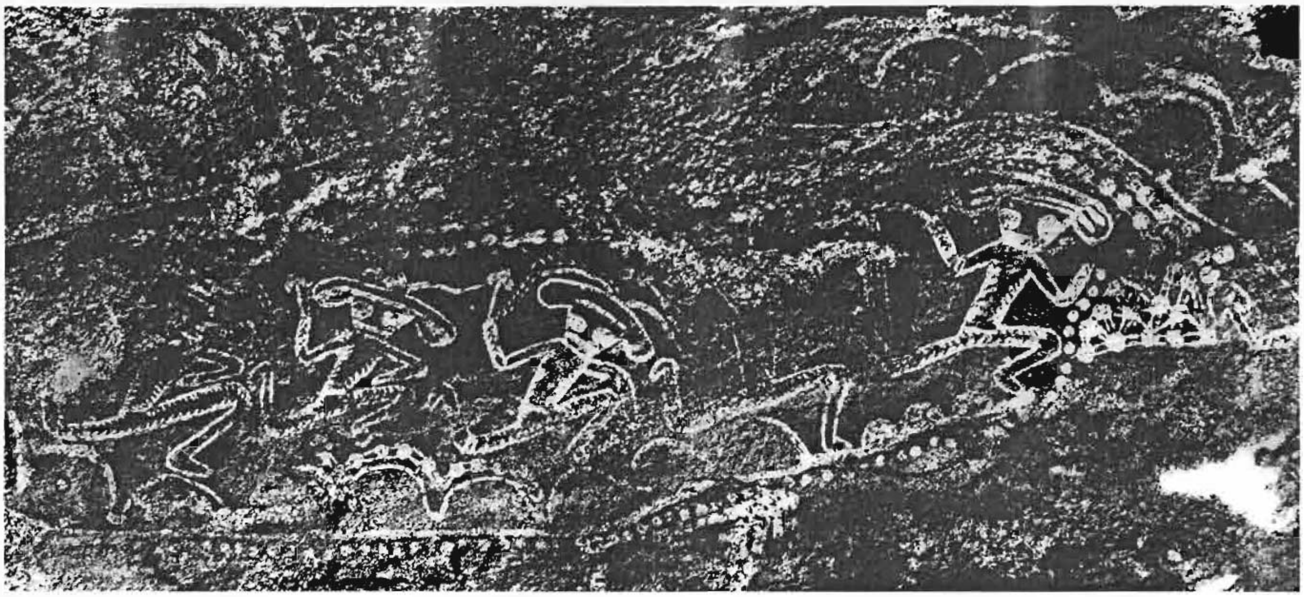
Rock paintings and incisions of the prehistoric periods are to be found all over the world, and serve as a testimony to the pre-literate history of human cultures. Rock art, the first permanent form of visual communication known to man, the some art which led to the invention of writing, goes back almost to the origins of mankind. In fact, in Tanzania, as in Australia, there are rock paintings which it would appear go back 40,000 years and more (Anati, 1989).

Since most of the works of rock art were, or were related to, initiation rites, or were part of religious practice and its context, the idea that these works should be associated with the use of hallucinogenic vegetals (as has already been put forward for some specific cases on the basis of ethnographic and ethnobotanical data) comes as no surprise. This use, where it arises, is historically associated with controlled rituals involving social groups of varying dimensions. It is perhaps not a chance occurrence that the areas where examples of rock art are to be found - areas in which it is most often asserted that the use of hallucinogens might have taken place, on the basis of the scenes represented or on the basis of the consideration that this practice might have served as a source of inspiration - are also the areas where the most famous examples are to be found in terms of imagination, mythological significance and polychromy.

We might consider, for example, the works of archeological (or rather "archeo-ethno-botanical") interest in the easternmost areas of Siberia, within the Arctic Circle, on the bonks of the Pegtymel River. An extensive petroglyphic area was found there dating back to the local neolithic period. Among these works, we find mushroom gatherers (Dikov, 1971). In some cases we find females wearing long and ornate "ear-rings" and an enormous mushroom on their heads, figures with the stance of people trying to keep their balance. The stocky form and the decoration on the mushroom lead one to suppose these mushrooms are *Amanita muscaria* (Fly-Agaric), the hallucinogenic mushroom most often associated with shaman practices in Euro-Asia and N. America (Wasson, 1979). Mushroom motifs have also been found in the petroglyphs of the prehistoric settlements of the Kamciatka peninsula on the banks of Lake Ushokovo (Dikov, 1979). The paleolithic culture of Ushokovo (protoeskimoleuts) belongs to the group of peoples who gave birth to the various paleo-eskimo cultures of N. America (2nd Millenium B. C.). It is to be imagined that these protoeskimoleuts belong to the peoples who contained within their culture, in embryo form, "protoshaman" religious practices.

In California, the rock art of the regions inhabited by the Chumash and Yokut, a polychromic manner of painting - particularly evident during the stylistic phase known as the "Santa Barbara Painted Style" - has been associated with the "toloache" cult centered around "Jimsonweed" (a hallucinogenic plant of the *Datura* genus) known to hove been used by a number of Californian and Mexican Indian tribes (Campbell, 1965:63-64; Wellmann, 1978 and 1981). Apparently, the first examples of Chumash rock art date back to 5,000 years ago (Hyder & Oliver, 1983).

The impressive Pecos River paintings in Texas have also been associated with the "mescal" cult (*Sophora secundiflora*, hallucinogenic beans of which were used during rites of initiation on the part of the Indian tribes of the region) (Howard, 1957). Furst (1986) affirms that the mescal cult goes back 10,000 years, which is to say back to the Paleo-Indian Hunters Period at the end of the Pleistocene period. Archeological excavations carried out in the areas where paintings are to be found reveal mescal seeds which go back to 8,000 B. C., when Carbon-14 dated. Peyote (*Lophophora williamsii*) has also been found during some of these excavations (Campbell, 1958).

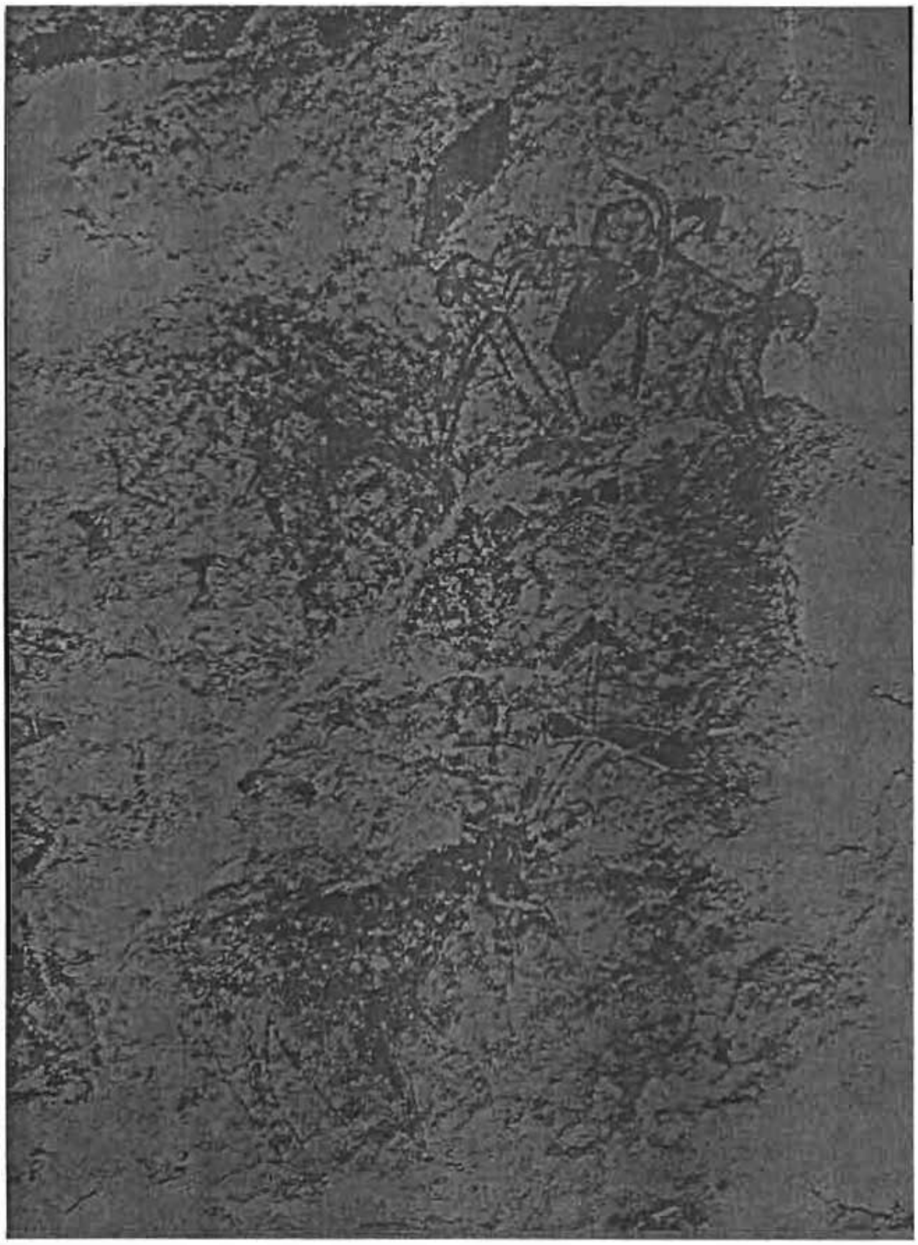


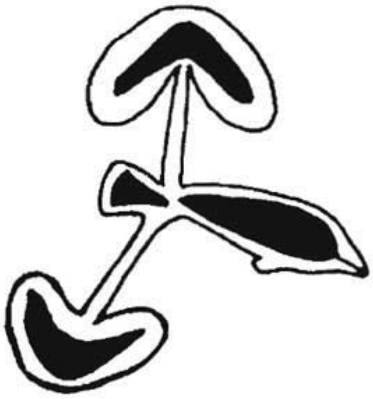
Tin-Tazarift (Tassili, Algeria) - Dancing masked anthropomorphs holding mushrooms (by Laioux, 1964).

An interesting and quite explicit use of "cohoba", a hallucinogenic snuff taken from the *Anadenanthera peregrina* tree has been documented among the peoples of the Borbon Caves art in the Dominican Republic (Pagan Perdomo, 1978). This art is probably an example of the Late Antillian Culture of the Tainos and goes back to a period shortly before the arrival of the Spaniards. In this painting, the subject of inhalation of cohoba - by means of cane pipes - is repeatedly represented (Franch, 1982).

The use of hallucinogens as a significant source of inspiration has also been associated with Peruvian rock art. The rock art in this case is based on incisions on rocks, as can be seen in the Rio Chinchipe works in the north of Peru, probably influenced by the use of *ayahuasca* (*Banisteriopsis* spp. & allies) (Andritzky, 1989: 55-57). That this is an ancient practice is confirmed by archeological findings (Naranjo, 1986). Also in the rock art of

Samanga, the mountainous region of the province of Ayabaca (Piura), among the petroglyphs, we will find figures which have been interpreted as images of *San Pedro* (*Trichocereus pachanoi*), the hallucinogenic cactus still used today in the north of Peru and in Ecuador during shaman healing rites (Polia, 1987 and 1988).





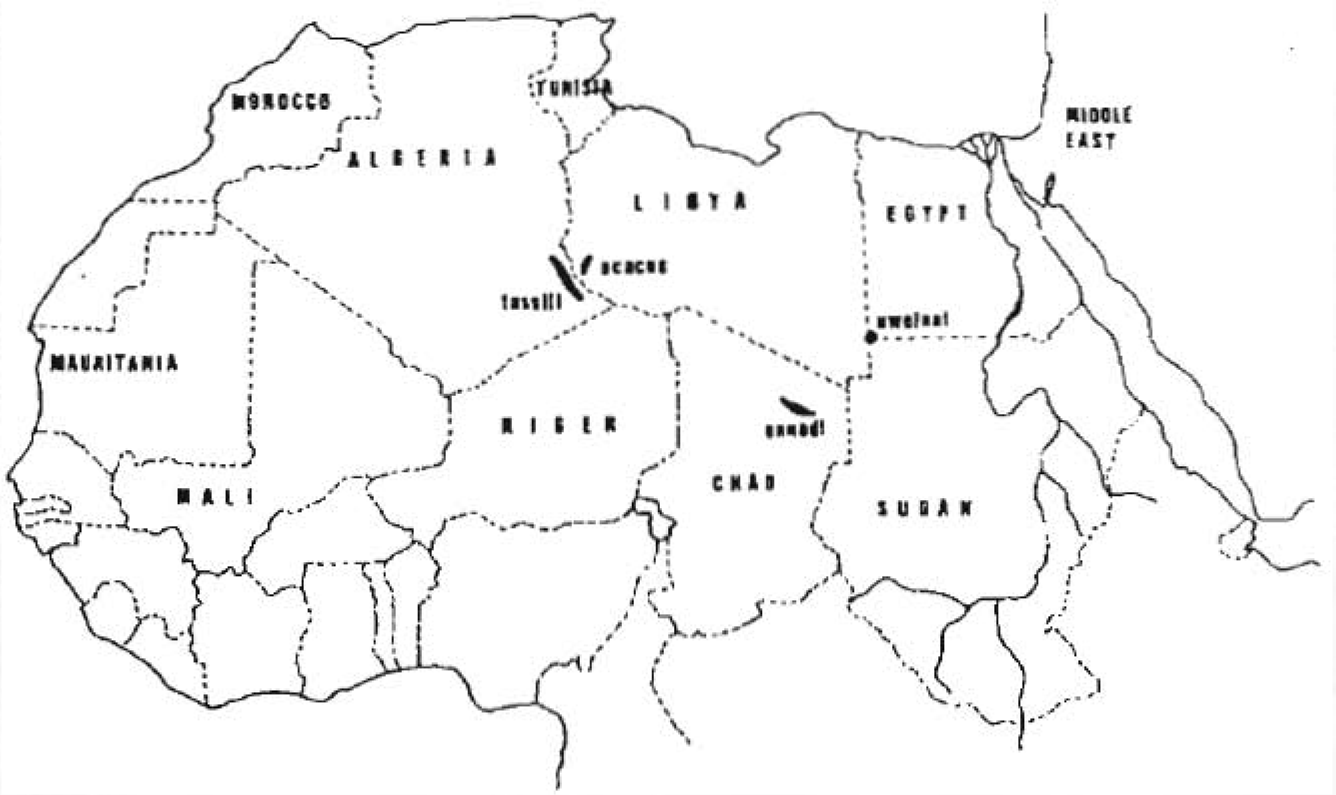
Tin-Abouteka (Tassili, Algeria) -"Round Heads " pictorial phase (Note, in the right-central part of the photo the image of the fish with mushroom-like symbols).

Indeed, archeological indications as to the use of hallucinogens are to be found within many Precolumbian cultures (Dobkin de Rios, 1974; Furst, 1974).

Recently it has even been put forward that even the more ancient paleolithic art of the Franco-Canthabric cave-sanctuaries were influenced by altered states of consciousness procured by various methods, among which the use of hallucinogens (Lewis-Williams & Dowson, 1988). The "psychograms" of the paleolithic period, a series of aniconic graphemes (points, vertical lines, circles, zig-zags, lozenges etc.) which, together with zoomorphic images, cover the walls of the European paleolithic caves, could be considered as the fruit of entoptic, phosphenic or hallucinatory states, typical sensorial phenomena pertaining to the field of altered states of consciousness, as might be gathered from Reichel-Dolmatoff's well-known research into the Tukano of the Amazon (1978: 43-47). Furthermore, natural changes in consciousness due to prolonged sensorial isolation have already been noted. These conditions can be determined in the deep paleolithic caves. Even though the "neuropsychological model" put forward by Lewis-Williams & Dowson is not sufficient on its own to interpret that complex phenomenon which is paleolithic art, this model at least paves the way to supposing that mind-altering factors may have contributed to a prehistoric will-to-art.

At this point, we should remember Kaplan's (1975) theory that mushrooms are represented in the Swedish cave art of the long Scandinavian Bronze Age.

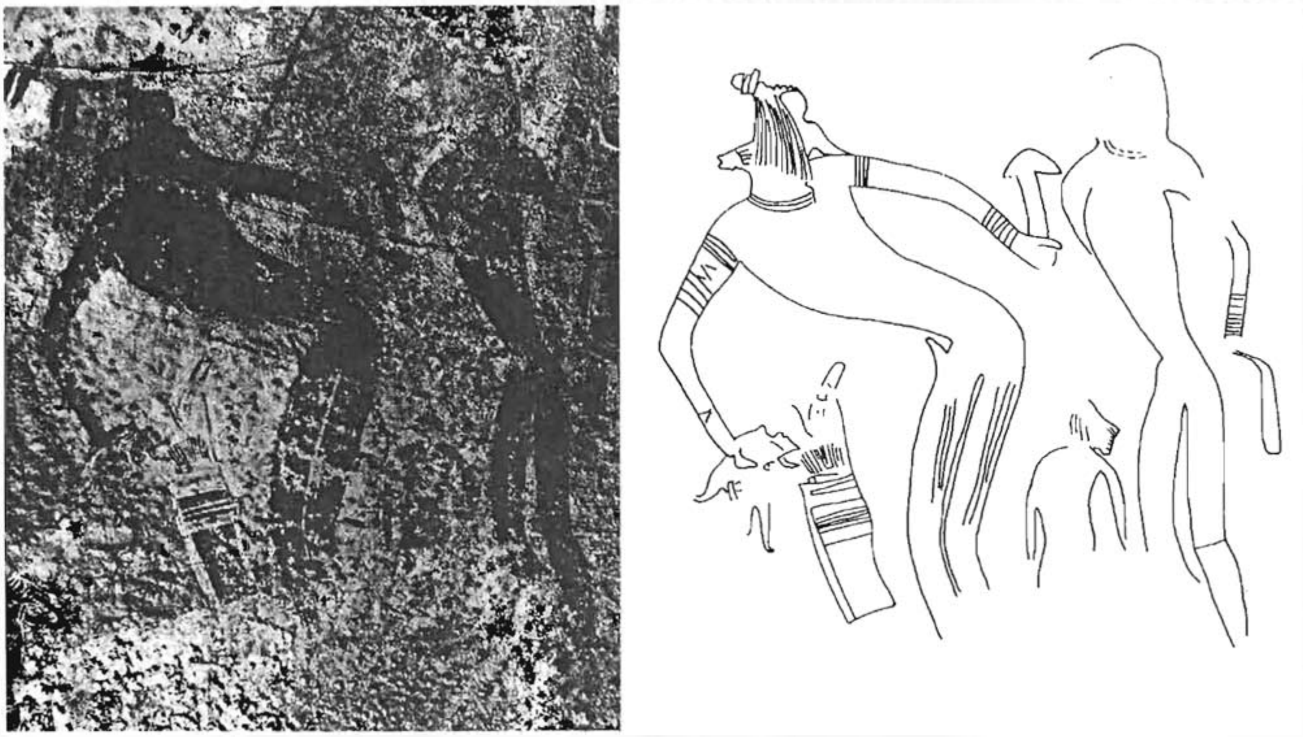
It should also be pointed out that the explicit representation of psychotropic vegetals, as sacred objects (and therefore subject to taboo), is rare and the few cases of explicit representation make up but a small part of prehistoric art, as sacred art, associated with the use of hallucinogens. We must consider that, generally speaking, sacred cult objects will not be represented and that it is more than likely that these will be hidden behind symbolic devices, also of a graphic nature, whose meaning is indeed beyond us.



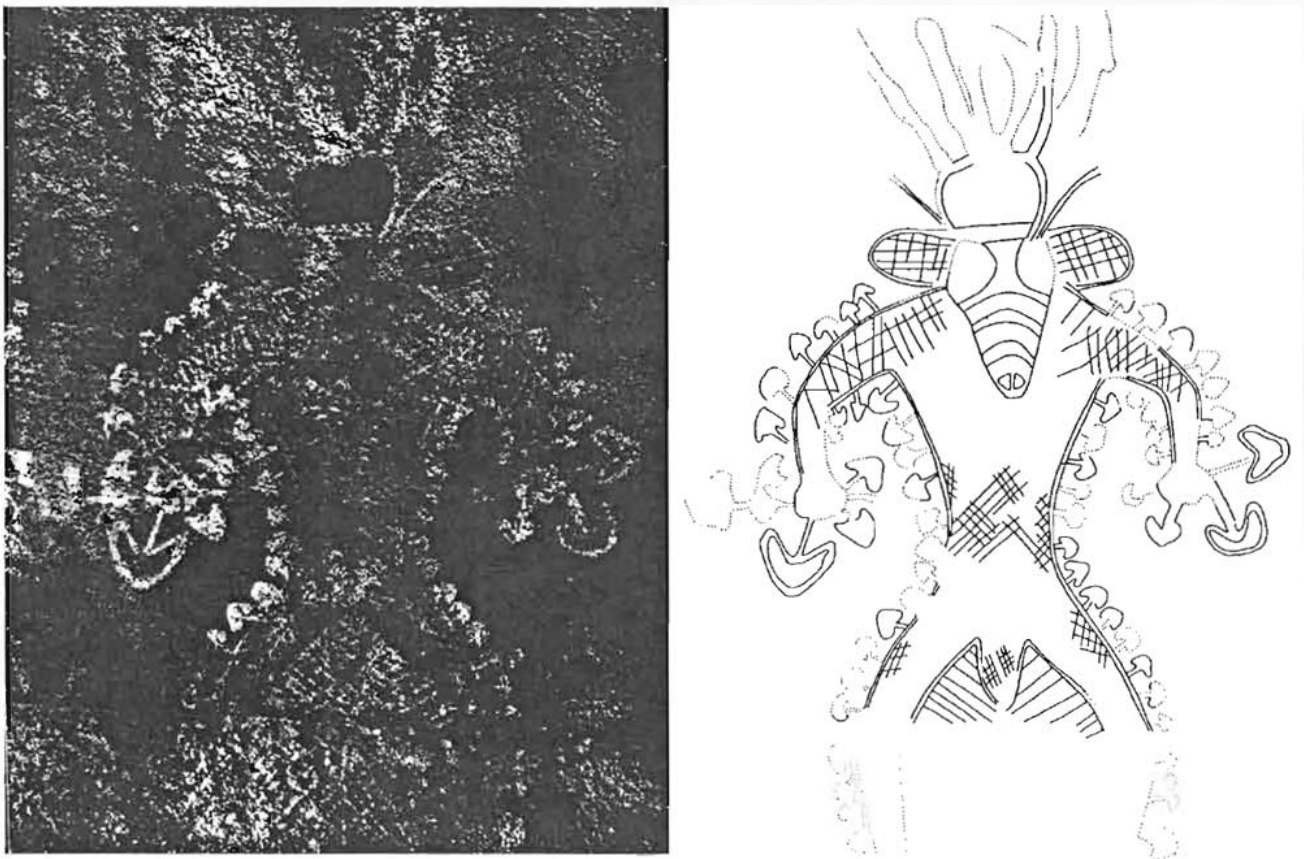
Geographical distribution of the "Round Heads " Painting Style in the Sahara.

Further evidence in support of the idea that the relationship between Man and hallucinogens - in this case mushrooms is indeed an ancient one comes from the ancient populations of the Sahara desert who inhabited this vast area when it was still covered with an extensive layer of vegetation (Samorini, 1989). The archeological findings consist in prehistoric paintings which the author personally had the opportunity to observe during two visits to Tassilli in Algeria. This could be the most ancient ethno-mycological finding up to the present day, which goes back to the so-called "Round Heads" Period (i.e. 9.000 - 7.000 years ago). The centre of this style is Tassili, but examples are also to be found at Tadrart Acacus (Libya), Ennedi (Chad) and, to a lesser extent, at Jebel Uweinat (Egypt) (Muzzolini, 1986:173-175).

Central Saharan rock art, apart from extensive concentrations of incisions, near the sites of ancient rivers, and rock-shelter paintings among the large promontories or high plateau which reach an altitude of some 2,000 metres, cover a period of 12,000 years, generally divided in *5* periods: the "*Bubalus antiquus*" Period, the works of which were produced by the Early Hunters at the end of the Pleistocene period (10.000 - 7.000 years B. C.) - characterized by representations of large wild animals (Mori, 1974); the "Round Heads" Period, in turn divided into various phases and styles, associated with the epipaleolithic populations of the Early Gatherers (7.000 - 5.000 years B. C.), whose works of fantasy have quite rightly become world famous; the "Bovidian" or "Pastoral" Period (starting 5.000 years B. C.), a population of animal herders and breeders whose art is predominantly concentrated on these activities and, after these, the "Horse" Period and, lastly, the "Camel" Period, the art works of which are stereotyped and of a lower quality.



Techekalaouen (Tassili, Algeria) "Offering" scene? The object offered has the shape of a big mushroom.



Matalem-Amazar (tassili, Algeria) - Masked anthropomorph with the body-line entirely covered by mushroom effigies (by Lajoux, 1964)

Some rock art experts have already produced evidence supporting the idea that the art of the Round Head Period could be influenced by ecstatic or hallucinogenic states. According to Anati (1989: 187), this art is produced by the Early Gatherers during the end of Pleistocene and the beginning of Holecene periods. Analogous works dating back nearly to the same period are to be found in various sites around the world (Sahara Desert, Tanzania, Texas, Mexico etc.). These areas were later to become arid or semi-arid when the lakes and rivers dried up. From the many works of art these peoples have left us we learn what were gatherers of wild vegetal foods: "people who lived in a sort of garden of Eden and who used mind-altering substances".

Sansoni too (1980) is of the opinion that "it might be that (the works of art of the Round Heads Period) are the works of normal consciousness or the results of particular ecstatic states associated with dance or the use of hallucinogenic substances. The context, or rather the "motivations" behind Round Heads art, just as with all the other periods of Sahara rock art, are generally of a religious and, perhaps, initiatory nature. Fabrizio Mori, discussing Acacus, stressed "the close relationship which there must have been between the painter and that figure so typical in all prehistoric societies whose main role is that of mediator between earth and sky: the wizard-priest" (Mori, 1975). According to Henri Lhote, the discoverer of the Tassili frescoes, "it seems evident that these painted cavities were secret sanctuaries" (Lhote, 1968).

Images of enormous mythological beings of human or animal form, side by side with a host of small horned and feathered beings in dancing stance cover the rock shelters of which there are very many on the high plateau of the Sahara which in some areas are so interconnected as to form true "citadels" with streets, squares and terraces.

One of the most important scenes is to be found in the Tin-Tazarift rock art site, at Tassili, in which we find a series of masked figures in line and hieratically dressed or dressed as dancers surrounded by long and lively festoons of geometrical designs of different kinds. Each dancer holds a mushroom-like object in the right hand and, even more surprising, two parallel lines come out of this object to reach the central part of the head of the dancer, the area of the roots of the two horns. This double line could signify an indirect association or non-material fluid passing from the object held in the right hand and the mind. This interpretation would coincide with the mushroom interpretation if we bear in mind the universal mental value induced by hallucinogenic mushrooms and vegetals, which is often of a mystical and spiritual nature (Dobkin de Rios, 1984:194). It would seem that these lines - in themselves an ideogram which represents something non-material in ancient art - represent the *effect* that the mushroom has on the human mind.

The whole scene is steeped in deep symbolic meanings and is a representation of a cultural event which actually happened and which was periodically repeated. Perhaps we are witnessing one of the most important moments in the social, religious and emotional lives of these peoples. The constant nature of the physical nature of the dancers and their stances reveals a coordinated will towards scenic representation for collective contexts. The dance represented here has all the indications of a ritual dance and perhaps, at a certain stage, this rite became ecstatic.

In the various scenes presented, a series of figurative constants lead us to imagine an accompanying conceptual structure associated with the ethno-mycological cult described here.

Evident examples of such constants are the two remarkable southern Tassili figures (sites: Aouanrhat and Matalem-Amazar). Both are approximately 0.8 metres tall, they wear the typical mask of this pictorial phase and a typical gait (legs bent inwards and arms bent downwards). Another common feature is the presence of mushroom symbols starting from the fore-arms and thighs; others are hand held. In the case of the Matalem-Amazar figure, these objects are scattered over the entire area surrounding the body.

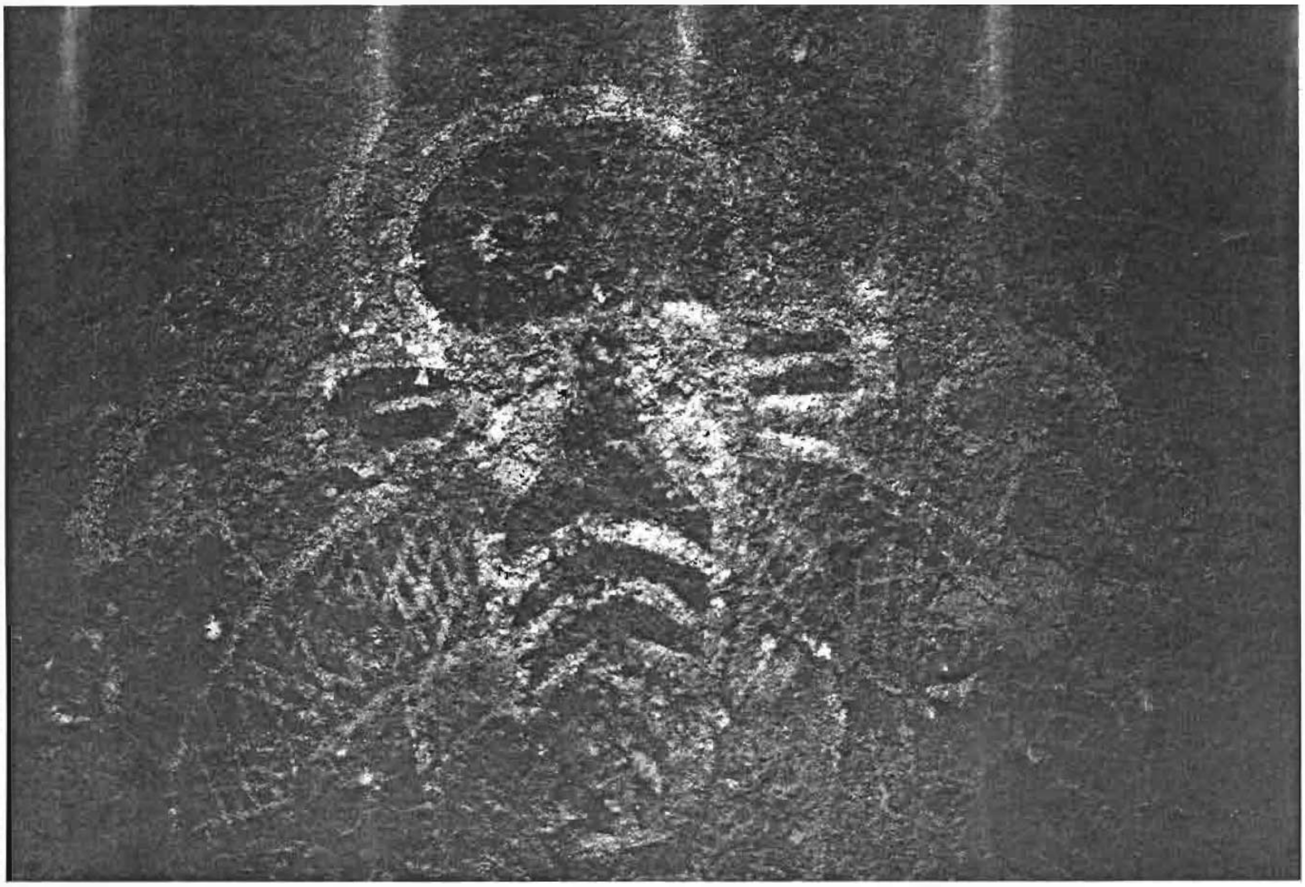
This mushroom symbol was first interpreted by researchers as an arrowhead, an oar (Mori 1975), a vegetal, probably a flower (Lhote, 1973: 210 and 251), or as an undefined enigmatic symbol. The form which most closely corresponds to this cult-abject is that of a mushroom, most probably of a psychotropic kind the sacramental and socialized use of which is represented in gathering and offering scenes and in the expressive ritual dances, in phosphenic geometrical patterns and in Tassili visionary works.

Thus, these two figures could be interpreted as images of the "spirit of the mushroom", known to exist in other cultures characterized by the use of a mushroom or other psychotropic vegetals.

In a shelter in Tin-Abouteka, in Tassili, there is a motif appearing at least twice which associates mushrooms and fish; a unique association of symbols among ethno-mycological cultures. Two mushrooms are depicted opposite each other, in a perpendicular position with regard to the fish motif and near the tail. Not far from here, above, we find other fish which are similar to the aforementioned but without the side-mushrooms.

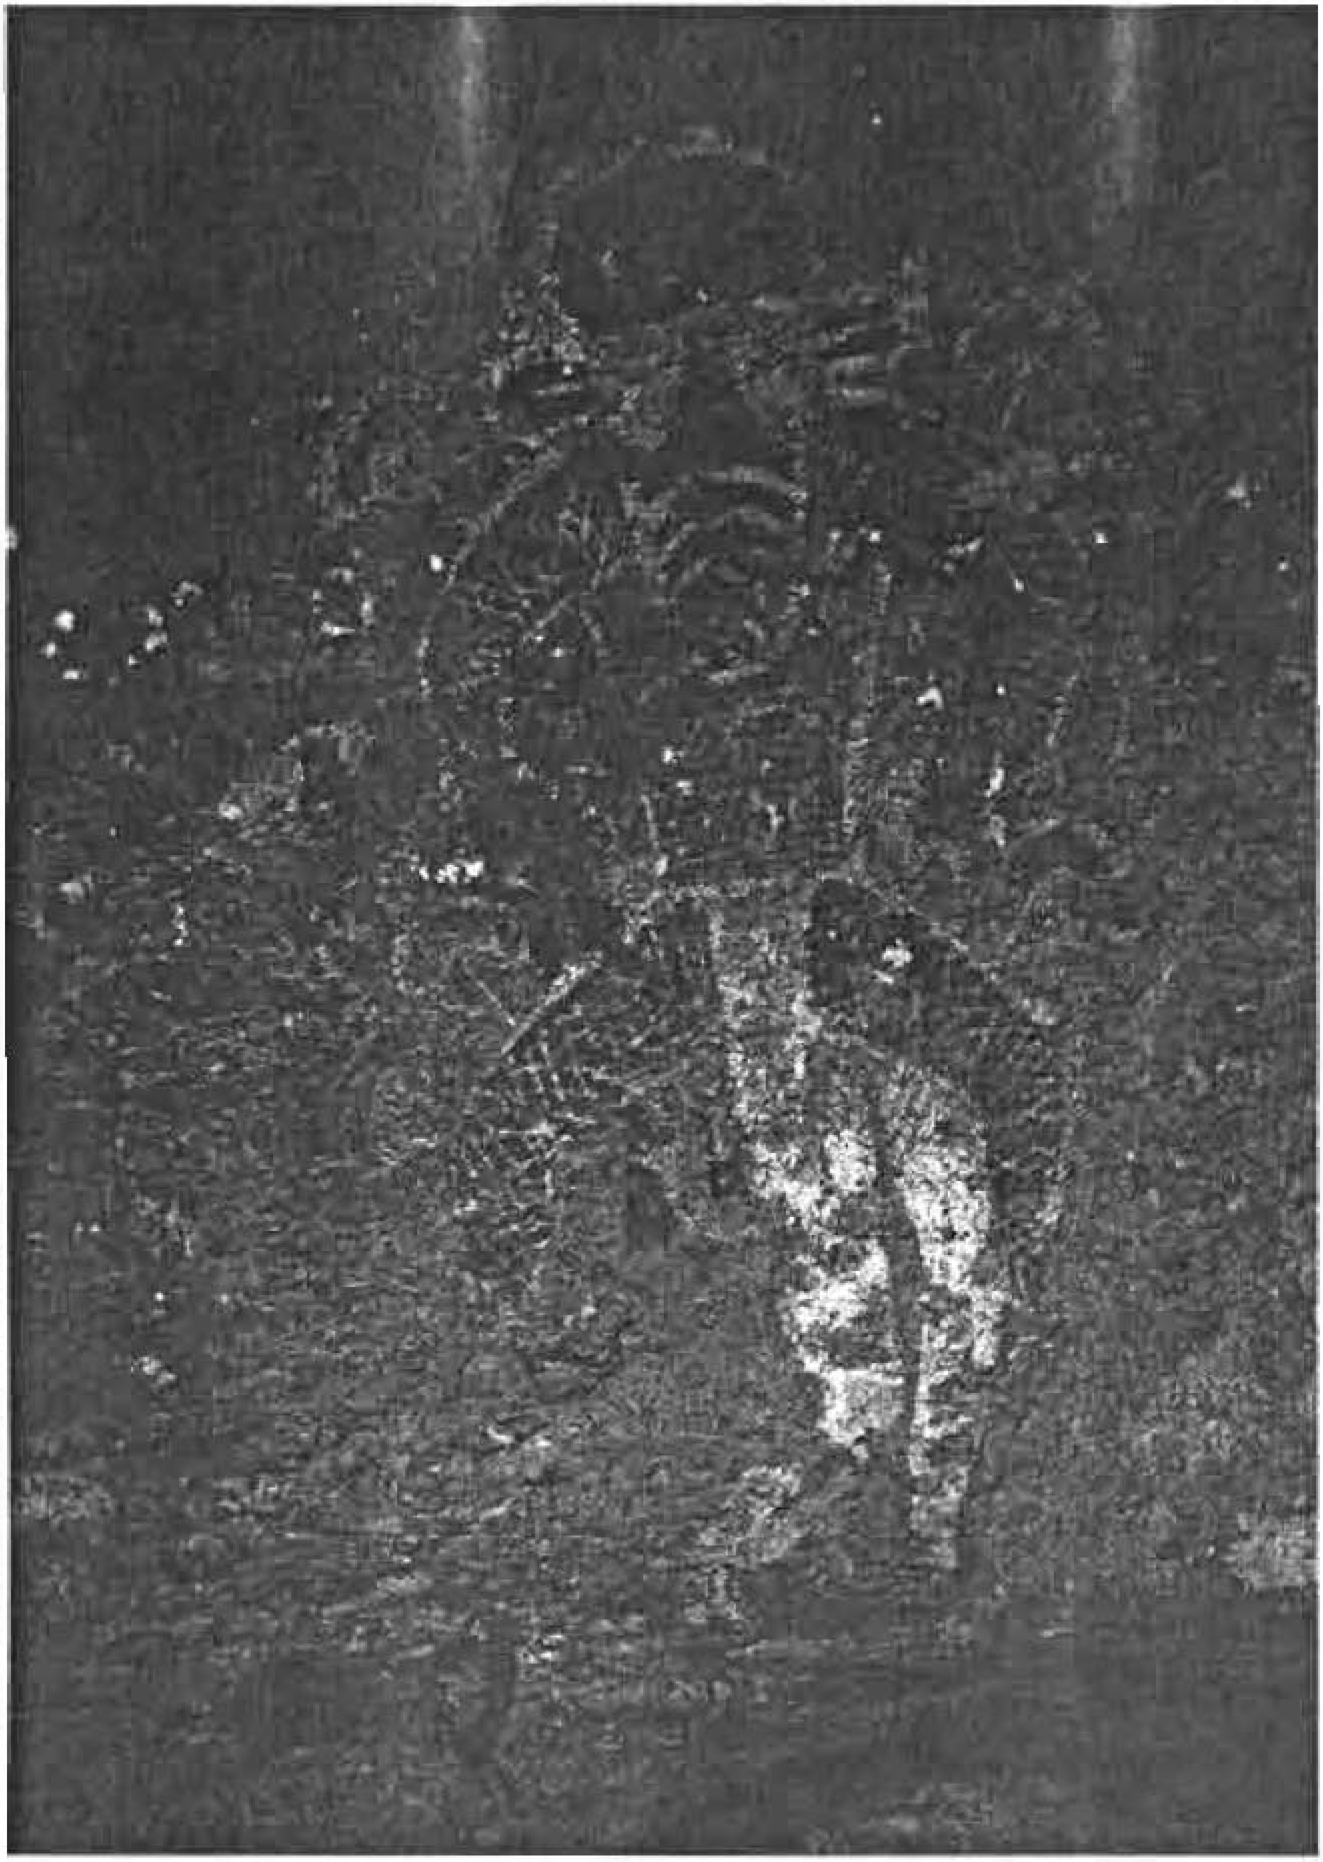
In the same Tin-Abouteka scene, yet another remarkable image could be explained in the light of ethno-mycological enquiry. In the middle we find an anthropomorphous figure traced only by an outline. The image is not complete and the body is bending; it probably also has a bow. Behind this figure, we find two mushrooms which seem to be positioned as though they were coming out from behind the anthropomorphs.

If the mushrooms in question are those which grow in dung, the association between these mushrooms and the rear of the figure may not be purely casual. It is known that many psychotropic mushrooms (above all, *Psilocybe* and *Panaeolus* genera) live in dung of certain quadrupeds and in particular bovines, cervides and equines. This specific ecological phenomenon cannot but have been taken into account with regard to the sacramental use of psychotropic mushrooms, leading to the creation of mystico-religious relations between the mushroom and the animal which produces its natural habitat. Furthermore, the dung left by herds of quadrupeds were important clues for prehistoric hunters on the lookout for game, and the deepening of such scatological knowledge probably goes back to the paleolithic period (the long period of the hunter of large game). Thus we have a further argument in favour of the version of events that would have it that there have been mythical associations, with religious interpretations, on different occasions, between the (sacred) animal and the hallucinogenic mushroom. The sacred deer in the Mesoamerican cultures and the cow in Indian Hindu culture (the dung of which provides a habitat for *Psilocybe cubensis*, a powerful hallucinogen still used today) could be interpreted in this zoo-scatological manner (Wasson, 1986:44; Furst, 1974; Samorini, 1988).



In-Aouanrhat (Tassili, Algeria) - Masked anthropomorph (detail).

In a painting at Jabbaren - one of the most richly endowed Tassili sites - there are at least 5 people portrayed in a row kneeling with their arms held up before them in front of three figures two of which are clearly anthropomorphous. It could be a scene of adoration in which the three figures would represent divinities or mythological figures. The two anthropomorphous figures have large horns while the upper portion of the third figure, behind them, is shaped like a large mushroom. If the scene is indeed a scene of adoration, it is an important testimonial as to Round Heads mystico-religious beliefs. This scene would thus be the representation of a "Holy Trinity" illustrated by a precise iconography. It is worth bearing in mind the fact that the upper part of one of the "trinity" figures in the adoration scene is mushroom-shaped. It could be related to the iconographic figure at Aouanrhat and Matalem-Amazar described above.



In-Aouanrhat, (Tassili, Algeria) Masked Anthropomorphic figure (divinity?) with mushroom-like symbols on the legs and the arms and inside the mask.

But the more or less anthropomorphous figures with mushroom-shaped heads are to be found repeatedly in Round Head art, some with "hat-heads" of umboned or papillate form which on two occasions are of a bluish colour while others carry a leaf or a small branch.

The occurrence of various data suggests the presence of a very ancient hallucinogenic mushroom cult with a complex differentiation between botanical species and related mythological representations. Indeed it would be remarkable to find out that, as part of the culture of the Late Stone Age which 7.000 to 9.000 years ago produced Round Heads rock art, we were in the presence of the oldest human culture yet discovered in which explicit representations of the ritual use of psychotropic mushrooms are to be found. Therefore, as the founders of modern ethno-mycology had already put forward - and this is especially true of Wasson (1986) - this Saharan testimony would demonstrate that the use of hallucinogens originates in the Paleolithic period and is invariably include within mystico-religious contexts and rituals.

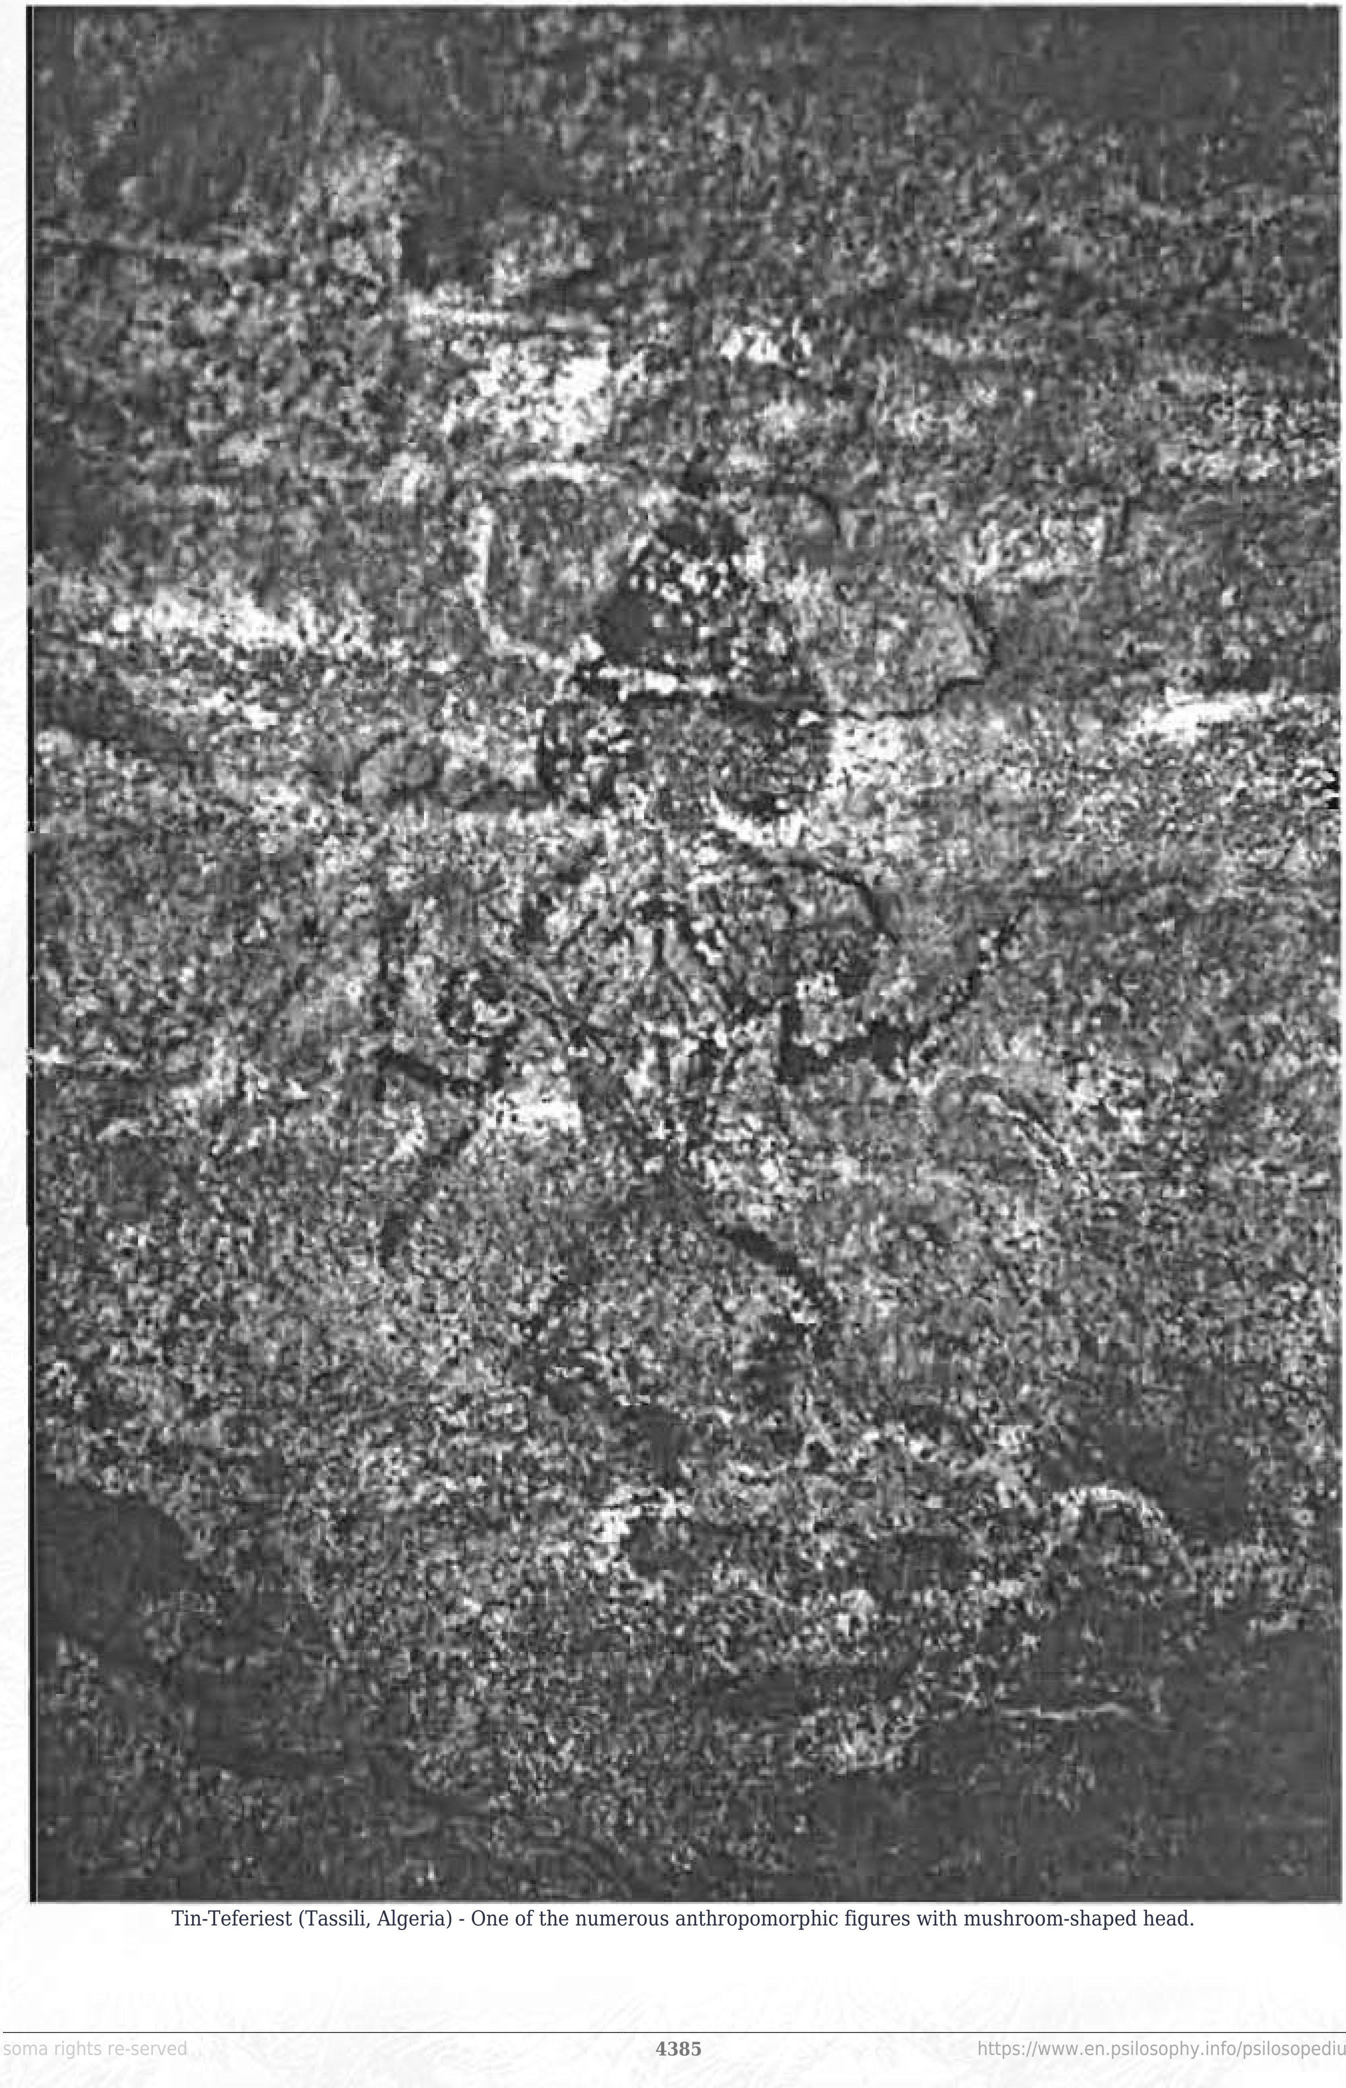
It is not easy to identify the mushrooms represented in Round Heads art. The biochemical characteristics of these mushrooms determine the action on the human mind and it either belongs to a flora which has disappeared or, retreated to the Saharan basin which later became desert. From the paintings it would seem there are at least two species one of which is small and topped with a "papilla" (a characteristic it would share with most known hallucinogenic *Psilocybe*) and the other of which is larger (like *Boletus* or *Amanita*). The colours used are white and probably the result of oxidation of the original colour).

The Sahara Desert area has undergone periodic and significant climatic variations. At least three long humid periods have been identified since 20.000 BC, interrupted by three periods of drought, and it appears that the drought we know today is less severe than the two which preceded it. The semi-quantitative graph drawn up by Muzzolini (1982) presents the "Great Humid Holocemic Period" characterized by the presence of enormous lakes all over the Saharan basin (10.000 BC - 5.500 BC). The generally accepted chronology of Round Heads art fits comfortably into this period. Pollen examination carried out at Tassili reveals that, during the Round Heads period, this area was vegetated by highland flora (2.000 m height) with the presence of coniferous trees and oaks (AA.VV., 1986: 97). It can be presumed that some of the mushrooms represented (the large ones) were indigenous to this wooded area in that they are intimately associated with these species of tree.

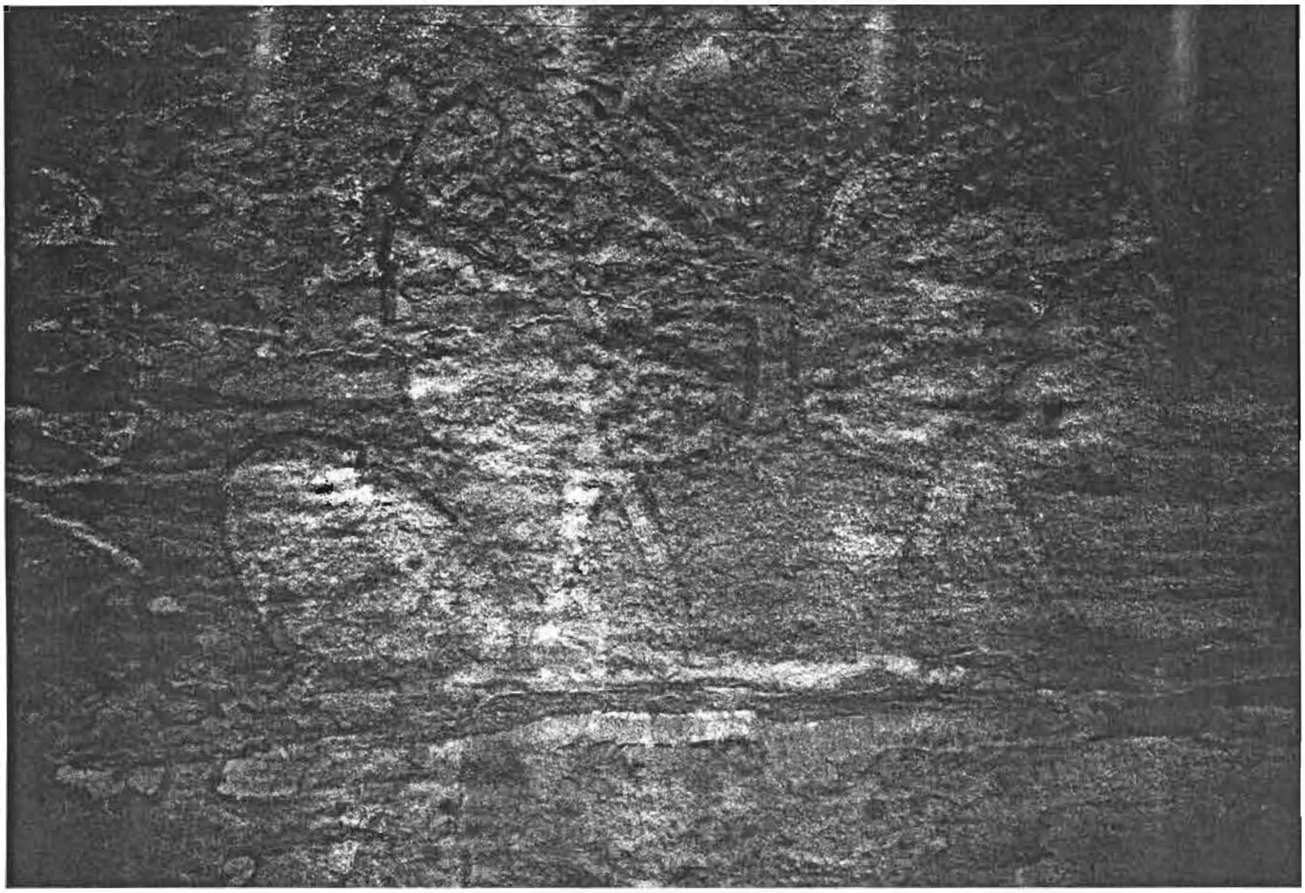
Mushrooms are not the only vegetals to be found in Round Heads art. We often find figures in typical costume and in hieratic positions, dancing, and holding in their hands small branches or leaves (and in one instance roots). At least two species occur fairly frequently in the images found at Tassili and nearby Acacus. In fact, the interest which surrounds the hallucinogens is always represented within a context of general interest in vegetals and it is most likely that it is within these contexts, related to religious activity and initiation, that we find the origins of individual specializations within the communities of these people concerning the magical, therapeutic and culinary aspects of vegetals.

This new piece in the ethno-mycological puzzle is even more significant if we consider it from the point of view of research into the use of hallucinogens in the immense African continent. Some progress has been made over the last few years as regards the study of this problem (see the work of e.g., Emboden, 1989; Hargreaves, 1986; Lehman & Mihalyi, 1982; Monfouga-Brousta, 1976; Wagner, 1991; Winkelman & Dobkin de Rios, 1989). Africa - both because of an ignorance of the facts which has continued up to the present day and because of the wealth and extreme old age of the indigenous "animist" religions - has still much to tell us concerning the human use of hallucinogens and the origins of such practice.

Only at the end of the drawing up of this paper I received news that also Terence McKenna (1988) proposed separately the Saharian ethnomycological hypothesis, through the indication of the ethnomycologist Jeff Gaines and the observation of the clear photographs of the Tassili paintings published by D. Lajoux (1964).



Tin-Teferiest (Tassili, Algeria) - One of the numerous anthropomorphic figures with mushroom-shaped head.



Jabbaren (Tassili, Algeria) - Big mushroom-shaped motives.

Miniature Mushroom Stones from Guatemala

by

Stephan F. de Borhegyi

Abstract - A cache of nine miniature mushroom stones and nine miniature metates with manos from the Verbena cemetery at Kaminaljuyú, Guatemala, date from the Verbena subphase of the Miraflores phase of the Preclassic, 1000- 500 B.C. All of the mushroom stones are of Type B with a circular groove around the base of the cap. This type has been found in a Verbena tomb in Mound E-III-3 at the same site. The cache of nine miniatures demonstrates considerable antiquity for the "mushroom-stone cult," and suggests a possible association with the nine lords of the night and gods of the underworld, as well as the possible existence of a nine-day cycle and nocturnal count in Preclassic times. The association of the miniature mushroom stones with the miniature metates and manos greatly strengthens the possibility that at least in some areas in pre-Columbian Mesoamerica metates were used to grind the sacred hallucinatory mushrooms to prepare them for ceremonial consumption.

During the month of January, 1960, while conducting archaeological investigations in Guatemala, I had the privilege of studying the rich, private collection of Karl Heinz Nottebohm, of Guatemala City. Among the many newly-acquired archaeological specimens in his collection was a striking group of ten miniature mushroom stones and two miniature metates with manos (Fig. 1). According to Nottebohm, nine of the mushroom stones, along with nine miniature metates and manos, were taken as a unit from a prehistoric cache in the Verbena cemetery at the archaeological site of Kaminaljuyú, in the outskirts of Guatemala City. The tenth specimen, the tallest in the collection (height, 19 cm., effigy mushroom stone in center of Fig. 1), was also found in the area of the Verbena cemetery some distance from the previously mentioned cache. Unfortunately, the exact location, within the Verbena cemetery, of the mound which yielded the cache containing the mushroom stones has not been disclosed by the finder.

Similar, but much larger, mushroom stones have been reported with relative frequency from Kaminaljuyú, as well as other areas in the Guatemalan Highlands and Southern Mexico (Kidder, Jennings, and Shook 1946: 104, 142, Figs. 58 *c*, 160 *a-h*; Shook and Kidder 1952: 112, Fig. 78 *f*; Lothrop 1933: 29, Fig. 11; Villacorta and Villacorta 1927: (123-25). My classification of mushroom stones (Borhegyi 1957) is presented in modified form in Figure 2 and Table 1.

These "enigmatic" objects ordinarily average from 28 to 38 cm. in height, although some of the presumably Late Classic (A.D. 600-900) mushroom stones, from the south coast area of Guatemala, are slightly smaller (22-26 cm.; Thompson 1948: 24, Fig. 19 *f*). The only miniature specimens, heretofore known, consisted of a fragmentary example in the Dieseldorff collection in the Guatemalan National Museum (No. 7567), representing a deer or rabbit (height of fragment, 7 cm.; Fig. 2 *14*), and one plain mushroom stone in my collection (height, 10.5 cm.). While the provenience of the former specimen is unknown (presumably the Department of Quiche, Guatemala), the plain example in my collection was discovered by one of my students in the Verbena cemetery area of Kaminaljuyú.

The nine miniature mushroom stones in the Nottebohm collection range in height from 14 cm. to 18 cm. Among them, there are four plain (including one tripod), three zoomorphic (one jaguar, two birds), and two anthropomorphic specimens. Although there are only two miniature metates with manos in Figure 1, the original cache contained nine. Apparently, there was one metate and mano for each miniature mushroom stone. Considering the reliability of both the owner and the finder, there is little doubt that the nine specimens, together with the metates and manos, were deposited in the cache in such a way as to constitute an offering.

All of the miniature mushroom stones in the Nottebohm collection have a circular groove around the base of the cap, which places them into my Type B (Fig. 2 *12-16*). Type B mushroom stones, without exception, are of Early and Late Preclassic date (1000 B.C.-A.D.200). Shook and Kidder (1952: 112, Fig. 78 *f*) found a large, tripod, jaguar-effigy mushroom stone (height, 37 cm.) with a similar circular groove around the base of the "mushroom" cap in Tomb I, Mound E-III-3, in the Verbena cemetery area. The contents of Tomb I in Mound E-III-3 were assigned to the Verbena subphase of the Miraflores phase (1000-500 B.C.). Shook and Kidder (1952: 112) state that "there can be no doubt that the making of these curious objects [mushroom stones] began at least as early as the Verbena subphase." There can also be little doubt that the nine miniature mushroom stones in the Nottebohm collection with their nine metates and manos, found in the cache in the Verbena cemetery area, are at least as early as 1000 B.C. The custom of circularly grooving the base of the mushroom-stone caps was discontinued after the Early Preclassic period. The Late Preclassic (500 B.C.-A.D. 200) and Classic (A.D. 200-900) period carved effigy, plain, and tripod mushroom stones have only plain caps (Fig. 2).

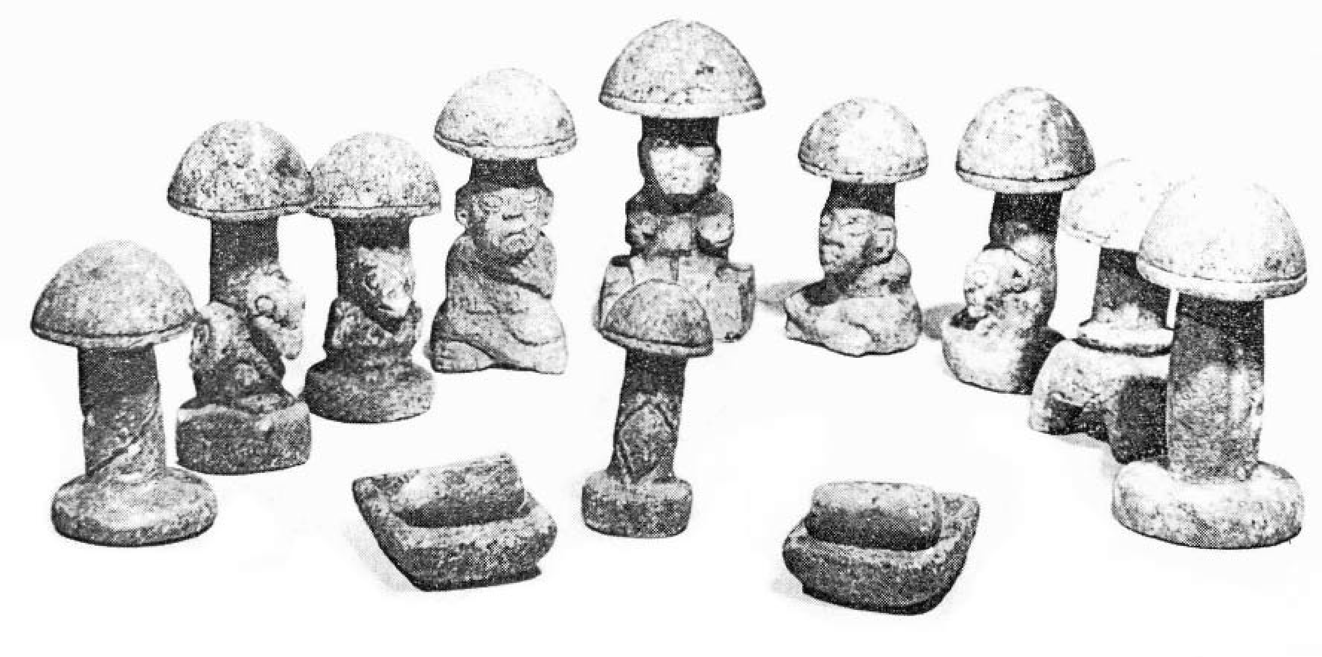

Fig 1. - Miniature mushroom stones, metates, and manos from Kaminaljuyú, Guatemala, in the Nottebohm collection. Except for the effigy mushroom stone in the center of the back row, all were found in a Late Preclassic cache (Verbena subphase of the Miraflores phase, 1000-500 B.C.). From left to right: *back row*, plain mushroom stone with grooved decoration, height 14 cm.; effigy mushroom stone, possibly a vulture, height 18 cm.; effigy mushroom stone representing an owl or Moan bird, height 15 cm.; effigy mushroom stone, an aged individual seated crosslegged, height 17.5 cm.; effigy mushroom stone of a seated individual with clenched fists, not associated with the cache, height 19 cm.; mushroom stone in form of a youthful individual seated crosslegged, height 16 cm.; effigy mushroom stone, possibly a jaguar, height 17 cm.; tripod mushroom stone, height 16 cm.; plain mushroom stone with vertical gouging, height 14 cm.; *front row*, miniature legless metate with mano, length of metate 10 cm., width 8 cm., length of mano 6 cm., diameter 2 cm.; plain mushroom stone with incised decoration, height 14 cm.; miniature metate with mano, dimensions same as other metate and mano.

It is interesting to note that the same Tomb I of Mound E-III-3 also contained four small mortars and pestles of gray stone, two of them in the shape of toads (Shook and Kidder 1952, Fig. 78 *a-c, e*). Shook and Kidder (1952: 111) observe that "neither the grinding depressions nor the ends of the pestles show appreciable wear and although it seems probable that these mortars were designed for pulverizing paints, none retains any trace of pigment." Furthermore, "the two round mortars and the two small ones with amphibian heads were stacked together in a great pile of offerings along the south side of the tomb and all five pestles lay with them." There seems little doubt that the jaguar-effigy mushroom stones and the stone mortars were placed in the tomb as burial offerings. It should also be noted that three other fragments of the heads of mushroom stones were found in the fill of Mound E-III-3.

TABLE 1. TYPOLOGY, CHRONOLOGY, AND DISTRIBUTION OF MUSHROOM STONES
(Modified from Borhegyi 1957)

Types	Chronology	Distribution
Type E Miscellaneous and possibly related stone (41-45) and pottery (46-48) objects.	Chronological position uncertain.	• Central Guatemalan Highlands Uncertain locality (41-45) • Western El Salvador Santa Elena (48) • Eastern El Salvador Not illustrated (compare 46-48) - Quelepa, San Rafael-Oriente, and Lolotique in Dept. San Miguel - Santa Elena in Dept. Usulután • Mexico Not illustrated - Guanacaste, Chiapas (compare 48) - El Bellote, Tabasco (compare 44, 46)
Type D Tripod mushroom stones with plain (39, 40) or carved (38) stems and with clubby (40) or sharp angled (38, 39) feet.	Late Classic 600-900 A.D.	• Central Guatemalan Highlands Kaminaljuyú (38-40) Not illustrated - Antigua (compare 38-40) - Zacualpa (compare 39-40) - Eucaliptus (compare 38-39) - Agua Caliente (compare 38-39) - Amatitlán (compare 38-39) - Pompeya (compare 38-39) - San Martin Jilotepeque (compare 38-39) - Tecpan-Iximché (compare 38-39) - Mixco Viejo (compare 40) • Pacific Coastal Plains of Guatemala Not illustrated (compare 39) - El Baúl - Los Diamantes - El Carmen • Western El Salvador Not illustrated (compare 39) - Tazumal - Finca la Montaña
Type C Effigy (17-31) or plain (32-37) mushroom stones with square (17,18,20-23,25,26,28,31,35) or rounded (19,24,32-34,36,37) bases and without circularly-grooved caps.	Late Preclassic 500 B.C. - 200 A.D. and probably Early Classic 200 - 600 A.D.	• Central Guatemalan Highlands Kaminaljuyú (17-20, 27-29) Cerro Alux, Mixco (31) Salcaja (25) Uncertain locality (21-24, 26, 30) Not illustrated - Tecpan-Iximché (compare 18, 36) - Amatitlán (compare 20) • Pa.cific Coastal Plains of Guatemala Lago Ixpaco (36) Not illustrated - Lago Ixpaco (compare 20) - El Salto (compare 21) - Guazacapán (compare 31) - Retalhuleu (compare 28) - Ayarza (compare 18) • Mexico Ocosingo, Chiapas (32) Not illustrated - La Grandeza, Chiapas - Chiapa de Corzo, Chiapas (compare 32) - Oaxaca (compare 32, 33, 36, 37) - Tabasco (compare 32) • Western El Salvador Tazumal (33) Las Victorias (35) Uncertain locality, probably Chatehuapa area (37) • Bolivia, South America Inca-Uyu, Chucuito (34)
Type B Effigy mushroom stones with circularly-grooved caps and square (12-14) or tripod (15, 16) bases.	Early and Late Preclassic 1000 B.C. - 200 A.D.	• Central (Juatemalan Highlands Kaminaljuyú (12, 13, 15) Quiché (16) Uncertain locality (14)
Type A Anthropomorphic stone sculptures with plain (1-5, 7) or circularly-grooved (6) mushroom caps; plain (10,11) and circularly-grooved (8,9) stone mushroom caps.	Chronological position uncertain.	• Central Guatemalan Highlands Kaminaljuyú (2-4, 8, 10) Salcaja (6) Chukumuk (9) Xikomuk (11) Uncertain locality (1, 5, 7)

It is significant that the nine miniature mushroom stones and the nine metates and manos in the Nottebohm collection were found as a unit in a cache. Ceremonial offerings, such as jade carvings, stingray spines, eccentric flints and incised obsidian blades in groups of nine have frequently been encountered in the Maya area. Most, however, were found in association with burials or as sub-stela caches or vault caches in sites in the Lowland Maya area (such as, Uaxactun, Tikal, Guatemala, and Baking Pot, Pomona, British Honduras; summary in Kidder 1947: 21-4, 59, Figs. 69-71). These caches date, not from the Preclassic, but from the Early and Late Classic (mostly Tepeu 2, A.D. 700-800) periods. To my knowledge, no Preclassic Highland Maya cache offerings in the number nine have previously been reported.

What is the significance of the number nine in ceremonial cache offerings? According to Thompson (1950: 12):

> In the pantheon of the peoples of Mexico and of the Maya there was a group of nine deities, called in Yucatec Bolon-ti-Ku, "nine gods," who were the lords of nights, and gods of the underworld. They ruled in succession over the nights, in contrast to the 13 sky gods who apparently ruled the days in sequence.

The glyphs of the nine Maya lords of nights and gods of the underworld are known (Thompson 1950, Fig. 34), but not all of them can be properly identified. On the other hand, the names of the nine lords of the nights of the Aztec have been preserved for us by Serna (1892). With the corrected orthography of Thompson (1950: 208), they are:

1. Xiuhtecutli, God of fire, year or grass.
2. ltzli, God of flint.
3. Piltzintecutli, Lord of the youths or youthful lord.
4. Centeotl, God of maize, ears of corn, and bread.
5. Mictlantecutli, God of infernal regions.
6. Chalchihuitlicue, Lady with skirt of jade.
7. Tlazolteotl, Goddess of love.
8. Tepeyollotl, Heart of the mountains (jaguar).
9. Quiauitecutli (Tlaloc), Lord of the rain.

The glyphs of the Maya Lords of the nights do not correspond closely to the Mexican gods. According to Thompson (1950: 208-10, Fig. 34), the Maya series presumably starts with glyph G_1 and ends with G_9. They may be summarized with reference to their various representational contents as follows:

G_1 Head of God C, water symbol (circlets, Kan cross), monkey features, fish symbol.
G_2 Water symbols (small circles), head variant that of a youthful deity, jade and vegetable symbols, possibly a rain deity.
G_3 Moan bird, bird of the rainclouds, a pluvial deity.
G_4 Roman nose deity, possibly a maize deity.
G_5 Earth monster, Mam (the god of the interior of the earth), the conch man.
G_6 A youngish deity.
G_7 Jaguar paw, puma, a deity of the interior of the earth (a counterpart of the Aztec jaguar god, Tepeyollotl).
G_8 Conch shell (symbol of the surface and the interior of the earth), Mam.
G_9 The night sun, aged sun god.

Admittedly, any attempt at identification of mushroom stones, with the nine gods of the Aztec or Maya pantheon, is on very shaky ground. Nevertheless, many if not all of the mushroom stones, both miniature and large, may possibly represent Highland Maya versions of the nine lords of the nights. They are listed here with tentative identifications in parentheses. Numbers refer to Figure 2.

Fig 2. - Typology of mushroom stones. See Table 1 for explanation. Modified from Borhegyi 1957.

1. Aged individual, seated crosslegged or squatting (aged sun god, night sun, Xiuhtecutli, G_9 - 1, 2, 16, 17).
2. Youth, seated crosslegged or squatting (Piltzintecutli, youthful lord, G_6 - 3-6, 18, 19, 41,42).
3. Birds, such as vultures, owls, Moan birds (G_3 - 28-30).
4. Monkeys, may be the spider monkey (G_1 God C-21).

5. Jaguars or pumas (Tepeyollotl, G_7 - 12, 15, 20, 22, 43).
6. Rabits or deer (fertility, moon - 13, 14, 23, 24).
7. Pisotes, coati-mundi, *chic* - association with buffoonery, women, sex, and love (25-27, 44).
8. Toads or frogs, rain association (G_2 - 31, 45).

Of the nine miniature effigy mushroom stones in the Nottebohm collection, the second from the left in Figure 1 represents a bird (possibly a Moan bird or G_3); the fourth from the left represents an aged individual, seated crosslegged (possibly the night sun or G_9); the third from the right represents a jaguar (possibly Tepeyollotl or G_7); and the fourth from the right represents a youth, seated crosslegged (possibly youthful lord, G_6 or G_2. No explanation can be given for the additional bird effigy, or for the three plain and one tripod mushroom stones.

Whether or not the tentative identification of four of the miniature mushroom stones with the gods of the night is correct, the presence of nine offerings in a ceremonial cache from the Preclassic period indicates that the Maya belief in the nine gods of the underworld-and possibly in the 13 gods of the sky-may have originated as early a 1000 B.C. This period also saw the beginning of mound-building activities and rich tombs in the Maya Highlands. This presupposes a highly organized and stratified, social structure. There has been some debate as to whether the social control necessary for the production of such large-scale public enterprises was externally motivated (in the form of a "police force"), or internally motivated (belief in the rewards of heaven and the punishments of hell). If the nine gods of the underworld did, indeed, represent the idea of a "hell," as reported by the early Spanish chroniclers, then the presence of the nine mushroom stones in a Preclassic cache may indicate the existence of this concept among the Highland Maya, at a very early date. It would also explain why pilgrims, flocking to the Maya ceremonial centers, were willing and eager to enlist in the extensive building activities.

The purpose of the nine miniature metates and manos is still in question. Like the four small mortars and pestles found in Tomb I of Mound E-III-3, none shows signs of wear or use. Their presence with the mushroom stones must, therefore, have been primarily ceremonial or symbolic. Could this suggest that regular-sized metates and manos were used in connection with the larger mushroom stones? Could they have been used to pulverize or crush actual dried or fresh "sacred" mushrooms (*teo-nanacatl*) to induce, when eaten, hallucinatory trances and dreams - dreams in which, according to 16th century Spanish chroniclers, jaguars, birds and snakes, as well as little gnome-like creatures (possibly gods of the underworld) were seen (Wasson and Wasson 1957: 223-4)? These and other questions still await an answer.

Pertinent to the mushroom stone and metate problem is the discovery by R. G. Wasson and Robert Ravicz in June and July, 1960, that the metate is still used in the mushroom rite among the Mixtec of Oaxaca. They found that the sacred mushrooms (*Psilocybe mexicana* Heim) are supposedly gathered by a virgin (usually female), that the virgin grinds them on a metate with a little water, and that the gray fluid heavy with sediment is then drunk by the person who wishes to consult the mushroom. This practice has not been reported elsewhere, but perhaps it survives in other areas not yet explored. If the ceremonial metates were a symbol of this practice, is it possible that the mortars and pestles reflected the crushing of the *ololiuqui* seeds, which were and are widely used as a substitute for mushrooms when the latter are not available?

An effigy mushroom stone in the Namuth Collection in New York (Fig. 3; also illustrated in Wasson and Wasson 1957, Vol. II, Pl. 44) represents an aged woman kneeling before a metate-like object. She is shown in the characteristic position employed by women to grind meal. The specimen is from the Guatemalan Highlands and belongs stylistically to the Preclassic period (Type B mushroom stones). It is quite possible that this mushroom stone depicts a Preclassic version of the very same mushroom-grinding ceremony observed by Wasson and Ravicz among the present day Mixtecs of Oaxaca.

When all questions of a theoretical nature are put aside, we can derive from the miniature mushroom stones in the Nottebohm collection the following new facts and inferences of interest to Highland Maya prehistory:

1. The existence of miniature mushroom stones (height of 10 to 19 cm.).
2. Their ceremonial association, in a group of nine, with miniature metates and manos.
3. The antiquity of the "mushroom-stone cult," as far back as the Verbena subphase of the Miraflores phase (1000-500 B.C.).
4. The possible association (or even representation) of the *Bolon-ti-Ku*, the nine gods of the night and the underworld.
5. The possible existence of the nine-day cycle and nocturnal count in Preclassic times.
6. The possibility of a more elaborate pantheon and counting system among the Preclassic Highland Maya than previously assumed.
7. The possibility that at least in some areas in pre-Columbian Mesoamerica, metates or mortars were used to grind the sacred mushrooms, or crush the *ololiuqui* seeds, before ceremonially drinking or eating them.

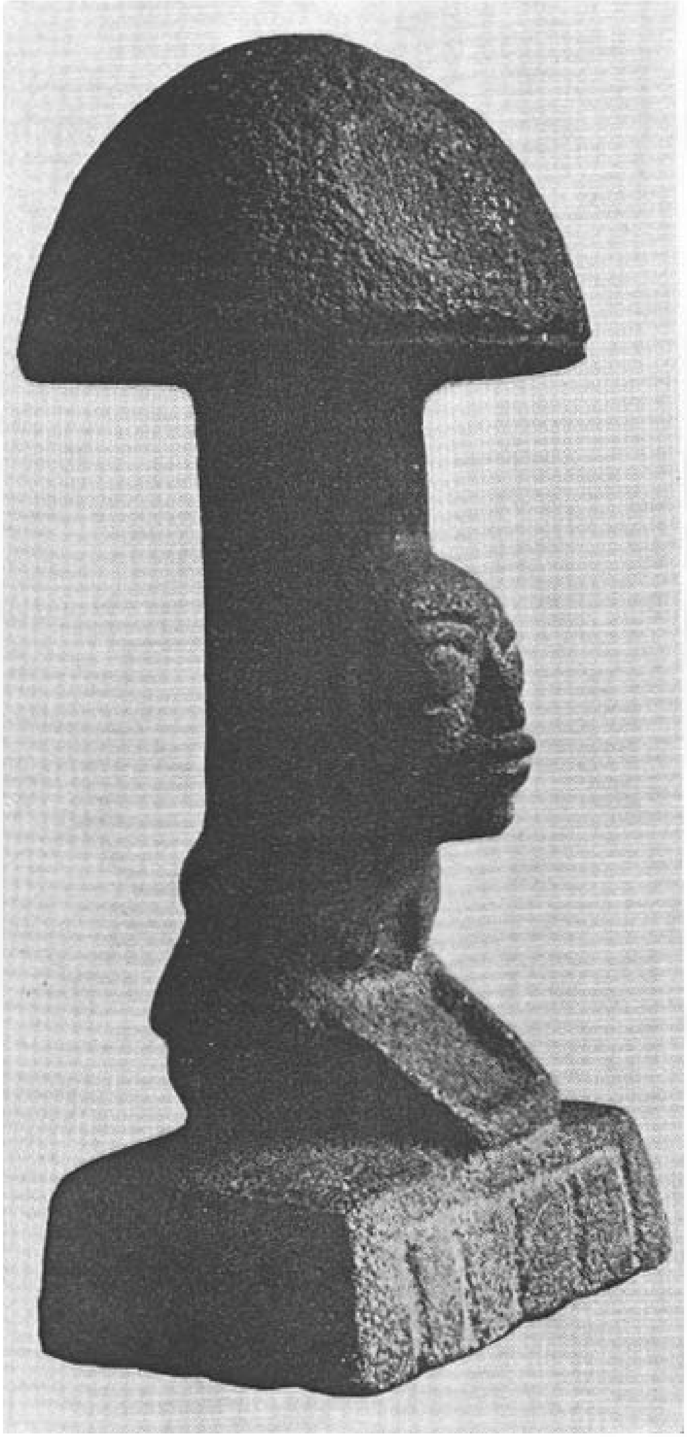

Fig 3. - Large effigy mushroom stone representing an aged woman kneeling before a metate, from highland Guatemala, exact location unknown. This Late Preclassic (l000-500 B.C.) specimen is in the Hans Namuth collection, New York. Height 36 cm. Photograph by Hans Namuth.

Acknowledgments - It is a pleasure to express my gratitude to the trustees of the Milwaukee Public Museum and to the American Philosophical Society, Philadelphia, under whose auspices the 1960 archaeological research in Guatemala was undertaken. Thanks are also extended to Karl Heinz Nottebohm for the use of material from his collections, to A. V. Kidder who read the manuscript and supplied several useful comments, to R. G. Wasson and Robert Ravicz for their data on Mixtec mushroom rites, and to Leo Johnson, photographer of the Milwaukee Public Museum, and Hans Namuth, New York, for the photographs.

This paper is dedicated to the memory of Dr. Valentina Pavlovna Wasson who, unfortunately, did not live long enough to see the many important results deriving from the research she conducted in collaboration with her husband, R. Gordon Wasson.

References

Abstract - Until recently, pre-Columbian mushroom-shaped pottery objects were known only from EI Salvador. New evidence indicates that they were also used in Chiapas, Tabasco, and Veracruz, in Mexico, in the Lowland Maya Rain Forest area, and possibly on the Pacific coast of Guatemala. They seem to be diagnostics of the latter part of the Late Pre-Classic and Proto-Classic periods. Due to their resemblance, when turned upside down, to round-bottomed, tall-necked jars, an undetermined number of specimens may have been classified by archaeologists and illustrated in the literature as jars. Their function is still unknown, but it is believed that, like the mushroom stones, they were used in connection with the ceremonial consumption and adoration of hallucinogenic mushrooms.

While mushroom-shaped stone objects have been illustrated and reported from archaeological sites and collections in Mexico, Guatemala, and El Salvador ever since the latter part of the 19th century (Brigham 1887, Sapper 1898, and Brinton 1898), it was not until the 1930's that Lothrop (1933, Fig. 11 *b, c*) and later on, Longyear (1944, Pl. IX, No. 26), called attention to similar mushroom-shaped objects made of clay. At this time it was assumed that while the plain and effigy mushroom stones had a fairly wide distribution, ranging from southern Mexico through Highland and Pacific coastal Guatemala to El Salvador, the use of plain, hollow pottery mushrooms in pre-Columbian times was restricted to eastern El Salvador (Kidder, Jennings, and Shook 1946: 142). This was still held to be true when the author began his study of the chronology and distribution of these enigmatic stone and pottery objects (De Borhegyi 1957). At this time, pottery mushrooms were designated as Type E objects (De Borhegyi 1957, Nos. 46 to 48 in the chart). Mushroom stones were classified into four types, A to D in chronological order. Type A mushroom stones, the earliest, dated to Early or Mid Pre-Classic times (1000 B.C. to 300 B.C.) , Types Band C overlapped the Mid and Late Pre-Classic, and the Type D or tripod mushroom stones were assigned to the Late Classic (A.D. 600-900) period. All pottery (Type E) mushrooms were thought to be of Late Classic origin.

In 1959 Lowe described and illustrated a pottery "mushroom stand" and two Type C plain mushroom stones from Chiapas (Lowe 1959: 49, 55, 75, 76, Figs. 29 *f*, 50 *a*, 60 *c-d*). However, he (Lowe 1959: 75-6) cautiously ascribed the presence of this plain pottery mushroom (found at the archaeological site of Guanacaste, near the Grijalva River, in the Central Depression of Chiapas) to Late Classic influences emanating from El Salvador (Fig. 1).

Meanwhile, the author noted six previously unrecognized plain and effigy pottery mushrooms in several private and museum collections in Mexico and the United States. These specimens (*four* in the Villahermosa Museum in Tabasco, and *two* in the private collection of R. Gordon Wasson of New York) were reportedly found near the archaeological site of El Bellote a few miles north of the well-known Maya site of Comalcalco on the Gulf coast of Mexico (Stirling 1957: Map 15). The objects in question were similar to the pottery mushrooms reported by Lowe from Guanacaste, and by Lothrop and Longyear from El Salvador. Both plain and effigy forms, some of which were incised and punctate decorated, were made of a polished dull reddish-orange ware (Figs. 2, 3, and 4). They were all characterized by rounded bases, were hollow, and ranged in height from 20 to 25 cm. Were it not for the one specimen (Fig. 4), which had a modeled and incised figure of a bearded and moustached, conventionalized human face with two arms on the stem, the objects could have been easily mistaken for inverted tall-necked jars with rounded bottoms and extended out flaring rims. Each of these six pottery mushrooms bore textile and fingernail impressions or rough shell pecking (with the crinkled edges of pecten shells?) on the upper surface of the mushroom cap. As a matter of fact, the reason that pottery mushrooms have gone unrecognized in Mesoamerica outside of El Salvador is that a still undetermined number may have been published and illustrated upside down as tall-necked jars.

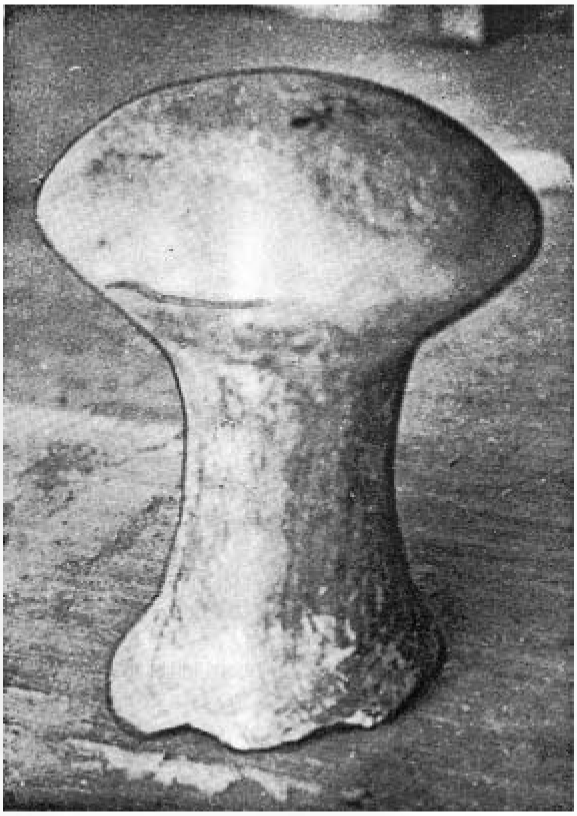

Fig. 1 - Plain hollow pottery mushroom from Guanacaste, Municipio La Concordia, Chiapas. Slipped dull reddish-orange ware. The mushroom cap shows extensive pecking and fingernail punching. Height: 23 cm.; top diameter: 16.5 cm. Late Pre-Classic or Proto-Classic (Lowe 1959: 49, 75-6; Figs. 29 *f*, 50 *a*, 60 *c, d*). Regional Museum, Tuxtla Gutierrez. New World Archaeological Foundation Collection (Milwaukee Public Museum Photo 2A59-8G).

The discovery of pottery mushrooms from the El Bellote area led to a re-examination of the archaeological finds and publications from the Mexican Gulf coast region. Stirling, who worked intensively in this area, excavated in the vicinity of the El Bellote site. He illustrates, upside down (Stirling 1957: 238-9, Pls. 59 *e, f, g, h, i*, 65 *a*-3) five (Type E) plain pottery mushrooms, and describes them as tall, thick-walled, sand-tempered pottery jars, with round "bottoms" expanded to bowl shape. The "bottoms" of these objects are roughened by textile imprints and pecked with what appears to be the crinkled edges of pecten shells. One complete specimen (Pl. 232, 65 *a*-3) was found in a sealed tomb at the site of Isla (near Paraiso and El Bellote; see Map 15, in Stirling 1957) in association with such typical Lowland Maya, Proto-Classic (A.D. 200-300) pottery vessels as round-bodied, bridged spouted "teapots." Four similar but fragmentary dull red ware pottery mushrooms (Pl. 59 *e, f, h, i*) were found in a shell mound at Ceiba, also near El Bellote, not far from the shores of the Atlantic. Here again the associated pottery forms (tetrapod vessels with tapering mammiform feet, polychrome spouted vessel, etc.) are indicative of Proto-Classic and Early Classic date. Stirlin, in a personal communication dated November, 1961, now believes that the "round-bottomed jars" he found at Isla and Ceiba are actually hollow pottery mushrooms. Moreover, he believes that the specimen illustrated here as Fig. 2 (at right), from the Villahermosa Museum, is the very same one he reported from the sealed tomb at Isla (Stirling 1957, Pl. 65 *a*-3).

A further examination of the archaeological literature has revealed red-brown ware, tall-necked, round-bottomed "jars" found by Drucker (1943: Pls. 16 *c, d, e*; 21 *c, d*, and 22 *a, d*) in Burials I-18 and II-18, at Cerro de las Mesas in Veracruz, which, when turned upside down, may represent pottery mushrooms similar to those of El Bellote. Because I have had no opportunity to examine these specimens, I am reluctant, at least for the time being, to classify them as pottery mushrooms.

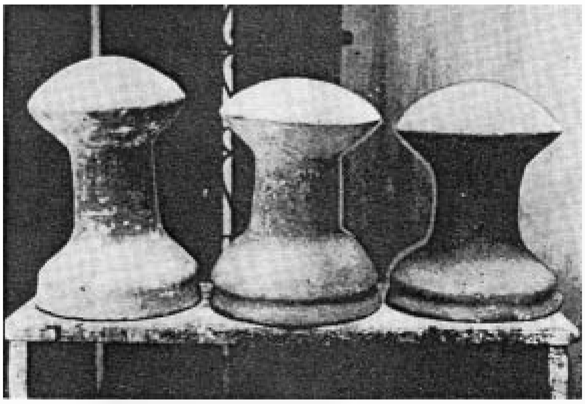

Fig. 2 - Three plain, hollow pottery mushrooms from El Bellore, Tabasco. Slipped, dull reddish-orange ware. The caps show textile impressions and shell pecking. Height of specimen at left: 25.4 cm. Proto-Classic. Specimen on right found at Isla, near El Bellote and illustrated by Stirling 1957: Pl. 65 *a*-3. Regional Museum, Villahermosa, Tabasco (Milwaukee Public Museum Photo 205129D).

It may be important to note that an unusual Remojadas style pottery figurine in the Wasson collection in New York, which is said to be from Tenenexpan, Veracruz (H: 30.5 cm.), represents a young woman seated crosslegged before what appears to be a small hollow pottery mushroom. Her right hand rests on the mushroom cap, while her left hand is extended upward trance-like or as if praying to the sky. She wears a square *quexquemitl* on her shoulders, a turban-like headdress, and what seems to be a necklace of beads. Her exposed legs, hands, and lips are smeared with black asphalt (*chapopote*) in keeping with the well-known Late Pre-Classic to Early Classic period Remojadas style (Fig. 5). To my knowledge no pottery mushrooms have been reported from the Remojadas archaeological zone. However, this interesting figurine gives us food for thought as to the pre-Columbian use of pottery mushrooms as objects of adoration by initiated "*curanderas*" (cf. Wasson and Wasson 1957: Pls. XLVII and XLVIII; Heim and Wasson 1958: Pls. I to IV).

Since 1960 numerous pottery mushroom fragments have been turned up in investigations by the New World Archaeological Foundation in the Central Depression of Chiapas. From Santa Cruz, Chiapas, Sanders (1961: 16, 28; Fig. 15 *b* and Pl. 6 *j*) illustrates and describes a Type E, plain pottery mushroom fragment found in the excavation of this site in his Trench 2 (level 4). The fragment is of a coarse-paste, unslipped, unburnished, thick-walled utility ware (named Chiapilla ware). Although only one fragment is illustrated (upside down), Sanders indicates (p. 28) that there were several of these "mushroom pots" or "mushroom vessels" in Trench 2 (Fig. 6). The Chiapilla period at the Santa Cruz site is equated by Sanders with the Late Pre-Classic (300 B.C.-A.D. 00) Francesa and Guanacaste phases at the site of Chiapa de Corzo (Chiapa IV-V periods). Due to the fact, however, that Level 4 in Trench 2 was a disturbed level, it is possible that the pottery mushrooms at this site are of the later Proto-Classic Santa Cruz period (Horcones, Istmo, Jiquipilas, Laguna phases at Chiapa de Corzo), A.D. 00- 200. The above specimens are now in the Regional Museum at Tuxtla Gutierrez in Chiapas where I examined them early in 1962. The cap of each pottery mushroom specimen shows marks of shell pecking, and in general the specimens are similar in all respects to the pottery mushrooms of Tabasco and El Salvador. While at the Tuxtla Museum, I also studied seven pottery mushroom fragments excavated at the site of Chiapa de Corzo. Due to the kind permission of Bruce Warren of the New World Archaeological Foundation, five of them are illustrated here (Fig. 7). Warren tells me (personal communication 1962) that they were found during the excavation of Trench 131 in the back of Mound SA, at Chiapa de Corzo, - and that based on their pottery association they are of the Proto-Classic, Istmo phase (Period VII at Chiapa de Corzo).

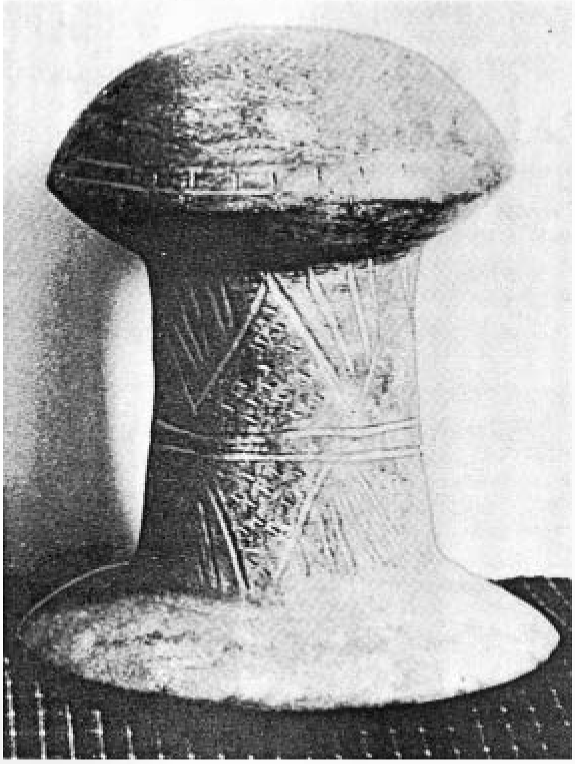

Fig. 3 - Plain hollow pottery mushroom from El Bellate, Tabasco. Decorated with incised and tool punctated design (note tool-incised design encircling the cap). Slipped dull reddish-orange ware. The cap shows extensive shell pecking marks. Height: 20 cm.; top diameter: 15.5 cm.; base diameter: 17.5 cm. Proto-Classic. Milwaukee Public Museum Collection, Museum No. 52851/ 18541. Donated by R. Gordon Wasson (Milwaukee Public Museum Photos 205126C, 2A147A).

Pottery mushroom specimens have also been excavated at the sites of Mirador and Berriozabal. They have been assigned to the Proto-Classic Chiapas VII (Istmo) and Early Classic Chiapas VIII (Jiquipilas) periods, and correspond in shape and time with the pottery mushrooms found at Guanacaste, Chiapa de Corzo, and Santa Cruz (personal communication, Lowe 1962).

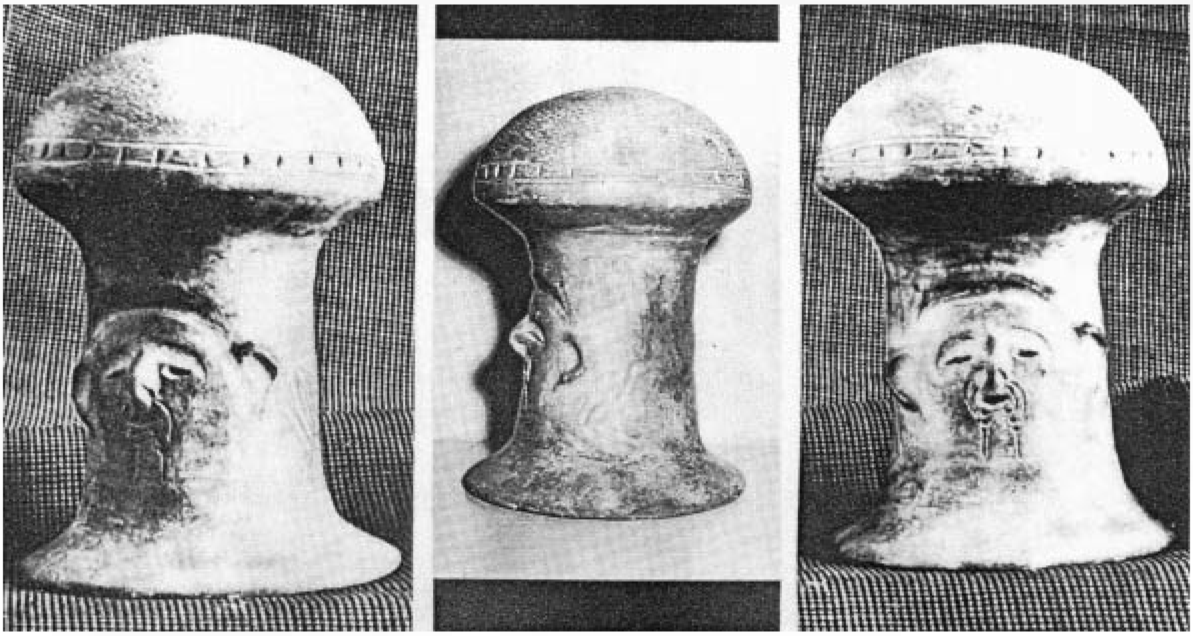

Fig. 4 - Hollow effigy pottery mushroom from El Bellote, Tabasco. Incised and modeled features depict (on the stem) a bearded, moustached individual with conventionalized arms. Note tool-incised and indented design encircling the cap. Slipped dull reddish-orange ware. The surface of the cap shows extensive pecking (for stylistic similarity compare with a modeled and incised spouted vessel from Isla in Stirling 1957: Pl. 66 *b*). Height: 20.3 cm.; top diameter: 13.6 cm.; base diameter: 14.6 cm. Proto-Classic. Private collection of R. Gordon Wasson, New York (photo courtesy Wasson; Milwaukee Public Museum Photos 205126A, B; 205114A, B, C).

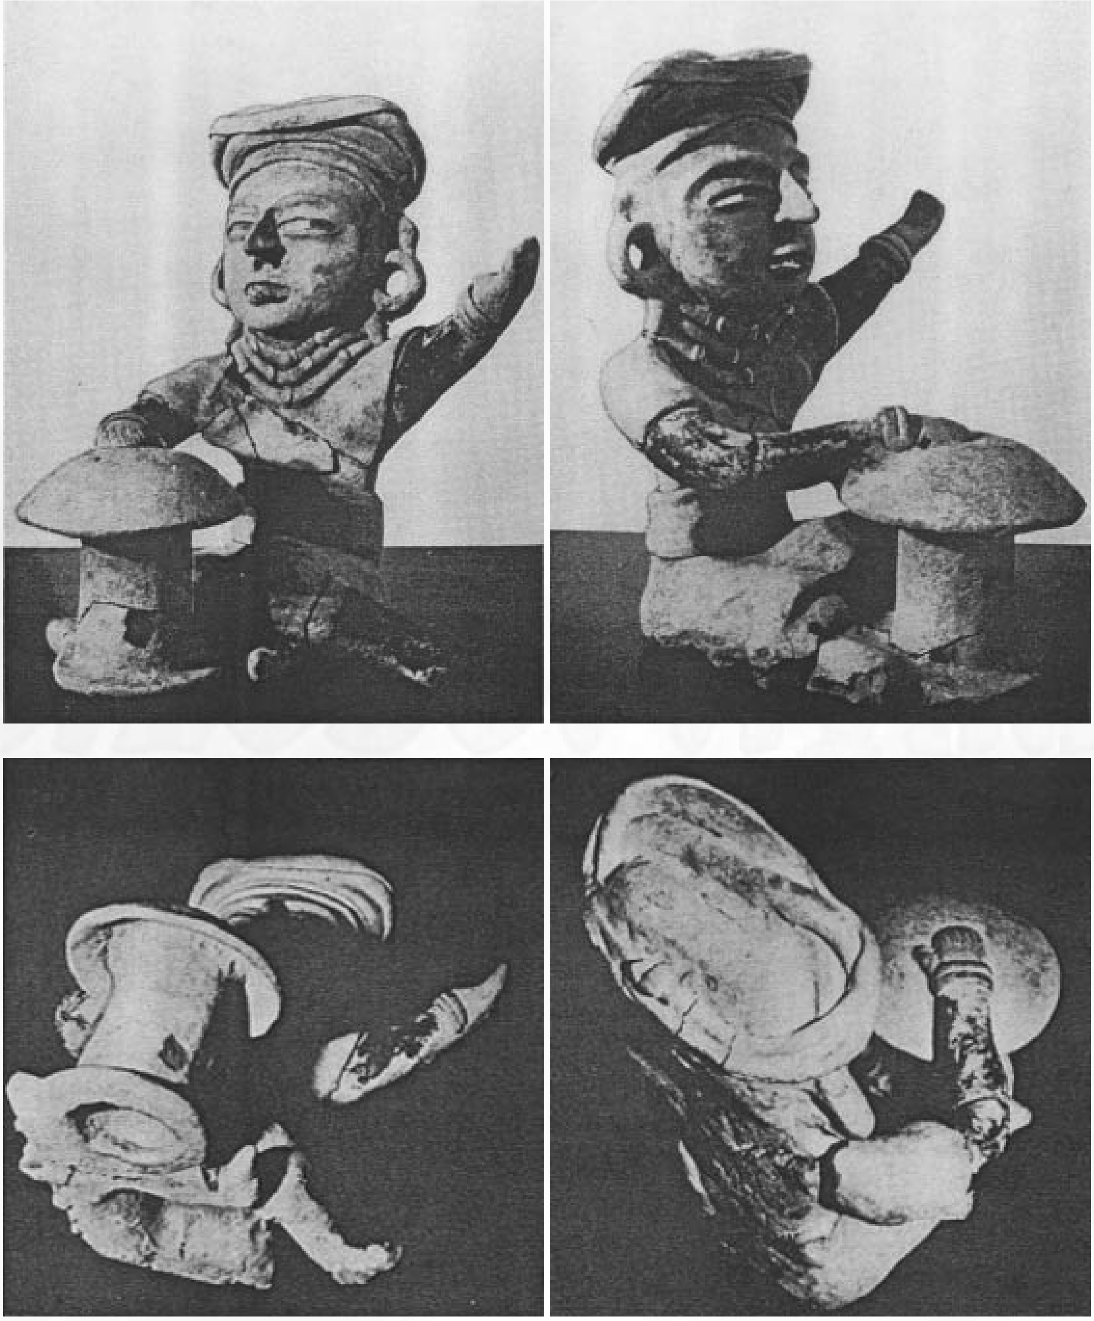
Most recently, Richard E. W. Adams (personal communication 1962) has reported finding several plain pottery mushrooms at the Lowland Maya Rain Forest site of Altar de Sacrificios on the Usumacinta River in the El Peten District in Guatemala. The specimens, according to Adams, are of a streaky brown and dull-red ware, and were found in association with Late Plancha (equivalent to Late Pre-Classic Chicanel) and Salinas (equal to Proto-Classic Matzanel) period pottery. Although I have not examined the specimens from Altar de Sacrificios, Mirador and Berriozabal, I feel certain that they are of the same type as those described earlier from El Bellote and Chiapa de Corzo.



Ryc. 5 - Four views of a Remojadas style pottery figurine from Tenenexpan, Veracruz. Represents a seated, cross-legged woman wearing a turban-like headdress, a square *quexquemitl*, and a beaded necklace. Her left hand rests on a plain, hollow pottery mushroom, while her right arm is extended upward as if in prayer. Part of base near pottery mushroom is missing. Made of yellowish-orange ware. The exposed sections of the woman's arms, legs, and lips are covered with black asphalt paint (*chapopote*). Height: 30.5 cm. Late Pre-Classic or Proto-Classic. Private collection of R. Gordon Wasson, New York (photo courtesy of Wasson; Milwaukee Public Museum Photos 205175B, C; 2A171D).

Chronology and Distribution

Pottery mushrooms are known with certainty from nine sites in Mesoamerica (Fig. 8):

a. Chiapas (*Central Depression*): Guanacaste, Santa Cruz, Chiapa de Corzo, Mirador, and Berriozábal (for location of these sites, see map in Lowe 1959, Fig. 64).
b. Tabasco (*Gulf Coast*): El Bellote, Isla, Ceiba.
c. Lowland Guatemala (*El Peten*): Altar de Sacrificios.

To this list of distribution in Mexico one can add tentatively:

Veracruz: Tenenexpan (Remojadas; see Fig. 5); and Cerro de Las Mesas (Drucker 1943).
Oaxaca: Xaaga, near Mitla.

From Xaaga, near Mitla, Heim and Wasson (1958: 121, Fig. 23 *b*) illustrate and describe nine crudely-manufactured miniature clay cups with mushroom-like applique designs, collected by Saville between 1898-1900. These curious cups are now in the collection of the American Museum of Natural History in New York, and mayor may not be part of the pottery mushroom complex of Mesoamerica. It may be significant, however, that the nine were found together, like the nine miniature mushroom stones found in a Pre-Classic cache at Kaminaljuyú, Guatemala (De Borhegyi 1961).

Since in these areas the pottery mushrooms seem to be restricted to the Late Pre-Classic (Chiapa IV-V) Francesa and Guanacaste phases and to the Proto-Classic (Chiapa VII, VIII, Istmo and Jiquipilas phases), they may be considered as diagnostic pottery shapes of these periods, along with such other diagnostics as mammiform and swollen vessel supports and bridged spouts (Wauchope 1950: Figs. 1-2).

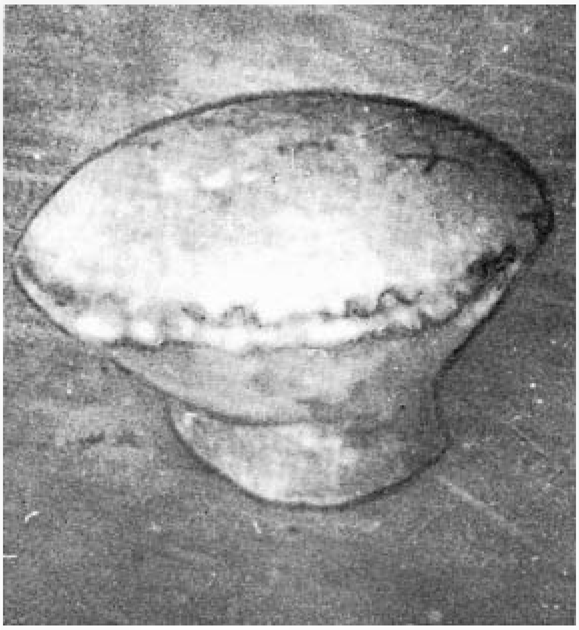


Fig. 6 - Plain hollow pottery mushroom from Santa Cruz, Chiapas (Trench 2, level 4). Coarse paste, unslipped, unburnished, thick-walled utility pottery (Chiapilla ware). Part of stem and base missing. Cap shows shell pecking marks. Top diameter: 12.3 cm. Late Pre-Classic or Proto-Classic. Regional Museum, Tuxtla Gutierrez, Chiapas. New World Archaeological Foundation Collection (photo courtesy Bruce Warren; Milwaukee Public Museum Photo 2A59-8G). This specimen is illustrated upside down by Sanders 1961: 16, 28; Fig. 15 *b*, Pl. 6 *j*.

Present evidence seems to point to their origin in the Central Depression of Chiapas during Late Pre-Classic times. They became increasingly popular during the ensuing Proto-Classic period in Chiapas. Their use and manufacture may have spread to the Gulf coast of Mexico via the Grijalva River and to other parts of the Lowland and Highland Maya areas. When more information becomes available, an equally good case may be brought forward for a Mexican Gulf coast origin. From here, along the same Usumacinta and Grijalva rivers, they could have reached the Highland and Lowland Maya areas and distant El Salvador, along with other Mid and Late Pre-Classic influences deriving from the great Olmec culture center of La Venta (Fig. 8). Be that as it may, we think the plain pottery mushrooms found in El Salvador represent an influence from southern Mexico via coastal Guatemala during Proto-Classic times, rather than the opposite situation previously postulated by Lowe (1959: 75-6). They may even help to explain the presence of many Mid and Late Pre-Classic and Proto-Classic La Venta-Olmec-like traits in El Salvador and further south (cf. Richardson 1940 and Boggs 1950).

Plain pottery mushrooms are known from El Salvador from the following sites (for the location of the sites, see map in Longyear 1944: 77; and Fig. 8):

Hacienda Mapilapa		West El Salvador
Chinameca	(Dept. San Miguel)	Eastern El Salvador
Quelepa	(Dept. San Miguel)	Eastern El Salvador
San Rafael Oriente	(Dept. San Miguel)	Eastern El Salvador
Lolotique	(Dept. San Miguel)	Eastern El Salvador
Santa Elena	(Dept. Usulatan)	Eastern El Salvador

This information comes from personal correspondence with Stanley Boggs (1953) who studied and photographed about 20 plain pottery mushrooms in private and museum collections in El Salvador (see also Longyear 1944: Pl. IX, No. 26; and de Borhegyi 1961: Fig. 2, Nos. 46-8; for Boggs' photos see Carnegie Institution of Washington files in Cambridge). According to Boggs, pottery mushrooms are more common in eastern El Salvador, while mushroom stones predominate west of the Rio Lempa. I believe that an unusual incised, red ware pottery drum from Costa Rica (Lothrop 1926: 275, Fig. 168 *a*) when turned upside down, may actually be a pottery mushroom. If so, it is the furthest known specimen of its kind south of El Salvador. Unfortunately, none of the pottery mushrooms recorded by Boggs and Longyear came from controlled excavations, and so their dating remains a question. However, since some of the pottery mushrooms from El Salvador were made of Usulatan resist ware (Guillemin personal communication 1962; see Fig. 9), it is quite possible that the pottery mushrooms in El Salvador were roughly contemporaneous with their Mexican and Lowland Maya counterparts. It should be noted, however, that Usulatan - a diagnostic ware for the Late Pre-Classic and Proto-Classic periods in the Highland and Central Lowland Maya regions - survived well into the Classic period in various parts of western Honduras and El Salvador (Shook and Kidder 1952: 97-100).

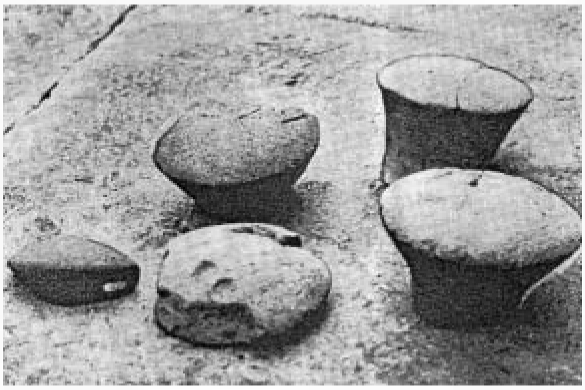

Fig. 7 - Five plain hollow pottery mushroom fragments from Chiapa de Corzo, Chiapas (Trench 131, back of Mound 5A). Coarse paste; unslipped ware. Parts of stems and bases missing. The caps of all five specimens show shell pecking. Range of top diameters: 13-17 cm. Proto-Classic. Regional Museum, Tuxtla Gutierrez. Chiapas. New World Archaeological Foundation Collection (photo courtesy Bruce Warren; Milwaukee Public Museum Photos 2A59-8E, F).

Just how and by what route the use of pottery mushrooms spread from Mexico to El Salvador is not clear. They have not been reported from the intermediate area even though Pre-Classic (De Borhegyi 1961: Table 1, Types A, B, C) and Classic period (Types C and D) mushroom stones are abundant at Highland and Pacific Coastal sites in Guatemala and also in western El Salvador (De Borhegyi 1961: Table 1, Nos. 33, 35, 37, and 39). It is possible, however, that a few hollow, flat-topped, bell-bottomed pottery fragments found during our recent excavations at Bilbao[1] and also whole specimens noted from the nearby archaeological sites of Los Tarros and

El Baul, all located in the Cotzumalhuapa archaeological zone in Guatemala, may represent a local variant of pottery mushrooms. They are made of a coarse reddish-brown "mud" ware, and unlike the pottery mushrooms of Mexico and El Salvador, have solid, flat, seat-like tops (Fig. 10). They are of Early Classic date and bear a slight resemblance to some of the "duck pots" of the Northern Highlands of Guatemala of the same and later periods, although they have neither handles nor effigy features (De Borhegyi 1952: Figs. 5, 6). Further study is necessary before it can be determined whether these seat-like pottery objects from coastal Guatemala form a link in the distribution of pottery mushrooms from Chiapas to El Salvador.

[1] The fragments were found by Parsons in his rest pit excavation (levels 8-11) during the Milwaukee Public Museum's 1961-62 excavation at Bilbao, sponsored by the National Science Foundation. Their resemblance to pottery mushrooms was first noted by Parsons. The ceramic association (Esperanza "mud" ware, Tiquisate ware, and San Juan Plumbate) indicates an Early and/or Late Classic date. Thompson's (1948) excavation at El Baúl yielded one whole and several fragmentary specimens. They were not illustrated or reported by him, but were found by Parsons in the Guatemalan National Museum among Thompson's El Baúl collections (Lot 96) deposited in the Museum.

Postulated Use of Pottery Mushrooms

Although many theories have been brought forth to explain the shape and use of mushroom stones (phallic representations, markers, seats, etc.; see Kidder, Jennings, and Shook 1946: Pl. 142; De Borhegyi 1961), nothing has been suggested so far concerning their pottery counterparts. If, as I believe, they are related in concept to mushroom stones, then they must have been used in the sacred mushroom ceremonies of Pre-

]

Columbian times during which mushrooms (*teo-nanacatl*; *Psilocybe mexicana* Heim) were ritually consumed to induce hallucinatory trances and fantasmagoric color dreams (Wasson and Wasson 1957: 223-4; De Borhegyi 1961: 503).

The humble pottery mushrooms, unlike their stone counterparts, are generally plain and do not represent any human or animal forms. The only exception is the specimen from El Bellote (Fig. 4) which represents a bearded and moustached individual, possibly a manifestation of the rain god (Tlaloc). Due to the fact that the distribution of mush room stones and pottery mushrooms overlaps in Tabasco, Chiapas, and El Salvador, it is clear that pottery mushrooms are not simply regional substitutes for stone mushrooms. Mushroom stones are numerous in all parts of Highland Guatemala and also in Oaxaca (especially in the Mixtequilla region), areas where pottery mushrooms have so far not been found (De Borhegyi 1961: Fig. 2). Both are present in areas where stone for carving was abundant, and are hardly beautiful enough to have been luxury or trade items. Moreover, pottery mushrooms were manufactured from local clay and in the prevalent local style. Nor do pottery mushrooms seem to represent a chronological variant, since Types A, B, C, and D mushroom stones are present in southern Mexico, Guatemala, and El Salvador from Early Pre-Classic times until the end of the Late Classic with a possible hiatus during the Early Classic.

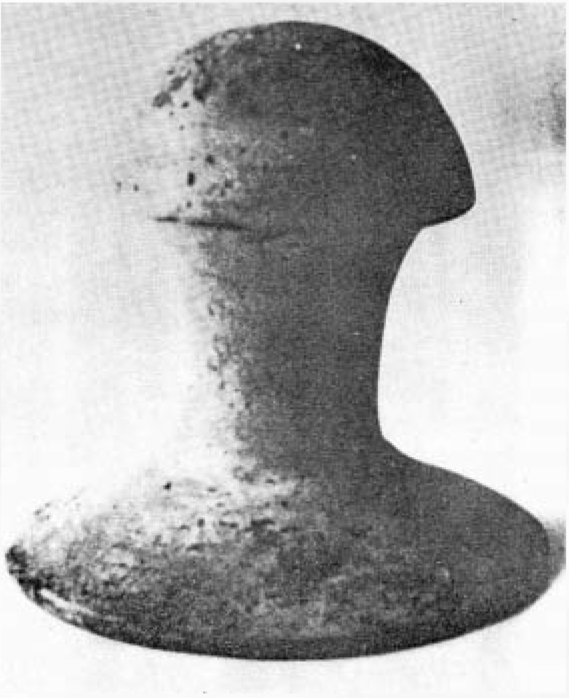

Fig. 9 - Plain hollow pottery mushroom from the Department of Usulatan, El Salvador. Negative-painted Usulatan ware. Height: 22 cm. Proto-Classic. Private collection in Guatemala City (photo courtesy Guillemin).

It can be suggested that pottery mushrooms were probably used in Pre-Columbian times by persons unable to afford the undoubtedly more valuable and harder-to-come-by mushroom stones, although the rich content of the sealed tombs at Isla, which contained a plain pottery mushroom (Stirling 1957: Pls. 65-6), seems to contradict this theory. That pottery mushrooms were for use exclusively by females in mushroom ceremonies, as suggested by our unusual specimen from Remojadas (Fig. 5), is an equally weak supposition, since many of the mushroom stones also represent females, either seated or grinding the sacred mushroom or *ololiuque* seeds on a metate (De Borhegyi 1961: Fig. 2, No.7, and Fig. 3).

A curious fact that should not be overlooked is that many of the pottery mushrooms, unlike the mushroom stones, show textile and fingernail imprints and signs of shell pecking on their caps. In this respect, they resemble the mushroom- shaped ceramic molds used today for making pottery in many parts of Mexico, such as Tzintzuntzan (Michoacan) and Metepec (state of Mexico; see Foster 1948: Figs. 2-3). Moreover, some of the Pre-Columbian pottery anvils from North America, although much smaller in size (Foster 1948: Fig. 6; and Barrett 1933: 342, Pl. 95), bear a slight resemblance to the pottery mushrooms of Mexico and El Salvador (Fig. 11). In this respect it is important to note that the mushroom-shaped modern ceramic molds of Mexico and the Pre-Columbian pottery anvils always have solid stems (handles), while the stems of the Pre-Columbian pottery mushrooms are invariably hollow. This suggests a major difference in concept and function.

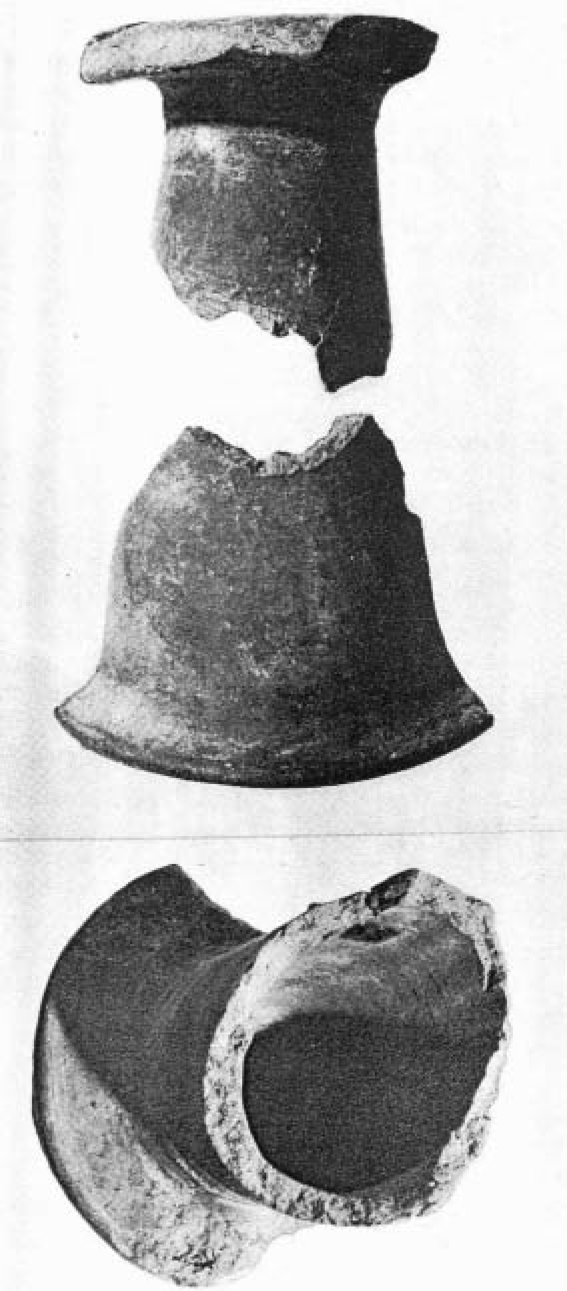

Fig. 10 - Plain hollow mushroom-like object from Bilbao, Cotzumalhuapa, Department of Escuintla, Guatemala (test pit, levels 8-11). Crudely manufactured; coarse paste; thick-walled reddish-brown "mud" ware. Parts of stem and base missing. Cap is solid and shows thumb marks, but no other markings. Approximate height: 26 cm.; top diameter: 13 cm.; base diameter: 15 cm. Early or Late Classic. National Museum, Guatemala City. Milwaukee Museum Bilbao excavations (Milwaukee Public Museum Photos 2A147J, L).

Until further evidence linking these pottery mushrooms to the Pre-Columbian mushroom cult comes to light, there remains a disconcerting possibility that some "pottery mushrooms" were actually molds used to form humble culinary pottery objects. But if they had no more exalted function, why were some of them included in rich tombs along with such luxury objects as carved shell forgets and jade beads (Stirling 1957: Pls. 65-66); and why have paddles, the necessary tools to the anvil process, never been encountered among the archaeological finds of Mesoamerica?

These and other questions still await answers. Meanwhile, it becomes increasingly clear that "pottery mushrooms," like mushroom stones, had a wide spatial distribution in Mesoamerica, and that a cautious re-examination of all round-bottomed, tall-stemmed, Late Pre-Classic and Proto-Classic jars in archaeological finds in the areas cited above, is in order.

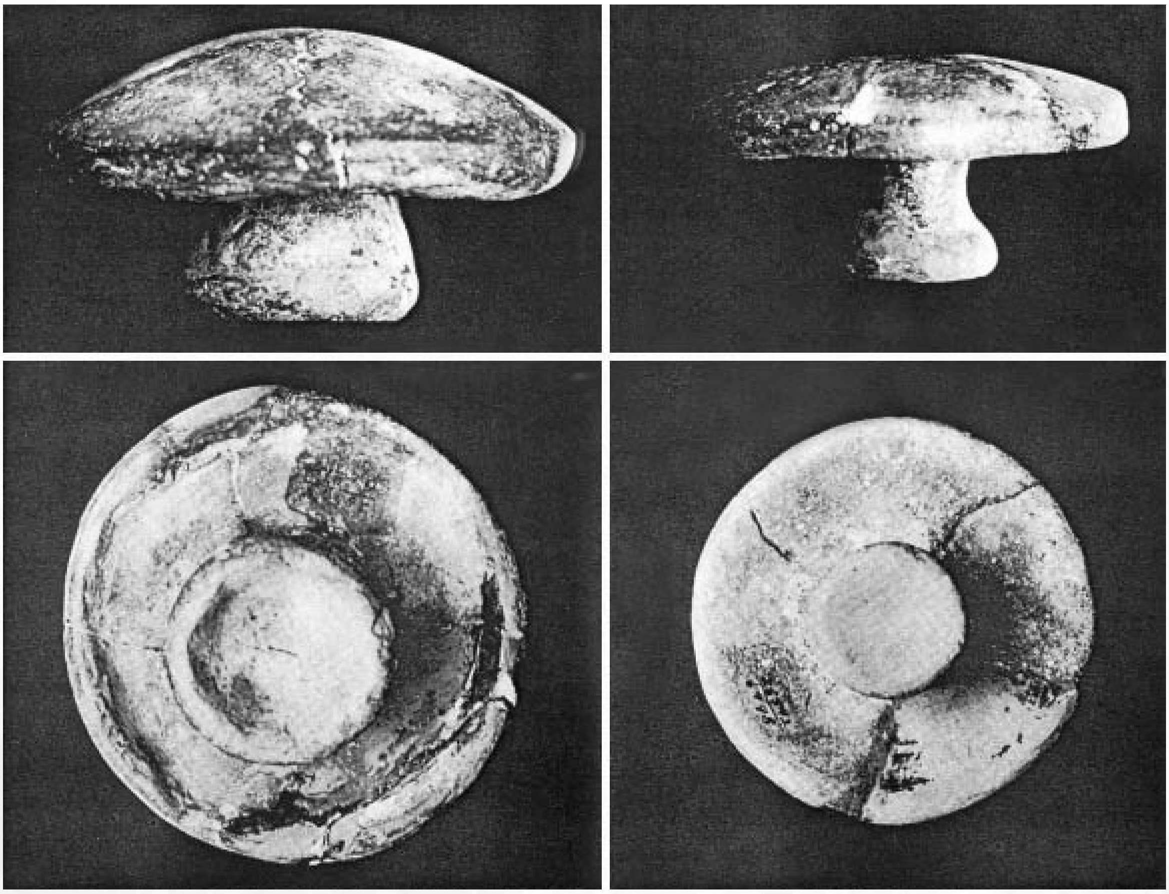

Fig. 11 - Two pottery shapers and modeling implements of mushroom form from the site of Aztalan, Wisconsin. Coarse ware. Heights: 5.7 and 4.4 cm.; top diameters 10.5 and 9 cm. Dated as approximately A.D. 1200. Milwaukee Public Museum Collection, Museum Nos. 26542, 26543. See Barrett 1933: Pl. 95. Photo Milwaukee Public Museum.

Acknowledgments

I wish to express my gratitude to the Trustees of the Milwaukee Public Museum and to the National Science Foundation, under whose auspices the 1961-62 archaeological research in Guatemala and Mexico was undertaken. Thanks are also extended to Gordon Wasson for the use and photographs of the specimens in his collection (Figs. 2-5) and for his never-failing help and encouragement toward research in mushroom lore. To Bruce Warren and Lee Parsons goes my appreciation for their stimulating ideas and comments, and for the use and photographs of the various specimens shown in this article as Figs. 1, 6, 7, and 10. Thanks are also due to Jose Luis Franco, Matthew Stirling, Stanley Boggs, Gareth Lowe, Richard E. W. Adams, and Jorge Guillemin, for supplying various useful data and comments. The map (Fig. 8) was prepared by Milwaukee Public Museum artist, Leland Tishler.

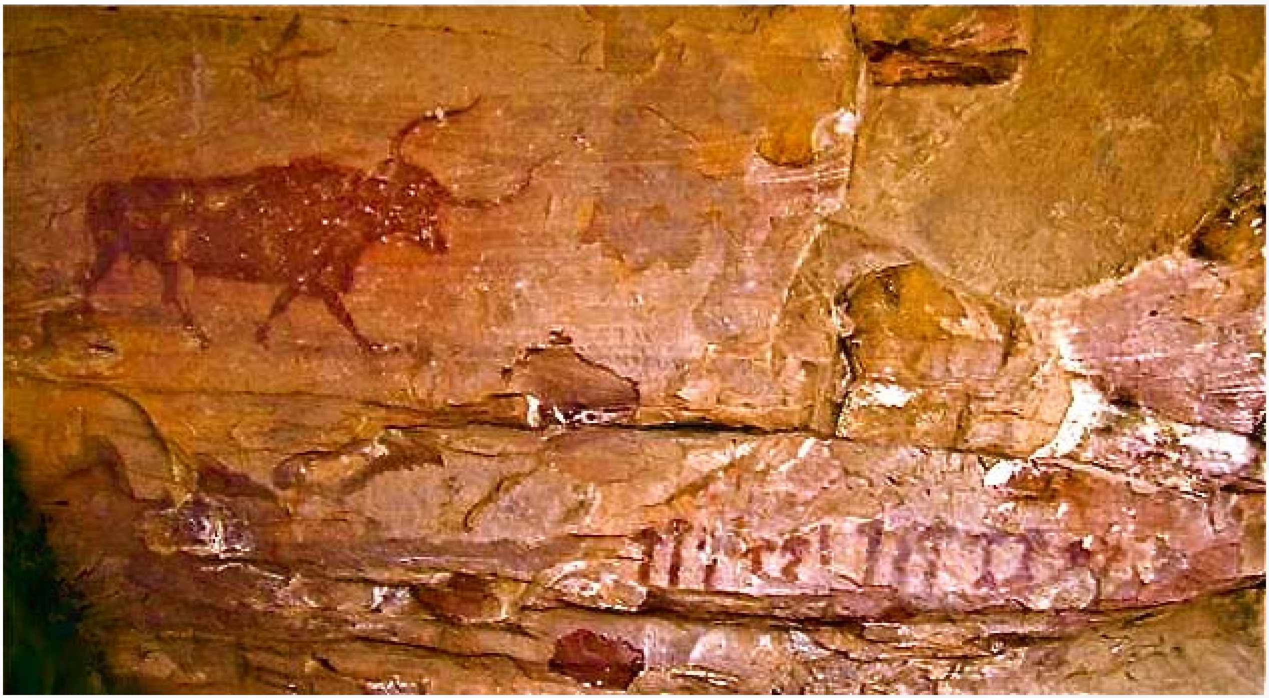
A Cave In Spain Contains the Earliest Known Depictions of Mushrooms

by

Brian Akers

original text: http://www.mushroomthejournal.com/a-cave-in-spain-contains-the-earliest-known-depictions-of-mushrooms/

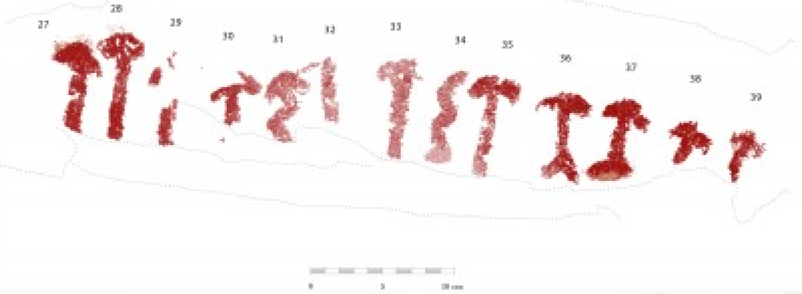
Selva Pascuala is a prehistoric archeological site in Spain with fungoid rock art. An upcoming article in *Economic Botany* reports on recent study there by an international multidisciplinary team. Research united archeologist Juan Ruiz, foremost expert on this site, with mycologists including Gaston Guzman, the leading authority on *Psilocybe*. Results suggest post-Paleolithic ritual use of psychoactive fungi. Comparison of local fungi with the fungal pictographs even pointed to *Psilocybe hispanica* as possibly the species depicted there. MTJ previews findings with the corresponding author, who first learned of the site thanks to his co-authors Carl Ruck and Alan Piper.



The Selva Pascuala rock painting, with bull at upper left and mushrooms lower right.
Photo by Alan Piper

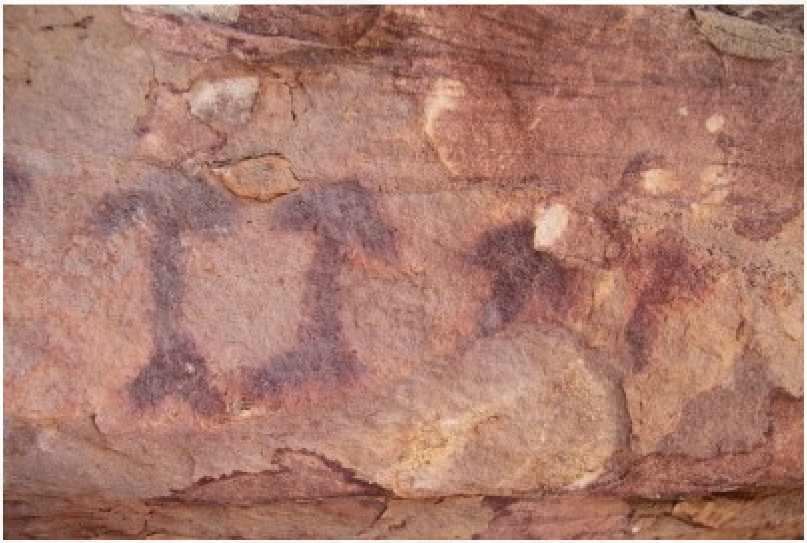
Leon: Can you tell a bit about this discovery, what's actually there? If we just start arguing medias res no one's going to know what we're talking about.

Brian: The Selva Pascuala rock shelter is a landscape formation in eastern Spain discovered by an archeologist in 1918, with prehistoric painted rock art; two panels including the one of interest, a mural prominently featuring mushrooms and a bull. It's one of a couple dozen similar sites with Mesolithic-Neolithic rock art in Spain's Mediterranean basin. The styles and content of this post-Paleolithic art in eastern Spain recall the older, more famous Paleolithic cave art, except it doesn't illustrate species that went extinct after the Ice Age ended and it's not found deep in caves, more open sites being typical. I was pretty startled when Selva Pascuala was brought to my attention, with its remarkably expressive art style, and this fungal angle. If ever there was archeo evidence on fungi - especially psychoactive in regional European prehistory, that could perhaps stand up to hard peer review for proper critical presentation as such - it looked like this might be it.



Selva mushrooms on their own.
Photo courtesy of Juan Francisco Ruiz López

Aha! Hmm... some of those look like mushrooms; some of them don't. Interesting.



Broken mushroom images of Selva Pascuala.
Photo courtesy of Juan Francisco Ruiz López

Ah; but when is "look like" reliable, versus deceptive? And which way might we more likely be fooled, in that case? Good point you raise: what are we seeing here in the mural? Perhaps the evidence itself can shed light; as I think it must. In that vein, see what you think about this close-up shot, zeroed in on caps in doubt. That's Triassic sandstone, not the most durable rock. And these figures are 6-8K years old, from carbon dating. Just think of the elements working their evil hand on that surface over that long haul of time! What we see is nothing pristine, only what's left. Where caps are missing we can see cratered pockmarks, rock face lost to the ravages of time and natural processes.

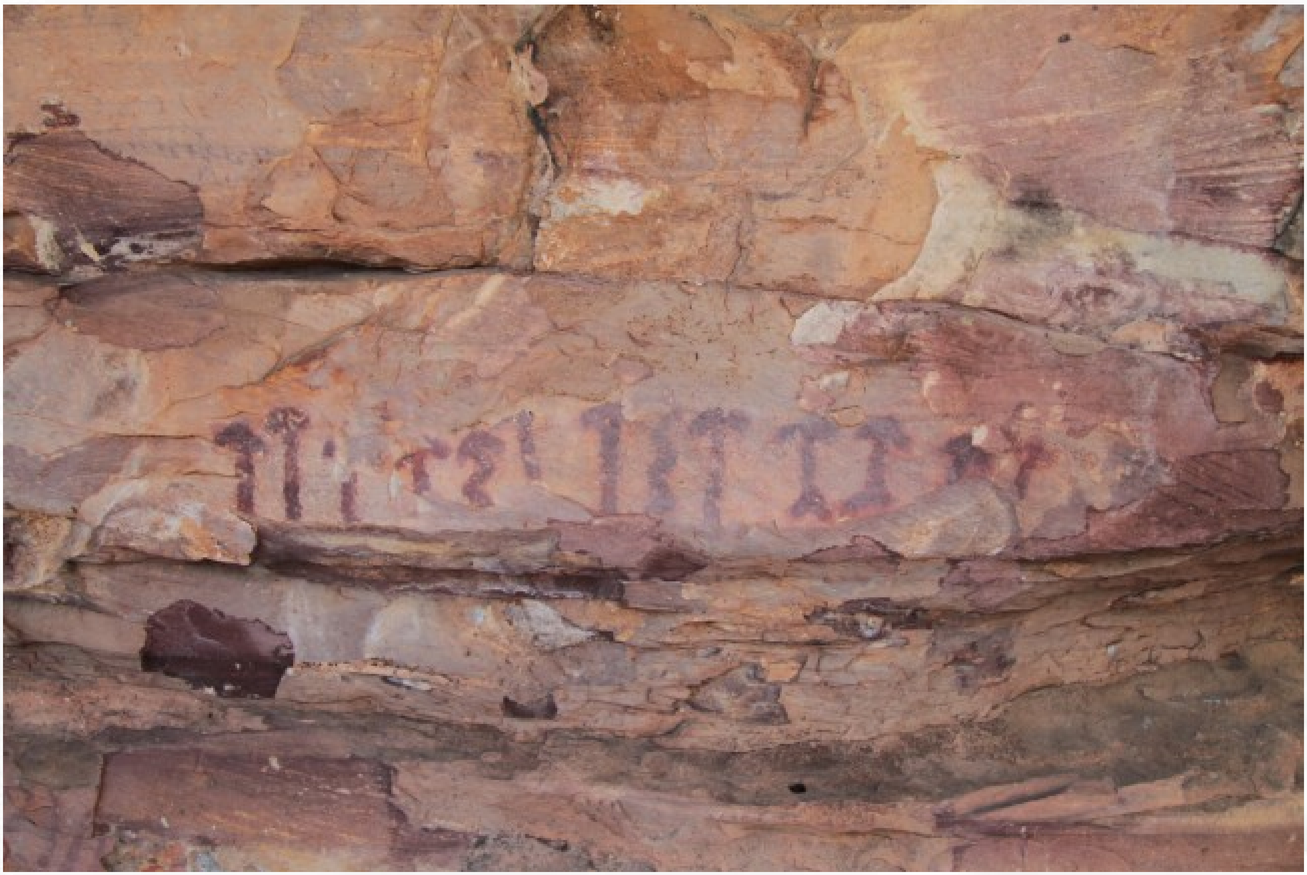
Some of the figures are fairly well preserved, good data points. But beware of others that are more worn, inviting misimpression. Stalks are mostly intact, but - it's like that old bumper sticker says: depileation happens. Erosion has made some mischief here; that minx, what a lively sense of humor. Long story short, the case of the purloined pilei proves something of a red herring; a Scooby-Doo caper by Mother Nature and her gang (she might have gotten away with it too, *if not for those meddling kids*).

But your larger point is crucial: are these mushrooms we see before us? - the very heart of the matter. Perhaps we could instead determine the figures are abstract 'signs' we can't 'decode;' and any resemblance to actual fungi, living or dead, is purely coincidental, or in the eye of the beholder? Indeed, how can we be sure the bull is a bull, for that matter? Maybe in some essential sense it's really an enigmatic figure; onto which we unwittingly project a culturally arbitrary notion "bull," imaginatively - like seeing shapes in clouds, perhaps? Maybe everything is 'just a social construct?' Sort of like evolution, 'just a theory'? What if, objectively speaking of course, there's no such thing as objectivity? Is everything relative, absolutely? I can get a bit apprehensive of slipping through a looking glass at some point, following deliberation along some lines.

Nothing against rationalism (as opposed to rationality); or torture of reason, clever rhetoric, whatever. But golly, what about evidence? The mural shows not one or two, but thirteen figures in a row; which affords pretty good comparison. And as we can see, it's no mere static repetition of some abstract motif or design logo. True, it's not photo realism. But it distinctly illustrates a range of interesting variation in the stalk and cap, resembling individual differences in actual specimens, whatever species. I don't think you have to be a mycologist to see that; *but it couldn't hurt* ;-).

It's this richer, more myco-detailed information in the mural, along with the generally mushroom-like appearance, that I think speaks for itself. There's really quite a bit there to explain. I'd welcome a plausible alternative hypothesis; or a statistical test.

Not to tout science, but I find the better emphasis rests in good data, no matter what theory it supports. Front burner: evidence. Otherwise, we can slip into 'believe it or not.' Its too easy to get swept away by theorizing, rhetoric, hermeneutics - tools of philosophy predating the scientific revolution. Ecce homo.



The mushrooms of Selva Pascuala in situ.
Photo courtesy of Juan Francisco Ruiz López

I do see your point about the variability of the rock images matching the variability in the mushroom. That's quite nice! But I don't know about the psychotropic interpretation - there are no rainbows emerging from the mushrooms, after all; and certainly the mammals in the picture aren't psychotropic.

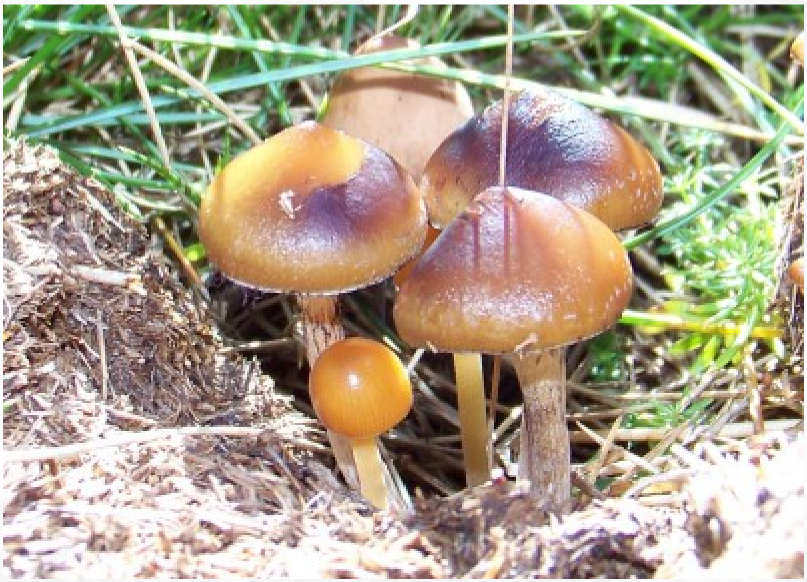
Many a true word is spoken in jest. And once again, you touch on key points - did you mean to do that? One might be a general premise, that the modern counterpart of native ritualism is our carefree, ever-loving rainbow counterculture. The Indians are trippers, dude; and Selva Pascuala points to stone age stoners, right? Such a notion may hold some romantic appeal to our inner psychedelic caveman. And it offers news copyists an angle - which makes it the story, no?

Well, popular fancy aside, I don't know of any indigenous concept of being a 'tripper' (or not). Native customs aren't some freaky-radical, far out thing. Shamans are more like - square. They carry the old folks' seal of approval; any fungi involved, too. Native rites aren't against a mainstream, like some generation gap or rebellion (much less partying!). They're deeply rooted, within norms, and uphold what the old folks say; consultation services of a specialist with both ritual and material business aspects. Going to church, or the doctor, native style, might be a better analogy than a Dead concert, or Burning Man (or rave, 'acid test' etc.).

It's a subtle point; all nuance. Even some anthropologists have said things like: "Psychedelics may be new to modern society, but users seldom realize they're merely reverting to ancient, traditional practices." Well, same type fungi may figure in both settings, true. And such an idea may be stimulating. But I find a fundamental contrast, not comparison, between native contexts of usage and the contemporary subculture of popular

interest - psychedelia. To me they seem fairly unrelated cultural patterns, even opposite. So for our post-Paleo mural, I'm not sure how much of a test we can get from rainbows. I know you're kidding to a degree, and I don't mean to sound all serious. But you deftly touch on some things aswirl in the mix here.
True, the herbivores aren't even psychoactive; but I bet they're still righteous smoke (mmm bbq). Seems a safe bet those species were present in that locale back when too, along with any fungi the mural portrays. Just to make sure you know, *Psilocybe hispanica* happens to be coprophilic; grows in manure too. Sheer synchronicity; maybe. Or were you just having a l'il fun?

My remarks were playful, but the serious portion of them would be that it's hard to see how one could narrow those illustrations down to any particular mushroom? They are, after all, quintessential LBMs - just brown pigment in a mushroom shape!



A cluster of *Psilocybe hispanica* in horse dung. The caps are light brown, and some of them are showing dark purplish spore deposits dropped by other mushrooms in the group.
Photo by Ignacio Serál

Funny, what my field guide says: "*Psilocybe hispanica* is the quintessential LBM!" Next question? Sorry; trying to kid. Of course you're so right again. Armchair theorists might roll eyeballs, go 'humbug' at any suggestion, even the most general, of mushrooms in rock art - but now, species? They'd have a field day. Surely no evidence could bear the weight of such a claim; and water boarding needed to force it in the first place! But you word it right and well I think, as a "how" question. Any answer must logically lie in method; otherwise Rorschach effect awaits. We get any result we want that way. Ancient astronauts, anyone? Evidence resides not in arguments, or how something looks to us (whoever we are), but what can be shown or demonstrated.
In this case, it boils down to visible, verifiable similarities between the figures in the mural, and regional *Psilocybe* species. Specifically, Gastón Guzmán alerted us to this *Psilocybe hispanica*, its manure habitat (a possible link to the mural's bull), and overall match with the pictographs. He cited *P. semilanceata* too, as a better-known species more widely distributed. But he noted it has a typically narrower pileus than *P. hispanica*, and a more acute apex, thus resembling the mural less closely; nor does it grow in manure.

Since publication, I've heard from Ignacio Serál, who lives in *P. hispanica*'s neighborhood (Aragon region). In fact it was Ignacio who discovered it, and brought it to Guzmán's attention (through Jonathon Ott, I'm told). Ignacio would be thrilled if that's his mushroom in the mural; but he notes *P. semilanceata* can also have a somewhat broadly bell shaped cap, like the figures. And, he suggests its more acute apex is just too fine a point (ahem) to hold much weight of analysis; which is only sensible I think, especially considering the graphic style and technique of the fungographs (not as fine-tipped as the bull). Above all he points out, although *P. semilanceata* may not grow in manure, it has a definite preference for manured grounds, where in fact its common. So it could be related to the mural's bull by common habitat, just as well as a coprophilic species. In fact, *P. hispanica* has been found at only one locale so far, about 170 miles from Selva; and only in horse manure not cattle. True, coprobic species can usually grow in either. Bottom line, insufficient data; inconclusive. So I can only agree, there's good reason not to over-emphasize any one species, and better not to

sharpen that pencil lead too much. That the area harbors species matching the mural, rather markedly, is the important finding; the core hypothesis being that the mural portrays genus *Psilocybe*.
With its wide distribution, *P. semilanceata* has long had a place in post-Wasson notions of mushroom rites in prehistoric Europe. Nor is close encounter with it unlikely, as a 1799 poisoning case of record may reflect (Sowerby 1803, for myco-hardcores). Seems its path has crossed ours, well before the advent of magic mushroom hunting. Big picture is, at least two regional *Psilocybe* species have features similar to the pictographs, both found in manured fields. And ethnographically, I doubt our post-Paleolithic Pascualans would have necessarily differentiated one from the other, as in our species concepts and classification.

Broad-capped *Psilocybe semilanceata* from nearby Spain.
Photo by Ignacio Serál

Well, it seems a bit disingenuous to say that your interpretation of the painted mushrooms as hallucinogenic was vindicated Gaston Guzman's ID of them as *P. hispanica*. Of course he's an expert, but you decided to enlist him and not, say, Maj Padamsee, our current expert in *Psathyrella*. When you asked Gaston for an opinion, you could be pretty sure that he wasn't going to say "You know, I just don't think it's a *Psilocybe*; I think it's some other sort of LBM."

Looking back, maybe I could have been sure, as you say - if such a thought (or worry?) had crossed my mind! But I didn't have any prior frame for what or how Guzman might advise or not. I was certainly interested to know, of course, and meant to find out. I figured the mural would be of interest to him in any case, and considered him the source par excellénce for possible comparison with *Psilocybe*. That there might well be one seemed clear; but I didn't explicitly ask him, "Do you think ...?" I figured no need; that question was in plain view, written right there on that wall (so to speak).
I don't know Maj Padamsee, though I'd be delighted; any mycological input on our mural would be of interest. But the idea that it illustrates *Psilocybe* goes well beyond graphic details that visibly match, beyond mycology itself, to the anthropology of fungi and the cross-cultural profile of *Psilocybe*; especially compared with something like *Psathyrella*. True as you hint, these genera look LBM-alike, but - they're miles apart ethnographically.
Not that *Psilocybe* ritualism is widespread, but it does exist. And it's no freak. It has its context, analogies; it ties in squarely to larger cultural patterns. By comparison, I don't know of any rites particular to *Psathyrella* across culture, nor even many secular applications. The Haitian 'djon-djon' [a *Psathyrella* that is a popular edible mushroom there], is an exception; but I wonder if that's deep-rooted tradition, or does it mainly reflect history, local poverty, resource crisis (nothing to eat?).

Various fungi are widely depicted of course, endlessly celebrated in art; but mainly in mundane, non-ritual contexts. Hallucinogenic-looking fungi may slip into kitchen decor, if they're pretty enough (depending on the kitchen?). But its hard to conceive a taxon of such scant cultural presence as *Psathyrella* sneaking into rock art. I'd agree though, it would have to be considered - if fungal morphology were all we had to go on, unaided by a bigger picture from ethnography, regional and site archeology. But this is why the broad interdisciplinary framework is vital for study here. I'd suggest a non-psychoactive LBM is simply unlikely - but on more specifically cross-cultural, rather than mycological, considerations.

It may seem a bit silly for prehistoric people to get all excited about a *Psathyrella*, or a *Conocybe*, or whatever, but we don't know what tastes they had. Larry Millman did a stint with former headhunters in Borneo, and found that their favorite edibles were *Xylaria polymorpha* (when young and just emerging: "pig's nipples") and *Calostoma cinnabarina* (pig's eyeball; they seem to have a thing for pigs). On one walk, they found a large *Agaricus*. Larry got all happy over it and told them how popular it was in America, and the head-hunters got all embarrassed and had to work real hard to find tactful things to say about our strange custom.

Whoa, hip ethnomycographic data. What a difference it makes when a cross-cultural observer knows an actual fruiting body from a carpophore. Sounds like he gave those ex-headhunters a nice little cultural moment too. Chalk up another *Agaricus*-related faux pas? But if they eat dead man's fingers, does that make them cannibals as well? Ah, the varied customs of different peoples. Strange in general, and food-wise; 'fungal delicacies' too. Well, you tell Larry Millman's Bornean friends they must not have read wikipedia on *Xylaria polymorpha*; it plainly says: "inedible." Which letter of that word do they not understand? But now what's this stirring; curiosity, to - taste it?
No slight to strangeness. Hey, how about our popular contemporary 'mushroom hunting' culture pattern? You know, the one we know and love, excitedly share; spread like a disease if we can? Shall we compare such passion to a summer fugu feast? Well, I'm sure every culture has its "extreme sports" (not always culinary), ways of walking the proverbial razor's edge, laughing in the face of death. I love my wild fungal goodies, I consider the hours I spend porcini-hunting golden. But is it risky; shall we count the ways? The customs, the species; take our weird celebration of *Laetiporus* for some choice edible fungus - please! Ok it tastes real good. And many can eat it without ill effect to whatever degree. But it has sure sickened some; I can testify (can I get a witness?). Only one confirmed kill on record for it, or at least, reported in NAMA's 30-year study.
But I gather our headhunter data concern food procurement, a general economic-subsistence activity. I'd emphasize that as a secular rather than ritual function. And the archeo data are important here, because our mural's signification rests on the interpretation of the entire site. It's possible the figures have no ritual meaning, but I suggest it's unlikely. For one thing, neither these painted rock shelters in Spain, nor the caves with Paleolithic art, were habitation sites.

Contrary to a scene from ONE MILLION YEARS BC, etc, nobody was living at these places, decorating their domicile. These are remote, austere locations, far from the beaten path and difficult to reach - even hazardous. Visiting them would be serious business, on clear intent. To just see it, gawk? A consensus has been emerging among specialists over decades that these sites generally reflect some sort of magico-religious use and meaning, likely including shamanistic. You've read up Lascaux, I bet, ideas about it; "scene of the dead man" there - he's nawt dead he's tranced out (?).
As you astutely intimate, fungal customs across culture are a many-splendored thing; and we need more data to improve our basis for comparative analysis. Still, perhaps we know enough to ask what kind of fool prehistoric ritual site would feature iconography of fungi merely edible rather than psychotropic (no matter how delicious)? In its cultural context, Selva Pascuala likely reflects not culinary but rather ritual use of fungi. But I must say you frame the questions superbly, bringing greater clarity to them with your solid fungal know-what; no call to dumb down gory details. Indeed, this type inquiry needs cross-cultural myco data like you cite - a refreshing change of pace. More often I see questions 'jumped,' raised without well-informed basis; judging by some "oops" glaring myco-bloopers I witness in some of the literature.

The Torre Balbina, a spike of stone on the ridge overlooking the Selva Pascuala cave.
Photo by Juan Francisco Ruiz López

Maybe they're boletes, a yummy food in the area.

Well, now, them's much better fixin's for "The Fungal Gourmet Goes Native." No denying, broader appeal there, rich traditions. But again, the whole ritual aspect... and - hey now, boletes aren't even LBMs! (are they?) Although hm, not sure now what percent serious you are, and what percent kidding. Or were you playing "both sides against the middle" perhaps (you crafty man)?

I was partly kidding about the boletes; though in that part of Europe I'd be more on the lookout for *Lactarius deliciosus* if they were going to depict an edible.

"That part of Europe!" You sound so traveled, so worldly. Know the region? Alas, I'm so provincial; just a good old boy. But if we're back to single species ideas, this mural might be getting to you? Although, following a cross-cultural data trail leads to a more comprehensive framework of myco-ethnology. Maybe another major perspective waits there for our multidisciplinary foundation; one last main angle of lighting maybe, on the relative likelihood an edible fungus would be depicted in this context.
Some anthropologists theorize that subsistence mode, the material adaptation by whatever tools/techniques to whatever food sources, more or less shapes the rest of any culture, i.e., social life, narrative and ritual traditions etc. 'Cultural materialist' theory follows from Marx - sort of hailed (in 'campus rad trad') as a

founding father of social sciences - that our thoughts, beliefs, etc., are largely dictated by our circumstances. Man's mind does not determine his material conditions; rather, man's conditions determine his mind - sort of thing. Sounds vaguely Nietzche-esque, recited that way, doesn't it? Well, those were days, an era of history - "it was a simpler time ... "

But certainly, physical sustenance, metabolic nutrition, is fundamental - a bare necessity. And across culture we'll find a wide gap there, for the relative significance of mushrooms compared to animals and plants: to my knowledge, without exception, no matter what the culture pattern, every society the world over is critically dependent for its survival, exclusively, on plants and animals as food, in whatever proportion. There's no culture anywhere in which fungi, however consumed or enjoyed, are vital as sources of nourishment. Fungi mostly don't contain much energy. Like celery and onion, they add a lot of flavor, and may have vitamins and iron. But they don't pack the carbon nutrition, the digestible proteins, lipids and carbs to serve as staples for our metabolic needs. Various species may be eaten depending on local traditions, which run the gamut. But there'd be no hunger crisis without mushrooms; one of cuisine maybe.

Plants and animals on the other hand, select species (cereal grains, legumes and root crops), have been humanity's lifeline; still are. They've stood between our kind and starvation from before we were bipeds, as they will into futurity. Fungi have claims upon us, but no such importance as that. Rather, the greater cross-cultural mark they've made in pre-history seems to stem from the psychoactive effects of certain species, and the resulting cultural interactions or responses, especially in terms of religion, myth and folklore, or story and narrative traditions, etc.

Many anthropologists theorize that shamanism in whatever form(s) was a major foundation of prehistoric culture, ultimately ancestral to medicinal practices and religion as known historically. Consider the significance of the animals shown in rock art for a prehistoric stage: hunting-gathering, nomadic herd-tracking - physical survival totally dependent on those prey, all bets placed there. They don't have to be psychoactive to be of mortal, ritual importance, and rock art is all about them as we see. Life itself revolves around them. But fungi, to rate sacred, are another matter. So it comes down to their relative economic insignificance - compared with their spiritual-mythic relevance.

I guess it took me a while to get your point about the ritual nature of the site - I was thinking "Well, why should the mushrooms have to be hallucinogenic? The big animals aren't." But if I understand you right, you're saying that mushrooms weren't an important enough food source to rank up there with bison, etc. on that basis; so if they're on the wall it must be for another reason, ergo ... magicness. Is this indeed your line of reasoning?

Exactly, that's the delicate intersection point, where our disciplinary perspectives converge, the ethnobiology. I think you get some idea, perhaps, how multi-component the research aspects are. Its challenging, crisscrossing tripwires of divergent fields, each with its technical depth; a lot to take into account, best as we can if possible. Myriad pitfalls, so many wrong moves possible. A regular temple of doom. But I digress ...

Spain is interesting territory for ethnomycology. I think Wasson's observation of sharp differences of tradition, mycophilic and mycophobic, has some merit. But to explain the pattern, and this ambiguously charged stimulus fungi seemingly present, is a whole 'nother magilla. And of course there's more to the story of fungi across culture than the fallout of mind-altering types. Our site expert and co-author, archeologist extraordinaire Juan Ruiz, isn't convinced myco-cultural prehistory is the root of it all. He considers differences in fungal attitudes between Basque, Catalon and Castilian (the latter reckoned mycophobic by Wasson) may not be so sharp, and variation in vocabulary and customs, etc., may correlate primarily with contrasting ecosystems of their home turf. Richly forested biomes offer more edible and thus commercially valuable species. Native peoples in such regions may appear more mycophilic simply because more fungal resources are readily available to them, he notes. An interesting field study might be done in Spain; strikes me as an intriguing part of the world for such questions.

Though the climate was quite different back then, and perhaps also the trees/mycorrhizal fungi.

Perhaps? Speculation your honor - inadmissible! Actually, good point again, that is a potentially critical factor. We dug into studies on paleoclimate in that part of the world. Whether it was exactly the same as now isn't clear, and there have been fluctuations even in historic times. But the Ice Age was long over by 6,000 BC. And as our article notes, the paleo-eco evidence indicates modern-like forests were well established by then. We see the mural shows familiar, contemporary animal species; but no extinct Pleistocene megafauna, a difference from older Paleolithic art. As climate fluctuates, ecological zones likely creep up or down in altitude, tracking with any change. But we found no basis in past climate data to question the idea that species known in the region today would not have been present 8K years ago.

Are there other cave-paintings of mushrooms elsewhere? If these are our first/oldest depictions of mushrooms, then surely we should celebrate them regardless of why they were created. Is Selva Pascuala the earliest (reliable) depiction of mushrooms?

There are a few other cases of rock art attributed to some kind of mushroom ritualism. But for reliability, I can't put anything next to Selva Pascuala. Its naturalistic style of representation, along with the coordinated archeo and myco study, dated by radiocarbon, etc. puts it in a class by itself, for evidence of its kind. I believe that it's the first such to have garnered critical peer review for proper scientific presentation. As to its age, the only comparison I know of may be rock art in a cave at Tassili, in the Sahara Desert, Algeria, as reported by Samorini. But I'm not sure how secure its dating is compared to post-Paleo rock art of Spain. A popularly published drawing based on one of the Tassili figures has become an icon of post-1990's psychedelia. But Tassili's pictorial style isn't exactly 'from life.' It's nothing even remotely like the semi-naturalistic detail we see at Selva Pascuala. Its vivid but in a different way, abstract-bizarre. Alas, poor Tassili: it's among the sites favored by ancient ET theorizing; nice competition for mushroom fancies eh?

I've seen photos online of the Tassili "bee-headed shaman" and - quite apart from the bee-headedness - he's drawn as if he's wearing mittens in the original, which does not stop all the redrawings of him from having several mushrooms sprouting from each hand. I find the leap from one to the other really strange. If that's the closest competition, then it seems that Selva is by far the oldest mushroom images that we have.

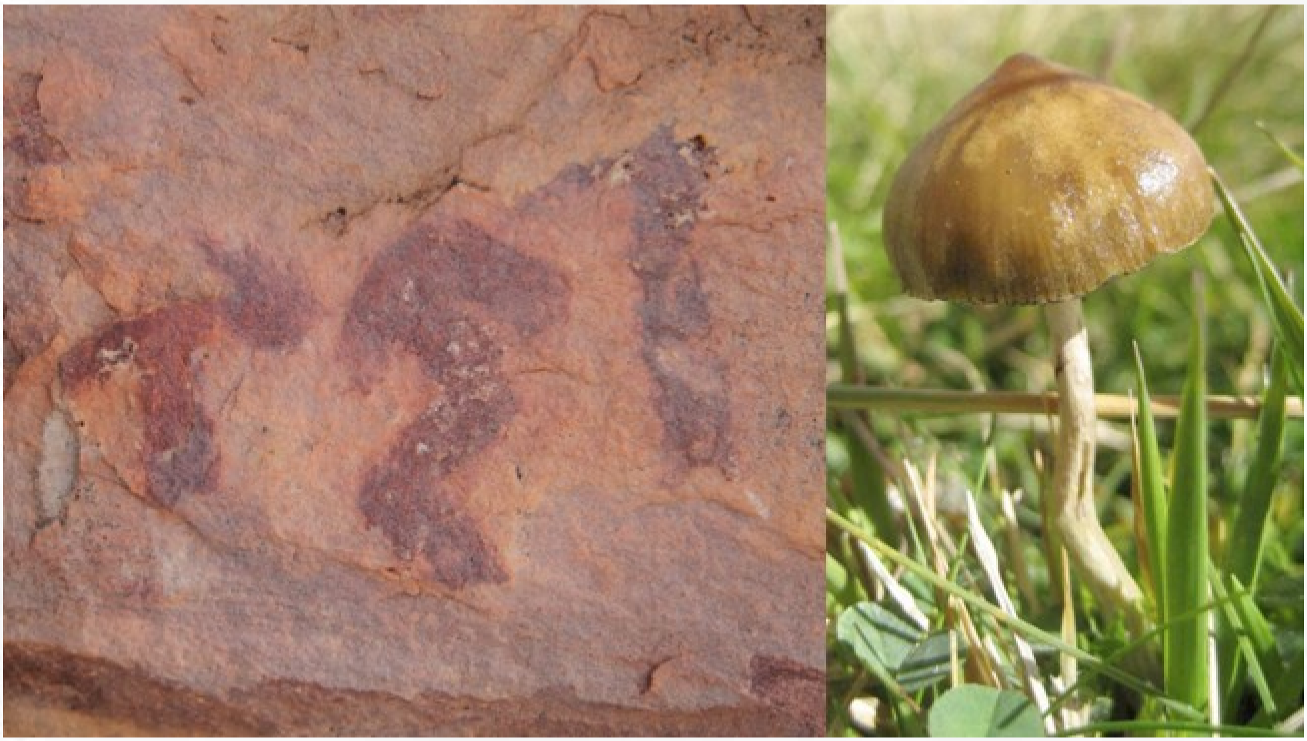
Yes, Tassili is a sitting duck for Ancient Psychonaut Theory. And any similarity to antique aliens may be coincidental or not, based on observations of contemporary subcultural patterns emerging in the wake of events since LSD's discovery. The term "Martian" appears in Tassili reference by the 1950's, before von Daniken - but within the flying saucer era. Le Quellec ("Shamans and Martians: The Same Struggle") compares a 'shamans everywhere' trend directly to the search for 'clues to an ancient extra-terrestrial presence in archeological remains.' I enjoy imaginative entertainment; but there's a potential for exploitation that can adversely affect research prospects (Le Quellec speaks of 'archaeomania'). Various 'interests' hover around, hoping to distract, or wanting it to prove something for them. How evidence is handled matters, depending on the purpose. It can become a foundation of understanding, or a banner for a cause; even a sideshow exhibit in a circus.
Another prehistoric fungal rock art site fortunately hasn't been so propagandized. It was found in northern Siberia by a Russian anthropologist, Dikov, on rocky formations in the Pegtymel River region. I don't know of any radiocarbon dates, but it's judged as prehistoric based on lichen growth and archeological sequences, regional styles. It's not as old as Selva Pascuala and, again, the graphic style is pretty abstract. But the region is well noted for fly agaric traditions. Shamanism there may likely be of Paleo-Siberian origin, based in part on cultural comparisons in N. America.
So, the ethnomyco interpretation of Pegtymel is supported by cross-cultural and regional data; it's just not as old. Still, a determined armchair theorist can simply argue at any hint of rock art and shamanism, or prehistoric mushroom rites. You can lead a horse to fungal pictographs, but you can't make it see them? Well if so, I think that's the horse's problem.

It's actually a fight that science has gone through for ages - pretty much the same one that Galileo had to put up with when he showed that objects fall at the same speed (when factoring out air resistance) whereas the standard wisdom at his time was that of course it was logical that heavier objects would fall faster.

Right; and it's what he could show that frosted that cake, not how it "looked to him" (we've each got our little coke bottle lens through which see things, I'm sure). That's a 24-carat example you cite, of "logic" vs. method; actually checking to see. Like the bear over the mountain; he didn't sit around philosophizing, much less arguing what he might see if he bothered. He went to the trouble, got up off his bear butt to have a look; did the Galileo. By some of Wasson and company's work, we might have almost predicted a discovery like Selva Pascuala. But reliability is relative, beyond conclusive test. We're not saying this is absolutely, 100% certain what was going on. We're just saying that this is the only explanation that there's evidence for. More evidence may turn up, showing us to be wrong. But it makes no sense to say "I don't believe that hypothesis" simply because you're uncomfortable with the notion of Mesolithic people using *Psilocybes* in a ritual context.

That's why fungal expertise is indispensable in such a unique case. Archeology is no exact science. Current understanding mainly reflects disagreement, ruled more by things we don't know than what we do. Its one theory against another.

Following our co-author, double-aught archeologist Juan Ruiz, rock art studies try so hard to prove things; when the best we might reasonably hope for at present is simply to adduce a solid hypothesis, uncover a forward trail. BTW there are other sites in eastern Spain, similar age, that also have fungoid-looking rock art; some in the vicinity of Selva Pascuala. Found a 'google image' pic labeled to one, Peña Escrita (looks like "praying mantis man" near the bottom).



Comparison of painted mushroom with present-day *P. hispanica*, showing the bent stem.
Photo of *Psilocybe* by Ignacio Serál

In the *Psilocybe* photos, I notice the crooked/bent stem on some of them really does resemble the cave paintings and is quite unusual. I see why Gaston made the connection with *hispanica*. But I have no idea how typical such a stem is for *Psilocybe* in general. The caps [for hispanica] seem to look very typical for *Psilocybes* (in my very, very limited experience, mostly with photos).

Ah, preaching to the choir now; music to my ears. I've stumbled onto some *Psilocybe* species in their habitats, but never had any contact, field or herbarium, with *Psilocybe hispanica*. Nor even close encounters of the Liberty Cap kind, despite how common and widely distributed it reportedly is. But as pics show, *P. hispanica* does pose a remarkable resemblance to our Selva mural. But a grasp of fungal morphology might be well to fully appreciate the correspondence. Nothing you lack; heck you've got that in spades.

But wouldn't you think, as George Bernard Shaw might affirm: such a point is likely lost on the most vocally opinionated; the very parties who ironically might better heed it. The more we know, usually, the less likely we are to be cocksure, the more interested in just finding out (for peat sake) - versus 'verbal volleyball,' debating answers prematurely on false certainty, trying to prove something as if we know, amidst theories in collision.

Candidly: I've noticed a few discussions, purportedly critical, trying to argue against possible fungal rites in ancient Europe - and on some, uh, mycologically strange grounds. You wouldn't believe. One; it seems bold research couldn't find any records of *Psilocybe semilanceata* "spoors" (this is published lit, Leon) in databases (no citation) - for prehistoric *fauna* (italics added, emphasis). Without wondering what sources such research consulted, for methods alone - do you know the word spoor, Leon? Meaning, animal trail? Its embedded in a tangled argument there were 'almost certainly' no stone age *Psilocybe* rites in Europe, because (get this logic) maybe there couldn't have been - because it wasn't even there in prehistory (maybe)! Because they couldn't find any "spoors" to prove it was! So a question not in evidence is simply conjured out of thin air by magic words, "absence of evidence" ginned up by narrative, re-told as "evidence of absence." Get it (snort)? Forgive the mockery, but I'm outraged by some of the stuff that goes down.

At the other end of the scale for investigative (and intellectual) authenticity, I have to thank my co-authors and colleagues at Selva Pascuala for realizing the scope and caliber of the site warranted a close, concerted myco look-see. I hope they're pleased with the way it's turned out. A site like that isn't found every day. By analogy I think of it almost like the 'Lucy' fossil, for its category of evidence.

We're only just scratching the surface of the world around us. We have miles to go before we sleep; light years. There's more to discover than can be discovered, more to know than can be known. Arguing theories, trying to persuade whomever that one makes more sense, has its place. Its a grand tradition, inherited from a golden age. But debate can't take the place of rigorous investigation, following the results wherever they lead. Especially with tools and techniques we have now, methods, instruments; all upon the foundation of centuries to work with, shoulders of giants. Research is inquiry's cutting edge now, at our present historic stage; what we can discover, not suppose. Fungi are a nice case in point. We barely know them; a circumstance not unrelated, I suggest, to their seeming power and ambiguity as cultural stimuli, from aversion to adoration.

I think we know that any talk of 'magic mushroom' rock art can elicit reactions pro or con. Indeed it faces a gauntlet of attitudes, from dismissively dogmatic to uncritically excitable. My co-author Carl takes his share of ribbing over his myco-exuberance, but I have his passion and enthusiasm to thank, among other things, for my invitation to this study. And some points on differing sides may be valid. A distant colleague, specialist in South American shamanism, emphasizes the fine print of questions arising here, the diversity of possibilities a phrase like "rock art shamanism" glosses over, and need for sound ethnographic orientation, not simplistic theoretical framework. What defines shamanism here, primarily? Is it the role and leadership of the ritual specialist? Or is induction of altered consciousness, understood by indigenous concepts of spirits and mythic powers, the central criterion? There are major questions to focus more sharply, an endeavor lost when focus is drawn into arguing over the blunter questions. Amid the fray, theories seems to go a wee bit one-sided at the expense of balance, maybe even tiptoeing around any data inconsistent or conflicting with whatever contention is up to bat, seems to me.

Merely avoiding pitfalls becomes high priority, if so. With the opportunity Selva Pascuala posed, it seemed the important thing would be simply to establish its credibility of study, from rigorous documentation through hard review. If our work makes any progress along such lines, that might be its main value. Now, having passed through its ring of fire, it poses a hard, implicit question: how else to account for the evidence, in all its aspects? The details of the pictographs and the morphology of *P. hispanica* aren't matters of theory or some argument, but findings of direct observation (no squinting or scrying); procedures subject to double-check, independent verification. No persuasion, or "believe it or not" routine.

A greater focus on methods and findings, versus arguing theories pro or con, would seem a promising avenue to advancement for this subject. If our little study, by its emphasis on concerted interdisciplinary study and findings, can find its way through the maze of conflicting arguments, each vulnerable to criticism for bias, perhaps it takes one small step. Seems to me hypotheses of whatever kind are much likelier tempered by doubt, than conviction.

I did read a while back that the idea has gained currency in paleoanthropological circles that quite a bit of the paintings/ markings in caves were done by teenagers, much for the same impulses that teenagers write on walls today.

While it's not prehistoric, ancient wall graffiti has been found in classical ruins - less likely the handiwork of old folks than young (at heart anyway?). But I'd distinguish that categorically from religious iconography, which is what we seem to have in the rock art of prehistoric Europe. No doubt, rock art studies reflect quite a range of notions, discussion points like you cite. I'm no expert, but on impression the whole subject seems complex, and fertile with dubious ideas easy to get. Theorizing has grown downright lively over the years; in fact its increasingly described as "contentious." Amid its swirls and eddies I've also seen "doodling" cited; like on a note pad, talking on the phone, maybe sitting on the couch. I wonder about some of the discussions, which often have a sound such as "nobody can prove ..." (or "prove otherwise"). That's not evidence, that's the old "we don't know, so..." -type argument from ignorance. The intractability of some approaches may be their main lesson to the wary (if we but heed).

Arch-musings may appeal mainly to the "rationalism" of armchair theorists: our temporally provincial, proudly skeptical, thoroughly modern mindset. But for theory, a lot of these ideas prove unexpectedly illogical - ancient

astronauts in reverse, almost. Significant energy and resources were expended to create and attend Selva Pascuala and other such sites. Nothing quite on the scale of the Great Pyramid - we're talking stone age hunters here, nomadic subsistence-settlement, undergoing transition to the Neolithic over centuries, in the prehistoric Mediterranean's unfashionable West End. But we can detect a pattern, well beyond relief of boredom or anything casual, random or impulsive. Teenage signs tend to be left closer to home, where others might see them. I wouldn't rely on the kids these days for explanation of Selva Pascuala (no offense). I hardly think the mural can be understood well in terms of graffiti or prehistoric doodling, however conceived. True, such colorful ideas can cast a certain spell, in their delightfully Trumanesque, tire-kicking "prove it" defiance (I have a soft spot for that stuff, I admit). But they're not "data driven." And they generally lack explanatory power, as I find, by their implicit - and may I say dubious - analogy, between prehistory, and social life as we know it.
Contrary views have a role of course. They're ideal sources for clues to possible flaws in rival theories. So we have more to gain than lose by granting them every consideration. But a fatal flaw they may share is a tendency to over-generalize from minimal evidence. In key ways, Selva Pascuala may tell us little about Australian rock art, for example. But the goal of our study wasn't to prove anything, nor grand theorizing; only to find out about something if we can - whether it proves to be what we think or not.

Is "rational" your own label for the people who proceed purely from argument and not from evidence? Or is it in general circulation and therefore difficult to change? It seems to me that "rational" confers more status on such an approach than it's worth: it's more of a rhetoric-and-logic approach, but logic can still be irrational when it has no rational/evidential foundation. So I would recommend "rhetorical/logical" as a more appropriate label for this approach, or - if you want to be insulting, which of course we shouldn't be - Aristotelian.

You say it well - what have you, been to college? My label along those lines would be "rationalist" actually. I think you and I both use 'rational' the same, for reason, clear thinking, in affirmation. This goes to a fine line between rational, and rationalism - i.e., intellectual justification, etc. Its Freud's concept of rationalization applied collectively, to map ideological contours of society, contemporary non-material culture pattern. I find two major faces of a loose, diffuse rationalist movement (Jacques Vallee calls it). One is "rhetoric and logic" gone wild, which you specifically note; seems names get dropped a bit in that big tent (like Foucault). Juan Ruiz quips, our 'post-structuralist' archeologues would breezily reject relativity and quantum physics, with no interest in the phenomena they account for - and no offer of any better theory - simply because at present physicists don't know how they integrate; and thus can't explain one in terms of the other; as a certain brand of logic demands apparently.
Tracing its outline, I find rationalism has this other side, drawing mainly from scientific knowledge and perspective, not philosophy; some call it scientific materialism or scientism. Rationalism seems to primarily reflect a kind of psycho-culturally driven opposition to irrationalism in various forms (mostly either "old time/age" or "new"). The common ground seems to be a familiar metaphysical premise, that there's an explanation for everything - scientific or logical (our choice) - and no baby, only dirty bathwater in any other perspective ("black tide of the occult," Freud's phrase). Some funambulating to do, I find, between 'rational' and 'rationalistic' - so I appreciate the focus on that fine line. Nice agility too - you're a sport; dodging quicksand at the cutting edge of multi-disciplinary research and inquiry, where the devil's hunter stalks rare game.

Congratulations on your well-deserved cover appearance in/on *Economic Botany*!

Thanks Leon, a humbling tribute; I'm obliged. The darkness of these caves seems a fit metaphor; I appreciate your help trying to light a candle. We're a long way from figuring everything out, but hopefully it's another step in the right direction.

A Prehistoric Mural in Spain Depicting Neurotropic Psilocybe Mushrooms?

A Prehistoric Mural in Spain Depicting Neurotropic Psilocybe Mushrooms? The Selva Pascuala mural, a work of post-Paleolithic rock art in Spain, contains fungoid figures herein hypothesized to depict neurotropic fungi, especially *Psilocybe hispanica*, a species that occurs in a neighboring region. This hypothesis is based on features of these figures related to fungal morphology, along with ethnographic analogy, and shamanistic explanations of rock art. If correct, this interpretation would support inference of prehistoric utilization of this fungus in the region. The mural represents the first direct evidence for possible ritual use of *Psilocybe* in prehistoric Europe.

¿Se Representan Setas Neurotrópicas Psilocybe en un Mural Prehistórico de España?. El panel de Selva Pascuala (Villar del Humo, Cuenca, España) conserva pinturas rupestres de cronología postpaleolítica entre las que se incluyen figuras con apariencia de seta, para las que aquí planteamos la hipótesis de que representan setas de efectos neurotrópicos, en concreto *Psilocybe hispanica*, una especie que crece en regiones próximas. Esta hipótesis se basa en las características de estas figuras en comparación con la morfología de dichas setas, a lo que se añade la analogía etnográfica y la teoría del chamanismo aplicada al arte rupestre. Si estamos en lo cierto, esta interpretación apoyaría la posible utilización regional de estas setas durante la Prehistoria. El panel supone la primera evidencia directa del posible uso ritual de *Psilocybe* en la Prehistoria europea.

Key Words: Psilocybe, neurotropic fungi, post-paleolithic, rock art, levantine art, schematic art.

Introduction

Ritual use of neurotropic fungi has been noted in several culture areas, most notably Mexico and Siberia. Almost 20 *Psilocybe* species have been used in shamanistic rites in Mexico (Guzmán 2008). In Siberia, shamans have made similar use of fly agaric, *Amanita muscaria* (L.:Fr.) Pers., a neurotropic fungus with pharmacology differing from that of *Psilocybe*.

These historic traditions of native Mexico and Siberia are well documented, but their cultural origins are unclear. Archaeological artifacts including ceramics from northwest Mexico, plus the so-called mushroom stones associated with the Mayan Classic and Preclassic periods, have been interpreted as evidence for usage of neurotropic fungi in Mesoamerica spanning more than 2,000 years (Borhegyi 1961; Furst 1974). Based on their studies, Wasson and Wasson (1957) suggested even greater antiquity for such practices, and proposed similar traditions were likely more common and widespread in prehistory. (For a recent critique of Wasson and Wasson [1957], see Letcher 2006.)

Evidence concerning the ritual use of fungi in prehistory is scant, but rock art from several regions has been cited in relation to the idea Wasson and Wasson (1957) put forth. Possibly the most ancient example is from Tassili, in the Sahara desert, southeast Algeria. In a cave there, Samorini (1992) found a painted mural dated 7000 to 9000 B.P. portraying fungi, possibly *Psilocybe mairei* Singer, according to G. Guzmán (pers. comm.), a species known from Algeria and Morocco. In northeastern Siberia, Dikov (1971) discovered fungoid petroglyphs on large exposed rocky formations in the Pegtymel River region, apparently of shamanistic significance and likely representing *Amanita muscaria*.

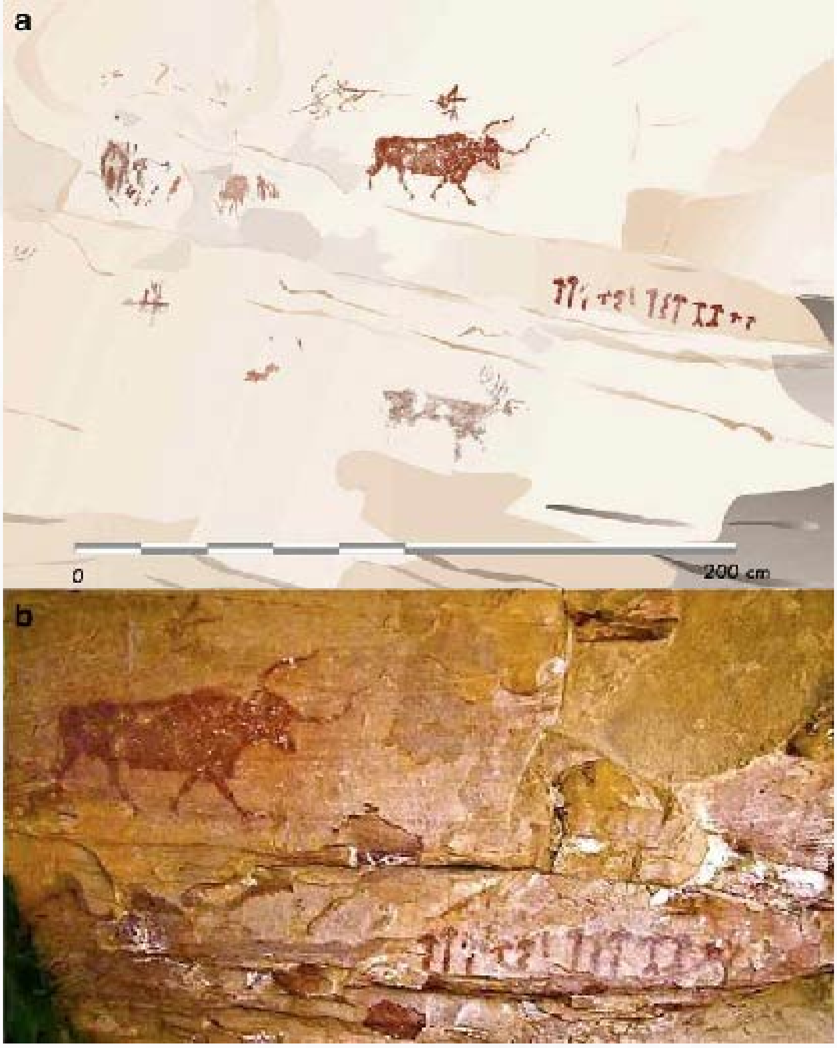

Fig. 1. The Selva Pascuala mural.
(**a**) Whole mural (digital tracing, J. F. Ruiz).
(**b**) Detail, bull and mushroom pictographs (photograph, A. Piper).

The present paper details findings from study of the Selva Pascuala mural (Fig. 1), a striking work of prehistoric rock art at the Villar del Humo cultural site in Cuenca, Spain. Along with other compositional elements including most prominently a bull, this painted scene contains distinctly fungoid pictographs. Previously described as anchor-like (Acosta 1968) or mushroom-like (Alonso 1983), these figures appear toward the lower right, in a distinct horizontal row of 13. Each consists of a vertically oriented, stalk-like lower portion varying from straight to sinuous, apparently representing the stipe, capped by an upper portion suggesting the pileus, convex to bluntly subconical in form.

Ramón Viñas, a Spanish archaeologist experienced in Levantine and Mexican rock art, was the first to suggest informally that these pictographs, true to their appearance, might in fact represent fungi (Viñas pers. comm. to J. F. Ruiz and J. F. Jordán in 2007). Their portrayal in association with a bull seemed especially interesting in this regard, considering the manure habitat of a few *Psilocybe* species. The purpose of our study was to assess the validity of Viñas' suggestion by testing it against data and analysis from archaeology and mycology. Our objective was to evaluate whether this hypothesis would prove tenable in light of various relevant lines of evidence.

The Site and Prehistoric Rock Art in Spain

The Selva Pascuala mural is one of two pictographic panels found at the Selva Pascuala rock shelter, which was discovered in 1918 by archaeologist E. Hernández-Pacheco (1959). The shelter measures 1,220 cm in width by 315 cm in height, and the fungal pictographs are up to 8.8 cm in height. The site is located in the municipality of Villar del Humo, within the central Spanish province of Cuenca. Villar del Humo lies within the outskirts of the Sierra de las Cuerdas, a group of medium-sized mountains of 900 to 1,500 m altitude in the southernmost part of the Sistema Ibérico range. The local landscape is rugged, with dense pine forests growing amid cliffs and boulders of reddish Triassic sandstone.

Although little is known of the post-Paleolithic culture in this region, it is noted as an important record of prehistoric rock art. The first such site was discovered in 1917. Following several archaeological surveys over the last decade, the number of rock art sites documented has grown from 13 to 40 (Poyato *et al*. 2007; Ruiz 2006).

The rock art of Villar del Humo belongs to two major art styles: Levantine and Schematic. Levantine art is distributed over the eastern half of the Iberian Peninsula, a region referred to as the Spanish Levant. It represents a naturalistic style in which human and animal figures play major roles, with vivid scenes of hunting activities, dancing, and fighting. Schematic art is found throughout the Peninsula and features dots, lines, zigzags, and schematized figures, painted with broader brushes and a less careful technique. Both styles occur together at various sites, including Selva Pascuala, and were probably produced by the same culture undergoing a long-term process of change (Mateo 2001; Ruiz 2006). However, some researchers believe they may reflect two consecutive cultures that coexisted and competed with each other in this part of the Peninsula over a period of time (Hernández and B. Martí 2000; Martínez and Villaverde 2002). At Selva Pascuala, naturalistic and schematic figures appear together in the mural with no appearance of competition or erasure of one by the other, suggesting a meaningful relationship in the overall composition, even if both styles were produced in different chronological periods.

Levantine and Schematic art are distinguished from Paleolithic rock art, particularly the remarkable Franco-Cantabrian tradition of northern Spain and southwestern France, known from cave sites such as Lascaux and Altamira among others. Franco-Cantabrian art typically occurs in deep caves, but Levantine and Schematic art is mainly found at rock shelters, which tend to be more open and exposed to the elements. Large animals are the principal subjects of Paleolithic cave paintings, whereas humans and their activities figure more prominently in Levantine and Schematic art. The latter styles are also distinguished from Paleolithic art by their use of plain colors, mainly red but also black and white. Finally, Levantine and Schematic paintings are relatively small, 1 m or less, compared with the typically larger scale of Franco-Cantabrian art.

Although Paleolithic art differs in some respects from these post-Paleolithic styles, their meanings may be related based on a common hunting and gathering adaptation that typified the Upper Pleistocene and persisted in the Iberian Peninsula until the fourth millennium B.C.E. In the eastern part of the Peninsula, Paleolithic and post-Paleolithic styles display some similarities, highlighted by new discoveries in the last decade. Both have a conspicuous, consistent emphasis on animals and hunting motifs, clearly reflected in the Levantine hunting scenes. Both traditions offer abundant evidence of magical or ritual functions, presumably based in symbolic meaning of the reduced number of animal species most often portrayed, apart from their relative economic importance. Anthropomorphism plays a role in these depictions, often assimilating the hunter to the hunted.

Such interpretations are based on similarities between the older and more recent styles of prehistoric art, plus ethnographic analogies with extant hunting and gathering cultures. There is an increasing consensus that painted rock shelters of the Spanish Levant and caves featuring Paleolithic art were long regarded as sacred sites or sanctuaries; that is, they were places of ritual importance. Based on the austerity of their location and consistent subject matter, these ancient rock art sites cannot be well understood in secular terms as mere creative decoration or artistic expression for its own sake (Díaz-Andreu 2001).

In recent decades, shamanistic interpretations involving altered states of consciousness or "archaic techniques of ecstasy" (Eliade 1964) have been proposed for rock art in Europe and elsewhere (Clottes and Lewis-Williams 1998; Lewis-Williams 2002; Lewis-Williams and Dowson 1988; Turpin 1994). Indigenous uses of neurotropic fungi typically involve a shamanistic context, and the identification proposed here is based in part on general explanations of rock art in shamanistic terms. It must be noted that such explanations remain theoretical thus far, and subject to disagreements as well as further study (for a recent critique see Bahn 2010).

Antiquity and Dating of the Mural

Considerable uncertainty prevails over the exact age of the Selva Pascuala mural, as well as Levantine and Schematic art in general. Levantine art was formerly interpreted as Paleolithic, but archaeologists nowadays tend to place it in a post-Paleolithic context; i.e., after the Pleistocene. Many prehistorians now date it close to the rise of the first Neolithic farming and herding communities in the Iberian Peninsula. As noted, the role of animals in Levantine art recalls Paleolithic art, pointing toward a cultural adaptation resembling that of the Upper Pleistocene. However, in contrast to Franco-Cantabrian art, extinct Ice Age fauna are absent from this post-Paleolithic style, reflecting its more recent origins. Indeed, at Selva Pascuala the panel other than the one studied here contains a scene of horse domestication, a rarity for Levantine and Schematic art indicating a Bronze Age cultural stage.

Recent research (Ruiz *et al*. 2006) using ^{14}C AMS analysis of calcium oxalate patinae has provided the first radiometric dates related to prehistoric art in the Sierra de las Cuerdas. Results indicate at least some Levantine art in the region could have been painted around 6000 B.C.E., prior to the Neolithic in the Iberian Peninsula (Ruiz *et al*. 2009). However, Levantine art was likely produced over a long period of time, up through the end of the Neolithic. On the other hand, Schematic art appears with the first Neolithic cultures, based on parallels between this style and decorated ceramics that have been well dated archaeologically (Torregrosa and Galiana 2001). The older Neolithic sites in the Peninsula are dated after circa 5600 B.C.E. (Zilhão 2001).

Conclusions about the age of the Selva Pascuala mural are tentative. Central portions, such as the bull, are clearly Levantine and may go back at least as far as 6000 B.C.E. The fungoid figures are interpreted as Schematic and likely Middle Neolithic, circa 4000 B.C.E. in this region. Unfortunately, the archaeological record for other cultural remains at the site is limited to some fragmentary evidence of fire usage and flint knapping; such is difficult to clearly associate with the mural. Selva Pascuala was not a habitation site but rather one of special purpose, consistent with a shamanistic interpretation.

Interpretation of the Mural and Mycological Identification

Based on its combination of Levantine and Schematic elements, the Selva Pascuala mural is likely to have originated with more than one artist in successive episodes of painting activity. Its interpretation must be qualified by indications it underwent a process of re-elaboration over time. At the center of the scene, animals are dominant. There are two large bulls, one of which has almost disappeared, plus a deer and several human figures. These are rendered in Levantine style and probably trace to an earlier stage, based on their central position. Several Schematic figures appear around the edge of the mural, apparently added later and without disturbing the previous composition. Some of them, including the mushroom-like pictographs studied here, play an apparent role more typical of Levantine human figures, being placed toward the margin, around the central portion in which animal figures predominate.

The fungoid figures in the mural display individual differences of form resembling the kind of morphological variation commonly observed in fruit bodies of a single species. Two of them, in the tenth and eleventh positions (counting left to right), also show a split or bifurcated base, which could lend to anthropomorphic interpretation as legs. Indeed, the figures in this row have been previously interpreted as schematized human beings (Alonso 1983).

Recently proposed explanations for rock art based on ritualized trance or altered states, together with ethnographic analogies for use of *Psilocybe* and *Amanita*, suggest that the pictographs, interpreted as mushrooms, would likely represent neurotropic fungi. In consultation with Dr. Gastón Guzmán, we noted features of the 13 fruit bodies and the variations among them in light of fungal morphology and taxonomic concepts. The pictographs appear to illustrate a fungus with a convex to conic-subumbonate pileus and a straight to sinuous stipe, lacking an annulus. Accordingly and using these criteria, mycological data were reviewed to determine whether any neurotropic species occurred in the region with features matching those indicated in the mural. *Amanita muscaria* was excluded because of its non-sinuous stipe and large, persistent annulus. Moreover its pileus is adorned with conspicuous veil remnants, typically emphasized in artistic treatments, and notably lacking in the mural figures. We also considered the mural's combination of bovine and fungal figures raised some question of a possible habitat association. Likewise, this posed no apparent connection with *A. muscaria*, a mycorrhizal species.

Close similarities were noted, however, between the mural pictographs and the neurotropic fungus *Psilocybe hispanica* Guzmán (Fig. 2). Known so far only from Spain, this species was described from a locale near Huesca in the Pyrenees Mountains, approximately 275 km northeast of Selva Pascuala, in the Aragon region. It is reportedly used there recreationally for its neurotropic effects, especially by young people (Fernández-Sasia 2006; Guzmán 2000; Guzmán and Castro 2006). Its pileus is convex to subconical, closely matching the pictographs. The straight to sinuous stipes of the mural's mushrooms also agree well with those of *P. hispanica* (Guzmán 2000). Our knowledge of this species to date is based on only three collections, so additional comparative data would be valuable. Nonetheless if the mural relates to a shamanistic context and the pictographs represent mushrooms, we consider *P. hispanica* a uniquely apt candidate for the likely identity of the species depicted, as proposed by Guzmán.

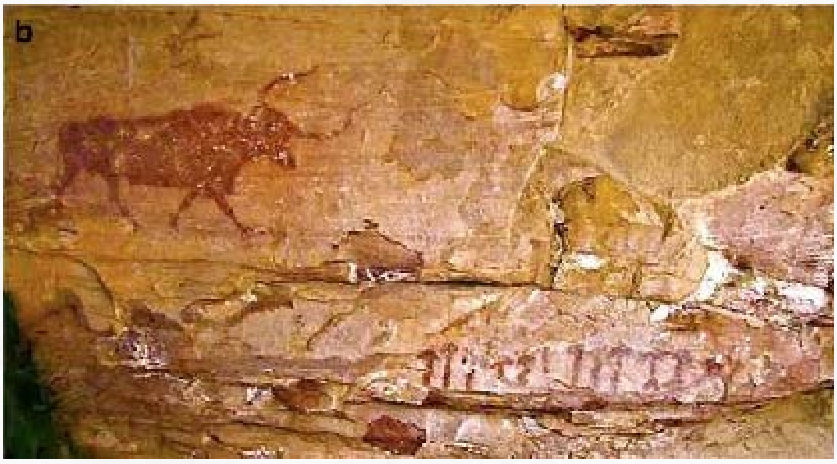

Fig. 2. *Psilocybe hispanica* Guzmán (photograph, I. Seral).

Habitat data also correlate with the identification tentatively suggested here. *Psilocybe hispanica* is a coprophilic species, coinciding with the mural's association of bovine with fungal figures. This species has been collected so far only from horse dung, but coprophilic fungi present a wide range for kinds of dung they inhabit. This is well illustrated by *Psilocybe cubensis* (Earle) Singer, and *P. coprophila* (Bull.: Fr.) P. Kumm., which occur on dung of many kinds of herbivorous mammals including horse and cattle, among others.

There is another neurotropic fungus in the region that might be considered in light of the mural pictographs, *Psilocybe semilanceata* (Fr.: Secr.) P. Kumm. This species is closely related to *P. hispanica* but differs in its pileus, which is acutely papillate and more narrowly conical to subcampanulate. These features point away from any relationship with the fungi depicted at Selva Pascuala. It grows only on soil rather than dung, likewise offering no specific link with the apparent bovine association in the mural.

Psilocybe hispanica has been found so far only in the Pyrenees region, in alpine *Pinus* forests at 2,000 to 3,000 m altitude. The Selva Pascuala site lies at 1,070 m. However, it is likely that *P. hispanica* has a wider ecological distribution than is presently known, based on studies of other species such as *P. aztecorum* R. Heim emend. Guzmán. The latter was originally described from alpine *Pinus* forests at 3,500 m altitude (Heim 1957), but Guzmán (1978) later found it in a non-alpine *Pinus* forest at 2,500 m.

In view of the temporal separation between the Selva Pascuala mural and our records of *Psilocybe hispanica* in the present, a related question arises of climate change as a possible factor affecting distribution of this species over time. We have no mid-Holocene records for the Sierra de las Cuerdas, but several studies have been published addressing paleoclimate for medium altitude mountains in a radius of approximately 100 km around Villar del Humo (Carrión and van Geel 1999; Fernández-Miranda and Moure 1977; Stevenson 2000). Studies indicate mature forests of *Pinus* species with some deciduous trees were well established. The data present no indications contrary to the likely presence of *P. hispanica* in the region during the era of the Selva Pascuala mural.

Following shamanistic explanations of rock art, ethnographic analogies for use of *Psilocybe* and *Amanita* suggest to us that Selva Pascuala probably reflects a similar context of neurotropic fungi consumption. Our interpretation of the mural, if correct, would imply ritual usage of neurotropic fungi, especially *Psilocybe hispanica*, as part of the post-Paleolithic culture pattern in this region. Accordingly, Selva Pascuala presents the first direct evidence for possible utilization of *Psilocybe* in prehistoric Europe. Along with Pegtymel and Tassilli, the mural represents the third reported instance of rock art suggesting prehistoric usage of neurotropic fungi. Tassilli is the only site previously known that may likely represent *Psilocybe*. Selva Pascuala thus offers the second such example.

Discussion

Examples of apparent Schematic style fungal depictions other than in Selva Pascuala have been recorded. These include Marmalo V at Villar del Humo (Alonso 1983-84), plus Monte Arabí and Cantos de la Visera, both at Yecla in the Murcia province (Acosta 1968). How such sites relate to Selva Pascuala is unclear, but their existence is interesting in view of our findings about the mural.

Selva Pascuala's apparent association of bovine imagery with *Psilocybe* is noteworthy in light of a mythic link between the bull and mushrooms, extending into classical Mediterranean history and seemingly related to intoxication. In Greek mythology, mushrooms bellow like bulls as they fruit from the ground; and Dionysus, the god of intoxication, manifests as a bull that his ecstatic devotees dismember barehanded (Ruck 2006). Fungi are similarly anthropomorphized as a variety of taurine monsters, which the mythic hero masters by decapitation, harvesting the head (Ruck *et al*. 2000). This mythic encounter of the hero with the bull and its harvesting as a magical plant is traceable to Mithraism and its revision as Zoroastrianism, arguably the earliest monotheistic religion. Deification of the bull in shamanistic contexts has been documented at shrines and sanctuaries excavated at Catal Höyük in Anatolia, a tradition dating back to the era of Selva Pascuala (Ruck *et al*. 2009). The Selva Pascuala mural also seems to express this widespread metaphoric zoomorphism.

If the identification proposed herein is correct, the dung habitat of *Psilocybe hispanica* is sufficient by itself to explain the mural's combination of fungus and bovine. But there may be more than habitat involved in this association, as well as other elements of the mural, possibly relating to the effects of *Psilocybe* upon humans or animals as observed by humans. The bifurcated bases of two of the fungal pictographs are suggestive of human legs. This might represent a transformation process relating to perceived effects on humans, in a sense reconciling previous interpretation of these pictographs as anthropomorphs. Observed effects of neurotropic fungi or plants upon animals that ingest them may also underlie fungal zoomorphism and anthropomorphism at Selva Pascuala and elsewhere. In any case, the mural's depiction of mushrooms carefully arranged in a row with correct detail and features, seems to suggest they held special significance for the artist and cultural context.

Conclusion

We suggest that Viñas' hypothesis is sound, and the Selva Pascuala mural likely depicts mushrooms, especially neurotropic fungi. Although *Psilocybe hispanica* presents a probable candidate for the species depicted, as indicated by Guzmán, we emphasize that this identification is tentative, and contingent upon a shamanistic interpretation of the mural. Understanding of Selva Pascuala and related sites will no doubt benefit from further research on rock art and post-Paleolithic culture in Spain.

Acknowledgments

The authors thank Gastón Guzmán for his identification of the mural fungi, plus members of his team - especially Florencia Ramirez-Guillen and Manuel Hernandez. We thank the authorities at the Institute of Ecology (Veracruz, Mexico) for their support. We also thank Juan Francisco Jordán Montes and José Alfredo González Celdrán for their involvement and onsite assistance to Carl Ruck and Alan Piper; and John Moeller for help obtaining literature sources.
